PREFACE

The A.S.M. Review of Metal Literature is published monthly by the American Society for Metals. The present volume is a collation of the issues from January through December 1961. It is the eighteenth volume in a series that began in 1944.

In most instances, the annotations are not intended to serve as a substitute for a reading of the articles listed. They are brief abstracts designed to indicate the scope and content of the article so that the reader may determine whether it is something he wants to read in its entirety. In other words, they are indicative rather than informative abstracts.

The table of contents lists the main headings into which the A.S.M. Review of Metal Literature is subdivided, together with secondary subdivisions indicating the scope of the main heading. The main sections are designated by capital letters, and individual annotations are identified by the appropriate capital letter preceded by a serial number.

The method of classifying the annotations into subject subdivisions is based upon the "ASM-SLA Metallurgical Literature Classification, International (Second) Edition," published by the American Society for Metals in 1958. Each annotation is likewise followed by code symbols which refer to the subdivisions and schedules of the ASM-SLA Classification.

An understanding of this coding system, however, is not essential to the use of this volume of the Review of Metal Literature, which is accompanied by a complete subject index starting on page 1405. Since the annotations are classified primarily by processes and properties, the subject index has been prepared with the emphasis primarily on materials. Subheads are included in sufficient detail to permit the location of articles on any specific subject related to the metal industry. Indexing is based on the content of the article and not merely on the title.

In using the book, if the primary interest is in the broad field of corrosion, or foundry practice, or heat treatment, turn immediately to the respective section as given in the table of contents. If the main interest is in aluminum alloys, or copper, or cast iron, turn to the corresponding heading in the subject index. If interest lies in specific aspects of foundry practices, or a particular type of heat treatment, these broad processes will be found indexed and subdivided in the subject index. An author index is also provided and a list of addresses of the journals and periodicals from which the literature references are taken.

The annotations have been prepared by technical abstractors and translators under the direction of Alan M. Rees, Abstracts Editor and Manager, Acquisitions and Analysis Department, Center for Documentation and Communication Research of Western Reserve University.

TABLE OF CONTENTS

Section A. GENERAL METALLURGY 1

History; education; statistics and economics; plant management; industrial relations; health and safety; industrial pollution and waste disposal; research and development; conservation of resources; professional activities; laws and legal actions; literature techniques; audio-visual techniques

Section B. ORE AND RAW MATERIAL PREPARATION 59

Sampling; mining methods; crushing, grinding and sizing; concentration (beneficiation); roasting and calcining; sintering processes; fuel distillation and gasification; processing of fuels; processing of refractories; processing of scrap; water treatment; production of industrial gases

Section C. EXTRACTION AND REFINING 76

Chemical extraction; smelting (except iron and steel); distillation; electrolytic processes; nonferrous vacuum reduction and refining; reduction by metals and gases; precipitation; separation of metals; amalgamation; decomposition; nonferrous melting and casting; isotope separation

Section D. IRON AND STEELMAKING 123

Blast furnace practice; openhearth practice; converter processes; electric arc processes; multistage processes; special processes; ingot casting; oxygen furnace processes

Section E. FOUNDRY 194

Melting techniques; sand casting; permanent mold casting; die casting; centrifugal casting; precision investment casting; other methods; pattern making; sand technology; molding; coremaking; rigging; pouring; casting cleaning; metallurgical control; casting reclamation

Section F. PRIMARY MECHANICAL WORKING 254

Preparation for working; forging (hammer and press); rolling; extrusion of rod, shapes and tube; swaging; tubemaking (except extrusion); drawing of rod and shapes; wire drawing; finishing operations; applied mechanics of primary metalworking (stress analysis)

Section G. SECONDARY MECHANICAL WORKING—FORMING AND MACHINING 295

Presswork in general; shearing; stamping; drawing; impact and cold extrusion; bending; stretch forming; heading; roll forming; thread rolling; spinning; bulging; die sinking; machining (mechanical); grinding; finish machining; flame and arc cutting; finish forming; special machining methods; applied mechanics of forming and machining (stress analysis)

Section H. POWDER METALLURGY 382

Powder production; powder properties; mixing and blending; molding or compacting; sintering; post-sintering operations; fiber metallurgy

Section J. HEAT TREATMENT 400

Homogenization; austenitizing; annealing; normalizing; patenting; quenching; precipitation hardening; case hardening; tempering; residual stress control; heating and cooling methods; other carbon diffusion processes; surface alterations; hardenability

Section K. ASSEMBLING AND JOINING 440

Arc welding; gas welding; resistance welding; thermit welding; forge welding; other welding processes; soldering; brazing; process control; bonding metals to nonmetals; adhesive joining; mechanical assembling

Section L. CLEANING, COATING AND FINISHING 531

Mechanical cleaning and polishing; chemical cleaning and polishing; electrochemical cleaning and polishing; chemical conversion coating; diffusion coating; dip coating; electroplating; electroforming; anodic coating; cathodic oxide coating; cladding or bonding; metal spraying; coating by weld deposition; coating by vapor deposition; painting and organic coating; ceramic coating (vitreous enameling); coating by chemical reduction; other methods

Section M. METALLOGRAPHY, CONSTITUTION AND PRIMARY STRUCTURE 631

Specimen preparation; microscopy; diffraction methods; other techniques; phase diagrams; atomic and molecular structures; crystal structures; primary microstructures; macrostructure

Section N. TRANSFORMATIONS AND RESULTING STRUCTURES . . . 711

Diffusion; nucleation; grain growth; recovery; recrystallization; diffusionless transformations; precipitation; austenite formation and decomposition (Fe-C system); other eutectoid reactions; superlattice formation (order-disorder); other solid-state reactions; liquid-solid reactions; liquid-liquid reactions; gas-solid reactions; gas-liquid reactions

Section P. PHYSICAL PROPERTIES AND THEIR MEASUREMENT . . . 792

Mass and volume; thermal; thermodynamics and kinetics; chemical kinetics; electrical and electrochemical; magnetic; radiation properties (electromagnetic); nuclear

Section Q. MECHANICAL PROPERTIES AND TESTS 880

Elastic properties; anelastic properties; miscellaneous plastic properties; plastic deformation mechanism; stresses; fracture mechanism; tensile properties and tests; compression properties and tests; hardness and hardness tests; torsion properties and tests; shear properties and tests; creep properties and tests; bend properties and tests; impact properties and tests; fatigue properties and tests; damping properties and tests; wear properties and tests; other properties and tests

Section R. CORROSION 1086

Mechanism of corrosion; corrosive effects; atmospheric corrosion; by waters; by chemicals, inorganic; by chemicals, organic; by soils; preventive measures; tests

Section S. INSPECTION AND CONTROL 1188

Sorting and identification; composition analysis; statistical analysis and control; flaw detection; size, thickness and mass measurement; surface roughness; temperature measurement and control; process control and measurement; radiation detection and measurement; miscellaneous service testing (life testing); standard practice and specifications; calibration

Section T. METAL PRODUCTS AND PARTS 1239

Automotive; marine; railroad; aircraft; structures; mining and oil field equipment; chemical processing equipment; electrical and electronic components; ordnance material (excluding explosives); agricultural equipment; civil engineering equipment; tools and hardware; machine parts; arts and crafts; consumer goods; nuclear reactor components

Section W. PLANT EQUIPMENT 1267

Plant installations; power generation and distribution; materials handling; general service equipment; ore and raw material preparation; fuel distillation and gasification; furnaces and equipment for primary metallurgy; melting and refining furnaces and equipment; casting; ingot and slab preparation; forging; rolling; forming and shaping; machine tools; powder metal processing; heat treating furnaces; other heat treating equipment; welding, brazing and soldering; mechanical assembling; mechanical cleaning and finishing; chemical and electrochemical cleaning and finishing; other cleaning and finishing

Section X. INSTRUMENTATION—LABORATORY AND CONTROL EQUIPMENT 1282

Size, thickness and mass; chemical laboratory; surface properties; thermal properties; electrical properties; nuclear properties; elastic and anelastic properties; mechanical properties; corrosion; radiation detection; optics and microscopy; metallography; photography and other visual aids; sorting and identification; atmosphere and humidity; flaw detection; temperature measurement; electricity; magnetism; pressure; rate, time and flow; computers and business machines; communication

AUTHOR INDEX 1301

SUBJECT INDEX 1405

SECTION A

GENERAL METALLURGICAL

1-A. Progress in Stainless and Heat-Resisting Steels. J. Lomas. Engineering and Boiler House Review, v. 75, Oct. 1960, p. 326-328.

Applications of stainless steel powders and tubing. Mechanical properties and corrosion resistance of austenitic stainless steels. (A-general; SS)

2-A. Refractory Metals a la Detroit. Journal of Metals, v. 12, Nov. 1960, p. 871-872.

A symposium on phase equilibria, physical and mechanical properties and oxidation resistance of refractory metals at high temperatures. Fabricating and processing. Use of protective coatings on the metals at high temperatures. (A-general; EG-d37)

3-A. Minor Metals. Charles T. Baroch, Donald E. Eilertsen, Frank L. Fisher, James Paone, H. Austin Tucker and F. W. Wessel. U. S. Bureau of Mines Minerals Yearbook, Preprint, 1959, 18 p.

Sources, production and consumption of Ce, Rb, Ga, Ge, In, Ra, Re, Sc, Se, Si, Tl, Th and Yt. Ore refining and recovery of metal from scrap. 52 ref. (A4; Ce, Ga, Ge, In, Ra, Rb, Re, Sc, Se, Si, Th, Tl, Yt)

4-A. Astroloy--A Superalloy for 1900° F. Use. J. F. Barker, W. H. Couts, Jr., and R. J. Morris. Metal Progress, v. 78, Dec. 1960, p. 94-97.

This latest addition to the ranks of Ni-base superalloys contains 4.50% Al, 3.5% Ti and 0.03% B. It has excellent yield strength and stress-to-rupture properties and can be readily shaped and welded while in the annealed condition. (A-general, Q-general, G-general; Ni-b, SGA-h)

5-A. Information Searching. Metal Progress, v. 78, Dec. 1960, p. 168, 170, 172.

Typical questions currently being searched by electronic retrieval equipment as part of the ASM Metals Documentation Service. Machine searching results are compared with conventional searches made through the indexes of several abstracting services. Lower costs, increased speed and greater completeness are seen as the main advantages over traditional library methods. (A14e)

6-A. "S" Inconel (Corrosion Resisting Casting Alloy). Alloy Digest, Ni-63, Dec. 1960, 2 p.

Nonmagnetic, high corrosion and heat resistant Ni-base alloy. It has an excellent combination of high strength, resistance to ordinary forms of corrosion, good heat resistance and freedom from aging or stress corrosion. It is a structurally stable alloy and does not lose its toughness or ductility due to internal structural changes even after long exposure to high temperatures. (A-general, Q-general; Ni-b, SGA-g)

7-A. Carpenter Stainless No. 12 (Cold Heading Stainless Steel). Alloy Digest, SS-111, Dec. 1960, 2 p.

Austenitic Cr-Ni alloy steel that work hardens very slowly. This steel work hardens more slowly than conventional 18-8 stainless steel and remains nonmagnetic after severe cold forming operations. (A-general, G10, 1-67; SS)

8-A. Birmal P. 83 (Die Casting Alloy). Alloy Digest, Al-98, Dec. 1960, 2 p.

Alloy has good casting characteristics and mechanical properties.

Because this alloy contains both Cu and Si it has better machining characteristics than the Al-Si alloys. Its resistance to corrosion is better than the Al-Cu alloys but is not as good as the Al-Si alloys. (A-general, E13, G17k; Al-b, Cu, Si)

9-A. Crucible B-120VCA (All Beta Titanium Alloy). Alloy Digest, Ti-28, Dec. 1960, 2 p.

Although requiring higher work forces to move, this alloy is more ameanable to cold forming than any other Ti alloy of comparable strength level. It also has good cold heading properties. It responds to age hardening and is designed to be stable for at least 1500 hr. under stress up to temperatures of 550° F. and to substantially higher temperatures for shorter times. (A-general, Q-general, 2-62; Ti-b)

10-A. Allegheny Metal 355 (Heat Treatable Stainless Steel). Alloy Digest, SS-112, Dec. 1960, 2 p.

Precipitation hardening stainless steel which maintains high strength from room temperature up to 1000° F. It has excellent corrosion resistance, is easy to fabricate and has low temperature hardening heat treatment. It depends on martensitic transformation to achieve its strength. (A-general, J-general, Q-general; SS)

11-A. AISI 6145 (Chromium-Vanadium Steel). Alloy Digest, SA-107, Dec. 1960, 2 p.

A tough, shock resisting, shallow-hardening Cr-V steel. It has high fatigue and impact resistance in the heat treated condition. It is adaptable for highly stressed heavy machinery parts which are heat treated after machining. (A-general, Q-general; AY)

12-A. Stentor (Non-Deforming Tool Steel, Type 02). Alloy Digest, TS-100, Dec. 1960, 2 p.

A deep hardening Mn toolsteel. It is oil hardening and nondeforming. The best combination of hardness and toughness is secured by drawing at 375-400° F. The low hardening temperature insures minimum distortion after heat treatment as well as less danger of cracking. The hardened alloy has good wear resistance and toughness. (A-general, Q-general; TS)

13-A. Leaded Naval Brass-605 (Free-Cutting Brass). Alloy Digest, Cu-94, Dec. 1960, 2 p.

A Cu-Zn alloy having relatively high strength, toughness and corrosion resistance. It has higher corrosion resistance than free-cutting brass, although it is not equal to leaded commercial bronze or TeCu. (A-general, Q-general; Cu-n)

14-A. (German.) Geology of the Iron Ore Deposit of Staffhorst-Schwaforden. Hans Gruss. Stahl und Eisen, v. 80, Oct. 27, 1960, p. 1449-1452.

Geological analysis of a recently found iron ore deposit (38% Fe, 7% SiO_2, 5% CaO, 21% CO_2) in terms of geologic-tectonical pattern, structural history of the cap-rock, stratigraphy of the ore-bed, mineralogical and chemical analysis, genesis of the ores, temperature conditions and ore reserves. 9 ref. (A4n; RM-n, Fe)

15-A. China's Mineral Wealth and Metal Production. K. P. Wang. Journal of Metals, v. 12, Dec. 1960, p. 945-951.

Survey of mineral resources including coal, iron, steel, Mn, W, Mo, Cu, Sn, Pb, Zn, Hg, Bi and Sb. Present and future status of less known mineral products, production, mineral output value and reserves. (A4)

16-A. Recent Metallurgical Developments for Tin. J. B. Long. Journal of Metals, v. 12, Dec. 1960, p. 964.

Mechanical and physical properties of Sn alloys and applications of these alloys. Review of Sn uses as an alloying element. (A-general, P-general, Q-general; Sn-b)

17-A. (French-German.) Copper-Silicon-Manganese Bronzes. A. Meyer. Pro-Metal, v. 13, Oct. 1960, p. 382-388.

Structure, melting point, liquidus and solidus temperature, density, thermal expansion and conductivity, electrical resistivity and specific heat of Si-Mn-bronzes containing 2-3% Si and approximately 1% Mn. Fabrication techniques, including forging at 700-875° C and oxy-acetylene welding, welding with coal electrode and protective gas arc welding. (A-general, F22, K-general, P-general; Cu-s, Si, Mn)

18-A. Columbium at Powderhorn, Colorado. Robert M. Grogan. Mines Magazine, v. 50, Sept. 1960, p. 15-16, 27.

Occurrence of Cb at Powderhorn, Colo. principally as the calcium columbium oxide mineral, pyrochlore, in a large carbonatite plug composed mainly of dolomitic marble and containing 0.25% Cb_2O_5. Comparison of deposit's Cb content with world sources. (A11a; Cb)

19-A. (Czech.) Hafnium. Karel Vetejska. Chemicke Listy, v. 54, no. 11, 1960, p. 1123-1132.

Literature review of preparation methods. Data for properties, including atomic weight, density, melting point, boiling point, chemical properties and corrosion by acids and salts. 50 ref. (A-general, P-general, R6; Hf)

20-A. Niobium, Tantalum, Molybdenum and Tungsten. Metal Industry, v. 97, Oct. 28, 1960, p. 359-361.

Proceedings of the University of Sheffield Refractory Metals Conference. Topics include melting, sintering, working, structure, mechanical and physical properties, oxidation and corrosion protection. (A-general, Cb, Mo, Ta, W)

21-A. (Pamphlet.) Super Hardtem-Heppenstal 1 Grade 3C40. Data Sheet no. 9, 1960, 2 p. Heppenstall Co., Pittsburgh, Pa.

Balanced chemical composition selected to provide a strong shock resistant steel for use as insert holder dies for very large presses for the fabrication of large airframe structures. It is also recommended for use as large press dies where the severity of the application precludes the use of Hardtem. (A-general, Q-general; TS)

22-A. (Book.) Advances in X-Ray Analysis, v. 2. William M. Mueller, Editor. 359 p. 1960. Plenum Press, Inc., 227 W. 17th St., New York 11, N. Y.

Proceedings of the seventh annual conference on application of X-ray analysis held Aug. 13-15, 1958 by the Research Institute at the University of Denver. Topics include X-ray diffraction, spectroscopy, microradiography and microscopy techniques and equipment used in analyses of metals, alloys and ore samples. Papers are abstracted separately. (A-general, S11p, M21, M22g)

23-A. (Book.) Advances in X-Ray Analysis, v. 3. William M. Mueller, Editor. 376 p. 1960. Plenum Press, Inc., 227 W. 17th St., New York 11, N. Y.

Proceedings of the eighth annual conference on applications of X-ray analysis held Aug. 12-14, 1959 by the Research Institute of the University of Denver. Topics include X-ray absorption fluorescence, diffraction and instrumentation in the analysis of metals, alloys and compounds. Papers are abstracted separately. (A-general, M22, S11p)

24-A. (Pamphlet.) Tradenames "Thermotem-10" and "Thermoneal-10" Heppenstall Grade R718. Data Sheet No. 4, 4 p., Heppenstall Co., Pittsburgh, Pa.

Chemical composition, tensile properties at elevated temperatures and hardness of a 5% Cr toolsteel. Methods of forging, annealing, hardening, tempering and surface protection. (A-general, 2-62; TS)

25-A. (Pamphlet.) Tradenames "Thermotem-12" and "Thermoneal-12" Heppenstall Grade T721. Data Sheet No. 6, 4 p., Heppenstall Co., Pittsburgh, Pa.

Chemical composition, tensile properties at elevated temperature and hardness of a 5% Cr hot work and toolsteel containing tungsten. Recommendations for forging, annealing, hardening, tempering and surface protection. (A-general, 2-62; TS)

26-A. (Pamphlet.) Tradenames "Thermotem-11" and "Thermoneal-11" Heppenstall Grade H722. Data Sheet No. 5, 4 p., Heppenstall Co., Pittsburgh, Pa.

Chemical composition, tensile properties at elevated temperatures and hardness of a 5% Cr hot work toolsteel containing V. Methods for forging, annealing, hardening, tempering and surface protection of the steel. (A-general, 2-62; TS)

27-A. (Spanish.) Light Metals for Industry: Aluminum. D. Iturrioz. Metalurgia y Electricidad, v. 24, Sept. 1960, p. 108-115.

Historical notes on Al metallurgy, development of Al alloys and expansion of production throughout the world. (A-general; Al)

28-A. New Toolsteel Gives Long Life. Iron Age, v. 186, Dec. 15, 1960, p. 108-109.

Rex 49 contains 1.10% C, 4.25% Cr, 6.75% W, 3.75% Mo, 2.0% V and 5.00% Co. This steel can be heat treated to Rc 67-69. It outperforms other high speed steels and increases tool life two to four times. (A-general; TS)

29-A. Titanium--Titan of the Metals. William Smallwood. Cornell Engineer, v. 26, Nov. 1960, p. 23-29.

Various oxides of Ti are converted to the tetrachloride and then reduced by molten Mg or Na to give a Ti sponge. Data are given for crystal structure, fabrication and processing characteristics and physical and mechanical properties. 15 ref. (A-general, C26, M26, P-general, Q-general; Ti, 6-74)

30-A. Nialite (Aluminum Bronze). Alloy Digest, Cu-96, Jan. 1961, 2 p.

A cast and heat treatable Al-Ni bronze having high strength, slack and corrosion resistance. Data are given for physical and mechanical properties, corrosion resistance and weldability. (A-general, P-general, Q-general; Cu-s, Al, Ni)

31-A. Stainless Steels and Other Ferrous Alloys. W. A. Luce and J. H. Peacock. I/EC (Industrial and Engineering Chemistry), v. 52, Oct. 1960, p. 881-885.

A literature review on various stainless steels and stainless alloys, their physical and mechanical properties and methods of manufacture, metalworking and surface treatment. Advances cited for stainless steel 304, AM 350, AM 355, AISI 201, 202, 304, 17-7 pH alloy and Unitemp 212. 56 ref. (A-general; SS)

32-A. Firthite FS-26 (High Temperature Cermet). Alloy Digest, Ti-29, Jan. 1961, 2 p.

Sintered titanium carbide cermet combining thermal shock resistance and ductility of metals with high temperature strength, oxidation resistance and hardness of ceramic refractory carbides. Mechanical and physical properties with emphasis on stress rupture. (A-general, P-general, Q-general; Ti-b, 6-70)

33-A. Lead, Its Alloy and Compounds. Edward J. Mullarkey. I/EC (Industrial and Engineering Chemistry), v. 53, Jan. 1961, p. 82-86.

Metallurgy; use in steelmaking; powders; shielding; bearings; optics; liquid metals; thermoelectricity; superconductivity; acoustics; corrosion; porcelain enameled Mg. 76 ref. (A-general; Pb 17-57)

34-A. (German.) Processing of Sulphuric Pickling Plant Wastes. Kurt Mathesius. Neue Hutte, v. 5, Nov. 1960, p. 641-646.

Physical and chemical processes for reconditioning of wastes including methods for recovery of $FeSO_4 \cdot 7H_2O$ by distillation, recovery of pure iron oxide by NaOH in the Reker process and neutralization of pickling sewage by CaO or MgO. (A8)

35-A. (German.) Investigation on a Sulphate Recovery Plant in a Wire Mill. Werner Funke. Neue Hutte, v. 5, Nov. 1960, p. 646-652.

Process and machinery for recovery of $FeSO_4$ from rolled and process-annealed wire pickling wastes by precipitation in cold stirring crystallizers. Data are given for solubility of $FeSO_4$ in solutions containing 0-540 g. H_2SO_4 per liter and in pickling wastes. (A8)

36-A. The Changing Iron Ore Industry. Robert M. Lloyd. Paper presented at Pittsburgh Regional Technical Meeting, American Iron and Steel Institute, Nov. 16, 1960, 19 p.

Survey of world ore production and consumption, major producing centers, resources, imports and exports. (A11; Fe)

37-A. Investigation of Bessemer Converter Smoke Control. A. R. Orban, J. D. Hummell and R. B. Engdahl. Metallurgical Society of AIME, Transactions, v. 218, Dec. 1960, p. 1039-1049.

Research program on smoke abatement sponsored by the American Iron and Steel Institute using a 300 lb. experimental Bessemer converter to simulate blowing conditions in a commercial vessel, with sampling and particle removal by a variety of techniques. Measurements of smoke and dust are also made in the field on a 30 ton commercial converter. 21 ref. (A8a, D3, 1-54)

38-A. Carpenter H-46 (Heat Resisting Steel). Alloy Digest, SS-113, Jan. 1961, 2 p.

Modified 12% Cr stainless steel designed primarily for high strength applications in the 900-1200° F. range.

Creep resisting properties of the alloy compare favorably with those of several of the lower grades of austenitic heat resisting steels in the 1000-1200° F. range. (A-general, Q-general, 2-62; SS, SGA-h, SGB-a)

39-A. Vascojet 1000-5 Temper (Ultra High-Strength, Heat-Resistant Steel). Alloy Digest, SA-109, Jan. 1961, 2 p.

Steel designed for applications requiring between 300,000 and 325,000 psi. ultimate tensile strength and 260,000-270,000 psi. yield strength, with good fatigue and impact properties. High strengths are retained, with a completely stable structure, to operating temperatures of 900-1000° F. (A-general, Q-general, 2-62; AY, SGA-h, SGB-a)

40-A. (Book.) Nonferrous Scrap Metal Guidebook. Michael Suisman and Howard M. Rasher, Editors. 135 p. 1960. National Association of Secondary Material Industries, 271 Madison Ave., New York 16, N. Y.

Refinining and alloying of Al, Cu scrap, brass mill scrap, brass and bronze ingot makers scrap, Pb, Mg, special alloys, stainless steel and Zn. World markets, commodity trading, business law and contractual relations and metal statistics. 91 ref. (A8d, B23; EG-a38)

41-A. (Book.) The Metallurgy of Hafnium. D. E. Thomas and E. T. Hayes, Editors. 384 p. May 1960. Naval Reactors, Div. of Reactor Development, U. S. Atomic Energy Commission. (Available from U. S. Government Printing Office, Washington, D. C.) $1.50.

Extraction of Hf from ores, reduction processes, refining, melting, fabrication and shaping. Phase diagrams for several Hf alloy systems together with physical and mechanical properties. (A-general, C-general, M24; Hf)

42-A. (Book.) Oxide Ceramics--Physical Chemistry and Technology. Eugene Ryshkewitch. 472 p. 1960. Academic Press Inc., 111 5th Ave., New York 3, N. Y. $16.

Occurrence, thermal and chemical characteristics, microstructure and phase relationships for alumina, spinel, magnesia, beryllia, zirconia, zirconium silicate, thoria and ceria. (A-general, P-general, M27, M24; 6-70)

43-A. (Book.) Industrial Electric Furnaces and Appliances, 2nd Edition. V. Paschkis and John Persson. 607 p. 1960. Interscience Publishers, Inc., 250 5th Ave., New York 1, N. Y. $24.

Design of and quantitative data for arc, submerged arc, resistance and direct heat furnaces. Mechanisms of heat transfer and induction and dielectric heating. Selection of furnaces. (A-general, W17j, W18s, 1-52)

44-A. (Book-Translation.) The Practical Anodising of Aluminum. Walter W. E. Hubner and A. Schiltknecht. Macdonald & Evans, Ltd., 8 John St., London W. C. I., England. 1960, 334 p. (Translated from the German by Winifred Lewis.)

Design and choice of materials, plant design, mechanical and chemical pretreatment of workpieces; methods of anodizing, brightening, coloring, sealing and mechanical after treatment. (A-general, L19; Al)

45-A. (Book.) An Introduction to Transition-Metal Chemistry--Ligand Field Theory. Leslie E. Orgel. 180 p. 1960. Methuen & Co. Ltd., London. $4.50.

Orbitals and energies, ionic radii, stability, energy level diagrams and spectra, reaction mechanisms and rates, valences and bonding mechanisms in transition metal compounds. (A-general, M25)

46-A. (Book.) Metal Finishing Guidebook-Directory 29th Annual Edition. 756 p. 1961. Metals and Plastics Publications, Inc., 381 Broadway, Westwood, N. J.

Finishing plant engineering, mechanical and chemical surface preparation, plating procedures, organic finishing and control, analysis and test methods. (A-general, L-general)

47-A. (Book-Translation.) Silicon and Its Binary Systems. A. S. Berezhnoi. 275 p. 1960. Consultants Bureau Enterprises, Inc., 227 W. 17th St., New York 11, N. Y. (Translated from the Russian.)

Physical properties of Si binary and ternary alloy systems and compositions of phases formed. Data for crystal lattice parameters and phase stability. 716 ref. (A-general, M24b, M24c, M26; Si-b)

48-A. (French.) Evolution and Recent Developments in Extractive Metallurgy. J.

De Cuyper. Revue des Questions Scientifiques, Oct. 20, 1960, p. 522-546.

Wet and dry methods of extraction and refining of conventional ferrous and nonferrous metals. Applications of new or rare metals and refractory alloys in electronics, nuclear energy, aircraft and missiles; special techniques used for production. (A-general)

49-A. International Figures in the History of the Man-Made Metal Plutonium. Arthur S. Coffinberry. Metal Progress, v. 79, Jan. 1961, p. 84-88.

An outline of work done in various laboratories in the United States, Canada, England, France and Russia, giving credit to the principal scientists and metallurgists. (A-general, A2; Pu)

50-A. Centenary of the German Metallurgical Society. Kurt Thomas. Metal Progress, v. 79, Jan. 1961, p. 103-106.

Although it has a comparatively small membership, Verein Deutscher Eisenhuttenleute is extraordinarily active in German educational and standardization activities and through its publications, 30% of which circulate abroad, has had unusually large influence on the international scene. (A12g, A2; Fe, ST)

51-A. Metallurgical Progress in Canada. Harold J. Roast. Metal Progress, v. 79, Jan. 1961, p. 117-120, 150, 152, 154, 158.

Information from more than a score of laboratories and research departments, industrial, educational and governmental, indicates vigorous advances in all branches of metallurgy, from ore beneficiation to production of dislocations in whiskers and from steel manufacture to atomic energy. (A-general)

52-A. (German.) Magnesium Metallurgy in Great Britain. Solution of Processing Problems. Christopher Smith. Zeitschrift fur Metallkunde, v. 51, Dec. 1960, p. 677-680.

Processing problems and details in hot roughing, rolling into sheet, straightening, pressing, extrusion and forging of common and new Mg alloys with Zr, Th and Be additions. Chemical and mechanical properties of Mg alloys. (A-general, F-general, G-general, Q-general; Mg-b, Be, Th, Zr)

53-A. (German.) Rhenium. Technica, v. 9, Nov. 1960, p. 1428.

Production of rhenium by reduction of ReS_2 or NH_4ReO_4 at 1000° C. by hydrogen. Powder metallurgical, catalytic, physical, chemical and mechanical properties. Use in electronics and in high-temperature thermocouples. (A-general, H-general, P-general, Q-general; Re, 17-57)

54-A. (German.) Steels for Plastics Industry. Technica, v. 9, Nov. 4, 1960, p. 1451-1455.

Composition, mechanical, chemical and other properties including machinability and hardenability of alloyed and unalloyed special steels such as through-hardening, nitriding and case-hardening steels; corrosion and compression resistant steels; and steels which undergo little dimensional change during heat treatment. (A-general, J-general, Q-general, T29s; ST, 17-57)

55-A. A Stainless Steel for Standard Weights. S. J. Rosenberg and T. P. Roysston. Materials Research and Standards, v. 1, Jan. 1961, p. 21-22.

Development of an austenitic stainless steel to meet requirements for use as a mass standard, the alloy being corrosion resistant, nonmagnetic and having a density of 8.4 g. per cc. Methods of fabrication and heat treatment to produce standard weights. (A-general, F-general, P-general, X20; SS-e, 17-57)

56-A. Refractory Metals. L. F. Yntema and Allan L. Percy. Midwest Engineer, v. 13, Dec. 1960, p. 8-11.

Historical review of the technology and applications of Ta, W, Mo and Cb. Data are given for physical and mechanical properties. (A-general, P-general, Q-general, 10-54; Cb, Mo, Ta, W, 17-57)

57-A. How Brass Mill Controls Wastes. W. M. Rumberger. Power Engineering, v. 64, Dec. 1960, p. 68-69.

Treatment of effluent from plants which contains Cu, Zn and hexavalent and trivalent Cr from pickling and cleaning operations includes reduction by SO_2 in an equalization tank, neutralization by lime slurry and precipitation of metals as hydroxides. (A8, C26, C27; Cr, Cu, Zn)

58-A. Latrobe C. L. W. Alloy Digest, TS-101, Jan. 1961, 2 p.

Development of a low carbon, medium tungsten hot work steel which will maintain its properties up to a dull red heat. Methods of annealing, hardening, tempering and machining. Physical and mechanical properties. (A-general, J-general, Q-general; TS)

59-A. Gilding Brass, 95%. Alloy Digest, Cu-96, Jan. 1961, 2 p.

Development of a corrosion resistant Cu alloy containing 5% Zn which is readily formed and has higher strength than Cu. Data are given for machinability, weldability, corrosion resistance and physical and mechanical properties. (A-general, R-general, G17k, K9s; Cu-b, Zn)

60-A. Titanite. Alloy Digest, Al-99, Jan. 1961, 2 p.

Development of a high strength, natural aging Al casting alloy requiring no heat treatment to develop high strength and shock resistance. Data are given for composition, physical and mechanical properties, castability and machinability. (A-general, P-general, Q-general, G17k; Al-b)

61-A. U.S.S. Carilloy 2 1/4 Cr-1 Mo. Alloy Digest, Al-99, Jan. 1961, 2 p.

Development of a low alloy, oxidation and corrosion resistant steel suitable for use at 900-1100° F. Mechanical and physical properties, workability, weldability and machinability. (A-general, R-general, G17k, K9s, Q23q; AY)

62-A. (German.) Evolution of Metallurgical Processes and Operating Practices. Friedrich A. Springorum. Stahl und Eisen, v. 80, Dec. 8, 1960, p. 1838-1849.

Development of acid and basic Bessemer and openhearth furnace steel melting processes from puddle process in 1860 to present state. Pig iron production in the blast furnace as affected by invention of slag-tuyere and cowper, resulting in rise in capacity from 25 tons per day in 1860 to modern 2000 tons per day. Recent developments in production of steel by oxygen refining and vacuum degassing. (A2, D-general)

63-A. (German.) History of Steel Shaping. Willy Ochel. Stahl und Eisen, v. 80, Dec. 8, 1960, p. 1852-1863.

Art of shaping by hammering and forging before invention of puddle process. Development of shaping by rolling as influenced by production of ingot steel by Bessemer and openhearth processes, evolution of rolling techniques and equipment for hot and cold rolling and development of processing techniques for rolled products. (A2, F23; ST)

64-A. (German.) Steel in Engineering Development During the Past Hundred Years. Hans Kallen. Stahl und Eisen, v. 80, Dec. 8, 1960, p. 1864-1877.

Development of heat treating, stainless, high-pressure and high-temperature resistant, high-speed and transformer steels and permanent magnet alloys as influenced by chemical, mechanical and nondestructive testing methods; processing (e.g., welding) methods and by experiences and needs of steel consumers in civil engineering, plant construction and chemical engineering. (A2, S-general; ST)

65-A. (Russian.) Low Alloy Steel With Vanadium for Railway Car Building and Construction. M. S. Mikhalev and M. I. Gol'dshtein. Stal', Nov. 1960, p. 1026-1029.

Experimental meltings of newly developed 15 GF Mn-V steel with 0.08-0.09% V. Study of microstructure, tendency of steel to aging and kinetics of austenite decomposition at various cooling rates. Steel exhibits satisfactory mechanical properties, workability, weldability and economical advantages for railway car applications. 11 ref. (A-general, M27, N-general, Q-general, T23p, 2-60; ST, V, 17-57)

66-A. Apex 39-11 (Aluminum Die Casting Alloy). Alloy Digest, Al-100, Feb. 1961, 2 p.

Alloy has excellent castability and the highest strength of the Al-Si-Cu group of die casting alloys, both at room and elevated temperatures. Machining characteristics are better than those of the Al-Si alloy. (A-general; Al-b)

67-A. Altemp-V36. (High Temperature Alloy). Alloy Digest, Co-25, Feb. 1961, 2 p.

A version of S-816 alloy but with better oxidation and corrosion resistance. In sheets, it also has higher

rupture and creep strength. It is designed for service in the range of 1200-1500° F. where high strength and corrosion resistance are required, and at higher temperatures for lower stress applications. (A-general; Co-b, SGA-h)

68-A. UHB-Orvar (Hot Work Toolsteel, Type H13). Alloy Digest, TS 102, Feb. 1961, 2 p.

Die casting die steel and a general hot work steel. It has the ability to harden satisfactorily in air, minimum tendency to scale on air cooling from the hardening temperature, high resistance to heat checking when repeatedly heated and cooled, high resistance to the washing and erosive action of the die casting alloy. (A-general; TS)

69-A. Durehete 1050 (High Temperature Bolting Steel). Alloy Digest, SA-111, Feb. 1961, 2 p.

A low carbon, Cr-Mo-V steel recommended for high temperature bolts and fasteners. It has a high level of structural stability and possesses a high resistance to creep and stress relaxation behavior. (A-general; CN-g)

70-A. AISI 4337 (Nickel-Molybdenum-Chromium Alloy Steel). Alloy Digest, SA-110, Feb. 1961, 2 p.

A tough, shock resisting, oil hardening alloy steel. In the heat treated condition it has high fatigue and tensile strength along with good ductility. (A-general; AY)

71-A. AISI Type 316 (Corrosion Resisting Steel). Alloy Digest, SS-114, Feb. 1961, 2 p.

A Mo-containing modification of the standard 18-12 stainless steel. Mo tends to increase the general corrosion resistance, decreases intergranular corrosion caused by carbide precipitation at certain elevated temperatures and tends to increase strength at elevated temperatures. (A-general; SS)

72-A. Mallory 28. Alloy Digest, Cu-97, Feb. 1961, 2 p.

Cu base alloy has exceptionally high electrical and thermal conductivity coupled with reasonably hard strength and hardness. (A-general; Cu-b)

73-A. Magnesium-AM-1000A (Casting Alloy). Alloy Digest, Mg-49, Feb. 1961, 2 p.

Alloy responds to an age hardening heat treatment producing high tensile properties and good fatigue strength. It is suited for parts which must withstand repeated stresses. (A-general, Mg-b)

74-A. Beryllium Described as True Space Age Metal. A. Townhill. Metals Review, v. 34, Jan. 1961, p. 22-23.

Processing of Be from BeO by thermal reduction of BeF_2 or electrolysis of fused salts. Mechanical and chemical properties, applications in space vehicles and nuclear reactors. Powder metallurgy techniques for production of Be forms. (A-general, C23, C26, H-general, Q-general; Be)

75-A. Growth of the Iron-Ore and Manganese Base of the Steel Industry of the USSR. P. Ya. Antropov. Paper from "Contemporary Problems of Metallurgy". Consultants Bureau, Inc., New York, 1960, p. 15-28.

Survey of Fe and Mn ore sources and reserves, including magnetite, hematite, limonite, martite, siderite, ankerite, titanomagnetite, Braunite, psilomelane and manganosilicate, with attention to composition, grade facility of mining and utilization with or without beneficiation. Some mining, ore dressing and reduction processes are given, with data for pig iron production. (A4n, A11a, B-general; Fe, Mn)

76-A. Chemistry of Titanium. I. I. Kornilov. Paper from "Contemporary Problems of Metallurgy". Consultants Bureau, Inc., New York, 1960, p. 484-490.

All of the elements of the periodic table are classified into four groups according to chemical interaction with Ti, in terms of solubility ionic or covalent bondings and formation of metallic solid solution and intermetallic compounds. Physical and mechanical properties of Ti are given with phase diagrams of quaternary, ternary and binary alloys. 13 ref. (A-general, M-general, P-general, Q-general; Ti)

77-A. (Pamphlet.) Tenzaloy. Bulletin no. 103R5, Federated Metals Div., American Smelting and Refining Co., 120 Broadway, New York 5, N. Y., 1960, 7 p.

Mechanical and physical properties of Tenzaloy, a high-strength Al casting alloy (7.5% Zn, 0.6% Cu, 0.4% Mg) which can be aged at 20° C. Casting, welding, brazing and finishing methods. (A-general, Q-general, P-general; Al-b, 5)

78-A. (Book.) Metalsmithing for the Artist-Craftsman. Richard Thomas. 173 p. 1960. Chilton Co., New York, N. Y. $7.50.

Review of casting, forming, joining and surface treatment techniques as metalsmithing processes. (A-general, G-general, K-general)

79-A. (Book.) X-Ray Spectrochemical Analysis. L. S. Birks. 137 p. 1959. Interscience Publishers, Inc., 250 5th Ave., New York 1, N. Y.

Production of X-rays and their interaction with crystals. Theory, operating conditions and methods for excitation of the X-ray spectra of metals, alloys, ceramics, glass, minerals and ores. Design of X-ray detectors such as Geiger counters and scintillation counters. (A-general, S11p)

80-A. (Book.) Extrusion of Metals. Claude E. Pearson and Redvers N. Parkins. 329 p. 1960. John Wiley & Sons, Inc., 440 4th Ave., New York, N. Y.

A review of the properties of metals and their alloys as applied to their extrusion by hydraulic, mechanical and pneumatic equipment under cold and hot conditions. Effect of flow, speed, pressure and friction on the behavior of metals during extrusion and the properties of the finished product. Papers are abstracted separately. (A-general, F24, G5)

81-A. (Book-Translation.) Contemporary Problems of Metallurgy. A. M. Samanin, Editor. 530 p. 1960. Consultants Bureau, Inc., 227 W. 17th St., New York 11, N. Y. $16.

Translation of 45 papers published by the Academy of Sciences of the USSR. Topics include ore sources and ore preparation, iron and steel metallurgy, nonferrous metallurgy; sheet and ingot rolling; and structures, transformations and physical and mechanical properties of ferrous and nonferrous alloys. Emphasis is on improvement of thermochemical and thermodynamic parameters and technical and economic indexes, with related equipment, of iron and steelmaking. Papers abstracted separately. (A-general)

82-A. (Book.) The Determination of Gases in Metals. 308 p. 1960. Iron and Steel Institute, 4 Grosvenor Gardens, London S. W. I., England. $8.80.

Report of a symposium organized by the Society for Analytical Chemistry, in conjunction with the Iron and Steel Institute and the Institute of Metals. Sampling of liquid metals. Determination of gases by micro vacuum fusion techniques, an isotope dilution method and activation analysis. Techniques for analysis of Fe, steel, cast iron, Be and other metals. Papers abstracted separately. (A-general, S11r; Be, CI, Fe, ST)

83-A. (Book-Translation.) Ultrasonics and Its Industrial Application. O. I. Babikov. 1960, 224 p. Consultants Bureau, Inc., 227 W. 17th St., New York 11, N. Y.

Characteristics of ultrasonic vibrations and their use in industries producing steel, Al, Cu, Ag, Zn, Pt and other metals, as well as gypsum, graphite, rubber, plastic, glass and porcelain. Applications of ultrasonics in the measurement of physical and metallurgical properties, flaw detection, drilling, cutting, polishing, soldering, plating, pulverizing and cleaning: 202 ref. (A-general, 1-74)

84-A. (Book.) Carbon Steel Sheets. American Iron and Steel Institute, Steel Products Manual, 1960, 112 p. AISI, 150 E. 42nd St., New York 17, N. Y.

Rolling and heat treating methods for producing uncoated sheets. Preparation and inspection of galvanized, electrolytic Zn and Sn coated and Al coated sheets. Applications in formed roofing and siding sheets. Mechanical properties. (A-general, Q-general, L-general; CN, Al, Sn, Zn, 4-53)

85-A. (Book-German.) 100 Jahre Verein Deutscher Eisenhuttenleute--1860-1960. 1960, 104 p. Verlag Stahleisen mbH., Dusseldorf, Germany.

Anniversary publication with papers on historical and technological evolution of metallurgical processes in iron and steel production: iron and steel melting in blast furnace, acid and basic Bessemer converter, openhearth furnace;

oxygen refining; processing of steel by casting and working; improvement of steel quality by new testing methods and special melting techniques (e.g., vacuum metallurgy); role of raw materials and fuels. (A-general, D-general)

86-A. (Book-Translation.) The Practical Anodizing of Aluminium. Walter W. E. Hubner and A. Schiltknecht. 320 p. 1960. Macdonald & Evans, 8 John St., London, W. C. I., England. $7.50.

Flow-sheet of the anodizing processes including mechanical and chemical pretreatment, brightening, anodic oxidation, sealing and after-treatment. Design and choice of materials. Plant design. (A-general, L19; Al)

87-A. (Book.) Boron--Synthesis, Structure and Properties. J. A. Kohn, W. F. Nye and G. K. Gaule, Editors. 189 p. 1960. Plenum Press, Inc., 227 W. 17th St., New York 11, N. Y. $8.50.

Proceedings of a Conference on Boron sponsored by U. S. Army Signal Research and Development Laboratory, Sept. 1959. Collection of articles on the preparation of high-purity, elemental, crystalline boron and borides. Mechanical and physical properties. Crystallography. (A-general; B)

88-A. (Book.) Production of Wide Steel Strip. Special Report no. 67. May 1960, 187 p. Iron and Steel Institute, 4 Grosvenor Gardens, London, S. W. 1, England.

Oxygen and openhearth steelmaking practices, hot and cold rolling techniques and heat treatments used to produce steel strip. Sn and plastic coating and galvanizing procedures for products. (A-general, D2, D10, F23, J-general, L-general; ST, 4-53)

89-A. Safety in Welding--Proposed Recommendations for Fire Prevention in Usage of Cutting and Welding Processes. Welding Fabrication and Design, v. 4, Jan. 1961, p. 15-17.

Cutting and welding by electric arc and oxy-fuel gas flame using safety precautions which minimize danger of fires. (A7p, G22, K1, K2)

90-A. Practical Steel Plant Research. Karl L. Fetters. Blast Furnace and Steel Plant, v. 49, Feb. 1961, p. 164-170.

Applications of research to problems encountered in steelmaking. (A9m, D-general)

91-A. Physical and Mechanical Properties of Commercial Molybdenum-Base Alloys. Defense Metals Information Center, Battelle Memorial Institute, DMIC Rept. 140, Nov. 30, 1960, 142 p. (Available as PB 151099 from U. S. Office of Technical Services, Washington 25, D. C.)

Compilation of the physical and mechanical properties of Mo and Mo-0.5% Ti, Mo-0.5% Zr, Mo-0.05% Zr, Mo-0.5% Ti-0.08% Zr, Mo-1.25% Ti-0.15% Zr-0.15% C, Mo-50% W and Mo-30% W alloys. Comparison to Ta-10% W, commercially pure tungsten and Fansteel 82 for applications at temperatures above 2000° F. 63 ref. (A-general, P-general, Q-general, 10-54; Mo-b, 17-57)

92-A. (Book-Translation.) Rare Earth Elements. D. I. Ryabchikov, Editor. 1959. 356 p. Academy of Sciences, USSR, Moscow.

A collection of 42 papers presented at a conference on rare earth metals. Papers deal with separation techniques, especially ion exchange chromatography and chemical, radiation and spectral methods of analysis. Applications of rare earths in the glass industry, metallurgy and in catalysis. (A-general, C-general, S-genera; EG-g45)

93-A. Recovery of Nickel, Chromium and Water. Electroplating and Metal Finishing, v. 14, Feb. 1961, p. 48-52, 75.

Use of static drag-out tanks, surface active additives, counterflow rinses and ion exchange equipment to recover Ni, Cr and water from drag-out, sludge and spray produced in plating operations. (A8)

94-A. (Italian.) Monel Alloys in the Foundry. Fonderia, v. 9, Dec. 1960, p. 537, 539, 541.

Composition and physical and mechanical properties of normal, H and S-Monel; casting methods and applications; and heat treatment. Data are given for high temperature stability, corrosion and erosion resistance, hardness, machinability and tensile, plastic and thermal properties. (A-general, E-general, P-general, Q-general; Ni-b)

95-A. (Book.) X-Ray Metallography. A. Taylor. 993 p. 1961. John Wiley &

Sons, Inc., 440 Park Avenue South, New York 16, N. Y. $27.

Crystallographic study of metals, alloys, steels and nonmetallic refractory materials to determine crystal structure and orientation, grain size, precipitation hardenability and internal stress. (A-general, M21f, M22g, M26)

96-A. (Italian.) Metallurgical Production: Ordinary and Special Steels. Pt. 4. Classification of Steel. Angelo Bellini. Rivista di Meccanica, v. 11, Nov. 21, 1960, p. 45-48.

Characteristics of nitriding steels and steels for automatic machining operations. Data are given for composition, heat treatment temperatures and mechanical properties. (A-general, P-general, Q-general; ST)

97-A. (German.) Current Status and Developmental Prospects of Special Metals. R. Kieffer. Radex Rundschau, Dec. 1960, p. 365-366.

Metallurgy (melting, reduction, working), thermodynamics (classification of phase diagrams), engineering application (Zr coated fuel elements, Mo and tungsten jets for missiles, Mo electrodes for glass melting furnaces, Ta in condensors) and economics (world production, price) of following transition elements: Cb, Ti, Zr, Ta, Mo and W. (A-general; Cb, Mo, Ta, Ti, W, Zr)

98-A. (German.) Thin Metal Layers. Production, Properties and Application. E. Ritter. Radex Rundschau, Dec. 1960, p. 389-394.

Method and plant for production of very thin metal layers by evaporation in high vacuum (up to 10^{-10} Torr) at elevated temperatures. Factors influencing structure of layers during formation such as reaction with gas phase and diffusion on condensing surface. Physical properties of layers including optical parameters (refraction index and adsorption coefficient) as a function of layer thickness; electrical resistance, magnetic properties. Application in optical and electrical engineering. (A-general, N15g, P-general; 14-62, 17-57)

99-A. (Italian.) Some Nickel-Copper Foundry Alloys. Angelo Azzolini. Fonderia Italiana, v. 9, Nov. 1960, p. 449-456.

Survey of alloys containing 60-65% Ni, 28-32% Cu, 0-3.70% Si, 0.20-1.5% Mn, 0.5-1.5% Fe, 0-3% Al and 0.10-0.20% C with additions of Ti, Zr, Nb or Mg. Methods of melting and casting, mechanical properties, forming and applications. 4 ref. (A-general, E-general, G-general, Q-general; Ni-b, Cu, 17-57)

100-A. (French.) Applications and Future Possibilities of Niobium. L. Habraken. Revue de la Societe Royale Belge des Ingenieurs et des Industriels, Dec. 1960, p. 538-561.

Review of physical and chemical properties of Cb and methods of preparation. Applications as alloying elements in austenitic steel, high-temperature alloys and carbides; future possibilities of application in aviation, missiles and nuclear power plants. 59 ref. (A-general, P-general, Q-general, 10-54; Cb, 17-57)

101-A. Notes on Beryllium. M. Schofield. Mining Magazine, v. 104, Feb. 1961, p. 77-79.

Review of refining and fabricating techniques. Physical and mechanical properties. Applications in nuclear reactor components. (A-general, P-general, Q-general; Be)

102-A. (Italian.) Spheroid Graphite Castings in Equipment for Transportation of Liquids. K. H. Kirgin. Nickel, Aug. 1960, p. 1-13.

Metallurgy, foundry practice and heat treatment of spheroid graphite cast iron. Resistance of spheroid graphite cast iron to thermal and mechanical shock. Corrosion and high-temperature resistance, pressure tightness and welding properties. (A-general, E-general, Q-general, R-general; CI-r)

103-A. (Book.) Short Course on Process Industry Corrosion, Proceedings. V. D. Miller, Editor. 448 p. 1960. National Association of Corrosion Engineers, 1061 M & M Building, Houston 2, Texas.

Corrosion resistance of Fe, steel, Al, Cu, Ta, Cb and other metallic and nonmetallic materials in various chemical environments. Applications in processing equipment. Papers are abstracted separately. (A-general, R6, R7, T29; Al, Cb, Cu, Fe, ST, Ta)

104-A. (German.) Beryllium. G. A. Meerson, D. D. Sokolov, N. F. Mironov, N. M. Bogorad, J. D. Pachomov, D. S. Lovovskij, E. S. Ivanow and V. M. Smelev. Kernenergie, v. 2, Oct-Nov. 1960, p. 939-945.

Review of Be technology including production by melting $Be_3Al_2Si_6O_{18}$, subsequent leaching and electrolysis or reduction by metallic Mg and processing by hot pressing and extruding at 1120-1150° C. under vacuum, pressing and sintering (1180-1200° C.) Be powder, vacuum casting and machining. Data for microstructure, mechanical properties and ductility. (A-general, Q-general, M27; Be)

105-A. Hyper-Eutectic Aluminium-Silicon Casting Alloys. S. J. Ashton, J. Muir and W. M. Doyle. Metal Industry, v. 98, Mar. 3, 1961, p. 171-172.

Melting at 800° C., sand casting, die casting and degassing of EX. 451 Al-Si alloy. Testing to determine effect of phosphorus content on tensile strength and insoluble phosphorus per cent. Measurements of grain size, nucleation efficiency and distribution and size of primary silicon phase. (A-general, C-general, E-general, Q-general, 2-60; Al, Si)

106-A. Annual Report-1960, International Tin Research Council, p. 20-33.

Review of research on hot tinning, electrodeposition and alloying of Sn with various metals. Mechanical and electrical properties, hardness, corrosion and rust resistance and crystal structure of Sn alloys and Sn plate. Applications. (A9m, Q-general, P15; SN)

107-A. (Book.) Finishing Handbook and Directory 1961. H. T. Chambers, Editor. 536 p. 1961. Sawell Publications Ltd., 4 Ludgate Circus, London 4, England.

Revised index of finishing processes including anodizing, electroplating, galvanizing, polishing and cleaning techniques. Plant and equipment design. 18 ref. (A-general, L-general)

108-A. (Book.) Aluminum Tank Repair. 1961. 91 p. Reynolds Metals Co., Richmond 18, Va.

Cleaning of tanks, mechanical forming of repair sections and Tig and Mig welding procedures. Repairing specific damage such as seepage leaks, cracks and structural failure. (A-general, K1, L-general, T26q; Al, 17-57)

109-A. (Book.) Cobalt--Its Chemistry, Metallurgy and Uses. Roland S. Young, Editor. 1960. 424 p. American Chemical Society Monograph no. 149, Reinhold Publishing Corp., New York.

Chemical, physical and mechanical properties, phase diagrams and catalytic behavior of Co and Co alloys in high-temperature, high-strength service and other metallurgical applications. (A-general, P-general, Q-general; Co-b)

110-A. (Book.) Hardness--Theory and Practice. Pt. 1. Practice. Louis Small. 1960. 537 p. Service Diamond Tool Co., Ferndale, Mich.

Principles, methods and equipment for Rockwell, Vickers, hardenability and Jominy, Knoop, hot hardness and microhardness testing. Application to sheet metal, castings and forgings, carbon alloy, tool and special steels and cemented carbides and plastics. Conversion scales for hardness values are given with American, German and British standards. (A-general, Q29, 10-54)

111-A. (Book.) Metals Handbook, 8th Edition. v. 1. Properties and Selection of Metals. Taylor Lyman, Editor. 1961, 1300 p. American Society for Metals, Metals Park, Novelty, Ohio.

The first of a series of volumes prepared by the American Society for Metals expanding the technical information coverage of the Metals Handbook. The volume contains 112 articles with compilations of data and reference tables covering mechanical and physical properties, performance characteristics and applications of carbon and low alloy steels, cast irons, stainless steels and heat resisting alloys, tool materials and nonferrous metals. Indexes are included with definitions of metallurgy and engineering technology. (A-general, P-general, Q-general, 17-52; CI, ST, SGA-h, TS, EG-a39)

112-A. L-D and Basic Lined Side-Blown Converter. K. Gupta and Bhanu Prakash. Paper from "Symposium on Pilot Plants in Metallurgical Research and Development". Council on Scientific & Industrial Research, Jamshedpur, India, 1960, p. 113-117.

Design and operation of L-D process cupola and converter and basic-lined side-blown converter pilot models. Models are compared as to composition of product, heat losses and capacity. (A9j, D3, D10a)

113-A. Steel Melting in a Pilot Plant Shaft Furnace. J. Eyre, C. Hulse and M. Thring. Paper from "Symposium on Pilot Plants in Metallurgical Research and Development". Council on Scientific & Industrial Research, Jamshedpur, India, 1960, p. 119-130.

Design and construction of counter-flow furnaces with various shapes. Performance of an experimental unit is discussed in terms of running conditions, thermal efficiency, analysis of product, metallic yield and refractory wear. (A9j, W17h, 1-52)

114-A. Pilot Plants in Metallurgical Research at Fried. Krupp, Essen. H. Krainer. Paper from "Symposium on Pilot Plants in Metallurgical Research and Development". Council on Scientific & Industrial Research, Jamshedpur, India, 1960, p. 131-136.

Design of pilot plants for experimental work on Fe ore reduction outside the blast furnace and on oxygen steelmaking using the L-D process. Emphasis is placed on the Krupp-Renn process. (A9j, D8j, D10)

115-A. Pilot Plants for the Agglomeration of Iron Ores on a Semi-Industrial Scale. H. Raush and F. Cappel. Paper from "Symposium on Pilot Plants in Metallurgical Research and Development". Council on Scientific & Industrial Research, Jamshedpur, India, 1960, p. 143-151.

Description of test equipment and methods for investigating sintering and pelletizing processes of agglomeration. (A9j, B16; Fe)

116-A. The Role of the Pilot Plant in Iron Ore Sintering. A. Grieve and F. Ely. Paper from "Symposium on Pilot Plants in Metallurgical Research and Development". Council on Scientific & Industrial Research, Jamshedpur, India, 1960, p. 153-159.

Investigation of a pilot plant sintering process by a pot test procedure to determine gas volume, sinter strength, mix permeability, shrinkage factors, coke rate and optimum sintering time. (A9j, B16; Fe)

117-A. Hot Dip Aluminizing of Steel Wire Laboratory Scale Investigations and Pilot Plant Studies. A. Kapoor, P. Gupte and B. Nijhawan. Paper from "Symposium on Pilot Plants in Metallurgical Research and Development". Council of Scientific & Industrial Research, Jamshedpur, India, 1960, p. 188-195.

Description of pilot tests on aluminized wire to determine effect of speed and direction of draw and thickness of wire on the coating weight. Outline of accelerated corrosion test programs in salt spray. Design of coil feeding arrangement, degreasing unit, furnace and sinker for pilot plant. (A9j, L16; ST, Al, 4-61)

118-A. Production of Manganese and Manganese Dioxide. N. Dhananjayan, H. Chakrabarte and T. Baneyei. Paper from "Symposium on Pilot Plants in Metallurgical Research and Development". Council of Scientific & Industrial Research, Jamshedpur, India, 1960, p. 204-212.

Design of a pilot plant for crushing and grinding ore, reducing ground ore, leaching reduced ore with acidic liquor, purifying leach liquor, preparing the electrolyte and electrolysis. (A9j, B13, C19n, C23; Mn)

119-A. Continuous Casting Development for Steel. Iain M. D. Halliday. Paper from "Symposium on Pilot Plants in Metallurgical Research and Development". Council on Scientific & Industrial Research, Jamshedpur, India, 1960, p. 253-265.

Pilot plant developments in the continuous casting of steel by processes employing vertically held water cooled molds. Consideration of pouring time, solidification procedures and mold design. (A9j, D9q)

120-A. (Book.) Vacuum Technology Transactions. C. Robert Meissner, Editor. 1959. 335 p. Pergamon Press, 122 E. 55th St., New York 22, N. Y. $20.

Publication of papers on the role of spectroscopy in vacuum science, high and ultrahigh vacuum techniques such as electron bombardment and deposition, vacuum system applications, preparation of thin films and vaporizing sources and ionic pumping. (A-general, 1-73)

121-A. (Pamphlet.) Effect of Alloying Elements. Paper from "Federated Aluminum Casting Alloys Handbook". American

Smelting and Refining Co., New York, 1960, p. 4-8.

Mechanical and physical properties of cast Al alloys at high temperatures as affected by Cu, Si, Mg, Mn, Fe, Zn, Ni and Ti contents. (A-general, P-general, Q-general, 2-60; Al-b, 5)

122-A. (Russian.) Regeneration of Mo From Depleted Pickling Solutions. V. N. Parusnikov. Tsvetnye Metally, Dec. 1960, p. 61-65.

Investigation of various methods of Mo recovery from acidic solutions. Effect of precipitation, distillation and neutralization techniques on yield and practicability. 8 ref. (A11d)

123-A. Recent Progress in Development of Self-Fluxing Air Proof Brazing Alloys. Nikolajs Bredzs and Harry Schwartzbart. Welding Journal, v. 40, Mar. 1961, p. 123s-129s.

Review of self-fluxing filler alloys containing Li and B used in brazing steel and nonferrous alloys. Factors analyzed are flux viscosity, effect of moisture during brazing with alloys without B and the Li-B ratio. Results indicate that optimum performance is obtained with an alloy of 78% Cu, 20% Zn, 1 1/2% B and 0-1/2% Li. 11 ref. (A-general, K8; SGA-f, 17-52)

124-A. (Book.) The Physical Examination of Metals, 2nd Edition. Bruce Chalmers and A. G. Quarrell, Editors. 917 p. 1960. Edward Arnold, Ltd., 41 Maddox St., London, W.I., England. $30.

Comparison of optical, electrical, thermal, magnetic, ultrasonic and X-ray methods for determining structures, physical and mechanical properties and soundness of metals. (A-general, S-general)

125-A. Improved Aluminum Offers Lifetime Brightness. A. L. Moxon and S. B. Wyman. Iron Age, v. 187, Mar. 23, 1961, p. 78-79.

Development of an Al bright alloy with a metal base purity no higher than that of conventional alloys which retains its luster even at increased film thicknesses without sacrificing strength and forming traits. (A-general; Al-b)

126-A. Radioactive Isotopes and Their Application in Metallurgy. D. H. Houseman. Paper from "The Physical Examination of Metals". Edward Arnold Ltd., London, England, 1960, p. 737-824.

Principles of artificial isotope preparation and utilization. Applications in study of diffusion, oxidation, wear and corrosion of metals. 181 ref. (A-general, 1-59)

127-A. Antimony, Bismuth, Gallium, Indium, Selenium and Tellurium. OTS Selective Bibliography SB-438. (Available from U.S. Office of Technical Services, Washington 25, D. C.)

Listing U.S. Government reports and foreign translations covering thermoelectric, optical and photoconductive properties, with the effects of radiation and impurities. (A-general; Sb, Si, Ga, In, Se, Te)

128-A. Germanium and Silicon. OTS Selective Bibliography SB-437. (Available from U.S. Office of Technical Services, Washington 25, D. C.)

Research reports of Army, Navy, Air Force, Atomic Energy Commission and other government agencies covering crystal structure, phase studies, optical and photoconductive properties, effects of impurities and radiation. (A-general; Ge, Si)

129-A. New Stainless Steel Offers Three Benefits. Steel, v. 148, Mar. 27, 1961, p. 178.

Development of a new free machining steel similar to Type 303 but with a lower sulphur content. Steel offers better machinability, improved corrosion resistance and good surface finish. (A-general, G17k; SS)

130-A. AISI 4615 (Case Hardening Alloy Steel). Alloy Digest, SA 112, Mar. 1961, 2 p.

Ni-Mo case hardening steel is outstanding for its uniformity of case and response to heat treatment, relative freedom from distortion during quenching and excellent toughness at high hardness. Its resistance to abnormal grain growth is of particular advantage in forging. (A-general; AY)

131-A. Haynes No. 713C (High Temperature Alloy). Alloy Digest, Ni-64, Mar. 1961, 2 p.

Vacuum melted cast nickel base alloy having outstanding rupture strength at 1700° F. combined with excellent resistance to thermal fatigue and good

castability. It was originally developed as an air-melted, air-cast alloy designated as Inconel 713C. (A-general; Ni-b)

132-A. Meehanite He (Heat Resisting Iron Casting). Alloy Digest, Ci-29, Mar. 1961, 2 p.

Casting alloy capable of resisting extreme thermal shock. Its maximum operating temperature is 1150° F. He metal is a relatively low strength material and is used in applications where mechanical properties are not of particular importance. (A-general; Fe-b)

133-A. WaiMet WI-52 (High Temperature Alloy). Alloy Digest, Co-26, Mar. 1961, 2 p.

Cobalt-base alloy having high strength with good ductility and corrosion resistance. It combines excellent high-temperature properties with good castability and is recommended for applications requiring high strength under continuous high heat up to 1750° F. Protective coatings of chromium and aluminum have been developed to offset the oxidation which occurs at 1750° F. (A-general; Co-b)

134-A. Nironze 635 (Age-Hardenable Copper Alloy). Alloy Digest, Cu-98, Mar. 1961, 2 p.

Copper-nickel silicon alloy which combines excellent cold working properties with high-tensile and very high-yield strengths, good electrical conductivity, excellent general corrosion and stress-corrosion resistance. Supplied in the solution-annealed and draw condition, it offers exceptional cold working properties. (A-general; Cu-b, Ni, Si)

135-A. Noral 730 (Aluminum Bearing Alloy). Alloy Digest, Al-101, Mar. 1961, 2 p.

Recommended where high loadings and speeds are encountered and where adequate lubrication is available. The qualities of tin as a bearing material are combined with the strength of aluminum to give excellent wear characteristics. With a thermal conductivity three times greater than that of steel and five times greater than Babbitt metal, Noral 730 is plastic enough to conform to any normal misalignment, it embeds particles easily and is, therefore, highly suitable for heavy duty machinery such as rolling mills. (A-general; Al-b)

136-A. Pandex Vac Arc (Stainless, Heat Resistant Superalloy). Alloy Digest, SS-115, Mar. 1961, 2 p.

Austenitic iron-nickel-chromium alloy designed for service up to 1300° F. where high strength, heat and corrosion resistance are required, and for service at higher temperatures where the stresses are moderate. It has good resistance to thermal fatigue and to cyclic heating. (A-general; SS)

137-A. Van Cut (High Speed Steel-Type M3). Alloy Digest, TS-103, Mar. 1961, 2 p.

Tungsten-molybdenum-vanadium high-speed steel with exceptional wear-resistance and hot strength. Toughness, as indicated by resistance to impact, is slightly higher than AISI T1 and a little less than AISI M2. (A-general; TS-m)

138-A. Further Studies on Active-Eutectoid Alloys of Titanium. R. F. Bunshah. New York University (Wright Air Development Division). U. S. Office of Technical Services, PB 161964, May 1960, 80 p. $2.

Development of a new class of Ti alloys of the alpha-compound type with potential utility where short time elevated strength properties are needed for one-cycle operation. Several of the alloys of this class showed outstanding short-time tensile strengths up to 1200° F. and exhibited correspondingly good creep rupture properties, but those alloys which displayed highest strengths also showed instability. It was established, however, that stability could be partially restored by some sacrifice in strength. (A-general; Ti-b)

139-A. (English.) Development of Siteel and Its General Characteristics. Keiiti Ohta. Kansai University, Technology Reports, Mar. 1959, p. 65-71.

Heat treatment characteristics and mechanical properties of a grain-refined FeSi alloy containing less than 8% Si. 11 ref. (A-general; Fe-b, Si)

140-A. Laboratory-Scale Casting Furnace for High Melting Point Metals. P. G. Clites and E. D. Calvert. U. S. Bureau of Mines, Report of Investigations 5726, 1961, 13 p.

Development of a 20 cu. in. capacity laboratory furnace for determining casting characteristics of metals and alloys and variable relationships involved in skull-melting and casting high temperature metals. Cast specimens are obtained from Zr, Ti, Hf, Cb, Mo, Ta, W, Fe, Cr and Cu. (A9, E10b, E-general; SGA-h)

141-A. Molybdenum Alloy and Process Technology. R. C. Nelson. Journal of Metals, v. 13, Mar. 1961, p. 223-224.

Mechanical properties of Mo-base alloys and the latest developments in forging, extrusion, casting, Kroll and bomb reducing, thermal dissociation, electrolysis, welding and coating of Mo-base alloy powders. (A-general, Q-general, F-general; Mo-b, 6)

142-A. (Pamphlet.) New Alloy: Fernico-5, General Electric Research Laboratory Bulletin, Winter 1961, 9 p.

Development of a vacuum melted Fe-Ni-Co alloy with a thermal expansion close to that of alumina so that it is especially suited for use in ceramic-to-metal seals for electron tubes, thermionic energy converters and high temperature circuits. (A-general, P11g; SGA-n, Fe-b, Co, Ni)

143-A. Capacitor Grade Tantalum. Lawrence H. Belz. Electrochemical Society, Journal, v. 108, Mar. 1961, p. 229-235.

Review of occurrence, production costs and properties of Ta. Powder metallurgy techniques and evaluation of various powder types in terms of their relation to anode design, production and performance. Effects of anode density and sintering temperature on performance. Production of sheet, wire and foil are reviewed with data for electrical characteristics. 4 ref. (A-general, C-general, H-general, P15, T1e, 10-54; Ta, 17-57)

144-A. (Book-Translation.) The Continuous Casting of Steel in Commercial Use. K. P. Korotkov, N. P. Maiorov, A. A. Akvortsov and A. D. Akimenko. 171 p. 1960. Pergamon Press, 122 E. 55th St., New York 22, New York. $8.50.

Principles and technological parameters of continuous casting, with attention to the design, operation and efficiency of a continuous casting steel plant in the USSR. Structure, mechanical properties and quality of the ingots produced. 35 ref. (A-general, D9q, Q-general; ST)

145-A. (Book.) Elementary Structural Analysis, 2nd Edition. C. H. Norris and John B. Wilbur. 651 p. 1960. McGraw-Hill Book Co., Inc., 330 W. 42nd St., New York 36, N. Y.

Review of the methods and applications of theoretical structural analysis. Designs for various structures, loads and service conditions. Determination of shear and bending moment, static stability, reactions, stress, influence lines, deflection, moment distribution and plastic behavior. (A-general, T26)

146-A. (Book.) The Electro-Erosion Machining of Metals. A. L. Livshits. 115 p. 1960. Butterworth & Co., Ltd., 88 Kingsway, London, W. C. 2, England. $5.75.

Principles of electro-erosion machining and techniques involved in the electro-pulse, electro-spark, anodo-mechanical and electro-contact methods. Design and operation of equipment with attention to pulse generation and control. (A-general, G24)

147-A. (French.) Metallurgy of High Strength Steels Containing 5% Chromium. G. A. Roberts. Revue de Metallurgie, v. 58, Jan. 1961, p. 65-77.

Hardened X2, X3, VJ, VJ-VM, X5 and Vascojet 1000 steels are mechanically tested after tempering at 100-700° C. Data are given for elastic limit, tensile strength and hardness as functions of the tempering temperature and time and of the carbon content and for fatigue strength and heat resistance. Application in jet airplane parts. 19 ref. (A-general, Q-general, 2-60, 2-64, T24; SGA-h, AY, Cr, 17-57)

148-A. (Book.) Effect of Surface-Active Media on the Deformation of Metals. V. I. Likhtman, P. A. Rebinder and G. V. Karpenko. 188 p. 1960. Chemical Publishing Co., 212 5th Ave., New York. $5.75.

Testing of single crystal and polycrystalline metals to determine the effects of surface active media on plastic and plastic deformation processes and on mechanical properties such as creep and fatigue. Analysis of the adsorption process and its effects and of the mechanisms governing adsorption fatigue and corrosion of metals. 101 ref. (A-general, Q24, Q-general, R-general, 10-54)

149-A. Beryllium as a Structural Material. Engineering Materials and Design Conference, Proceedings, Feb. 1960, p. E1-E8.

Fabrication of cast or powdered Be, including machining, brazing and welding. Physical and mechanical properties and possible applications of Be in aircraft structures. 9 ref. (A-general, G-general, K-general, P-general, Q-general, T24; Be, 17-57)

150-A. Properties of the New Cobalt-Base Alloy UMCo50. L. Habraken and D. Coutsouradis. Cobalt, Mar. 1961, p. 3-21.

Heat treatment effects on the structure and properties of Co-Cr-Fe alloys and the effects of addition elements on UMCo50 (50% Co, 30% Cr, 20% Fe). Data are given for thermal shock, abrasion, impact, oxidation and corrosion resistance, machinability, weldability, hardness, tensile properties and stress and melting characteristics. 13 ref. (A-general, G17k, K9s, Q-general, R-general, 2-60, 2-64, 3-66; Co-b)

151-A. What Beryllium Can Do for You. Paul E. Gage. Product Engineering, v. 32, Feb. 20, 1961, p. 82-85.

Mechanical and physical properties of Be are compared to light, heavy, reactive and refractory metals, stainless steels and superalloys. Applications in environments requiring high thermal stability and good strength to weight ratio. (A-general, P-general, Q-general; Be, 17-57)

152-A. Niobium-20 wt.% Uranium, High Temperature Metallic Fuel of the Future. John A. DeMastry, Frederic R. Shober and Ronald F. Dickerson. Nuclear Science and Engineering, v. 9, Mar. 1961, p. 299-304.

Development of a 20% U-Cb alloy for reactor fuel application. Fabrication characteristics, mechanical properties and corrosion behavior in air, CO_2, NaK, water and steam are reported with data given for temperature and aging effects on properties. 6 ref. (A-general, Q-general, R-general, T11, 2-62, 2-65; Cb-b, U, 17-57)

153-A. Unusual Metals. Bryan Whipple. Michigan Technic, v. 79, Mar. 1961, p. 13-15.

Physical and mechanical properties of metals such as Os, V, Sc, Ge, Te, Cs, Th, In, Pt, Ga, Hf, Pd, Re, Pr, Gd, Dy and Tc. Cost comparison and survey of applications in industry. (A-general, P-general, Q-general; EG-b, EG-c, EG-d, EG-g, 17-57)

154-A. Hyper-Eutectic Aluminum Silicon Casting Alloys. S. J. Ashton, J. Muir and W. M. Doyle. Metal Industry, v. 98, Feb. 1961, p. 143-146.

Mean tensile properties of sand-cast and die-cast Al-Si test bars and effect of pouring temperature, Na contamination, holding time, remelting and degassing on the primary Si phase in hyper-eutectic Al-Si alloys. Use of ferro-phosphorus in refining the alloy. (A-general, E25, N-general, Q27, 2-60; Al-b, Si)

155-A. A Review of the Effects of Starting Material on the Processing and Properties of Tungsten, Molybdenum, Columbium and Tantalum. Defense Metals Information Center, Battelle Memorial Institute, DMIC Memo. 90, Mar. 13, 1961, 37 p. (Available as PB 161240 from U. S. Office of Technical Services, Washington 25, D. C.)

A summary relating characteristics of the as-reduced refractory metal powders W, Mo, Cb and Ta to the properties of the consolidated or fabricated product. Effect of powder history on purity, particle size and on homogeneity of alloys; effect of powder particle size on compaction and sintering and effect of powder purity on composition and properties after sintering and melting. 41 ref. (A-general, H-general, P-general, Q-general; Cb, W, Mo, Ta, EG-d37, 6)

156-A. A New High-Temperature Alloy. Metal Treatment and Drop Forging, v. 28, Mar. 1961, p. 123-124.

Development of a Ni-base alloy containing 25% Cr and 3% each of Mo, Co and W. Alloy is meant for service above 980° C. and has good creep-rupture properties, low coefficient of expansion and good oxidation resistance. (A-general; Ni-b, Cr)

157-A. (Pamphlet.) Symposium on Temperature--Its Measurement and Control in Science and Industry. American Institute of Physics, 335 E. 45th St., New York 17, N. Y. Mar. 1961, 116 p. $5.

Review of papers presented at symposium in Columbus, Ohio, Mar. 27-31, 1961, sponsored by American Institute

of Physics, Instrument Society of America and National Bureau of Standards. Topics include temperature measurement methods and equipment and materials of application. (A-general, X9, 10-54)

158-A. (Pamphlet.) Uniloy 303 MA. Universal-Cyclops Steel Corp., Bridgeville, Pa. 1961, 11 p.

Development of a new free machining stainless steel which combines greatly improved machinability with improved corrosion resistance and resistance to splitting. Data for composition, physical and mechanical properties and workability. (A-general, G17k; SS)

159-A. (Pamphlet.) Stronger Cast Stainless Keeps Promises. E. A. Schoefer. Reprint from Chemical Engineering, Mar. 7, 1960, 4 p. Alloy Casting Institute, 1001 Franklin Ave., Garden City, N. Y.

Data for mechanical properties, corrosion and abrasive wear resistance, machinability, weldability and linear coefficient of thermal expansion of Cd-4MCu cast alloy. Applications. (A-general, G17k, K9s, Q-general; SS, 5)

160-A. (Books-French.) Equilibrium Diagrams of Quaternary Systems. v. 1-2, 1960. R. Cayron. Institut de Metallurgie, Louvain, France. 162 p.

Equilibrium diagrams for compositions and various temperatures of quaternary systems in general, with special reference to the Sn-Bi-Cd-Pb, Ag-Ni-Cu-Au and Ag-Pb-Cu-S systems. Primarily the liquid-solid transformations are considered with mention of some quinary and more complex systems. 5 ref. (A-general, M24d, N12)

161-A. Aluminum and Its Alloys in 1960. E. Elliott. Metallurgia, v. 63, Feb. 1961, p. 65-70.

Review of research and technical progress in metallurgy of Al and Al alloys including extraction founding, fabrication, constitution and physical and mechanical properties. Applications. (To be continued.) 88 ref. (A9; Al-b)

162-A. Electrical Resistance Alloys. Research & Industry (India), v. 6, Jan. 1961, p. 1-3.

Electrical resistance alloys free from Ni and Co and Fe, Cr and Al are developed for use as a substitute for Nichrome and Kanthol. The addition of Ti and Zr suppresses the tendency towards grain growth and improves the high-temperature properties. (A-general; Fe-b, Al, Cr)

163-A. (Book.) Materials Handbook. 8th Edition. George S. Brady. 1022 p. 1956. McGraw-Hill Book Co., Inc., 330 W. 42nd St., New York 36, N. Y. $6.50.

Data are given for physical and mechanical properties, sources, applications, colors and compositions of metals, alloys, ceramics, plastics, chemicals, fuels, gases, abrasives, woods, refractories, lubricants and ores. (A-general, A11, P-general, Q-general, 11-68)

164-A. (French.) A New Columbium Steel. S. Witis. Industrie du Petrole, v. 28, Dec. 1960, p. 87.

Technical characteristics and composition of GLX-W Cb steel. Application in pipeline construction. (A-general, T26r; ST, Cb, 17-57)

165-A. (Book.) Nondestructive Testing. Warren J. McGonnagle. 455 p. 1961. McGraw-Hill Book Co., Inc., 330 W. 42nd St., New York 36, N. Y. $15.

Comprehensive survey of theoretical and empirical background, development and applications of nondestructive testing methods including visual, pressure and leak, penetrant, thermal, X-ray and gamma radiography, ultrasonics, dynamic, magnetic, electrical, eddy current, chemical, residual stress, irradiation and thickness measurement techniques. Metal discontinuities are analyzed and related to specific testing procedures. 397 ref. (A-general, 11-64, S13)

166-A. Rare Metals Are a Challenge to Metallurgy. Australasian Manufacturer, v. 45, Mar. 4, 1961, p. 68-71.

Extraction and refining of Be from beryl by fluorination, fusion and electrolysis and of Zr from zicron by chloride conversion process and reduction with Mg or Na. Data are given for mechanical and physical properties, corrosion resistance and neutron absorption cross section. (A-general, C-general, P-general, Q-general; Be, Zr)

167-A. (Book.) Vacuum Microbalance Techniques, v. 1. M. J. Katz, Editor. 152 p. 1961. Plenum Press, Inc., 227 W. 17th St., New York 11, N. Y.

Conference report on design, construction and applications of vacuum microbalances including automatic recording, pivotal and quartz types and use with omegatron spectrometer. Topics include operation under ultra-high vacuum and high-temperature conditions and the study of ion-bombardment, sputtering rates and mass changes. Effects of pressure on sample weight changes and microgravimetric study of hydrogen and the effect of thermomolecular gas flow on balance suspension are presented and a corrective procedure described for thermonuclear effects on oxidation behavior. 5 ref. (A-general, 10-64, S11e, 1-73)

168-A. (Russian.) Alkali-Sulphidic Method for Treatment of Lead Works Dust. Z. A. Serikov and S. M. Anisimov. Tsvetnaya Metallurgiya, June 1960, p. 65-73.

Extraction of Pb, Zn and Cd and the metals Tl, Se, As and Te from Pb dust by melting at low temperature and leaching with NaOH and H_2SO_4 solution. Design of the apparatus for alkali-sulphidic melting of the dust. 8 ref. (A8a; Pb)

169-A. Review of Recent Development in the Technology of High-Strength Stainless Steels. D. A. Roberts. Defense Metals Information Center, Battelle Memorial Institute, DMIC Memo. 99, Apr. 14, 1961, 2 p.

Improvement of the rupture life of an alloy composed of 35% Mn, 8% Al, 0.5% V, 0.6% C and balance Fe, by the addition of Mo, W or both. The alloy is oxidation resistant and contains no Cr. 3 ref. (A-general, 10-54, Q3, 2-60; SS, Mn, W, Mo, SGB-a)

170-A. (German.) New Development of Aluminum Alloys. Paul Brenner. Jahrbuch 1959 der WGL, Oct. 1959, p. 343-357.

Review of design and fabrication of age hardenable, Mg containing alloys for aircraft, heat resistant alloys and sintered products. Improvement of mechanical properties, particularly tensile, yield and fatigue strength by product design, such as taper-rolled sheet and strip, resin bonded Al foil honeycomb and other sandwich construction, special extruded profiles and heavy forgings. (A-general, F-general, G-general, Q-general; Al-b)

171-A. How to Get the Most Out of 6063 Extrusion Alloy. M. E. Molitor and H. E. Miller. Modern Metals, v. 17, Apr. 1961, p. 44, 46-47.

Development of a precipitation-hardening alloy for extrusion industry. Mg-Si phase diagram is used to explain how composition, homogenization, reheat temperature, extrusion quench rate and aging time and temperature affect mechanical properties. (A-general; Al-b)

172-A. (Book-Translation.) Continuous Casting of Steel. M. C. Biochenko. 218 p. 1961. Butterworth & Co., Ltd., 88 Kingsway, W.C.2, London, England. $9.50.

Continuous production of ingots, billets and slabs and the "ingotless" rolling of strip, both ferrous and nonferrous. Defects, ductility and structure as affected by cooling and solidification methods. 64 ref. (A-general, D9q)

173-A. (Italian.) Hard American Aluminum-Magnesium Alloys of the 5000 Series. Alluminio, v. 30, Jan. 1961, p. 25-26.

Mechanical characteristics, weldability, machinability and composition of 5052, 5454, 5154, 5086, 5083 and 5456 Al-Mg alloys. (A-general, K9s, G17k, Q-general, 2-60, Al-b, Mg)

174-A. (French.) Refractory Steels and Alloys. Principles of Application. R. Neyret. Chimie & Industrie, v. 85, Jan. 1961, p. 73-85.

Structure and mechanical properties of austenitic steels and alloys and their resistance to oxidation, elevated temperatures, hot gases and carburizing atmospheres. Influence of the presence of P, S, Co and V. (A-general, Q-general, R1h, 2-60, 2-62; SGA-h, AY)

175-A. (Italian.) Aluminum Alloy With High Silicon Content. Fonderia, v. 10, Feb. 1961, p. 75-78.

Compositon, melting and casting techniques, physical and mechanical properties and applications of X392 Al-Si alloys. (A-general, C-general, P-general, Q-general, 2-60; Al-b, Si, 17-57)

176-A. Review of Recent Developments in the Technology of Molybdenum and Molybdenum-Base Alloys. J. A. Houck. Defense Metals Information Center, Battelle Memorial Institute, DMIC Memo. 96, Apr. 7, 1961, 2 p. (Available as PB 161246 from U. S. Office of Technical Services, Washington 25, D. C.)

Summary of production and alloying methods, including Kroll process reduction, powder metallurgy and dispersion strenthening. Data are given for mechanical properties, workability and high-temperature properties for alloys containing Ti, Zr, W and C. (A-general, C26, H-general, Q-general, 2-60, 2-62, 10-54; Mo-b, C, Ti, W, Zr)

177-A. High Strength, Medium Alloy Steel Takes Heat. Steel, v. 148, May 1, 1961, p. 60-61.

Development of a temper resistant alloy steel capable of retaining ultra-high strength after tempering at 1000-1300° F. (A-general; AY)

178-A. (German.) Properties and Usefulness of Heat Resistant 12% Chromium Steel. Gerhard Kruger. Neue Hutte, v. 6, Mar. 1961, p. 131-138.

Development of heat resistant 12% Cr steel from corrosion resistant turbine blade steel X20 Cr 13 by alloying with Mo, W and V to increase stress-rupture strength at elevated temperatures (600° C.) Data are given for stress-rupture and mechanical strength, corrosion resistance, constitution diagrams, microstructure, workability and weldability. Survey of engineering applications. (A-general, K9s, Q-general, R-general, 2-60, 2-62; SS, Cr, Mo, W, V, 17-57)

179-A. (Book.) The Interpretation of X-Ray Diffraction Photographs. N. F. M. Henry, H. Lipson and W. A. Wooster. 282 p. 1960. MacMillan & Co., Ltd., London, England. $16.

Oscillation photographs, Lave photographs and Weissenberg photographs produced by X-ray refraction and absorption are used to determine crystal orientation. (A-general, M22g)

180-A. (Book.) Impact. The Theory and Physical Behavior of Colliding Solids. Werner Goldsmith. 379 p. 1960. Edward Arnold, Ltd., 41 Maddox St., London W. 2, England. $17.50.

Impact, torsion, compressive and tensile testing of elastic solids, spheres, bars, masses, beams and rods by dynamic loading. 442 ref. (A-general, Q28n, Q27b, Q1b)

181-A. (Book-Translation.) High Temperature Metallography. M. G. Lozinskii. 474 p. 1961. Pergamon Press, 122 E. 55th St., New York 22, N. Y. $17.50.

Construction and maintenance of apparatus for investigating the structure and mechanical properties of metals by heating in vacuum. Basic principles of high-temperature metallography. Methods for measuring and for investigating the deformation of metals and alloys at high temperatures in vacuum. 252 ref. (A-general, M-general, 1-66)

182-A. Bethlehem 57 Special (Hot Work Tool Steel, Type H25). Alloy Digest, TS-104, Apr. 1961.

Steel has high red-hardness and abrasion resistance and therefore is excellent for hot work applications at high operating temperatures. Its other advantages are good resistance to wash, good resistance to heat checking and adequate shock resistance. (A-general; TS)

183-A. Duralumin-K (Heat Treatable, Wrought Aluminum Alloy). Alloy Digest, Al-102, Apr. 1961, 2 p.

High strength, wrought alloy recommended for highly stressed applications. It responds to precipitation-hardening heat treatment. (A-general; Al-b)

184-A. Max-El 2-B (Free-Machining Steel). Alloy Digest, CS-15, Apr. 1961, 2 p.

General purpose free-machining steel offering a good combination of strength, toughness and abrasion resistance as well as excellent machinability. It is generally used in the as-rolled condition at a Brinell hardness of 200-235. (A-general; CN)

185-A. Jethete M. 151 (Hardenable Corrosion Resisting Steel). Alloy Digest, SS-116, Apr. 1961, 2 p.

Corrosion resistant steels of the 12% Cr type especially suitable for sheet and strip applications where a 112,000 psi. tensile strength material might be selected with easy fabrication and welding and for service at elevated temperature. (A-general; SS)

186-A. Inconel 718 (Age-Hardenable Nickel-Base Alloy). Alloy Digest, Ni-65, Apr. 1961, 2 p.

Ni-Cr alloy having exceptionally high tensile, yield, creep and rupture strength at temperatures up to 1300° F. (A-general; Ni-b)

187-A. Hydro-T-Metal (Architectural and Industrial Zinc-Base Alloy). Alloy Digest, Zn-7, Apr. 1961, 2 p.

Alloy of Ti, Cu, Cr, Mn and high-grade Zn. It has good resistance to deformation under stress and can be subjected to high temperatures without grain growth and consequent loss of strength. As a result, it resists stretch or sag under tension at temperature change. (A-general; Zn-b)

188-A. Amzirc (High Conductivity Copper Alloy). Alloy Digest, Cu-99, Apr. 1961, 2 p.

Consists of high conductivity, oxygen-free OFHC Cu and a small amount of high-purity Zr. The alloy has high electrical conductivity combined with strength at elevated temperatures. It is free from notch sensitivity. (A-general; Cu-b)

189-A. (Book.) Metallizing of Plastics. Harold Narcus. 208 p. 1960. Rheinhold Publishing Co., 430 Park Ave., New York 22, N. Y. $5.50.

Plastics are metallized with various metals by chemical reduction, metal evaporation, cathode sputtering, Ag spray method and other miscellaneous processes. Data presented on characteristics of metallized deposits. Plating eliminates undesirable properties of plastics, increases tensile, impact and flexural strength and increases resistance to abrasion and heat distortion. 74 ref. (A-general, L23)

190-A. Imperial (Manganese Steel). Alloy Digest, SA-113, Apr. 1961, 2 p.

High-carbon high-manganese steel possessing great ductility. Its ductility, which is its most valuable property, can be greatly affected by the rate of cooling. It has great toughness and high wear resistance. (A-general; AY)

191-A. Aluminum and Its Alloys in 1960. Some Aspects of Research and Technical Progress. E. Elliott. Metallurgia, v. 63, Mar. 1961, p. 105-114.

Review of the metallurgy of Al and its alloys, including extraction, founding, fabrication, constitution, properties and standardization and applications. (A-general; Al-b)

192-A. Copper and Copper Alloys. Metallurgia, v. 63, Mar. 1961, p. 133-135.

Summary developments in the field of Cu and Cu alloys including extraction, fabrication, finishing, mechanical and physical properties and testing. (To be continued). (A-general; Cu-b)

193-A. Manganese Puts Muscle and Corrosion Resistance in Aluminum. Union Carbide Metals Review, v. 4, Winter-Spring, 1961, p. 19-20.

Alloying of Al with Mn to produce heat treatable, nonheat treatable and casting alloy of high-tensile strength and corrosion resistance and with improved grain structure, purity and ductility. (A-general; Al-b, Mn)

194-A. (Book.) Embrittlement by Liquid Metals. Harold Markus, Joseph M. McCaughey and William Rostoker. 159 p. 1960. Reinhold Publishing Corp., 430 Park Ave., New York 22, N. Y. $7.95.

Discussion reviews literature on embrittlement in solid metals, crack propagation, factors influencing embrittlement and its mechanism, delayed failure, metal fracture and static stress and concludes that the origin of fracture is at the liquid metal-metal interface. 147 ref. (A-general, Q26s)

195-A. Austenitic Manganese Steels--New Alloys Developed With Improved Wearing Qualities. T. E. Norman, D. V. Doane and A. Solomom. Alloy Metals Review, v. 9, Mar. 1961, p. 1-11.

Austenitic steels having a combination of good mechanical properties and improved resistance to gouging abrasion are produced when carbide dispersions are developed in the 12% Mn high C (0.61-1.47%) types. Grain refinement and carbide dispersions are obtained by combining a 2% Mo addition with a pearlitizing heat treatment at 1100° F. followed by a re-austenitizing treatment at 1600-1900° F. 12 ref. (A-general; SS-e)

196-A. Aluminum Addition to 303 Stainless Improves Machinability. Machine and

Tool Blue Book, v. 56, May 1961, p. 115-116.

Description of a free machining Cr-Ni stainless steel designated Uniloy 303 MA. Chemical resistance, corrosion resistance, weldability and surface finish. (A-general, G17k; SS)

197-A. (Book.) Open Hearth Proceedings. v. 43. 1961. 289 p. American Institute of Mining, Metallurgical and Petroleum Engineers, 29 W. 39th St., New York 18, N. Y.

Series of papers from the 43rd Conference of the National Open Hearth Steel Committee of the Iron and Steel Division on techniques and equipment involved in openhearth steelmaking with emphasis on use of oxygen. (A-general, D9)

198-A. (Book.) The Effect of Atmosphere on the Fatigue of Lead. K. U. Snowden. 1959. 73 p. University of Melbourne Press, Melbourne, Australia.

Study of the fatigue properties of high-purity polycrystalline Pb in air at various pressures and in separate gas atmospheres. Results indicate that oxygen reduces fatigue life by forming intercrystalline cracks and has a more damaging effect when strain is decreased. 48 ref. (A-general, Q7; Pb)

199-A. A Review of Recent Developments in Titanium. R. A. Wood. Light Metal Age, v. 19, Apr. 1961, p. 6, 10.

A review in the following areas: markets; chemical reactions, as spontaneous ignition of Ti in oxygen; corrosion; mechanical properties such as notch sensitivity, embrittling effect and fracture toughness; the status of new high-strength alloys; and applications in wire and missiles. 15 ref. (A-general; Ti)

200-A. Powdered Metals Are Big Business. Hugh Canning. Canadian Chemical Processing, v. 45, Apr. 1961, p. 66-69.

Report on the production, applications and properties of powdered metals including Zn, Pb, Cu, Ni and Co. (A-general; Co, Cu, Ni, Pb, Zn, 6)

201-A. Materials for Extreme Service. E. A. Kachik. Chemical Engineering Progress, v. 57, Apr. 1961, p. 65-68.

Development of high-temperature materials and processes. Vacuum arc and vacuum induction melting, explosive forming and hardening, flame or arc spraying of materials, film formation on ceramic substrates, powder metallurgy processes discussed for new temperatures and future usage. (A-general; SGA-h)

202-A. New Weldable 18% Nickel Steel Has High Ductility. Welding Engineer, v. 46, May 1961, p. 85.

Development of a 18% Ni alloy steel with exceptional toughness at high-strength levels. Sound crack-free welds can be obtained with manual or automatic welding without preheating. (A-general, K9s; ST, Ni)

203-A. Refractory Metals Emerging as Structural Materials. Steel, v. 148, May 8, 1961, p. 115-130.

Mechanical and physical properties, fabricability and availability of the refractory metals in relation to their use as structural materials. (A-general, P-general, Q-general; EG-d37)

204-A. (Book.) Advances in Cryogenic Engineering. v. 6. K. D. Timmerhaus, Editor. 1961. 662 p. Plenum Press, Inc., 227 W. 17th St., New York 11, N. Y. $15.

Collection of papers from the proceedings of the Sixth National Conference held by the National Bureau of Standards and the University of Colorado at Boulder, Colorado, Aug. 23-25, 1961. Topics covered are superconductivity, transfer phenomena, design of equipment, physical equilibria, heat transfer, thermometry and mechanical properties at cryogenic temperatures. (A-general, 1-67)

205-A. An Investigation of Intermetallic Compounds for Very High Temperature Applications. R. M. Payne. Brush Beryllium Co. (Wright Air Development Division). U. S. Office of Technical Services, July 1960, 130 p. $3.

Preparation, fabrication and properties of intermetallic compounds under development for service at temperature ranging from 2300-3000° F. The compounds, principally beryllides, are prepared by solid-state reactions and fabricated chiefly by hot pressing techniques. Oxidation tests in dry air at 2500-3000° F. and in moist air (57° F. dew point) at 2300-2500° F. (A-general; Be, 14-68)

206-A. Titanium Alloy Forgings. H. J. Henning and P. D. Frost. Defense Metals Information Center. U. S. Office of Technical Services, PB 15100, Dec. 1960, 89 p. $2.25.

Current information on the availability, metallurgical and dimensional quality and mechanical properties of Ti die forgings. Data on many typical forgings including alpha-beta alloy forgings, alpha-alloy forgings and all-beta forging alloy. (A-general; Ti-b, 4-51)

207-A. High-Temperature Metallurgy and Heat Resistant Alloys. OTS Selective Bibliography SB-452, 34 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.10.

Lists research reports of the Army, Navy, Air Force, Bureau of Mines and other government agencies as well as foreign research literature on heat resistant alloys and high-temperature metallurgy. Significant literature is cited on high-temperature intermetallic compounds, alloys by powder metallurgy, brazing for high-temperature service and certain high-temperature metal coatings. A separate listing of Atomic Energy Commission research reports on high-temperature metallurgy include 89 citations. (A-general, 1-66; SGA-h)

208-A. (Book.) The Wire Industry Encyclopaedic Handbook. 528 p. 1961. Wire Industry, Ltd., 33 Turnival St., London, England.

Handbook on wire drawing and fabricating including an index of brand names, a list of specifications and standards and selected articles on lubrication, die maintenance and raw materials selection. (A-general, F28)

209-A. Electrolytic Destruction of Cyanide Residues. John M. Connard and G. Paul Beardsley. Metal Finishing, v. 59, May 1961, p. 54-55.

A mild steel tank with carbon anodes and mild steel cathodes is used to destroy cyanide-bearing materials from Cd, Zn and Cu plating baths. (A8b)

210-A. Tantung Investment Casting. R. A. Haskell and A. N. Neyrinck. Precision Metal Molding, v. 19, May 1961, p. 49-51.

Data given for Rockwell hardness, coefficient of thermal expansion, rupture and tensile strengths, thermal conductivity and hot hardness of investment castings of Tantung 166A, a group of cast alloys based on Co and containing Cr, W, Ta, Mn, Fe and C. (A-general; Co-b, Cr, W, 5-62)

211-A. Porcelain-Enameled Aluminum Extrusions. Precision Metal Molding, v. 19, May 1961, p. 61-62, 64.

Appearance, durability, chemical, impact, abrasion and thermal shock resistance and thermal stability given for porcelain enameled 6061 Al alloy. 3 ref. (A-general; Al-b, 4-58, 8-71)

212-A. Malleable Iron--Past, Present, Future. Gordon B. Mannweiler. Modern Castings, v. 39, Mar. 1961, p. 49-50.

Review of industrial development and applications of malleable Fe with attention to increase mechanical strength by improved production methods and quality control. (A-general, Q-general, 10-54, T-general; CI-s, 17-57)

213-A. Improved Stainless. Automatic Machining, v. 22, May 1961, p. 39-41.

Corrosion and end-wise splitting resistance, machinability and finishing qualities of Uniloy 303 MA which differs from 303 stainless mainly in the substitution of Al for about half of the sulphur. (A-general; SS)

214-A. (French.) Cast Steel. Pratique des Industries Mecaniques, v. 47, Feb. 1961, p. 29-31.

Composition, mechanical properties and applications of some cast stainless and mild steels. (A-general; CN, SS, 5)

215-A. (French.) Numerous Steels for High-Temperature and High-Mechanical Strength Applications. Metallurgie et la Construction Mecanique, v. 93, Feb. 1961, p. 87-89, 91, 93, 95.

Composition, mechanical properties and suggested heat treatments for PH 55, D 979, AF 71, 19-9 W Mo, 19-9 D-L, GSA, B-18B, N-153, gamma and S-495 steels. (A-general; ST, SGA-h, SGB-a)

216-A. AM355 for Gas Turbine Engines. Paul A. Bergman. Metal Progress, v. 79, May 1961, p. 79-88.

AM355, a controlled-transformation stainless steel, offers an excellent combination of the better features found in the 300 and 400 series. This article discusses general characteristics and

properties of AM355 forgings and bar stock including the effects of retained austenite and its control. (A-general, T24b, Q-general; SS)

217-A. Armco High Strength no. 1 (High-Strength Low-Alloy Steel). Alloy Digest, SA-115, May 1961, 2 p.

Important advantages claimed over carbon steels in flat rolled steel applications are increased strength, decreased weight, longer life and greater resistance to corrosion, shock and fatigue resistance. (A-general; AY, SGB-a)

218-A. Premabraze 130 (High Temperature Brazing Alloy). Alloy Digest, Au-1, May 1961, 2 p.

A solid solution type Au-Ni brazing alloy with a composition characterized by a sharp melting point. (A-general; Au-b, Ni)

219-A. Climelt Molybdenum-0.5% Ti (High Temperature Alloy). Alloy Digest, Mo-2, May 1961, 2 p.

A Mo alloy having high strength at elevated temperatures, high modulus of elasticity, low coefficient of expansion and high-thermal conductivity. It has exceptionally high rupture properties above 1600° F. (A-general; Mo-b, Ti)

220-A. Aluminum 360 and A360 (Aluminum Die Casting Alloy). Alloy Digest, Al-103, May 1961, 2 p.

Alloy A360 is a purer form of alloy 360 having lower impurity maximums. Both alloys have excellent casting characteristics, good corrosion resistance and good mechanical properties. (A-general; Al-b)

221-A. Revere no. 533 (Nickel Silver). Alloy Digest, Cu-100, May 1961, 2 p.

An 18% nickel silver alloy having ductility, malleability and resistance to corrosion. It is recommended for deep drawing applications. (A-general; Cu-b, Ni)

222-A. Hipersil (Silicon-Iron Magnetic Alloy). Alloy Digest, Fe-19, May 1961, 2 p.

A high-permeability Si-Fe alloy recommended for use in transformers. It has low hysteresis loss and preferred orientation. Its superior magnetic qualities exist only in the rolling direction. (A-general; Fe-b, Si)

223-A. Unimach UCX-3 (High Strength Alloy Steel). Alloy Digest, SA-114, May 1961, 2 p.

Co modification of the AISI 4100 series type of steel. It is essentially not notch sensitive in the 225,000-235,000 psi. yield strength range. It is a new ultra-high-strength steel suitable for manufacture of high-performance rocket motor uses. (A-general; AY, Co)

224-A. Cooper PH-55B (Precipitation-Hardening Stainless Steel). Alloy Digest, SS-117, May 1961, 2 p.

A high-strength high-ductility alloy recommended for corrosion resistance of parts subjected to a combination of stress and shock. It responds to an age hardening heat treatment. (A-general; SS)

225-A. (Slovak.) High-Strength Weldable Steels in Hungarian Industry. Bela Zorkoczy. Zvaracsky Sbornik, v. 10, Jan. 1961, p. 41-50.

Composition and mechanical properties of the Mn-Ti-Al steel MTA50. Impact strength for the temperature range -40 to 20° C. Structure in the rolled and normalized states. Fatigue strength. (A-general, K9s; ST, SGB-a)

226-A. High Temperature Properties and Alloying Behavior of the Refractory Platinum-Group Metals. R. W. Douglass, F. C. Holden and R. I. Jaffee. Battelle Memorial Institute (Department of the Navy). U. S. Office of Technical Services, PB 161823, Aug. 1959, 118 p. $2.75.

Results of a literature survey. The major emphasis is on the metallurgical properties of the four more refractory Pt group metals, Rh, Ir, Os and Ru. Information on Pt and Pd is included. (A-general; Pt, Pd, Rh, Os, Ru, Ir)

227-A. Cobalt. OTS Selective Bibliography SB-457. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.10.

Research reports of the Army, Navy, Air Force, Atomic Energy Commission and other government agencies are listed in addition to translations of foreign technical literature and government owned patents available for license on Co metals, alloys and compounds including isotopes. (A-general; Co)

228-A. Beryllium Research and Development in the Area of Composite Materials. J. Greenspan. Nuclear Metals, Inc. (Wright Air Development Division). U. S. Office of Technical Services, PB 171083, July 1960, 121 p. $2.75.

Studies of the bend ductility of Be sheets designed for sample width and thickness show that the amount of ductility is sensitive to grain orientation as well as to the sample dimensions. In narrow samples (small width/thickness ratio), bend ductility is highest with a highly preferred basal plane texture. (A-general, Q5g; Be, 4-53)

229-A. Beryllium: A Survey of the Literature. K. D. Carroll. Lockheed Aircraft Corp. U. S. Office of Technical Services, PB 161812, Apr. 1960, 59 p. $1.50.

Literature on Be published in the period 1957-1960 is surveyed and listed. Each entry carries a short abstract of the contents. (A-general; Be)

230-A. Beryllium: A Search of the Literature 1957-1959. K. D. Carroll. Lockheed Aircraft Corp. U. S. Office of Technical Services, PB 161811, Jan. 1960, 113 p. $2.

The fields of Be metallurgy, crystallography, fabrication methods and the application of Be to aircraft and missiles are reviewed. Also included are references on the toxicology of Be, its hazard limits and means of detection. (A-general; Be)

231-A. Evaluation of Beryllides. J. R. Lewis. Journal of Metals, v. 13, May 1961, p. 357-362.

Evaluation of properties, fabrication and nuclear applications of Be and its alloys in terms of density, elastic modulus, melting point, oxidation and impact resistance, hardness and thermal characteristics. 42 ref. (A-general; Be-b)

232-A. (Russian.) Die Steels for Hot Pressing of Hard-to-Work Alloys. E. V. Smirnov. Metallovedenie i Termicheskaya Obrabotka Metallov, Feb. 1961, p. 31-35.

Establishment of optimum ratio for carbon and alloying elements. Hardness and mechanical properties tested in terms of heat treatment and composition. (A-general; TS)

233-A. Review of Recent Developments in the Technology of Nickel-Base and Cobalt-Base Alloys. D. A. Roberts. Defense Metals Information Center, Battelle Memorial Institute, DMIC Memo. 104, May 5, 1961, 4 p. (Available as PB 171623 from U. S. Office of Technical Services, Washington 25, D. C.)

Summary of alloy development including a cast Ni-base Cr-Co superalloy, IN-100 with improved rupture properties to 1900° F.; a Co-based Cr-W casting alloy, no. 152, with improved fatigue, thermal shock and oxidation resistance but with lower creep strength than no. 151 and a series of Ni-based casting alloys with superior stress-rupture life to Udimet 700 and Nicrotung. Also investigated are dispersion-hardened alloys by powder metallurgy techniques and the mechanical and physical properties of existing alloys. (A-general, H-general, P-general, Q-general, 2-60; Ni-b, Co-b)

234-A. Review of Recent Developments in the Metallurgy of Beryllium. Webster Hodge. Defense Metals Information Center, Battelle Memorial Institute, DMIC Memo 105, May 10, 1961, 5 p. (Available as PB 171624, U. S. Office of Technical Services, Washington 25, D. C.).

Summary of DMIC reports (Feb. 1-Apr. 30, 1961), covering purification by zone refining and distillation; metallographic examination; and measurement of mechanical and physical properties as a function of composition, heat treatment and fabrication and working processes. 14 ref. (A-general, C-general, F-general, Q-general, P-general, 2-60, 2-64, 3-68; Be, 10-54)

235-A. Mechanical Properties of Materials at High Temperature. A. I. Smith. Chartered Mechanical Engineer, v. 8, May 1961, p. 278-285.

Literature review of recent research in the U. S. and Britain on equipment and procedures for testing materials such as W, Mo, Ta, Cb, Ti, Be and their alloys. Emphasis on material strengths at high temperatures for use in nuclear reactors, rockets and turbines. 87 ref. (A-general, Q-general; SGAh, Be, Cb, Mo, Ta, Ti, W)

236-A. (German.) Principles of Waste Gas Processing in the Oxygen Top-Blowing Process. Hans Hoff. Stahl und Eisen, v. 81, Apr. 27, 1961, p. 562-571.

Investigation of gas formation in the converter and volume of waste gas in the dust removal plant as a function of time during course of refining as a basis for development of two methods of waste gas control, comprising controlled suction of waste gas, with subsequent combustion and dust removal and dust removal without previous combustion. (A8a, D3)

237-A. (French.) Gallium. Pierre de la Breteque. Bulletin de la Societe Chimique de France, Jan. 1961, p. 48-54.

Occurrence, physical and chemical properties, analysis, extraction and purification of Ga. Its alloys and compounds and their utilization. (A-general; Ga)

238-A. (Pamphlet.) Metallurgical Problems Encountered in the Manufacture of Large Rimming Steel Ingots. Great Lakes Steel Corp., Detroit, Mar. 22, 1961, 36 p.

Review of investigations conducted on large low-carbon rimming steel ingots and slabs. Skin-zone sulphur chemistry, core-zone sulphur distribution, skin-core patterns and slab test patterns. Influence of oxygen content and sulphur distribution on metallurgical quality. (A-general; ST-d, 5-59)

239-A. (Book.) Extractive Metallurgy of Copper, Nickel and Cobalt". Paul Queneau, Editor. 1961. 647 p. Interscience Publishers, Inc., 250 Fifth Ave., New York 1.

Papers presented at a symposium sponsored by the Extractive Metallurgy Division of the Metallurgy Society, American Institute of Mining, Metallurgical and Petroleum Engineers, New York, Feb. 15-18, 1960. Subjects covered include Cu, Ni and Co separation, fluid bed roasting, fuel-fired smelting and converting processes, electric furnace smelting, atmospheric and elevated pressure leaching, refining, dialysis and recovery processes. An annotated bibliography of 1190 references is included. Papers are abstracted separately. (A-general, C-general, 11-64; Cu, Co, Ni)

240-A. (Italian.) Low-Alloy Casting Steels. G. Violi. Metallurgia Italiana, v. 53, Feb. 1961, p. 45-52.

Effect of alloying elements (Cr, Mo, Mn and Ni) during heat treatment. Relations between heat treatment, microstructure and mechanical properties of steel castings. Determination of empirical quality index. (A-general; AY, 5)

241-A. (Book.) Materials for Nuclear Engineers. A. B. McIntosh and T. J. Heal, Editors. 1960. 373 p. Interscience Publishers, Inc., 250 Fifth Ave., New York 1. $11.35.

Preparation, fabrication, physical and nuclear properties, mechanical properties, effects of reactor conditions and compatibility of U, Pu, Th, ceramic fuels, graphite, Mg, Be and Zr. Applications in nuclear reactors. (A-general, T11; U, Pu, Th, Mg, Be, Zr, NM, 17-57)

242-A. Uranium. R. W. Nichols. Paper from "Materials for Nuclear Engineers". Interscience Publishers, Inc., New York 1, 1960, p. 8-63.

Review of uranium metallurgy including extraction and fabrication techniques; elastic, tensile, creep, thermal, electrical, nuclear, magnetic and optical properties; allotropic forms, phase changes and dimensional stability; effects of irradiation; and compatibility with air, carbon dioxide, hydrogen, nitrogen, water and other metals. 56 ref. (A-general, T11; U, 10-54, 17-57)

243-A. Materials Information--Its Use in Nuclear Engineering. A. B. McIntosh. Paper from "Materials for Nuclear Engineers". Interscience Publishers, Inc., New York 1, 1960, p. 1-7.

Physical and mechanical properties, compatibility, fabrication techniques, behavior under reactor conditions and other factors affecting use of metal and nonmetal materials in nuclear power engineering. Reasons for variation in properties. (A-general, T11; 10-54, 17-57)

244-A. Plutonium. K. Q. Bagley. Paper from "Materials for Nuclear Engineers". Interscience Publishers, Inc., New York 1, 1960, p. 64-111.

Review of Pu metallurgy including occurrence, extraction fabrication and handling; crystallography and allotropic transformations; nuclear, thermal, elastic, tensile, magnetic and other properties; corrosion resistance and compatibility with other materials; lattice parameters and phase diagrams

of Pu alloy systems. Applications in nuclear reactors. 40 ref. (A-general, T11; Pu, 10-54, 17-57)

245-A. Thorium. I. P. Bell. Paper from "Materials for Nuclear Engineers". Interscience Publishers, Inc., New York 1, 1960, p. 112-132.

Review of Th metallurgy for nuclear reactor applications including occurrence and methods of extraction; physical and mechanical properties and their variation with temperature, strain rate, alloying elements and impurities; irradiation stability and resistance to reaction with water, gases, liquid metals and solids; melting, casting, powder metallurgy, working, machining and welding methods. 23 ref. (A-general, T11; Th, 10-54, 17-57)

246-A. Magnesium. T. J. Heal. Paper from "Materials for Nuclear Engineers". Interscience Publishers, Inc., New York 1, 1960, p. 219-268.

Review of metallurgy of Mg and Mg alloys including extraction and fabrication methods; structure, deformation characteristics, ignition temperature, electrical resistivity and thermal, nuclear, tensile, creep, elastic and other properties; theoretical mechanisms of intergranular cavitation; compatibility with gases, aqueous media and metals; effects of irradiation; application as canning materials for fuel elements. 36 ref. (A-general, T11; Mg-b, 10-54, 17-57)

247-A. Beryllium. L. R. Williams and P. B. Eyre. Paper from "Materials for Nuclear Engineers". Interscience Publishers, Inc., New York 1, 1960, p. 269-318.

Review of Be metallurgy including production by metallic reduction or electrolysis; melting, casting and purification; powder production and consolidation; mechanical working, joining and machining; behavior of single crystals; effects of strain rate, grain size and elevated temperatures on tensile, stress rupture and creep properties; neutron cross section, crystal structure, electrical, thermodynamic, thermal and elastic properties; compatibility with air, hydrogen, carbon dioxide, water, liquid metals and uranium; canning techniques, toxicity and safety precautions in handling. 70 ref. (A-general, T11; Be, 10-54, 17-57)

248-A. Zirconium. C. Tyzack. Paper from "Materials for Nuclear Engineers". Interscience Publishers, Inc., New York 1, 1960, p. 319-366.

Review of Zr metallurgy including extraction, fabrication and joining of Zr and Zr alloys; lattice parameters and creep, fatigue, tensile, elastic, nuclear, thermal, electrical and thermodynamic properties; effects of cold work and impurity content; compatibility with air, carbon dioxide, hydrogen, oxygen, acids, alkalies, aqueous media, uranium and liquid metals; applications in nuclear reactors. 81 ref. (A-general, T11; Zr-b, 10-54, 17-57)

249-A. (Book.) Fatigue Testing and Analysis of Results. W. Weibull, Editor. 1961. 305 p. Pergamon Press Inc., 122 E. 55th St., New York 22. $12.

General survey of fatigue test procedures, nomenclature, machines and equipment, measuring devices and test piece design and preparation. Methods discussed include routine, short and long-life cumulative damage, service stimulating, abbreviated and accelerated tests. Testing factors and planning presentation and analysis of results. (A-general, Q7)

250-A. Production of Wide Steel Strip. A. J. K. Honeyman. Iron and Steel Institute, Journal, v. 198, May 1961, p. 1-4.

Review of a symposium in London, May 1960, discussing papers from the UK, USA, Australia, Holland and Italy on future requirements of the tin-plate and vehicle industries and steelmaking, hot rolling, cold rolling, heat treatment and coating techniques for producing wide strip. (A-general; ST, 4-53)

251-A. (Book.) Symposium on the Testing and Evaluation of Materials for Solid Propellant Rocket Motor Casings, Report no. MAB-156-M. 314 p. 1959. National Academy of Sciences, Washington 25, D. C.

Symposium held by the National Research Council on Feb. 2-3, 1959, covering material selection and design, fracture and failure mechanisms, mechanical testing procedures and fabrication methods for high-strength steel and Ti alloy sheet. Topics include bend, center-cracked tensile, notched tensile and bulge tests; crack propagation and fracture sensitivity studies; application of the mechanics theory to fracture

analysis. (A-general, Q-general, Q26, T2p; SGB-a, ST, Ti-b, 4-53, 17-57)

252-A. Status of the Beryllium Industry in the United States of America. Bengt R. F. Kjellgren. NML (National Metallurgical Laboratory) Technical Journal, v. 3, Feb. 1961, p. 37-45.

Detection of beryl source with scintillation counter and Sb gamma-ray source. Mining, crushing, separation and reduction of beryl followed by vacuum casting to produce Be billets. Mechanical and physical properties of Be given. (A-general; Be)

253-A. Review of Recent Developments in the Technology of Tungsten. V. D. Barth. Defense Metals Information Center, Battelle Memorial Institute, DMIC Memo. 108, May 18, 1961, 4 p. (Available as PB 171627 from U. S. Office of Technical Services, Washington 25, D. C.)

Explosive forming, vacuum casting, arc melting, forging, extruding, electron beam welding and brazing of tungsten to produce billets, weldments and missile nozzles. Testing of 85 W-15 Mo alloy at temperatures to 4000° F. to determine yield strength, ultimate tensile strength, elongation and loading time to fracture. 9 ref. (A-general; W)

254-A. Hardened Particles Increase Alloy's Tool Resistance. E. J. Stefanides. Design News, v. 16, May 22, 1961, p. 64-65.

Report on heat resistant alloy (Infusite) with solid hardened particles in suspension. Alloy is capable of resisting pressure applied by carbide cutting tools and is, therefore, utilized in the fabrication of safes. (A-general; SGA-h)

255-A. Copper and Copper Alloys. A Survey of Technical Progress During 1960. Metallurgia, v. 63, Apr. 1961, p. 175-184.

Literature review of some 236 references covering extraction, fabrication, finishing, properties and testing. (A-general; Cu-b)

256-A. Conference on Internal Steel Quality and Methods of Its Assessment. West of Scotland Iron and Steel Institute, Journal, v. 68, 1960-1961, 202 p.

Conference papers on internal steel defects and inspection procedures for castings, forgings, plates and weldments. Vacuum casting technique for heavy forgings. 38 ref. (A-general, S-general, 9; 4-51, 4-53, 5, 7-51)

257-A. Low-Temperature Bonding. Electromechanical Design, v. 5, Apr. 1961, p. 30.

Report on bonding properties of Ga when mixed with Cu, Ag, Ni and Au. Resultant alloys are high-temperature resistant (to 900° C.) after hardening and are useful in fastening wire to heat sensitive electronic devices. (A-general; Ga-b, Ag, Au, Cu, Ni)

258-A. (German.) Melting, Molding and Casting of Ferrous and Nonferrous Metals. Montanwissenschaftliche Literaturberichte, v. 6, Dec. 1960, p. 2381-2607.

Review of the literature with abstracts covering scientific principles, process control, energy and materials; melting and refining technology, properties of metals, foundry practice, metal processing; corrosion, corrosion protection and surface treatments; material testing and refractories used in furnaces. (A-general, C-general, D-general, E-general, 10-54, 11-65)

259-A. (Book.) Atomic Theory for Students of Metallurgy. William Hume-Rothery. 1960. 427 p. Institute of Metals, 17 Belgrave Square, London, S.W.1, England. $7.50.

Review of the electron theory of metals and alloys including structure of the free atom, assemblies of atoms, free electron theory of metals, Brillouin-zone theory of metals and the crystal structure of metallic elements. (A-general, M25)

260-A. (Book.) Proceedings--American Petroleum Institute. Section 3. Refining. v. 40. 1960. 430 p. American Petroleum Institute, 12 Ave. of the Americans, New York 20, N. Y.

Collection of papers on corrosion problems, tubing inspection and maintenance, use of power fuels, use of lubricants, design of piping and waste disposal in refinery installations. (A-general, R-general, T29n)

261-A. Pipe Production Expedited by Cranes With Memories. Steel, v. 148, May 29, 1961, p. 77.

Crane magnets automatically controlled by sensing devices, memory

units and limit switches are used to transfer pipe from welding stations to the testing area. (A5a, T26r)

262-A. (Book.) Rare Metals Handbook. 2nd Edition. Clifford A. Hampel, Editor. 1961. 715 p. Reinhold Publishing Co., 420 Park Ave., New York 22, N. Y. $20.

Physical, mechanical, chemical, atomic and electrical properties given. Production, occurrence, fabrication, derivation, recovery and applications of each. Rare earths, alkaline earths, platinum metals, refractory metals plus Cs, Cr, Pu, Rb, Sc and Yt discussed. (A-general; EG-c, EG-d37, EG-g)

263-A. The Alkaline Earth Metals--Calcium, Barium and Strontium. Charles L. Mantell. Chapter 2 from "Rare Metals Handbook". Reinhold Publishing Co., New York 22, 1961, p. 15-31.

Physical, chemical, electrical, thermodynamic, tensile, atomic, chemical and crystalline properties given for each element. Discussion of analysis, derivation, production, recovery and electrolytic processes and subsequent application. 149 ref. (A-general; EG-f)

264-A. Beryllium. Bengt R. F. Kjellgren. Chapter 3 from "Rare Metals Handbook". Reinhold Publishing Co., New York 22, 1961, p. 32-57.

Beryllium oxides and alloys discussed. Occurrence, consumption, derivation, production, extrusion, fabrication and applications. Physical, mechanical, chemical, thermodynamic and toxic properties given. 28 ref. (A-general; Be)

265-A. Bismuth. Herbert E. Howe. Chapter 4 from "Rare Metals Handbook". Reinhold Publishing Co., New York 22, 1961, p. 58-68.

Physical, chemical, mechanical and atomic properties given. Bi binary, ternary, quartenary and quinary systems with compositions and eutectic temperatures given. Electrolytic processes and fabrication described. 28 ref. (A-general; Bi)

266-A. Boron. Hugh S. Cooper. Chapter 5 from "Rare Metals Handbook". Reinhold Publishing Co., New York 22, 1961, p. 69-81.

Specific heat, resistivity, physical and chemical properties given. Occurrence, analysis, fabrication and applications. Electrolysis and reduction processes. 107 ref. (A-general; B)

267-A. Cadmium. F. G. McCutcheon and John R. Musgrave. Chapter 6 from "Rare Metals Handbook". Reinhold Publishing Co., New York 22, 1961, p. 82-92.

Physical, chemical, thermal, electrical, toxic properties given. Occurrence, derivation, recovery, purification and electroplating processes described. Binary and ternary systems discussed. 81 ref. (A-general; Cd)

268-A. Chromium. R. W. Fountain. Chapter 7 from "Rare Metals Handbook". Reinhold Publishing Co., New York 22, 1961, p. 93-113.

Physical, chemical, mechanical, electrical and toxic properties given. Chromium alum, chromic acid and iodide processes described. Ductility and transition temperatures. Deposition, arc melting, fabrication. Applications. 91 ref. (A-general; Cr)

269-A. Cobalt. C. R. Whittemore. Chapter 8 from "Rare Metals Handbook". Reinhold Publishing Co., New York 22, 1961, p. 114-148.

Occurrence, concentration in ores and metallurgy. Physical, chemical, thermodynamic, mechanical, atomic and electrical properties. Data for Co-bearing magnetic materials. Reduction, purification, leaching and corrosion processes. Applications. 29 ref. (A-general; Co)

270-A. Columbium. Edwin M. Sherwood. Chapter 9 from "Rare Metals Handbook". Reinhold Publishing Co., New York 22, 1961, p. 149-177.

Thermodynamic, chemical, physical, mechanical and corrosion properties listed. Corrosion as affected by HCl, H_2SO_4, NaOH and KOH concentration. Solvent extraction, crystallization, extractive metallurgy, refining and welding by argon-arc and electron beam described. 158 ref. (A-general; Cb)

271-A. Gallium. A. P. Thompson. Chapter 10 from "Rare Metals Handbook". Reinhold Publishing Co., New York 22, 1961, p. 178-187.

Physical, chemical, corrosive, toxic and thermodynamic properties given. Alloys formed with Ga. Metals and nonmetals resistant to Ga. Occurrence, production, recovery and application methods. 41 ref. (A-general; Ga)

272-A. Germanium. H. R. Harner. Chapter 11 from "Rare Metals Handbook". Reinhold Publishing Co., New York 22, 1961, p. 188-197.

Physical, chemical and thermodynamic properties. Alloys and compounds of Ge with eutectic and melting temperatures are reported. Occurrence, recovery, fabrication and applications described. 84 ref. (A-general; Ge)

273-A. Hafnium. Donald R. Martin and Philip J. Pizzolato. Chapter 12 from "Rare Metals Handbook". Reinhold Publishing Co., New York 22, 1961, p. 198-219.

Physical, mechanical, chemical and structural properties at various temperatures. Occurrence, extraction and separation from Zr. Melting, fabrication, welding and metallography. Applications. 130 ref. (A-general; Hf)

274-A. Indium. J. R. Mills, R. A. King and C. E. T. White. Chapter 13 from "Rare Metals Handbook". Reinhold Publishing Co., New York 22, 1961, p. 220-238.

Physical, chemical, mechanical and thermodynamic properties. Listing of In alloy systems. Occurrence, derivation and several recovery processes discussed. Corrosion rate determined in various acids and alkalis. 81 ref. (A-general; In)

275-A. Lithium. P. E. Landolt and Marshall Sittig. Chapter 14 from "Rare Metals Handbook". Reinhold Publishing Co., New York 22, 1961, p. 239-270.

Electrochemical, thermodynamic, physical properties tabulated. Li oxides, nitrides, halides, salts, alloys and intermetallic compounds listed and discussed. Data given for occurrence, production, and efficiency of conversion from spodumene and other ores. 124 ref. (A-general; Li)

276-A. Manganese. Charles L. Mantell. Chapter 15 from "Rare Metals Handbook". Reinhold Publishing Co., New York 22, 1961, p. 271-282.

Physical and chemical properties and allotropism of Mn given. Occurrence, production, electrowinning and electrolysis processes. Application of Mn in Type 201 and 202 steel. 19 ref. (A-general; Mn)

277-A. Molybdenum. R. S. Archer. Chapter 16 from "Rare Metals Handbook". Reinhold Publishing Co., New York 22, 1961, p. 283-303.

Physical, mechanical, atomic, thermodynamic, hardness and emissivity properties given. Corrosive effects from hydrochloric, sulphuric, phosphoric and hydrofluoric acids. Fabrication and applications. (A-general; Mo)

278-A. The Platinum Metals. F. E. Beamish, W. A. E. McBryde and R. R. Barefoot. Chapter 17 from "Rare Metals Handbook". Reinhold Publishing Co., New York 22, 1961, p. 304-335.

Physical, thermal, chemical and mechanical properties given for Pt, Pd, Ru, Os, Rh and Ir. Occurrence, production, recovery and separation from Ni ores, refining and fabrication. Acid corrosion resistance. Applications discussed. 102 ref. (A-general; Ir, Os, Pd, Pt, Rh, Ru)

279-A. Plutonium. W. N. Miner, A. S. Coffinberry, F. W. Schonfeld, J. T. Waber, R. N. R. Mulford and R. E. Tate. Chapter 18 from "Rare Metals Handbook". Reinhold Publishing Co., New York 22, 1961, p. 336-392.

Physical, chemical, thermal, mechanical properties; crystal structure for Pu binary compounds and allotropes; phase diagrams for several Pu systems. Occurrence, production, derivation, separation, pyrometallurgy, metallography and applications discussed. 224 ref. (A-general; Pu)

280-A. Rare Earth Metals. Howard E. Kremers. Chapter 19 from "Rare Metals Handbook". Reinhold Publishing Co., New York 22, 1961, p. 393-417.

Physical, chemical, thermal, elastic, magnetic, mechanical and electrical properties. Discussion of ferrous and nonferrous alloys and table of binary and ternary systems. Occurrence, analysis, production, preparation and applications. 111 ref. (A-general; EG-g)

281-A. Rhenium. A. D. Melaven. Chapter 20 from "Rare Metals Handbook". Reinhold Publishing Co., New York 22, 1961, p. 418-433.

Atomic, physical, mechanical, thermal and chemical properties given. Occurrence, production, derivation and extraction. Preparation from potassium and ammonium perrhenates discussed. Applications. 96 ref. (A-general; Re)

282-A. Rubidium and Cesium. Clifford A. Hampel. Chapter 21 from "Rare Metals Handbook". Reinhold Publishing Co., New York 22, 1961, p. 434-440.

Atomic, thermal, physical and chemical properties listed. Occurrence, derivation, production, preparation and applications discussed. 13 ref. (A-general; Cs, Rb)

283-A. Scandium. A. H. Daane. Chapter 22 from "Rare Metals Handbook". Reinhold Publishing Co., New York 22, 1961, p. 441-446.

Atomic, thermal and chemical properties given. Preparation of scandium fluoride and scandium metal by various processes. 13 ref. (A-general; Sc)

284-A. Selenium. John R. Stone and Peter E. Caron. Chapter 23 from "Rare Metals Handbook". Reinhold Publishing Co., New York 22, 1961, p. 447-458.

Physical properties given for metallic Se. Solid, allotropic, amorphous, crystalline, liquid and vapor states discussed. Formation of Se compounds. Occurrence, derivation and applications. 35 ref. (A-general; Se)

285-A. Silicon. Donald W. Lyon and Jack E. Field. Chapter 24 from "Rare Metals Handbook". Reinhold Publishing Co., New York 22, 1961, p. 459-468.

Physical, chemical and thermodynamic properties given. Occurrence, production, derivation, analysis and applications. 112 ref. (A-general; Si)

286-A. Tantalum. Clifford A. Hampel. Chapter 25 from "Rare Metals Handbook". Reinhold Publishing Co., New York 22, 1961, p. 469-518.

Physical, mechanical, chemical and corrosive properties given. Effect of temperature and cold reduction on tensile and hardness properties. Extraction, consolidation, purification, electrolysis and melting processes. 103 ref. (A-general; Ta)

287-A. Tellurium. John R. Stone and Peter E. Carbon. Chapter 26 from "Rare Metals Handbook". Reinhold Publishing Co., New York 22, 1961, p. 519-528.

Physical and chemical properties of hexagonal Te and Te compounds. Occurrence, derivation and applications. 30 ref. (A-general; Te)

288-A. Thallium. Herbert E. Howe. Chapter 27 from "Rare Metals Handbook". Reinhold Publishing Co., New York 22, 1961, p. 529-535.

Physical and chemical properties; eutectic points of various Tl alloys. Occurrence, production and applications. 75 ref. (A-general; Tl)

289-A. Thorium. Harley A. Wilhelm. Chapter 28 from "Rare Metals Handbook". Reinhold Publishing Co., New York 22, 1961, p. 536-558.

Physical, chemical, electrical, thermodynamic and mechanical properties for Th and Th compounds. Production, fused salt electrolysis, bomb reduction, metallography and other processes discussed. 90 ref. (A-general; Th)

290-A. Titanium. H. R. Ogden. Chapter 29 from "Rare Metals Handbook". Reinhold Publishing Co., New York 22, 1961, p. 559-579.

Physical, mechanical, electrical, thermodynamic properties for Ti and commercial Ti alloys. Occurrence, extraction, metallurgy, electrolysis, corrosion and fabrication. Applications. 13 ref. (A-general; Ti)

291-A. Tungsten. K. C. Li. Chapter 30 from "Rare Metals Handbook". Reinhold Publishing Co., New York 22, 1961, p. 580-597.

Physical, mechanical and chemical properties for tungsten and tungsten alloys. Metallurgy, metallography, fabrication, melting and spraying techniques. Applications. 29 ref. (A-general; W)

292-A. Uranium. Saul Isserow. Chapter 31 from "Rare Metals Handbook". Reinhold Publishing Co., New York 22, 1961, p. 598-628.

Physical, mechanical, chemical, tensile, thermodynamic properties given.

Refining, milling, preparation; reaction with elements, compounds, acids, alkalis and salts. 181 ref. (A-general; U)

293-A. Vanadium. H. E. Dunn and D. L. Edlund. Chapter 32 from "Rare Metals Handbook". Reinhold Publishing Co., New York 22, 1961, p. 629-652.

Physical, thermodynamic, mechanical and chemical properties given. Corrosion by various acids and sea water; fabrication, metallography and applications. Optical and physical properties of vanadium minerals. 25 ref. (A-general; V)

294-A. Yttrium. A. H. Daane. Chapter 33 from "Rare Metals Handbook". Reinhold Publishing Co., New York 22, 1961, p. 653-666.

Physical, mechanical, thermodynamic properties given. Occurrence, separation, preparation, reduction and melting techniques. Applications. 20 ref. (A-general; Y)

295-A. Zirconium. A. W. Schlechten. Chapter 34 from "Rare Metals Handbook". Reinhold Publishing Co., New York 22, 1961, p. 667-686.

Physical, mechanical, chemical, thermal properties given. Separation, production, decomposition, electrodeposition; corrosion by acids, gases, liquid metals, organic compounds, chlorides and alkalis; applications. 73 ref. (A-general; Zr)

296-A. Magnesium-Lithium Alloys--Lightest Metals for Spacecraft. Magnesium Products, May 1961, p. 1-2.

Effect of solution heat treating and extrusion on the elongation, compressive yield strength, tensile yield strength, ultimate tensile strength, brittleness and failure of LA141 and LA91 Mg alloys. These Mg alloys can be melted and cast by open-air flux methods or in a closed system under partial pressures of inert atmospheres and may be readily welded using inert-gas-shielded arc welding techniques or by spot welding. (A-general; Mg-b, Li)

297-A. (Pamphlet.) Electron Beam Tantalum Alloy. May 31, 1961. 2 p. Stauffer Metals Division, 1201 South 47th St., Richmond 4, Calif.

Data given for composition, physical properties, room temperature and elevated temperature, tensile properties, Brinell hardness, Charpy V Notch impact strength and stress rupture life. Effect of annealing and cold rolling on mechanical properties. Fabrication techniques such as electron beam or inert gas fusion welding, forging, annealing, rolling, tempering, stress relieving and recrystallization. (A-general; Ta-b)

298-A. Some Recent Advances in the Metallurgy of Nickel and Its Alloys. L. B. Pfeil. Australian Institute of Metals, Journal, v. 6, Feb. 1961, p. 53-61.

Review of extraction processes for Ni. Influence of trace elements on properties of Ni alloys. Ni plating. Applications of Ni at low temperatures. (A-general; Ni-b)

299-A. Extensive Program Presented at AFS Technical Sessions. Foundry, v. 89, June 1961, p. 142-144, 146, 148, 151, 153-154, 158, 161, 162.

Papers presented at the American Foundrymen's Society 65th Annual Castings Congress, San Francisco, May 11, 1961. Topics include gray iron, brass and bronze, malleable iron, light metals, heat transfer, patternmaking, industrial engineering and costs and safety hygiene and air pollution. (A-general, E-general, 10-54; CI, EG-a39, Cu-n)

300-A. Ductile Iron Society Meets in San Francisco. Foundry, v. 89, June 1961, p. 182-183.

Summaries of papers on trends in use of ductile iron presented at American Foundrymen's Society 65th Annual Castings Congress (San Francisco, May 11, 1961). Topics include tests on impact properties, holding times when casting with Mg and future production estimates. (A-general, E-general, 10-54; CI-r)

301-A. The Emergence of Titanium. M. Schofield. Iron & Steel, v. 34, May 1961, p. 173-175.

Historical review on the production of pure Ti metal, Ti powder and Ti sponge. Use of Ti as a deoxidizer and alloying element in steel and cast iron production. (A-general; Ti)

302-A. (Pamphlet.) Tool Steels. B. L. Averbach. 1961. 32 p. Climax Molybdenum Co., Division of American Metal Climax, Inc., 1270 Ave. of the Americas, New York 20, N. Y.

Principle types of toolsteel containing Mo are reviewed in terms of heat treatment and microstructural constituents with attention to hot hardness and dimensional stability in high-temperature service. Data are given for physical and mechanical properties as a function of composition, temperature and heat treatment. 32 ref. (A-general, J-general, N-general, P-general, Q-general; TS, 17-57)

303-A. Cast Magnesium and the Designer. Light Metals, v. 24, May 1961, p. 136-137.

Symposium papers on Mg castings and their design. (Joint meeting of the Assoc. of German Engineers and the Assoc. of German Foundrymen, Essen, Germany, Mar. 23-24, 1961). Subjects covered include production development, Mg alloy metallurgy, machining, surface protection and treatment, design, sand, gravity and pressure die castings and industrial applications. (A-general; Mg, 5)

304-A. (German.) Metallic Thorium. G. A. Meerson and A. F. Islankina. Planseeberichte fur Pulvermetallurgie, v. 8, Jan. 1961, p. 173-187.

Review of production of metallic Th by reduction of ThO_2 and by electrolysis of halide salts. Sintering of Th in terms of properties of raw Th powder. Pressing. Physical and mechanical properties of sintered Th. 20 ref. (A-general; Th)

305-A. High Speed Steels Meet Tool Needs. Pt. 1. Peter Payson. Metal Progress, v. 79, June 1961, p. 65-68.

Since the introduction of 18-4-1 at the turn of the century, engineers have improved alloys and lowered costs, until today's users have a wide variety of excellent high-speed steels to choose from. (A-general; TS-m)

306-A. Better Air-Hardening Tool Steels. Neil J. Culp. Metal Progress, v. 79, June 1961, p. 70-72.

Toolsteels which can be fully hardened by cooling in air from austenitizing temperatures in the 1500-1600° F. range are often the answer to problems involving warpage, distortion and uniformity in hardening. (A-general; TS)

307-A. Classification and Selection of Tool Steels. Metal Progress, v. 79, June 1961, p. 96-B.

Designations, composition and applications of 14 principal types of toolsteels. (A-general; TS)

308-A. Freer Machining and Better Corrosion Resistance. Tooling and Production, v. 27, June 1961, p. 49.

Description of 303 MA Uniloy, a freer machining and more corrosion resistant steel than AISI 303. 303 MA Uniloy combines Al with sulphur additions to provide a superior microstructure. (A-general; SS)

309-A. Aluminum EC (Electrical Conductivity Grade of Aluminum). Alloy Digest, Al-104, June 1961, 2 p.

Alloy is required to meet the commonly specified minimum conductivity requirement of 61% of the International Annealed Copper Standard. It has a mass conductivity of 201%. The electrical conductivity does not change with cold work, at least up to 41% cold reduction. It is of higher purity than commercial aluminum 1100. (A-general; Al-b)

310-A. N-S 25 (High Temperature Spring Alloy). Alloy Digest, Co-27, June 1961, 2 p.

This Co-base alloy has high resistance to oxidation and carburization up to 1800° F., has high fatigue strength against mechanical and thermal stresses and excellent hot ductility. It is nonmagnetic. It is recommended for spring applications operating at temperatures from 400-1400° F. (A-general; Co-b)

311-A. Jalcase 9 (Free-Cutting Carbon Steel). Alloy Digest, Cs-16, June 1961, 2 p.

Steel will not harden deeply on heat treatment except in thin sections. It should not be used where it is essential that properties be approximately the same throughout the full sections. The grade responds very well to induction or flame hardening treatments where a high order of surface hardness is desired. (A-general; CN)

312-A. Cunico (Permanent Magnet Alloy). Alloy Digest, Cu-101, June 1961, 2 p.

Cu-base permanent magnet alloy is ductile, malleable and machinable after its heat treated stage; has lower residual and higher coercive force than Alnico II. Cunico can be magnetized in any direction since it does not possess directional properties. (A-general; Cu-b)

313-A. Ni-Vee Type B (Constructional Bronze). Alloy Digest, Cu-102, June 1961, 2 p.

Has the engineering advantages of easy castability, low shrinkage, pressure tightness, fine grain, economy and versatility. In common with other bearing bronzes, it may be mated with itself or other metals to provide satisfactory resistance to seizure, galling and metal-to-metal wear. (A-general; Cu-s)

314-A. Scaife MX-2 (Ultra High Strength Steel). Alloy Digest, SA-116, June 1961, 2 p.

Co modified Type 4140 ultra-high strength steel having high multiaxial capabilities at the 225,000-235,000 psi. (0.2% offset) yield strength levels. (A-general; ST, SGB-a)

315-A. Enduro S-1 Nickel (Corrosion Resisting, Hardenable Steel). Alloy Digest, SS-118, 2 p.

Cr type martensitic corrosion resisting steel to which Ni is added to increase corrosion resistance and mechanical properties; it has high oxidation resistance and can be used in the annealed condition up to 1300° F. (A-general; SS)

316-A. Potomac A (High Strength Steel). Alloy Digest, TS-105, June 1961, 2 p.

Medium carbon, alloy steel that can maintain strength at elevated temperatures up to 1000° F. is recommended for hot die applications and structure components where strength at elevated temperatures is important. (A-general; AY)

317-A. Copper. OTS Selective Bibliography SB-458. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.10.

Research reports of the Army, Navy, Air Force, Atomic Energy Commission and other government agencies are listed in addition to translations and government owned patents. Reports cover general research on high and low temperature properties, Cu films, powder metallurgy, electrolytic Cu and semiconducting properties of intermetallic Cu compounds. (A-general; Cu)

318-A. Composite Stainless Wire Withstands Flexing Damage. Steel, v. 148, June 19, 1961, p. 88-89.

Development of a composite wire with a core of phosphor bronze and an outer surface of 304 stainless steel. Wire combines the corrosion resistance of stainless steel with improved flex resistance. (A-general; Cu-s, SS, 4-61)

319-A. New Steel Extends Process Tool Life. Steel, v. 148, June 19, 1961, p. 108.

A new tungsten toolsteel combines deep hardening at low temperatures with good wear resistance and dimensional stability. Steel has increased service life of rotary press punch holders to a year. (A-general; TS, W)

320-A. (German.) Recent Developments in the Magnesium Field. Karl Ernst Mann. Zeitschrift fur Metallkunde, v. 52, Apr. 1961, p. 243-251.

Review of current status of Mg technology including production by electrolysis of $MgCl_2$ and by melting, processing techniques such as continuous casting, impact extrusion, mechanical properties of cast and impact extrusion alloys, research on Mg-Li and Mg-Zr alloys, corrosion protection by surface treatment and alloying and application of Mg in motor and gear cases as a canning material for reactor fuel elements and in corrosion protection of Fe. (A-general; Mg)

321-A. New Tool Steel Uses Tungsten to Lubricate Forming Punch. Iron Age, v. 187, June 15, 1961, p. 106-107.

Powdered iron oxide is compacted into magnetic cores for computers using a rotary press with a punch holder, composed of a new tungsten tool and die steel containing 1.50% C, 2% Mg, 0.25% Si, 0.90% Cr, 1% Mo and 4% W. It combines low hardening temperature, good wear resistance and dimensional stability and produces a slippery abrasive resistant surface under load. (A-general; TS, W)

322-A. Cleaner Chrome Boon to Melters. Iron Age, v. 187, June 15, 1961, p. 116.

Oxygen blowing of ferrochrome to produce a highly refined charge chrome for use in stainless and toolsteels, steel castings and cast iron. The resulting product has the composition 58-65% Cr, 4.25% C, 1% Si and 0.03% S. (A-general; AD-n31, Cr)

323-A. (Book.) Powder Metallurgy. Metallurgical Society of AIME. Werner Leszynski, Editor. 1961. 847 p. Interscience Publishers, Inc., 250 Fifth Ave., New York 1, N. Y.

Proceedings of an International Conference held in New York, June 13-17, 1960, under the joint sponsorship of the Metal Powder Industries Federation and the Powder Metallurgy Committee of the Institute of Metals Division, The Metallurgical Society, American Institute of Mining, Metallurgical and Petroleum Engineers. (A-general, H-general)

324-A. How to Get More From High Speed Steels. George A. Roberts and John C. Hamaker, Jr. Steel, v. 148, June 12, 1961, p. 140-144.

Super-high-speed steels (high carbon, high vanadium) now fill the gap between conventional high-speed steels and the carbides and ceramics. Special surface treatments reduce friction and improve tool performance. (A-general; TS-m)

325-A. (Book.) Metal Industry Handbook and Directory 1961. 1961. 560 p. Iliffe Books Ltd., Dorset House, Stamford St., S. E. 1, London, England.

General properties of metals and alloys; data and tables; electroplating and allied processes; directory of trade names, manufacturers and products. (A-general, L17, 11-68)

326-A. (Book.) Industrial Furnaces. v. 1. 5th Edition. W. Trinks and Matthew Mawhinney. 1961. 486 p. John Wiley & Sons, Inc., 440 Park Ave. South, New York 16, N.Y.

Basic principles underlying furnace design and operation; theory and calculation of heat transfer; movement of gases in furnaces; fuel economy. A-general, 1-55)

327-A. Developments in Stainless Steel. Mechanical World and Engineering Record, v. 141, June 1961, p. 214-215.

Review of recent research on stress corrosion cracking, effect of chemical composition and heat treatment on microstructure and corrosion resistance. Influence of strain rate and temperature on ductility and effect of machining transformation. (A9; SS)

328-A. (German.) Niobium--Metal With a Future. R. Kieffer and B. F. Kieffer. Metall, v. 15, May 1961, p. 394-403.

Review of mechanical and chemical properties such as affinity to gases, production methods of liquid-liquid extraction, fused salt electrolysis or alkaline reduction, processing methods, alloying techniques with Ta, Mo, W, Ti, Zr, V, Al and C and applications in nuclear technology and as a hard metal. 51 ref. (A-general; Cb)

329-A. (German.) Investigation of Natural Age Hardening AlZnMg Alloys. Pt. 1. W. Rosenkranz. Metall, v. 15, May 1961, p. 425-432.

Results of cold and warm age hardening and corrosion tests on AlZnMg alloys of various composition. Investigation of a new AlZnMg alloy with 7.5% $MgZn_2$ with respect to mechanical properties as influenced by various heat treatments and natural age hardening of pressed specimens as influenced by pressing temperature and preheat treating. (A-general; Al-b, Mg, Zn)

330-A. (Book.) Rare Earth Alloys. Karl A. Gschneider, Jr. 1961. 449 p. D. Van Nostrand Co., Inc., 120 Alexander St., Princeton, N. J. $12.75.

Extensive compilation of information on the known rare earth alloy systems brings the phase diagrams, crystallographic and thermodynamic data and physical and mechanical properties of these alloys into a single, convenient reference volume. 653 ref. (A-general; EG-g45)

331-A. Commercial Production of Rhenium Metal. Microtechnic, v. 15, Apr. 1961, p. A 50.

Review of properties and commercial production of wrought Rh rod, wire and strip with attention to high temperature, welding and electrical applications. (A-general, 10-54; Re, 4, 17-53)

332-A. (Book.) Physical Chemistry of Process Metallurgy. Pt. 1. v. 7. Metallurgical Society of AIME. George R. St. Pierre, Editor. 1959. 644 p. Interscience

Publishers, Inc., 250 Fifth Ave., New York 1, N. Y. $22.50.

Collection of papers from an international symposium on physical, chemical and thermodynamic properties of liquid metals and slags, nature and structure of liquid metals and solubility and phase equilibria in metals systems. Papers are abstracted separately. (A-general, N14)

333-A. Materials for the Future. C. L. Kobrin. Iron Age, v. 187, June 22, 1961, p. 115-122.

Review of possible lines of future development in computer designed alloys, ductile ceramics, heat resistant plastics. A greater interchangeability of materials will be apparent. Composites which combine the test features of all materials will be in greater demand. There will be metal-plastics, glass-plastics, glass-metals. They may be of clad, reinforced or sandwich concepts. Reinforcing will be in the form of powders, flakes and fibers. (A-general)

334-A. (French.) A New Cobalt Alloy and Its Applications in the Construction of Metallurgical Furnaces. Journal du Four Electrique et des Industries Electrochimiques, v. 66, Apr. 1961, p. 131-132.

Melting, deoxidation and casting of an alloy composed of 50% Co and 50% ferrochrome and containing 0.05-0.2% carbon. Application in the manufacture of heat resistant furnace components. Physical and mechanical properties. (A-general; Co-b)

335-A. Review of Recent Developments in Titanium and Titanium Alloy Technology. R. A. Wood. Defense Metals Information Center, Battelle Memorial Institute, DMIC Memo. 93, Mar. 27, 1961, 5 p. (Available as PB 161243 from U. S. Office of Technical Services, Washington 25, D. C.)

Review of research with reference to chemical reactions, corrosion mechanisms and mechanical properties of Ti and Ti alloys. Production processes. 15 ref. (A-general; Ti-b)

336-A. (Czech.) Economy Austenitic Steels of the Cr-Mn-Ni-N Type. K. Hybek, J. Solc and M. Zezulova. Strojirenstvi, v. 11, Apr. 1961, p. 275-282.

Sheet containing 0.08-0.12% C, 5.5-9.53% Mn, 0.34-0.60% Si, 0.020-0.035% P, 0.008-0.035% S, 3.5-5.35% Ni, 16-19% Cr and 0-0.35% N is tested for structure, corrosion resistance in 5-10% acetic acid at room temperature and 90° C. and in boiling solution of 3% NaCl and 10% lactic acid, mechanical properties and weldability. Effect of 0-80% cold deformation on ductility. 6 ref. (A-general; SS-e)

337-A. Physical Metallurgy of Nickel-Base Superalloys. C. H. Lund. Defense Metals Information Center, Battelle Memorial Institute, DMIC Memo. 153, May 5, 1961, 40 p. (Available as PB 171422 from U. S. Office of Technical Services, Washington 25, D. C.)

Solid-solution hardening precipitation hardening, strengthening by B and Zr additions and failure are considered in theoretical terms. Heat treatment reactions in regard to microstructural changes and carbide behavior. Tabulated mechanical properties of 30 British, U. S. and Soviet alloys. 37 ref. (A-general, Ni-b, SGA-h)

338-A. High-Strength Steel Forgings. H. J. Henning and F. W. Boulger. Defense Metals Information Center, Battelle Memorial Institute. U. S. Office of Technical Services, PB 151102, Jan. 1961, 62 p. $1.75.

Data are presented on forgings made from martensitic steels heat treated to strengths ranging from 240,000-300,000 psi. Forging characteristics, design limitations, dimensional tolerances and quality control problems. (A-general; SS-c, 4-51)

339-A. Physical and Mechanical Properties of Electrorefined Vanadium. J. D. Ramsdall, W. L. O'Brien, J. S. Winston and D. R. Schuyler. U. S. Bureau of Mines, Report of Investigations 5769, 1961, 22 p.

Evaluation of workability, recrystallization characteristics and mechanical and physical properties of high-purity electrorefined vanadium. Tabular and graphic presentation of effects of temperature, O, N and C on properties. 12 ref. (A-general; V)

340-A. (Book.) Physical Chemistry of Process Metallurgy. Pt. 2. v. 8. Metallurgical Society of AIME. George R. St. Pierre. 1959. 727 p. Interscience Publishers, Inc., 250 Fifth Ave., New York 1, N. Y. $25.

Papers and discussions from conference held at Pittsburgh, Penn. on Apr. 27 to

May 1, 1959. Topics include process reaction rates and mechanisms; solidification of metals; properties of halide and sulphide melts; industrial applications of physical chemistry; desulphurization in the steel plant; hydro and electro metallurgy; process controls and statistical methods. Papers are abstracted separately. (A-general, 10-54)

341-A. Alloy "713C" Has Good Properties to 1800° F. F. Kenneth Iverson. Precision Metal Molding, v. 19, June 1961, p. 44-45.

Composition and elevated temperature creep rupture and tensile properties of a precipitation hardening, vacuum melted Ni-base, Cr-Al-Mo alloy. Methods of investment casting, machining, grinding and welding the alloy. (A-general, Q-general, 2-62; Ni-b, Cr, Al, Mo)

342-A. Iron, Carbon Steel and Alloy Steel. H. S. Link and R. J. Schmitt. I/EC (Industrial and Engineering Chemistry), v. 53, July 1961, p. 590-595.

Review of literature on physical and mechanical properties of Fe and carbon, low-alloy and stainless steels in various structural shapes. Fabrication techniques with emphasis on welding. Corrosion studies. 33 ref. (A-general; AY, CN, Fe, SS, 4-57)

343-A. A New Nickel-Cobalt-Molybdenum Plate Steel. Cobalt, no. 11, June 1961, p. 38.

Development of a new 18% Ni alloy steel composed of 18% Ni, 7% C, 5% Mo, less than 0.5% Ti and a maximum of 0.05% C. Values are given for yield and tensile strength, Charpy-V notch impact strength and endurance limit determined after heat treating at 500° C. and hot rolling or solution annealing at 820° C. (A-general; ST, Co)

344-A. The Platinum Metals Today. Metal Progress, v. 80, July 1961, p. 87-90, 116, 118, 120, 122, 124.

The design engineer, seeking unusual metals with desirable properties, may find that the metals in the Pt group have much to offer. Their resistance to corrosion by almost all acids and freedom from oxide film formation at high temperatures made them useful in many applications. (A-general, Q-general; EG-c, 17-57)

345-A. Development of New Nickel-Base Brazing Alloys Having Ductility. R. A. Long. Welding Journal, v. 40, June 1961, p. 259s-264s.

Requirements of brazing filler metals. Development of a new brazing alloy based on the ternary system Ni-Mo-Si. Effects of addition of Mn, Cr, Sn, Li, Be, Co and Fe on liquidus and solidus temperatures. Data are given for oxidation resistance, hardness, flow and wetting characteristics and ductility. (A-general, Q-general, 2-60; SGA-b, Ni-b, Mo, Si)

346-A. (German.) The Rare Earth Metals--Deposits, Extraction and Application. Franz Matthes. Wissenschaftliche Zeitschrift, v. 3, no. 2, 1960-1961, p. 111-114.

Review of properties (density, melting point, boiling point, stable oxides), ore minerals and deposits, extraction metallurgy and application of rare earth metals. (A-general, 10-54; EG-g)

347-A. (Book.) Seventh International Conference on Low Temperature Physics, Proceedings. G. M. Graham and A. C. Hollis Hallett. 1961. 725 p., University of Toronto Press, Canada. $15.

Papers presented at the conference held at the University of Toronto, Aug. 29-Sept. 3, 1960, by the Union Internationale de Physique Pure et Appliquee with the co-operation of the Canadian Assoc. of Physicists. Topics include the Mossbauer effect, magnetic relaxation, proton polarization, nuclear orientation, Fermi surface, ultrasonic attenuation, resistance minima, superconductivity and electrical, transport and thermodynamic properties of metals, salts and gases at temperatures near or below 10° K. Papers are abstracted separately. (A-general, P-general, P15g, P12. 2-63, 10-54)

348-A. Development and Progress of High Speed Steels. Robert S. Rowe. Australian Machinery and Production Engineering, v. 14, June 1961, p. 23, 25, 27.

Survey of high-speed steels with special reference to the microstructure. Chemical composition and physical and mechanical properties of several German, American and Swedish makes of toolsteels available in Australia. 7 ref. (A-general, P-general, Q-general, 10-54; TS)

349-A. (Book.) SLA Bibliography No. 3 Guide to Metallurgical Information. Elizabeth W. Tapia, Editor. 1961. 85 p. Special Libraries Assoc., 31 E. 10th St., New York 3, N.Y.

An annotated and indexed compilation of reference sources covering process physical and mechanical metallurgy as applied to ferrous and nonferrous metals. References include abstracting services, bibliographies, encyclopedias, dictionaries, handbooks, patent literature and specifications and standards on a world basis. (A-general, 11-65)

350-A. (Book.) Progress in Very High Pressure Research. F. P. Bundy, W. R. Hibbard, Jr., and H. M. Strong, Editors. 1961. 314 p. John Wiley & Sons, Inc., 440 Park Ave., New York 16, N. Y.

Papers presented at an International Conference held at Bolton Landing, Lake George, New York, on June 14, 1960, covering equipment and technique for high pressure forming, structures of materials formed under high pressure and behavior of matter under high pressure such as electrical and magnetic changes in materials resulting from decrease of interatomic or intermolecular distances. A review of high pressure work in the U.S.S.R. is included. Papers are abstracted separately. (A-general, 3-74, 10-54)

351-A. (Book-German.) Mechanical Technology. Alfred Kopecky and Rudolf Schamschula. 1961. 431 p. Springer Verlag Wien, Austria.

Textbook of mechanical technology of materials with emphasis on metals. Properties, structure and production of metals and nonmetallic materials, material testing, forming and fabrications, bonding by welding and soldering. (A-general, 10-54)

352-A. Review of Recent Developments in the Technology of Molybdenum and Molybdenum-Base Alloys. J. S. Houck. Defense Metals Information Center, Battelle Memorial Institute, DMIC Memo. 114, July 5, 1961, 3 p.

Effect of melting and primary fabrication practice on the yield strength of Mo-0.5% Ti sheet bars and the effect of heat treatment prior to swaging on the rupture strength of TZC alloy. Studies on strength properties and hot hardness of Mo-TZC alloy and M-W alloys. 8 ref. (A-general, F-general, Q-general, 2-60, 2-64, 3-68; Mo-b, 10-54)

353-A. Review of Recent Developments in the Technology of Columbium and Tantalum. E. S. Bartlett and F. F. Schmidt. Defense Metals Information Center, Battelle Memorial Institute, DMIC Memo. 115, July 7, 1961, 4 p.

Effect of the addition of Zr, Mo, Ta and W on the mechanical properties of Cb alloys. Impact and tensile properties of Cb-14W alloy and heat treatment studies on Cb alloys containing Zr, Mo and W. Bend ductility of Ta-30Cb-7.5 alloy. 11 ref. (A-general, Q-general, 2-60, 2-64; Cb-b, Ta-b, 10-54)

354-A. New Alloy Steel. Engineer, v. 211, June 23, 1961, p. 1042.

An austenitic creep-resisting alloy steel for service temperatures up to 675° C. which contains 15% Cr, 16% Ni, 6% Mn and smaller percentages of Si, Mo, V, Cb and B. Mechanical properties are given for the alloy in the solution treated condition. (A-general, Q-general, Q3, 2-62, 2-64; AY)

355-A. (Translation-Brutcher no. 5174.) Properties of Materials Based on Borides. K. I. Portnoi. Issledovanue Splavov Tsvetnykh Metallov Sbornik, Feb. 1960, p. 197-204.

Study of Ti, Cr and Zr borides; specimen preparation, scaling resistance, relative brittleness and borolites. (A-general; Ti, Cr, Zr, NM-a37)

356-A. Beryllium Bronze. Metal Treatment and Drop Forging, v. 28, June 1961, p. 241-242.

Values are given for Brinell hardness and electrical conductivity of a Cu-Be alloy containing 2.5% Be after heat treatment at 800° C. Applications of beryllium bronze are reviewed with special discussion of method of making electron microscope grids. (A-general, P15g, Q29m, T1, 17-57; Cu-b, Be)

357-A. Aluminum 363 (Aluminum Casting Alloy). Alloy Digest, Al-105, July 1961, 2 p.

Al-Si-Cu-Zn casting alloy having good tensile ductility in the as-cast condition responds to a solution and age-hardening

treatment. (A-general; Al-b, Si, Cu, Zn)

358-A. Tantung G. Alloy Digest, Co-28, July 1961, 2 p.

Cast Cr-W Co-base alloy containing Ta or Cr carbide and having wear and corrosion resistance is used primarily for cutting tools. Tantung bridges the gap between maximum cutting speeds possible with high-speed steel and minimum speeds practical with carbides. (A-general; Co-b, Cr, W, Ta, Cb, C)

359-A. Red Brass, 85% (Corrosion Resistant Brass). Alloy Digest, Cu-103, July 1961, 2 p.

Formerly called Rich Low Brass, it is noted for its rich golden color and is frequently used to imitate Au in costume jewelry and related products. Extensively used for plumbing and industrial piping, it has excellent corrosion resistance to water and withstands repetitive forming and bending operations and does not cold work harden rapidly. (A-general; Cu-n)

360-A. Cunisil-837 (High-Strength Copper Alloy). Alloy Digest, Cu-104, July 1961 1961, 2 p.

Most of the Ni and Si in heat treated Cunisil are present as an intermetallic compound of nickel silicide and it is the precipitation of nickel silicide in the form of particles of submicroscopic size by a relatively low temperature heat treatment that accounts largely for the distinctive properties of the alloy. (A-general; Cu, Ni, Si)

361-A. Timken HS-260 (Ultra-Strength Steel). Alloy Digest, SA-117, July 1961, 2 p.

Steel designed for minimum tensile strength level of 260,000 psi. in the heat-treated condition. It exhibits good ductility and impact values consistent with the high hardness. (A-general; AY)

362-A. AISI Type 501 (Corrosion Resisting Steel). Alloy Digest, SS-119, July 1961, 2 p.

Low-Cr type corrosion resisting steel that is used for its heat resistance and good mechanical properties at elevated temperatures as well as for its corrosion resistance at moderately elevated temperatures. Its resistance to heat and corrosion does not compare to a genuine stainless steel but it serves well for a moderately priced alloy. (A-general; SS, Cr)

363-A. Par-Exc (Tool and Die Steel, Type S1). Alloy Digest, TS-106, July 1961, 2 p.

Medium-carbon low-alloy and die steel recommended for hubbing dies, punches, small die casting dies, hot work tools and other parts requiring moderate hardness and high toughness. This grade can be carburized to produce a wear resisting surface with a high strength high toughness score. (A-general; TS)

364-A. Badger (Non-Deforming Tool Steel, Type O1). Alloy Digest, TS-107, July, 1961, 2 p.

Oil hardening, nondeforming tool and die steel having good hardenability characteristics. W and Cr additions increase its wear resistance over the straight Mn oil-hardening type die steel. (A-general; TS, W, Cr)

365-A. (Punched Cards.) High Temperature Strength Data for Metals and Alloys. American Society for Testing Materials, 1916 Race St., Philadelphia 3, Pa. $22.50.

Compilation of data in the form of hand sorted edge-notched punched cards indicating chemical composition, heat treatment, microstructure, hardness, short-time tensile properties, creep and rupture strength for temperatures to 1700° F. The cards are coded for sorting by material, form, type of test, alloy, producer of the material and source of data. Materials include alloy, stainless and carbon steels, refractory and superalloys, light metals and Ni, Co and Cr-base alloys. (A-general, A14, Q-general, 2-62; SGA-h, ST, EG-a39 Ni-b, Co-b, Cr-b)

366-A. Marbrite Steels for Industry. Australasian Manufacturer, v. 46, June 10, 1961, p. 80-82.

Physical and mechanical properties and applications of bright steel bars; free-cutting steels; Ledbrite, a lead-bearing free-cutting steel designed to reduce cycle times and increase tool life and case hardening and oil quenching steels. (A-general, Q-general, 2-60; AY, TS-b)

367-A. Industrial Cryogenics Explores New Areas. Pt. 2. Chemical Processing, v. 24, July 1961, p. 27-49.

Review of parameters governing cryogenic insulation and storage; mechanical properties of a modified ductile iron for cryogenic applications; use of N_2 in cryogenics; thermal shock resistance of 304 stainless steel extended bonnet valves and the application of CO_2 in cryogenic cooling. (A-general, Q-general, 2-63; CI-q, SGB, 1-52, 17-57)

368-A. (German.) Properties of the Material -- "Chill Gray Cast Iron". S. Portz. Maschinenbau Technik, v. 10. May 1961, p. 228-232.

Microstructure as influenced by cooling rate, mechanical properties including hardness, damping properties and tensile, compression and bending strength and technological properties such as wear resistance, machinability and resistance to internal pressure of chilled gray cast iron. 6 ref. (A-general, G17k, M27, Q-general, 2-64; CI)

369-A. (German.) On Technology of High-Melting Metals. Technica, v. 10, June 9, 1961, p. 769-771.

Review of physical, mechanical and chemical properties at room and elevated temperatures for high melting point metals, special processing methods including working and annealing under Ar atmosphere and electron beam melting and welding and development of heat resistant Cb-W-Ta alloys. (A-general, C-general, P-general, Q-general, 2-60, 2-64, 3-68; EG-d37)

370-A. (Book-Translation.) Soviet Electrochemistry. v. 1. Kinetics and Polarography. 1961. 264 p. Consultants Bureau, Inc., 227 W. 17th St., New York 11, N. Y.

Proceedings of the Fourth Conference on Electrochemistry, Moscow, USSR, Oct. 1-6, 1956, held by the Division of Chemical Sciences and the Institute of Physical Chemistry, Academy of Sciences, USSR. Papers presented on double-layer absorption, hydrogen overvoltage, electrochemical and diffusion kinetics and polarography. Abbreviated conference discussion on principal subjects are included. 589 ref. (A-general, L17, P15, 10-54)

371-A. Novel Integral Nozzle Perfected. John F. Judge. Missiles and Rockets, v. 9, July 24, 1961, p. 37-38.

Summary of research activities carried out at the Haynes Stellite Co., Division of Union Carbide. Topics include the development of a tungsten-graphite integral rocket nozzle which resists erosion and crack formation; production of a high-strength Cb-base alloy, Haynes alloy Cb-752, which is easily fabricated by conventional methods and forms a ductile weld joint; market research for refractory products and oxidation and aerospace applications of Cb. (A9, R1h, T2p, T24; Cb-b, W, 17-57)

372-A. (Book.) Year Book of the American Bureau of Metal Statistics. (40th Annual Issue for 1960). 1961. 139 p. American Bureau of Metal Statistics, 50 Broadway, New York 4, N. Y. $4.

Mine production, smelter production, consumption, imports and exports and other economic statistics on a world-wide basis. Tables of metal prices, monthly and annual; lists of metallurgical plants and their capacities; tables of production statistics by companies, both domestic and foreign, relating to nonferrous metals. (A4)

373-A. Haynes Stellite Alloy No. 3 (Heat, Corrosion and Wear Resistant Alloy). Alloy Digest, Co-29, Aug. 1961, 2 p.

Co-base alloy having high hardness and compressive strength, high heat and corrosion resistance, along with excellent abrasion and wear resistance. (A-general, Q-general, 2-60, 2-62; Co-b)

374-A. Alten 50 WR (Alloy Cast Iron). Alloy Digest, CI-30, Aug. 1961, 2 p.

Possesses high strength and high fatigue limit to permit high working stresses with lightness of sections and good resistance to wear against sliding friction. It withstands abrasion at high speeds and high unit pressures. Its maximum operating temperature is about 650° F. (A-general, Q-general, 2-60, 2-62; CI)

375-A. Alcan 236 (Aluminum Casting Alloy). Alloy Digest, Al-106, Aug. 1961, 2 p.

A 7% Cu, 2% Si aluminum alloy recommended for medium stressed castings, which is a nonheat treatable,

general purpose alloy with excellent machining qualities and good casting characteristics, possessing moderate strength. (A-general, E25p, G17k, Q-general; Al-b, Cu, Si)

376-A. Cunife-1 (Permanent Magnet Alloy). Alloy Digest, Cu-105, Aug. 1961, 2 p.

Alloy of Cu, Ni and Fe which is malleable, ductile and machinable, even after it has been age-hardened. The magnetic properties are fully developed only after extensive cold working. The preferred direction of magnetization is along the direction of cold working and the best magnetic properties are found only in the smaller sizes of rods or wires. Magnetically, it compares favorably with Alnico III. (A-general, P-general, Q-general, 2-60, 2-64, 3-68; SGA-n, Cu-b, Ni, Fe)

377-A. Nimonic 105 (Heat and Corrosion-Resisting Alloy). Alloy Digest, Ni-66, Aug. 1961, 2 p.

Ni-Cr-Co-base alloy with a significant content of Mo together with Ti and Al has outstanding resistance to creep at very high temperatures. (A-general, Q-general, Q3, 2-60, 2-62; Ni-b, Cr, Co)

378-A. AISI 94B30 (Ni-Cr-Mo-B Alloy Steel). Alloy Digest, SA-118, Apr. 1961, 2 p.

Triple alloy mild carbon steel having good hardenability, strength and toughness. It is an oil or water hardening steel and is relatively free of temper brittleness. The high depth hardness is reflected in good torque properties. It has good shock resistance and is recommended for heavy duty, moderately high strength applications. (A-general, Q-general, 2-60, 2-64; CN)

379-A. Esco Alloy 45S (Stainless Casting Alloy). Alloy Digest, SS-120, Apr. 1961, 2 p.

Austenitic, Mo-bearing stainless steel containing some ferrite that possesses distinct metallurgical characteristics that distinguish it from the similar (but not identical) AISI wrought grades Type 316 and Type 319. The major difference between the two groups is one of metallurgical structure, which influences their corrosion resistance, weldability and mechanical properties. (A-general, Q-general, 2-60, 3-71; SS-e, Mo)

380-A. Select B FM (Air Hardening Tool Steel, Type A-2). Alloy Digest, TS-108, Aug. 1961, 2 p.

High carbon, medium chrome type die steel. Air hardening and minimum distortion properties have been successfully combined with ease of machining, maximum toughness and good wearing properties to make this steel ideal for many applications. Harmful carbide segregation is not present in this steel. Intricate shapes may be heat treated with little danger of warping or cracking. (A-general, Q-general, 2-60, 2-64; TS-h)

381-A. (Book.) Stainless Steel Industry of Japan. Apr. 1961. 147 p. Japan Stainless Steel Assoc., Murako Bldg., 6, 2-Chome, Takara-cho, Chuo-ku, Tokyo, Japan.

History and development of the Japanese stainless steel industry. Review of production techniques and equipment including melting, casting, hot and cold working, fabrication, forging, quality control and research. Economic and statistical considerations. (A4, 10-54; ST)

382-A. The Venturi Scrubber for Cleaning Oxygen Steel Process Gasses. Howard P. Willet and Daniel E. Pike. Iron and Steel Engineer, v. 38, July 1961, p. 126-131.

Method for sizing gas cleaning plants and description of the Venturi gas cleaning system. Removal of fume containing Fe_2O_3, FeO, Mn_3O_4 and oxides of Si, Ca, Al and P accompanying the L-D oxygen steel process. Comparisons are made with electrostatic precipitator systems in terms of power consumption, space requirements and dust processing. 7 ref. (A8a, D10a, W13c)

383-A. Nickel. OTS Selective Bibliography SB-465. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.10.

Research reports of the Army, Navy, Air Force, U. S. Atomic Energy Commission and other government agencies are listed in addition to translations of foreign technical literature and government-owned patents available for license

on Ni, metal, alloys, compounds and catalysts. (A-general, 10-52; Ni)

384-A. Research in the Machine Tool Industry. Metal Treatment and Drop Forging, v. 28, July 1961, p. 291-294.

Survey of machine tool applied research including study of tungsten carbide and metrology. Future trends. (A9, T6n)

385-A. Rare Indium in the Metal Industries. M. Schofield. Metallurgia, v. 63, May 1961, p. 231-232, 237.

Applications of In include electroplating of bearing alloys, lubrication of dies and production of dental and surgical metals, solder and low-melting alloys. (A-general, 10-54; In, 17-57)

386-A. (Book-Translation.) The Metallurgy of Semiconductors. Yu. M. Shashkov. 1961. 183 p. Consultants Bureau, Inc., 227 W. 17th St., New York 11, N.Y.

Survey of physiochemical, electrical and optical parameters of Ge and Si; methods for extractive metallurgy and refining; and production of semiconductors. Topics include growth of monocrystals by zone melting and crystal pulling techniques, heat treatment, doping and the production of heterogeneous electrical structure in monocrystals, impurity diffusion and distribution, preparation of ohmic contacts and etching. 293 ref. (A-general, C-general, P-general, P15g; EG-j31, Ge, Si)

387-A. (Book-German.) Material Science of Nuclear Technology. Willfrid Epprecht. 1961. 407 p. Birkhauser Verlag Basel. Stuttgart, Germany.

Textbook covering principles of nuclear physics; physical chemistry of reactor materials including properties of the atom, solid state physics, properties of liquids and gases and surface reactions; effect of nuclear radiation on materials; reactor materials for fission and breeding, fuel elements, construction and absorption and shielding purposes. (A-general, 10-54, T11, 17-57)

388-A. Review of Recent Developments in the Technology of High-Strength Stainless Steels. D. A. Roberts. Defense Metals Information Center, Battelle Memorial Institute, DMIC Memo. 117, July 14, 1961, 3 p.

Survey of research for Apr. 1-June 30, 1961. Topics include the processing of wide sheet of Rene 41, AM 350, AM 355, A286, Potomac 4, 422, and 4340 to close tolerance; crack strength and propagation in AM 355, 4340, and Ti; heat treatment and resultant properties of Armco 12-8-6 PH and 20, 25% nickel steels. 4 ref. (A-general, G-general, J-general, Q-general, 10-54; SS, SGA-h)

389-A. (Pamphlet.) Annual Report of Defence Standards Laboratories. (June 30, 1960). Dept. of Supply--Australian Defence Scientific Service, Maribyrnong, Victoria, Australia.

Use of radioactive tracers and other techniques to determine electrode potential, corrosion resistance, tensile strength, creep resistance, microstructure and half-life of Fe, steel, stainless steel, Ir-192, Cr, Ti, Zn, Pb and Cu alloys, steel boiler tube and Cr-Ni liquid oxygen tanks. (A9, P-general, Q-general, R-general, S-general, 11-63)

390-A. A Survey of Research on the Transuranic Elements. M. B. Waldron. Contemporary Physics, v. 2, June 1961, p. 385-402.

Present and future status of research on Th, U, Pu, Np and Am are discussed with a review of methods of production and physical properties of these and other transuranic elements. (A-general, EG-h30, 10-54)

391-A. (German.) Tantalum. E. Erben and R. Lesser. Metall, v. 15, July 1961, p. 679-686.

Review of Ta metallurgy including ore sources; production of metal powder by fused salt electrolysis and subsequent reduction processes; sintering of compacts up to 2600° C.; electron beam melting and casting; and resultant physical, chemical and mechanical properties and applications. (A-general, C23p, C5k, H-general, P-general, Q-general; Ta)

392-A. Gray Iron-ASTM Specification A48. Machine Design--Ferrous Metals Book, 1961, p. 2-4.

Physical and mechanical properties; fabrication; applications; and general characteristics. (A-general, P-general, Q-general; CI-n)

393-A. Ductile Iron--ASTM Specifications A339 and A396. Machine Design--Ferrous Metals Book, 1961, p. 5-6.
Physical and mechanical properties; heat treatment; characteristics; applications; design considerations; fabrication. (A-general, P-general, Q-general, 2-64; CI-r)

394-A. Malleable Iron--ASTM Specifications A47 and A220. Machine Design--Ferrous Metals Book, 1961, p. 7-8.
Physical and mechanical properties; characteristics; applications; fabrication; corrosion resistance. (A-general, P-general, Q-general; CI-s)

395-A. Carbon Steel Castings--ASTM Specifications A27, A148 and A216. Machine Design--Ferrous Metals Book, 1961, p. 9-14.
Physical and mechanical properties; elevated and low temperature properties; characteristics; design considerations; fabrication; heat treatment. (A-general, P-general, Q-general, 2-61; CN-p)

396-A. Alloy Steel Castings--ASTM Specifications A148, A217 and A352. Machine Design--Ferrous Metals Book, 1961, p. 15-20.
Physical and mechanical properties at low and elevated temperatures; design considerations; fabrication; general characteristics. (A-general, P-general, Q-general, 2-61; AY, SS-b)

397-A. Plain Carbon Steels--AISI Types 1010 and 1015. Machine Design--Ferrous Metals Book, 1961, p. 21-23.
Physical and mechanical properties at low and elevated temperatures; fabrication; and general characteristics. (A-general, P-general, Q-general, 2-61; CN-g)

398-A. Plain Carbon Steels--AISI Types 1020 and 1025. Machine Design--Ferrous Metals Book, 1961, p. 25-26.
Physical and mechanical properties at low and elevated temperatures; treatment temperatures; fabrication; and general characteristics. (A-general, P-general, Q-general, 2-61, 2-64; CN)

399-A. Plain Carbon Steels--AISI Types 1030 and 1035. Machine Design--Ferrous Metals Book, 1961, p. 27-29.
Physical and mechanical properties at low and elevated temperatures; fabrication; corrosion resistance; and general characteristics. (A-general, P-general, Q-general, 2-61; CN-p)

400-A. Plain Carbon Steels--AISI Types 1040 and 1045. Machine Design--Ferrous Metals Book, 1961, p. 30-32.
Physical and mechanical properties at low and elevated temperatures; fabrication; treatment temperatures; general characteristics. (A-general, P-general, Q-general, 2-61, 2-64; CN-p)

401-A. Plain Carbon Steels--AISI Types 1050, 1055 and 1060. Machine Design--Ferrous Metals Book, 1961, p. 33-34.
Physical and mechanical properties; treatment temperatures; machinability and weldability; corrosion resistance. (A-general, P-general, Q-general, 2-64; CN-r)

402-A. Resulphurized Steels--AISI Types B1112, B1113, C1113, C1212, C1213 and SAE 12L14. Machine Design--Ferrous Metals Book, 1961, p. 35-36.
Physical and mechanical properties; weldability and machinability; corrosion resistance and general characteristics. (A-general, G17k, K9s, P-general, Q-general; CN, SGA-k)

403-A. Resulphurized Steels--AISI Types 1117 and 1118. Machine Design--Ferrous Metals Book, 1961, p. 37-39.
Physical and mechanical properties; design data; treatment temperatures; fabrication; and general characteristics. (A-general, P-general, Q-general, 2-64; CN, SGA-k)

404-A. Resulphurized Steels--AISI Types 1137, 1141, and 1144. Machine Design--Ferrous Metals Book, 1961, p. 40-42.
Physical and mechanical properties; treatment temperatures; fabrication; and general characteristics. (A-general, P-general, Q-general, 2-64; CN, SGA-k)

405-A. Low Alloy Steels--AISI Types 4130, 4140 and 4150. Machine Design--Ferrous Metals Book, 1961, p. 43-46.
Physical and mechanical properties at low and elevated temperature;

fabrication; corrosion resistance; and general characteristics. (A-general, P-general, Q-general, 2-61; AY)

406-A. Low Alloy Steels--AISI Types 4320, 4337 and 4340. Machine Design--Ferrous Metals Book, 1961, p. 47-52.

Physical and mechanical properties at low and elevated temperatures; treatment temperatures; fabrication; corrosion resistance; general characteristics. (A-general, P-general, Q-general, 2-61, 2-64; AY)

407-A. Low Alloy Steels-AISI Types 8620, 8630, 8640 and 8650. Machine Design--Ferrous Metals Book, 1961, p. 50-52.

Physical and mechanical properties; low temperature properties; treatment temperatures; characteristics; fabrication; corrosion resistance. (A-general, P-general, Q-general, 2-62, 2-64; AY)

408-A. Corrosion-Resistant Steel Castings-- ACI Types CA-15, CA-40, CB-30, CC-50 and CE-30. Machine Design--Ferrous Metals Book, 1961, p. 53-58.

Physical and mechanical properties of Fe-Cr or Fe-Cr-Ni alloys; heat treatment; characteristics; applications; design considerations; fabrication. (A-general, P-general, Q-general, 2-64; SS-b, SGA-g, Cr, Ni)

409-A. Corrosion-Resistant Steel Castings--ACI Types CF-3, CF-8, CF-20, CF-3M, CF-8M, CF-12M and CF-8C. Machine Design--Ferrous Metals Book, 1961, p. 56-58.

Physical and mechanical properties of Fe-Cr-Ni alloys; heat treatment; characteristics; applications; design considerations; fabrication. (A-general, P-general, Q-general, 2-64; SS-b, SGA-g, Cr, Ni)

410-A. Corrosion-Resistant Steel Castings--ACI Types CF-16F, CH-20, CK-20 and CN-7M. Machine Design--Ferrous Metals Book, 1961, p. 59-61.

Physical and mechanical properties of Fe-CN-Ni alloys; applications; design considerations; fabrication; characteristics. (A-general, P-general, Q-general, 2-64; SS-b, SGA-g, Cr, Ni)

411-A. Heat-Resistant Alloy Castings--ACI Types HA, HD, HE and HF. Machine Design--Ferrous Metals Book, 1961, p. 62-64.

Physical and mechanical properties of Fe-Cr alloys; elevated temperature properties; heat treatment; applications; design considerations; fabrication; characteristics. (A-general, P-general, Q-general, 2-62, 2-64; SS-b, SGA-h, Cr)

412-A. Heat-Resistant Alloy Castings--ACI Types HH, HI, HK, HL and HN. Machine Design--Ferrous Metals Book, 1961, p. 65-67.

Mechanical and physical properties of Fe-Cr alloys; elevated temperature properties; heat treatment; characteristics; applications; design considerations; fabrication. (A-general, P-general, Q-general, 2-61, 2-64; SS-b, SGA-h, Cr)

413-A. Heat-Resistant Alloy Castings--ACI Types HT, HU, HW and HX. Machine Design--Ferrous Metals Book, 1961, p. 68-70.

Physical and mechanical properties of Fe-Cr-Ni alloys at high temperature; heat treatment; characteristics; applications; design considerations; fabrication. (A-general, P-general, Q-general, 2-62, 2-64; SS-b, SGA-h, Cr, Ni)

414-A. Stainless Steels--AISI Types 201 and 202. Machine Design--Ferrous Metals Book, 1961, p. 71-72.

Physical and mechanical properties; treatment temperatures; characteristics; applications; fabrication; corrosion resistance. (A-general, P-general, Q-general, 2-64; SS-e)

415-A. Stainless Steels--AISI Types 301, 302, 302B, 303, 303Se, 304, 304L and 305. Machine Design--Ferrous Metals Book, 1961, p. 73-77.

Physical and mechanical properties; elevated and low temperature properties; treatment temperature; characteristics; applications; fabrication; corrosion resistance. (A-general, P-general, Q-general, 2-61, 2-64; SS-e)

416-A. Stainless Steels--AISI Types 316, 316L and 317. Machine Design--Ferrous Metals Book, 1961, p. 78-80.

Physical and mechanical properties at low and elevated temperatures; treatment temperatures; characteristics;

application; fabrication; corrosion resistance. (A-general, P-general, Q-general, 2-61, 2-64; SS-e)

417-A. Stainless Steels AISI Types 321, 347 and 348. Machine Design--Ferrous Metals Book, 1961, p. 81-82.

Physical and mechanical properties; elevated temperature properties; treatment temperatures; characteristics; applications; fabrication; corrosion resistance. (A-general, P-general, Q-general, 2-61, 2-64; SS-e)

418-A. Stainless Steels--AISI Types 308, 309, 309S, 310, 310S and 314. Machine Design--Ferrous Metals Book, 1961, p. 83-85.

Physical and mechanical properties; elevated temperature properties; treatment temperatures; characteristics; applications; fabrication; corrosion resistance. (A-general, P-general, Q-general, 2-61, 2-64; SS-e)

419-A. Stainless Steels--AISI Types 403, 410, 414, 416 and 416Se. Machine Design--Ferrous Metals Book, 1961, p. 86-88.

Physical and mechanical properties at low and elevated temperatures; characteristics; applications; fabrication; corrosion resistance. (A-general, P-general, Q-general, 2-60; SS-b)

420-A. Stainless Steels--AISI Types 405, 430, 430F, 430FSe and 446. Machine Design--Ferrous Metals Book, 1961, p. 89-91.

Physical and mechanical properties; elevated and low temperature properties; treatment temperatures; characteristics; applications, fabrication; corrosion resistance. (A-general, P-general, Q-general, 2-60, 2-64; SS-b)

421-A. Stainless Steels--AISI Types 431, 440A, 440B and 440C. Machine Design--Ferrous Metals Book, 1961, p. 92-94.

Physical and mechanical properties; elevated temperature properties; treatment temperatures; characteristics; applications; fabrication; corrosion resistance. (A-general, P-general, Q-general, 2-61, 2-64; SS)

422-A. Molybdenum Metal. L. F. C. Northcott. Alloy Metals Review, v. 9, June 1961, p. 2-8.

Extraction and refining. Production by arc melting or powder metallurgy techniques. Physical constants, structure, oxidation resistance, applications and mechanical properties. Effects of temperature and alloying additions on mechanical properties of Mo and Mo alloys. (A-general, C-general, M26, P-general, Q-general, R1h; Mo, 17-57)

423-A. Properties and Uses of Tantalum. Mechanical World and Engineering Record, v. 141, Aug. 1961, p. 281-282.

Review of recent research. Physical and mechanical properties and corrosion resistance. Alloying with Zr, Cb and W. Applications. (A9, P-general, Q-general, R-general; Ta, Zr, Cb, W, 17-57)

424-A. The Elements That Surround Us--Tantalum. Union Carbide Metals Review, v. 4, Summer 1961, p. 10-11.

History and development; ore sources; extraction and refining; corrosion resistance, fabricability, mechanical and physical properties with emphasis on dielectric properties; applications. (A-general, C-general, P-general, Q-general, R-general; Ta, 17-57)

425-A. Evolution of Ultrahigh-Strength Hardenable Steels for Solid-Propellant Rocket-Motor Cases. H. J. Hucek, A. R. Elsea and A. M. Hall. Defense Metals Information Center, Battelle Memorial Institute, DMIC Rept. 154, May 25, 1961, 40 p. (Available as PB 171423 from U. S. Office of Technical Services, Washington 25, D. C.)

Current roster of special steels from AISI 4130 through AISI 4340 including 5Cr-Mo-V steels (hot work die steels). Influence of composition and tempering on performance and mechanical properties. Benefits of vacuum melting. 36 ref. (A-general, D8m, Q-general, 2-60, 2-64; SGB-q, SGB-a, ST, TS-k)

426-A. (Translation-Brutcher no. 5162.) Data Sheet on High-Speed Steels of Increased Productivity. Metallovedenie i Termicheskaya Obrabota Metallov, Nov. 1959, p. 31-34.

Information on six new Russian HS steels: composition; heat treatment; red hardness; mechanical properties after quenching and tempering; propensity to surface decarburization; and hot hardness. (A-general, J-general; TS-m)

427-A. (Book.) Advances in Electron Tube Techniques. Fifth U. S. National Conference, Proceedings (Sept. 1960). 1961. 235 p. David Slater, Editor. Pergamon Press Inc., 122 E. 55th St., New York 22, N. Y. $15.

Evaluation of various metals and alloys and ceramics as to suitability for application in cathodes, envelopes and gettering systems of electron tubes. Description of vacuum equipment for study of the systems. Review of metallurgy and fabrication technology for metals and nonmetals in manufacturing electron tubes. Papers are abstracted separately. (A-general, T1j, 10-54, 17-57)

428-A. (Book-Translation.) Soviet Electrochemistry. v. 3. Applied. 1959. 231 p. Consultants Bureau, Inc., 227 W. 17th St., New York 11, N.Y.

Papers presented at the Fourth Conference on Electrochemistry, Oct. 1-6, 1956. Topics include electrodeposition, electrolysis in nonferrous metallurgy and operation of chemical sources of current. Papers are abstracted separately. (A-general, C23, L17, P15, 10-54)

429-A. Tungsten-Rhenium Size Range Grows. Steel, v. 149, Aug. 14, 1961, p. 155.

Tensile strength, melting point and ductility are given for a newly developed tungsten -26% Re alloy wire and strip. Applications. (A-general, P12n, Q23p, Q27a; W, Re, 17-57)

430-A. (German.) Corrosion and Precipitation Properties of Heat Resistant Alloyed Steels for Petrochemical and Oil Processing Engineering. Paul Hermann Huppertz. Erdol und Kohle, v. 14, May 1961, p. 371-374.

Review of chemical (corrosion and scaling resistance), physical (thermal conductivity, thermal expansion) and technological (microstructure, mechanical properties) properties of Cr-Ni alloyed heat resistant steels including cast and rolled 18/8, 26/9, 25/12 and 25/20 chromium-nickel steels. (A-general, M27, P11, Q-general, R-general; SGA-h, SS, Cr, Ni, 10-54)

431-A. (Book.) Symposium on Electrode Processes, Transactions. Ernest Yeager, Editor. 1961. 374 p. John Wiley & Sons, Inc., 440 Park Ave., New York 16, N. Y. $20.

Papers from symposium of the Theoretical Electrochemistry Div. of the Electrochemical Society held in Philadelphia, Pa., on May 4-6, 1959. Subjects covered include electrode kinetics, metallic ion adsorption, electrodeposition and dissolution processes, electrode reaction mechanisms, hydrogen evolution and faradaic impedance and rectification. Effects of double layer, acousto-electrochemical phenomena, electron transfer and isotopes on such processes. 493 ref. (A-general, L17, P15, 10-54)

432-A. Zirconium, Zircaloy and Hafnium--Safe Practice Guide for Shipping, Storing, Handling, Processing and Scrap Disposal. W. W. Allison. Westinghouse Electric Corp. U. S. Atomic Energy Commission, WAPD-TM-17, Dec. 1960, 33 p. $.75.

Procedures for safe handling, storage, shipping and processing. Topics covered include machining, pickling and scrap handling. (A5a, G17, L12g; Zr, Hf)

433-A. Metallurgy in the Navy. Office of Naval Research, PB 151110, Feb. 1960, 114 p. $2.50.

Review of metallurgical materials; problems associated with deep diving submarines; material requirements of hypersonic flight vehicles; direct energy conversion; the navy research and development program in metallurgy; the refractory metal program; semiconductor research; and irradiation effects in magnetic materials. (A-general)

434-A. (Book.) Columbian Metallurgy. v. 10. Metallurgical Society of AIME. D. L. Douglass and F. W. Kunz, Editors. 1961. 746 p. Interscience Publishers, Inc., 250 Fifth Ave., New York 1, N. Y.

Proceedings of a symposium sponsored by the Hudson-Mohawk Section, AIME, in cooperation with the Metallurgical Society, American Institute of Mining, Metallurgical and Petroleum Engineers, Bolton Landing,

New York, June 9-10, 1960. Papers are abstracted separately. (A-general; Cb)

435-A. A Critical Comparison of Columbium With Other Materials for Missile, Aircraft and Nuclear Applications. W. J. Harris, Jr. Paper from "Columbium Metallurgy". v. 10. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1961, p. 3-10.

Corrosion resistance, oxidation and property levels of Cb in relation to Mo and other metals for application in re-entry vehicles such as the Dynasoar, in nuclear reactors and in energy conversion devices. (A-general; Cb, 17-57)

436-A. (Book-Translation.) Theory of Elasticity. V. V. Novozhilov. 1961. 448 p. Pergamon Press, Inc., 122 E. 55th St. New York 22, N. Y.

Review of the basic principles of the modern theory of elastic deformation. Application of mathematical physics in the solution of deformation problems of solid elastic bodies (plastic, rubber and polycrystalline metals and their alloys). Determination of the geometrical properties of the deformation of solid bodies, conditions of equilibrium and strain energy-stress relationship. (A-general, Q21, 10-54)

437-A. (Book.) Principles of Manufacturing Materials and Processes. James S. Campbell. 1961. 674 p. McGraw-Hill Book Co., Inc., 330 W. 42nd St., New York 36, N. Y. $9.75.

Review of commercial application of basic principles of physics and chemistry to the manufacturing and processing of metals, alloys and plastics. Topics include metallurgy and heat treating, mechanical working, foundry practice, cleaning and finishing, measuring and gaging, welding, brazing and soldering, material properties and design and applications of equipment. (A-general, 11-64)

438-A. (German.) Facts About Copper. Technik und Betrieb, v. 13, July 1961, p. 102.

Review of basic and well-known facts about Cu deposits, smelting and processing, physical, chemical and mechanical properties and applications. (A-general, 10-54; Cu)

439-A. Foote Mineral Offers Ultra-high Purity Lithium. Chemical and Engineering News, v. 39, Aug. 21, 1961, p. 48.

Development of a commercially available ultra high purity Li containing at least 99.92% Li and 60 and 70 ppm. N_2 for heat transfer applications which can be stored in stainless steel containers. Description of three other new Li products including high-purity lithium hydride, dry lithium metal powder and lithium peroxide. (A-general; Li)

440-A. Venturi Scrubber Wages War Against Air Pollution. Iron Age, v. 188, Aug. 31, 1961, p. 90-91.

Design and operation of a wet scrubber system for cleaning iron oxide fumes from openhearth furnace stocks. (A8a, 1-52)

441-A. New Low-Cost Stainless Steel Takes Severe Cold Working. Iron Age, v. 188, Aug. 31, 1961, p. 96-97.

Development of a new, low work-hardening stainless steel alloy designated Armco 18-9 LW for severe cold forming applications. Expected uses for fasteners, screws and related parts in automotive, aircraft, missile, chemical equipment and appliances where corrosion resistance is important. (A-general, Q23q, T-general; SS, 17-57)

442-A. Successful Cleaning of Open-Hearth Exhaust Gas With a High Energy Venturi Scrubber. C. A. Bishop, W. W. Campbell, D. L. Hunter and M. W. Lightner. Industrial Heating, v. 28, Aug. 1961, p. 1516, 1518, 1520.

An evaluation of the performance of a venturi scrubber system installed on a 225-ton openhearth furnace. Influence of the amount of scrubber pressure drop and outlet dust loading on cleaning efficiency. (A8a, 1-52)

443-A. A Materials System Program. A. P. Binsacca. Metals Engineering Quarterly, v. 1, Aug. 1961, p. 62-69.

Compression of the time schedules between preliminary design concept and delivered articles necessitates effective planning and controlling the type and direction of materials research, development effort and the manufacture of products. By utilizing sound management concepts through its Materials System Program, the Norair Div. of Northrup

Corp. attains the required level of proficiency to enable efficient, reliable design and manufacture of products. (A5)

444-A. A New High-Strength Aluminum Alloy. J. A. Neck, Jr., Marshall Holt and D. O. Sprowls. Metal Progress, v. 80, Sept. 1961, p. 87-91.

Initially introduced as an aircraft forging alloy for high stressed parts operating at 500-600° F., Alloy 2219 has demonstrated other outstanding characteristics--good weldability, high strength and resistance to stress-corrosion cracking--that make it suitable for applications in transportation, missiles and the chemical process industries. (A-general, Q-general, R-general, 2-60, 2-61, 3-66; Al)

445-A. "Metals for Today and Tomorrow"--An ASM Seminar at Monterey. Robert C. Bertossa. Metal Progress, v. 80, Sept. 1961, p. 142-158.

Review of high temperature properties, oxidation resistance and working of refractory metals; magnetic materials development; and metals for semiconductors. (A-general; EG-d37, EG-j31, SGA-n)

446-A. (Russian.) Using New Steel for Dies of Blank Cutters to Increase Their Durability. V. I. Zaleskii, F. P. Mikhailenko and V. V. Hubarev. Kuznechno-Shtampovochnoe Proizvodstvo, Mar. 1961, p. 9-16.

Newly developed 5KhHS steel contains 0.53% C, 0.98% Mn, 1.34% Si, 2.02% Cr, 0.015% P and 0.015% S. Parameters of heat treatment and machining technology. Tabulation of properties and comparisons with standard steels. (A-general, Q-general, 17-67; AY)

447-A. Commercial Production of Esshete 1250 and Vacuum Cast Steel. British Steelmaker, v. 27, Aug. 1961, p. 250-251.

An austenitic steel developed for oxidation and creep resistance at temperatures up to 675° C. Tabulation of mechanical properties. Parameters of production and applications for vacuum cast (stream degassed) steel ingots weighing up to 180 tons. (A-general, D9s, 1-73, 17-57; SS-e, ST)

448-A. (German.) New Investigations on Use of Lead. G. Heuser. Metall, v. 15, Aug. 1961, p. 772-775.

Review of new processing methods and technical applications for Pb, Pb alloys and Pb-containing enamels including production of hard and creep-resistant metals by powder metallurgy; continuous extrusion of tubes and cable coatings; use in noise abatement; use with metal-fiber reinforcements; and cladding of steel. Research on binary Pb compounds with Bi, Sb, As, Cu, Ag, Se, Te, Tl, Sn and Zn, and on Pb enamels. (A-general; Pb-b, 17-57)

449-A. (German.) Development of World's Lead and Zinc Production and Consumption. W. Macking. Metall, v. 15, Aug. 1961, p. 801-807.

Review of mining and melting production of Pb and Zn and consumption of refined Pb and of raw and refined Zn according to fields of application. (A4p, B12, C-general; Pb, Zn)

450-A. (German.) Economical and Technical Development of Zinc Pressure Die Casting in Europe. K. Bayer. Metall, v. 15, Aug. 1961, p. 813-817.

Review of production and consumption of Zn pressure die castings in Germany, Britain, France, Italy, Austria, Sweden and Spain in 1952-1960. Use of Zn castings in automobile parts. (A4p, T21; Zn, 5-61, 17-57)

451-A. (German.) Production and Use of Zinc in France. C. A. Wahl. Metall, v. 15, Aug. 1961, p. 817-820.

Review of research and production and applications of Zn and Zn alloys, rolled, galvanized and electroplated products, in cathodic protection system and in anticorrosive paints. (A-general, L-general; Zn, 17-57)

452-A, Metal Extraction and Chemical Metallurgy. F. D. Richardson. Chemistry & Industry, July 29, 1961, p. 1132-1142.

Pioneer work in the chemistry of melts is reviewed, beginning with the basic steelmaking process and the electrolytic process for Al; models and theories for solutions, molten salts and slags; silicate mixtures; and representation of equilibrium data by application of thermodynamics to metallurgical problems. (A2, A9, 10-54)

453-A. Work of the B. I. S. R. A. With Particular Reference to Fuel. W. C. L. Hessenberg. Institute of Fuel, Journal, v. 34, July 1961, p. 267-272.

Fuel economies are explored by considering the design of radiating furnaces and the use of induction heaters, quartz infrared heaters and fluidizer beds. Other investigations include automatic programming of electric-arc furnace operation and the design of a continuous strip annealing plant. (A-general, 10-52)

454-A. Cleaning Waste Gases From Open Hearth Steel Processes. W. Strauss. Mining & Chemical Engineering Review, v. 53, June 15, 1961, p. 50-55.

Methods discussed include collection by impingement, interception and diffusion; inertial separation; thermal precipitation; agglomeration; and magnetic separation. Parameters of design and operation of various systems and comparative efficiency of applications. 7 ref. (A8a, D2, 10-54)

455-A. (Book.) Thermoelectricity--Science and Engineering. Robert R. Heikes and Roland W. Ure, Jr. 1961. 576 p. Interscience Publishers, Inc., 250 Fifth Ave., New York 1, N. Y.

Review of the physics and chemistry of thermoelectric materials, the design of materials and device technology. Thermoelectric materials considered include semiconductors, semimetals, ionic crystals mixed valence materials and liquids. Chapters are abstracted separately. (A-general, P11, P15, 11-64; EG-j)

456-A. (Italian.) News on Fusion of 85-5-5-5 Alloys. Fonderia, v. 10, July 1961, p. 305-309.

Effect of pouring temperature, preheating, temperature of the chill, mold material, additions of Al, Si, Mn, Pb and Zn and pouring rate on tensile strength, elongation, fracture aspect, density, color and porosity of 85-5-5-5 Cu alloy. (A-general, P-general, Q-general, 1-52, 2-60, 3-67; Cu-b)

457-A. (Italian.) News on Aluminum Bronzes. Fonderia, v. 10, July 1961, p. 311-313.

Fusing, nitriding, cooling, casting and tempering of aluminum bronzes. Techniques of effecting phase transformations to improve hardness, tensile strength, ductility, grain size and corrosion wear and abrasion resistance. (A-general, P-general, Q-general; Cu-s, Al)

458-A. Cesium Picked for Stardom in Space. Steel, v. 149, Sept. 18, 1961, p. 139-141.

Application of Cs to ion propulsion, thermionics and magnetohydrodynamics (MHD). (A-general; Cs, 17-57)

459-A. Review of Recent Developments in the Technology of Beryllium. Webster Hodge. Defense Metals Information Center, Battelle Memorial Institute, DMIC Memo. 123, Aug. 18, 1961, 3 p.

Review of articles on the technology of Be, May-July 1961. Purification, casting, machining and reaction of Be with CO are noted and data presented on chemical and physical properties affected. 9 ref. (A-general, 10-54; Be)

460-A. (German.) Investigation of Medieval Charcoal-Hearth Smelting in Sauerland. Manfred Sonnecken. Stahl und Eisen, v. 81, Aug. 17, 1961, p. 1138-1143.

Historic investigation of 500 medieval charcoal-hearth smelters. Chemical analysis of ore, slag and metal relics. Reconstruction of design of charcoal hearths and determination of age of smelters by ceramic relics. (A2, D-general, 10-54)

461-A. Unimach No. 2 (High-Temperature Alloy Steel). Alloy Digest, SA-120, Sept. 1961, 2 p.

Deep-hardening steel which will harden throughout in large sections by air cooling from 1800-1900° F. It also exhibits secondary hardening characteristics and of particular significance is the fact that high temperatures are employed with the result that internal stresses are reduced to a minimum. (A-general, J5, 2-62; AY)

462-A. Carpenter Stainless 304+B (Corrosion Resisting Steel). Alloy Digest, SS-121, Sept. 1961, 2 p.

304+B is similar to conventional Type 304 with the addition of boron to give it a much higher thermal neutron absorption cross section than other austenitic stainless steels. (A-general, P18j, 2-60; SS, B)

463-A. Marvel (Hot Work Die Steel, Type H21). Alloy Digest, TS-109, Sept. 1961, 2 p.

Low-carbon, high-tungsten, hot work die steel, particularly adapted for dies which may become heated to a dull red heat while in operation. The alloy will withstand temperatures up to approximately 1100° F. without reduction from the maximum hardness attainable and will resist higher temperatures without loss of hardness when previously subjected to an equally higher tempering temperature. (A-general, Q29p, 2-64; TS-k)

464-A. Apex 400 (Aluminum Casting Alloy). Alloy Digest, Al-107, Sept. 1961, 2 p.

A 4% magnesium type aluminum-casting alloy having high corrosion resistance is not heat treatable and is recommended for marine applications and food processing equipment. (A-general, R-general; Al-b)

465-A. Eclipsaloy 520 (Magnesium Sand Casting Alloy). Alloy Digest, Mg-50, Sept. 1961, 2 p.

Heat treatable Mg sand casting alloy has excellent combination of high strength, toughness and resistence to weathering. The alloy has good ductility, excellent fatigue strength and reduced notch sensitivity. It is easily cast and is distinguished by extremely fine grain in both thick and thin sections. (A-general, Q-general; Mg-b)

466-A. Mueller 602 Bronze (Bearing Bronze Alloy). Alloy Digest, Cu-106, Sept. 1961, 2 p.

Bearing alloy for use with hard or soft mating members that do not have a high polish. The alloy can be used where high hardness and mechanical properties are not necessary. It will cold work lightly and has good machinability. (A-general, Q-general; Cu-s, SGA-c)

467-A. Ampco 22 (Aluminum Bronze). Alloy Digest, Cu-107, Sept. 1961, 2 p.

A hard, low ductility aluminum bronze recommended for drawing and forming dies. High alloy content of Ampco Metal 22 gives it a duplex structure of approximately 50% of each phase. The field of service of this alloy, with few exceptions, is limited to forming and/or drawing stainless and clean mild steels, especially when runs are long or gage is heavy and it is essential that tolerances be maintained. (A-general, Q23q, 2-60; SGA-j, Cu-s, Al)

468-A. N-A-Xtra (Super-Strength Structural Steel). Alloy Digest, SA-119, Sept. 1961, 2 p.

Low-carbon, low-alloy quenched and tempered steel recommended for structures and equipment requiring good abrasion resistance, atmospheric corrosion resistance, high tensile strength, high fatigue resistance, good formability and ease of welding. (A-general, Q-general; AY, SGB-s)

469-A. New Alloy Strengthens Valve Stems. Modern Castings, v. 40, Sept. 1961, p. 45-47.

Development of a new bronze alloy containing 7% Zn and 2% Al provides protection against both dezincification and dealuminization in valve stems. (A-general, T7b; Cu-s, 17-57)

470-A. (Italian.) Native Copper and Its Working in Prehistoric Times. H. H. Coghlan. Trattamenti Termici e Protettivi dei Metalli, v. 4, May-June 1961, p. 9-16.

Hammering, bending, grinding, annealing and fusion of native Cu in the stone and bronze age and its world distribution. Determination of Brinell hardness, elongation, tensile strength and structure. (A-general, A2, Q-general; Cu)

471-A. Design Information on AM 350 Stainless Steel for Aircraft and Missiles. R. J. Favor, O. L. Deel and W. P. Achbach. Defense Metals Information Center, Battelle Memorial Institute DMIC Rept. 156, July 26, 1961, 10 p.

Heat treating, forming, forging, welding and machining of semiaustenitic precipitation-hardenable steel in sheet, strip, foil, wire and other forms. Tentative room temperature design, allowable strengths and elevated temperature design curves are presented for various tensile, yield and shear stengths. 22 ref. (A-general, Q-general, T24, 10-54, 11-62, 17-51)

472-A. Fume Cleaning. Metal Industry, v. 99, Aug. 4, 1961, p. 92.

A transportable pilot venturi scrubber employs two complete cones of water for removal of dust particles from industrial fumes with an efficiency of 99.6%

in the range 5-0.01 microns. (A8a, W13c, 1-53)

473-A. An Up-To-Date Look at Prefinished Metals. R. J. Fabian. Materials in Design Engineering, v. 54, Aug. 1961, p. 129-140.

Availability, physical and mechanical properties, corrosion resistance, fabrication and joining techniques, design considerations and applications of preplated, prepainted, hot dipped, textured and embossed metals, plastics-metal laminates and special prefinished Al. (A-general, F-general, G-general, Q-general; 8)

474-A. (German.) Steels at Low Temperatures. Hermann Schumann. Abhandlungen der Deutschen Akademie der Wissenschaften zu Berlin, (Brochure), no. 10, 1960, 32 p.

Low-temperature technology of ferritic unalloyed, low alloyed and Ni steels and of austenitic Mn and CrNi steels. Mechanical properties of cast austenitic CrNi steels and of austenitic welding joints at temperatures between 20 and -180° C. Influence of delta ferrite on mechanical properties at temperatures from -180 to 20° C. (A-general, 2-63; ST)

475-A. (German.) The Rare Earth Metals--Occurrence, Production and Use. Franz Matthes. Chemische Technik, v. 13, May 1961, p. 290-292.

Review of occurrence of rare earth metals in mineral form; dressing and concentration operations; separation; extraction by electrolysis or reduction by metals such as Ca, Mg, Al or alkali metals; applications as alloying elements for Fe, steel and nonferrous metals and in semiconductor technology. (A-general, C-general, 17-57; EG-g45)

476-A. Columbium Treated Steel Promises Pipeline Savings. Steel, v. 149, Sept. 25, 1961, p. 160-162.

Development of XC-60 for pipeline construction requires thinner wall pipe for welding with standard equipment. The addition of Cb reduces grain size of steel and increases yield and tensile strengths. (A-general, M27c, Q-general, T26r, 17-57; ST, Cb)

477-A. (German.) Columbium and Tantalum as Materials. W. von Haken. Chemische Industrie, v. 13, May 1961, p. 314-320.

Physical, chemical and mechanical properties of Cb and Ta and their alloys; ore deposits; mining and extraction; statistics of Cb and Ta production and use. (A-general; Cb, Ta)

478-A. (German.) Magnesium Use, Extraction and Economical Importance. Chemische Industrie, v. 13, June 1961, p. 358-362.

Productive and mechanical properties of Mg and Mg alloys are reviewed in terms of applications in consumer goods and the automotive, electrical, aircraft and nuclear-component industries. (A-general, Q-general, 17-57)

479-A. Cryogenic Materials Data Handbook. T. F. Durham. Cryogenic Engineering Laboratory, National Bureau of Standards. (Ballistic Missile Div.). U. S. Office of Technical Services, PB 171809, Sept. 1961, 555 p. $7.

Covers the field of cryogenics from 1940 through 1959 and includes some previously unpublished laboratory test data. Information on Al, Co, Cu, Fe, Ni, Ti, carbides, nonmetals (such as ice, mylar and teflon), Be and Mo. Properties range from yield strength through expansivity to mechanical hysteresis. (A-general, P-general, Q-general, 2-63, 11-68)

480-A. Thermocouple Alloy for 5000° F. Materials in Design Engineering, v. 54, Sept. 1961, p. 13.

Temperatures up to 5000° F. can now be measured with thermocouples using newly available 25% Re-W alloy wire. The high-strength alloy retains room temperature ductility after heating to temperatures as high as 3600° F. (A-general, Q23p, 2-62; W, Re, 17-57)

481-A. (Translation-Brutcher no. 5182.) Some Problems in Physical Investigations of Metal and Alloys. I. B. Borovskii and A. A. Baikova. Trudy Institute Metallurgii Imeni, v. 4, 1960, p. 3-8.

Review of work done in recent years at Baikov Institute of Physical Methods of Investigation, such as on effect of trace amounts of impurities on the electron energy spectrum of the base material over a wide temperature range; on the nature of the bonding forces in intermetallic compounds of the electron

type; and in metal compounds having special properties. Work done on and with the microanalyzer, developed 12 yr. ago in the USSR. Problems now open to solution and being solved using the microanalyzer. (A-general)

482-A. (Translation-Brutcher no. 5143.) Service Performance and Applications of Hot Strength 12% Chromium Steel. G. Kruger. Neue Hutte, v. 6, Mar. 1961, p. 131-138.

Previously abstracted. See item 178-A, 1961. (A-general, Q-general, R-general, 2-60, 2-62; SS, 17-57)

483-A. 90Ta-10W Offers High Temperature Strength Plus Ductility. M. L. Torti. Space/Aeronautics, v. 36, Sept. 1961, p. 87-88, 90, 93.

Physical and mechanical properties, preliminary design data, actual and potential applications and workability of newly developed alloy. (A-general, P-general, Q-general; SGA-h, Ta, W, 17-57)

484-A. Beryllium Update--1961. Al. Knoerr and Mike Eigo. Engineering and Mining Journal, v. 162, Sept. 1961, p. 87-97.

Survey of Be industry including geology and statistics of ore development; recovery by Van Dornick flotation procedure; physical and mechanical properties of oxides; and applications including preparation of solid fuel rocket propellants. (A-general, B14h, P-general, Q-general, T24e; Be)

485-A. Quality Control in the Production of Steel Sheet for Deep Drawing and Pressing. W. O. Thomas. Sheet Metal Industries, v. 38, Sept. 1961, p. 659-674.

Processing of rimmed and stabilized steel includes deoxidation, pickling, cold reduction, annealing and temper rolling. Influence of annealing on surface quality and of temper rolling on mechanical properties. 9 ref. (A-general, G4, 2-64, 3-68, 17-54; ST)

486-A. A Review of Recent Developments in Titanium and Titanium Alloy Technology. R. A. Wood. Defense Metals Information Center, Battelle Memorial Institute, DMIC Memo. 126, Sept. 15, 1961, 8 p.

Developments from June-Aug. 1961, with reference to Ti-13V-11Cr-3Al all-beta alloy and Ti-8Al-1Mo-1V, Ti-7Al-12Zr and Ti-5Al-5Sn-5Zr super alpha alloys. Physical properties are related to fabrication procedures including brazing, welding, heat treating and cold rolling. 18 ref. (A-general, F23, 1-67, J-general, K-general, 10-54)

487-A. Rare-Earth Metals. Space/Aeronautics R & D Technical Handbook, v. 4, 1961-1962, p. H13-H15.

Electrical, thermal, magnetic, mechanical, thermodynamic and corrosion properties of the rare earths and Sc and Y. (A-general; EG-g45, EG-b40)

488-A. Production Engineering--State of the Art. Space/Aeronautics R & D Technical Handbook, v. 4, 1961-1962, p. I3-I9.

A survey of materials and methods employed in maching, conventional forming, high energy rate forming, joining and advanced processes such as plasma spraying, filament winding, diffusion bonding and electroforming. 39 ref. (A-general, 1-52, 17-57)

489-A. (Book.) Vacuum Metallurgy Conference, Transactions, 1960. Rointan F. Bunshah, Editor. Interscience Publishers, Inc., New York 1, N. Y. 1961. 352 p.

Papers presented at the fourth annual conference on vacuum metallurgy, sponsored by the Dept. of Metallurgical Engineering in co-operation with the Office of Special Service to Industry, New York University, June 1-3, 1960. Topics include melting and arc behavior, induction melting, electron beam melting and welding techniques, metallizing and evaporation, degassing, teeming and casting. Technological parameter is discussed for vacuum refining and alloying of refractory, reactive, light and transition metals, superalloys and steels with evaluation of resultant physical and mechanical properties, microstructures, compositions and impurity levels. (A-general, C-general, D9, K6, P-general, Q-general, 1-73)

490-A. (Italian.) Cooling Plants and Flue Gas Purification of L-D Converters. H. Rasworschegg. Metallurgia Italiana, v. 53, July 1961, p. 353-362.

Cooling and purifying high temperature (2000° C.) flue gases from L-D converters in order to remove dust (oxides) and to permit heat regeneration. Comparison of vapor production economy and cost of a simple cooling system. (A8a, A11e, D10a, 1-52)

491-A. Developments in Titanium. M. Schofield. Mining Magazine, v. 105, Aug. 1961, p. 76-79.

Methods of production including extraction from ilmenite and rutile sources by the Kroll magnesium reduction process. Applications in aircraft and chemical industries. (A-general, C-general; Ti, 17-57)

492-A. "Exotics" Move Ahead. Bernard S. Miller. Metalworking, v. 17, Oct. 1961, p. 11-13, 28-29.

Review of fabrication techniques, heat treatment and resultant physical and mechanical properties of refractory and heat resistant metals and alloys with particular reference to Cb, W, Mo, Ta and Be and their alloys with Al, Ti, V, Hf, Zr and Re. Topics include arc and electron beam welding, hot rolling, compaction and sintering, forging and spinning processes; and high temperature strength, oxidation, ductile-brittle transition, weldability and formability. Survey of applications of sheet and structural shapes including aircraft, rocket and reactor components. (A-general, F-general, G-general, P-general, Q-general; EG-d37, SGA-h, 10-54)

493-A. New Steel Machines Faster. Iron Age, v. 188, Oct. 5, 1961, p. 82.

A new Te-bearing free-machining steel, La-Led X, increases speeds and feeds in machining. High-speed screw machines are being designed to accommodate the steel which also contains Pb and sulphur. (A-general, G17k; SGA-k, ST, Te, Pb, S)

494-A. 'Theoretical Formability' Praised. John F. Judge. Missiles and Rockets, v. 9, Sept. 25, 1961, p. 40-41, 46.

Topics discussed at an Air Force sponsored symposium includes a new approach for selection of materials and fabricating methods for production of missile hardware; current and future developments in high temperature adhesives; joining of stainless steels with exothermic materials into metal sandwiches; and oxidation coatings on Cb, Mo and Ta. (A-general, G-general, K12, L21, T24c, 1-52, 2-62, 11-63, 17-57; SS, Cb, Mo, Ta)

495-A. Practical Steel Plant Research. Karl L. Fetters. Paper from "Regional Technical Meetings, 1960". American Iron and Steel Institute, New York 17, 1961, p. 187-206.

Review of techniques for welding high strength electrical resistance pipeline and eliminating the Bauschinger effect in steel tube by heat treatment. (A9, K-general, Q24; ST, 4-60, 10-54)

496-A. (Book.) Regional Technical Meetings, 1960. 1961. 507 p. American Iron and Steel Institute, 150 E. 42nd St., New York 17, N. Y.

Papers presented at the annual series of Regional Meetings dealing with workhardening and drawability of steels, production of coke, process control and automation, plant research, blast furnace processes and other related topics. (A-general, D-general, J-general, W-general, 11-64; Fe-b, ST)

497-A. Lead and Lead Alloys. Pt. 4. Lead Cable Sheathing Alloys and Alloy Development. S. A. Hiscock. Electrical Journal, v. 167, Aug. 4, 1961, p. 278-282.

Review of physical and mechanical properties, composition, installation and operational characteristics of Pb alloys. Tabulation of data for standard British, American and German specified Pb alloys. (A-general, R10e, T1b; Pb-b, 17-57)

498-A. (Book.) The Rare Earths. F. H. Spedding and A. H. Daane, Editors. 1961. 641 p. John Wiley & Sons, Inc., 440 Park Ave. South, New York 16, N. Y.

Papers presented at a symposium on the rare-earth metals in Nov. 1959, under the sponsorship of the American Society for Metals and the Atomic Energy Commission. Topics include separation of rare earths, preparation of rare-earth metals and properties of metals and alloys. Papers abstracted separately. (A-general, 11-64; EG-g45)

499-A. What's Happening to Beryllium? Journal of Metals, v. 13, Sept. 1961, p. 598-606.

Survey of ore deposits; direct, flotation and chemical extraction processes and plant expansion and market trends. (A-general; Be, 10-54)

500-A. (Swedish.) A Hundred Years Old Water Pipe of Cast Iron. Gjuteriet, v. 51, Jan. 1961, p. 5-6.

Examination of composition, degree of corrosion tensile strength, hardness, fracture characteristics, casting defects and microstructure of specimens taken from a water main. (A-general, T26r; CI, 17-57)

501-A. Meehanite HS (Heat Resisting Iron Casting). Alloy Digest, CI-31, Oct. 1961, 2 p.

Tough machinable metal which provides maximum resistance to scaling and growth up to 1700° F. (A-general, G17k; CI, SGA-h, SGA-g)

502-A. Mueller 604 (High-Leaded Bearing Alloy). Alloy Digest, Cu-108, Oct. 1961, 2 p.

Leaded Cu-base bearing alloy that can be used with hard or soft matting members possesses excellent bearing properties, high mechanical properties and good corrosion resistance. It is a free-cutting bearing bronze with self-aligning properties and excellent wear resistance. (A-general, Q-general, 2-60; Cu-s, SGA-c, SGA-m)

503-A. Climelt Molybdenum-0.5% Ti-0.08% Zr (High Temperature Alloy). Alloy Digest, Mo-3, Oct. 1961, 2p.

Mo-base alloy that offers substantial benefits for high temperature applications. It has higher recrystallization temperature and better stress-rupture strength than unalloyed Mo and Mo-0.5% Ti alloy. (A-general, N5, Q-general, 2-60; Mo-b, Ti)

504-A. Circle Lin (Heat and Corrosion Resisting Alloy). Alloy Digest, Ni-67, Oct. 1961, 2 p.

A Ni-base alloy with an excellent combination of high strength, resistance to ordinary forms of corrosion, good heat resistance and freedom from aging or stress corrosion. It is a structurally stable alloy and it does not lose its toughness or ductility due to internal structural changes even after long exposure to high temperatures. (A-general, Q-general, 2-62; Ni-b, SGA-h)

505-A. AISI 4650 (Nickel Molybdenum Steel). Alloy Digest, SA-121, Oct. 1961, 2 p.

Medium carbon alloy steel providing exceptionally uniform properties with good machining characteristics together with good resistance to warping and distortion in heat treatment. (A-general, G17k, Q-general, 2-64; AY)

506-A. General Alloys Q-60 (Corrosion Resisting Steel). Alloy Digest, SS-122, Oct. 1961, 2 p.

An Fe-Cr casting alloy providing excellent resistance to corrosion by nitric acid. It maintains an essentially ferritic structure and even at the high carbon levels only a small amount of ferrite transforms at elevated temperature to austenite for subsequent change to martensite upon rapid cooling. (A-general, N-general, 2-64; SS, SGA-g)

507-A. MST 431 (Titanium Sheet Alloy). Alloy Digest, Ti-30, Oct. 1961, 2 p.

Alpha-beta type Ti sheet alloy presently being supplied in the solution treated, solution treated and aged and annealed conditions. Its principal advantage is good formability in the solution treated condition with subsequent high strength capability through an aging treatment. Properties indicate good strength and thermal stability for sheet applications up to 800° F. for long times. (A-general, Q-general, 2-60, 2-62, 2-64; Ti-b, 4-53)

508-A. Circle C (High Speed Steel). Alloy Digest, TS-110, Oct. 1961, 2 p.

High production Co-W super high-speed steel recommended for difficult cutting operations. It is specially adapted for heavy duty lathe, planer, shaper and boring mill tools and can be used profitably on material where ordinary high-speed tools fail. (A-general, Q-general, 2-60; TS-m, Co, W)

509-A. Ultrahigh Strength Materials of the Future. John J. Gilman. Mechanical Engineering, v. 83, Sept. 1961, p. 55-59.

Strength evaluation for monocrystals composed of interstitial compounds of the transition metals or of covalent compounds of the light metals. Chemical and mechanical properties are evaluated for carbides, borides and nitrides of transitional metals. 17 ref. (A-general,

Q-general, P-general, 10-54; 14-61, 14-67, 14-68)

510-A. The International Conference at Copenhagen. G. Courtois. Microtechnic, v. 15, July 1961, p. 110-113.

Conference on use of radioactive elements in industry and in the physical sciences held Sept. 6-17, 1960. Discussion includes increased usage of tritium and problems relating to wear and lubrication. (A-general, Q9, 1-59)

511-A. (French.) Controlled Atmospheres. Jean Guingand. Journal des Industries du Gaz, v. 85, June 1961, p. 243-252.

Annealing, hardening, case hardening, brazing, sintering and arc welding of carbon steel, stainless steel, silicon steel, high-speed toolsteel and various ferrous and nonferrous alloys in atmospheres containing O, CO, CO_2, N, H, A and He. Chemical equilibria for various metallurgical processes as a function of temperature and description of metallurgical furnaces and equipment. (A-general, H15q, J2k, K1, K8, 1-52, 17-57)

512-A. Properties and Application of Allegheny Ludlum Electrical Steel 4750 Strip Products. Steel Horizons (Technical Horizons), v. 23, Fourth quarter 1961, 4 p. (Insert).

A high-permeability Ni-Fe alloy having low induction and high saturation points has applications in transformers. Techniques are given for high-temperature hydrogen annealing of laminations and other finished parts. (A-general, J2k, P15, T1; ST-f, 4-53, 7-59)

513-A. What Alloy Shall I Use...for High-Temperature Applications (Above 1200° F.)? Ward F. Simmons. Metal Progress, v. 80, Oct. 1961, p. 84.

Fe, Ni and Co-base superalloys for applications between 1200 and 1800° F., are likely to remain the only metallic materials for use at high temperatures under oxidizing conditions. (A-general, 2-62; SGA-h, SGB-s, Fe-b, Ni-b, Co-b, 17-57)

514-A. What Refractory Shall I Use... for Ultrahigh-Temperature Applications (Above 1800° F.)? D. J. Maykuth and H. R. Ogden. Metal Progress, v. 80, Oct. 1961, p. 92.

On the basis of strength, Mo alloys are recommended for service up to about 2800° F. At higher temperatures the strength advantage shifts to tungsten alloys. Cb and Ta alloys offer superior forming and welding properties and improved low-temperature ductility. (A-general, 2-62; EG-d37, Cb-b, Ta-b, 17-57)

515-A. What Tool Steel Shall I Use...for Applications in Structures and Components? Metal Progress, v. 80, Oct. 1961, p. 104.

Already used in aircraft structure, fasteners and wear parts, toolsteels are valuable as primary engineering materials because of their high hot hardness, strength, wear resistance and toughness. (A-general, Q-general, 2-62; TS, SGB-s, 17-57)

516-A. What Metal Shall I Use...for High-Strength Welded Structures?...Aluminum. Metal Progress, v. 80, Oct. 1961, p. 121-125.

Nominal composition, typical mechanical properties, characteristics governing selection and applications of 5456, 5083, 5086, 5154, 5454, 6061, 6062, 2219, 2014 and 7178 Al alloys. (A-general, T-general, Q-general; Al-b, 7-51, 17-57)

517-A. What Metal Shall I Use... for High-Strength Welded Structures?...Magnesium. Lloyd Lockwood. Metal Progress, v. 80, Oct. 1961, p. 125-127.

Composition, mechanical properties, outstanding characteristics and typical uses of AZ31B, ZE10A, HK31A, HM21A Mg alloy sheet and plate and ZK21A, AZ80A, HM31A, AZ61A, ZK60A Mg alloy extrusions. (A-general, Q-general, T-general, 2-60; Mg-b, 7-51, 17-57)

518-A. An Introduction to Aluminium and Its Alloys. D. M. Walker. New Zealand Engineering, v. 16, Aug. 15, 1961, p. 303-304.

Review of Al metallurgy including extraction processes with compositions, properties and applications given for some representative wrought and casting alloys. (A-general, C-general; Al-b, 10-54)

519-A. Heat-Treatable Titanium Sheet Alloys. D. Goold. Engineering Materials and Design, v. 4, Oct. 1961, p. 658-659.

B120VCA and Ex011 alloys containing additions of V, Cr, Al and Mo are

compared on the basis of density, formability, age hardening, weldability, creep strength, notch sensitivity and tensile strength. Applications for extrusions, rod and wire. (A-general, K9s, N7a, Q-general; Ti-b, 4-53)

520-A. Data Sheet No. 68: Cobalt-Base Super-Alloys. Engineering Materials and Design, v. 4, Oct. 1961, p. 687.

Rupture properties and compositions for Haynes alloys no. 25, 31 and 21 and Jessop alloys no. G. 65, G. 34 and G. 32 with high-temperature (920-1100° C.) applications. (A-general, Q3m, 11-62; Co-b, SGA-h)

521-A. Data Sheet No. 69: High Alloy Steels, Ni and Co Alloys for Investment Castings. Engineering Materials and Design, v. 4, Oct. 1961, p. 689.

Tensile strength, yield stress, elongation, corrosion resistance, heat resistance and creep strength are given for Ni and Co alloys containing C, Si, Mn, Cr, Mo, Cu, Ti, Fe, W, Mn, Al, Mg, S and P. (A-general, E15, Q-general, R-general, 11-62; SS, Ni, Co)

522-A. Essehete 1250. Iron & Steel, v. 34, Oct. 1, 1961, p. 464.

Austenitic creep-resisting steel containing 15% Cr, 10% Ni and 6% Mn has a high level of rupture strength with ductility. Physical properties and applications. Tabulation of mechanical properties in the solution-treated condition and of stress rupture data. (A-general, P-general, Q-general; SS-e, Cr, Mn, Ni)

523-A. Cast 9% Nickel Steel for Low Temperature Service. W. J. Jackson. Iron & Steel, v. 34, Oct. 1, 1961, p. 474-475.

Heat treatment cycles for the development of optimum low temperature impact properties in ASTM A353-58 alloy. Room temperature tensile properties and Charpy V-notch impact values obtained in the testing temperature range -196 to 100° C. are given. 7 ref. (A-general, J-general, Q27, 2-63; CN, Ni, 5)

524-A. Order Copper by the Numbers. Iron Age, v. 188, Oct. 12, 1961, p. 168-169.

The use of a three-digit number code to classify various coppers, brasses, bronzes and other Cu alloys. The composition previously accepted trade name of the Cu alloys and the numbers assigned to them. Use of the number code in data-processing applications. (A-general, 11-62, 11-69; Cu-b)

525-A. Review of Recent Developments in the Technology of Tungsten. V. D. Barth. Defense Metals Information Center, Battelle Memorial Institute, DMIC Memo. 127, Sept. 22, 1961, 7 p.

Review of literature covering consolidation, fabrication, plasma arc spraying, forging, centrifugal casting, electron beam melting, extrusion, oxidation (at 1300° C. to 3000° C.), protection, siliconizing and ductility as influenced by surface condition. 16 ref. (A-general, 10-54; W)

526-A. Action in Beryllium. Iron Age, v. 188, Oct. 19, 1961, p. 107.

The capacity and operations of a Be fabrication plant which includes a precision machine shop and an inspection setup including X-ray. Review of the government stockpiling program and of foreign and domestic sources of Be ore. (A-general, A11, G-general, 1-52; Be)

527-A. Trilay--A Noble Metal Composite Material. J. S. Hill. Engelhard Industries, Inc., Technical Bulletin, v. 11, Sept. 1961, p. 45-47.

Two outside layers of wrought Pt or Pt alloy are bonded to an inner layer of Pt, Pt alloy, Ag, Cu or Ni produced by powder metallurgy techniques. Applications in cement and glass industries include crucibles, outer sheaths of swaged thermocouples and small melting pots. (A-general, T29a; Pt-b, 7-59)

528-A. Review of Recent Developments in the Technology of Columbium and Tantalum. E. S. Bartlett and F. F. Schmidt. Defense Metals Information Center, Battelle Memorial Institute, DMIC Memo. 130, Oct. 10, 1961, 4 p.

Measurement of the tensile properties of Cb-1Zr alloy and several Ta alloys at very high temperatures. Production of Cb-base alloys in the form of sheet, strip, extrusions and forgings. Production of Ta alloy wire and sheet. Target properties for Ta alloys include good high-temperature strength and low-temperature ductility. 10 ref. (A-general, F-general, Q-general, 2-61; Cb-b)

529-A. Review of Recent Developments in the Technology of Molybdenum-Base Alloys. J. A. Houck. Defense Metals Information Center, Battelle Memorial Institute DMIC Memo. 129, Oct. 6, 1961, 3 p.

Production of high purity molybdenum by reducing MoS_2 with Sn. Improvements in the preparation of Ca-reduced Mo. Measurement at room temperature and/or very high temperatures of the tensile properties of Mo and of Mo-Ti and Mo-Zr-Ti alloys. Production and evaluation of Mo and Mo alloy sheet. 6 ref. (A-general, C26, F23, Q27, 2-61; Mo, Mo-b)

530-A. 1961 Metal Selector. Steel, v. 149, Oct. 16, 1961, p. 115-116.

Composition, physical and mechanical properties and applications are tabulated for refractory, high temperature, cast high, spring, Cu, Be, Al, Ti, Mg, Zn and Zr alloys, stainless, heat resistant, H, alloy, high strength and superstrength steels and ferrous castings. (A-general, P-general, Q-general, 11-62, 17-57; ST-b, EG-b, Al-b, Be-b, Cu-b, Mg-b, Ti-b, Zn-b, Zr-b)

531-A. (French.) Classification of Cast Steels. Journal d'Informations Techniques des Industries de la Fonderie, no. 128, July-Aug. 1961, p. 1-2.

Compositions are given for steels resistant to pressure and to temperatures up to 550° C., containing 0.40-1.20% Mo, 0.40-2.75% Cr and 0-0.50% V. Further data for wear-resistant steels containing 0-1.2% Cr, 0-4% Ni, 0-0.4% Mo and 0-14.5% Mn. (A-general, 2-60, 11-62; ST, SGA-h, SGA-m, Cr, Mn, Mo, Ni, V)

532-A. (Italian.) Titanium in the Chemical Industry. Acciaio Inossidabile, v. 18, July-Aug. 1961, p. 69-85.

Rolling, forging, pressing, arc and resistance welding, annealing, sanding, pickling; chemical composition, physical and mechanical properties of ATI 24 and ATI 45 titanium and its use for making pipes, bolts, nuts, tanks, plates, heat exchangers, valves, pumps, rotors and mixers used in chemical processing. (A-general, T29; Ti)

533-A. A Long Life Ahead For Oka Niobium. Charles R. Graham. Canadian Chemical Processing, v. 45, Sept. 1961, p. 61-62, 64.

Production of Cb and Ta from pyrochlore ores discovered in Oka, Quebec. Cb is shown to have high temperature strength, high corrosion resistance, good thermal neutron absorption properties, excellent heat transfer properties and resistance to weight loss when exposed to low melting metals. Major applications are in nuclear reactors, stainless steel alloys and space-craft components. (A11a, B-general, P11k, P17c, Q-general, R-general, 17-57; Cb, Ta)

534-A. New Ultra High Strength Steel. Materials in Design Engineering, v. 54, Oct. 1961, p. 9.

Development of a medium alloy steel, Vascojet M-A, which is consumable vacuum arc melted to provide more ductility and a smaller differential between longitudinal and transverse mechanical properties. (A-general, D8m, Q-general; SS, SGB-a)

535-A. (French.) New Metals. Rene Paris. Chimia, v. 15, Sept. 15, 1961, p. 443-449.

Preparation of Be, Ti, Zr, Ta and Cb from their ores. Densities, melting points and boiling points. Tensile strength and heat resistance of Ti alloys containing Al, Cr, Fe, Mn, Sn or V. Transformations in Ti. Ductility of Be as a function of temperature between 20-1000° C. 7 ref. (A-general, N-general, P10a, P12n, Q23, 2-61, 10-54; Be, Cb, Ta, Ti, Zr)

536-A. Recovery of Zinc and Tin From Secondary Products. P. M. Sullivan and D. H. Chambers. Metal Industry, v. 99, Sept. 22, 1961, p. 226-229.

Electrolytic recovery of Zn and Sn from galvanizer's dross containing Pb, Fe, Cd, Cu and Zn which is amalgamated with Hg and leached. The electrolytic product is analyzed in terms of efficiency, purity and cell operation parameters. 9 ref. (A11d, C29, 1-52; Sn, Zn)

537-A. (German.) The Rare-Earth Metals. Theor Pinkwasser. STZ (Schweiz. Technische Zeitschrift), v. 58, Sept. 14, 1961, p. 762-764.

Review of production by thermic reduction and electrolysis and of physical, chemical and mechanical properties of the rare-earth metals Ce, Dy, Er, Eu, Gd, Ho, La, Lu, Nd, Sm, Sc, Tb, Tm, Yb and Y. (A-general, C23, C26, P-general, Q-general, 10-54; EG-g45)

538-A. (German.) Current Status of Archeological Research on Double Pyramidal Shaped Iron Bars. Otto Kleemann. Archiv fur das Eisenhuttenwesen, v. 32, Sept. 1961, p. 581-585.

Review of today's knowledge of geographic distribution, production, age and use of forged Fe bar relics of typical double pyramidal shape. (A2; Fe, 4-55)

539-A. (German.) Investigation of Prehistoric Iron Bar Relics. Wilhelm Radeker and Friedrich Karl Naumann. Archiv fur das Eisenhuttenwesen, v. 32, Sept. 1961, p. 587-595.

Chemical analysis, microscopic investigation, mechanical testing and test forging of prehistoric Fe bar relics of typical double pyramidal shape, including extraction residues and analysis of slag inclusions. Attempts to determine age and origin of relics. (A2; Fe, 4-55)

540-A. Guide for Use of Clad-Steel Plate. Tappi (Technical Assoc. of the Pulp and Paper Industry), v. 44, Oct. 1961, p. 154A-155A.

Bond strength and corrosion resistance factors with reference to handling, flame cutting, welding, heating and passivation of 300 and 400 stainless steel cladding metal and A-285 Grade C, A-201, A-202 and A-212 steel backing metal. (A-general, 10-54; ST, SS, 7-59)

541-A. Refractory Metals in Europe. Robert I. Jaffe. Journal of Metals, v. 13, Oct. 1961, p. 714-716.

Review of industrial application, research and production procedures for Co, Ta, Mo, W, Re and their alloys. (A-general, 10-54; Co, Mo, Re, Ta, W)

542-A. (German.) Electrostatic Dust Precipitation in Iron Works. Kurt Guthmann. Staub, v. 21, Sept. 1, 1961, p. 398-402.

Dust removal is discussed with emphasis on electrostatic precipitation from waste gases produced by blast furnace and Krupp-Renn smelting and conventional and oxygen steel refining in converters, openhearth and electro-furnaces, Kaldo and Graef rotors. (A8a, D-general, 1-52)

543-A. The Metallurgist in the Heavy Steel Industry. L. Reeve. Metallurgist, v. 11, Sept. 1961, p. 348-356.

A review is given of the relationship of the metallurgist to quality and production control and to the development of new steels. The report includes a tabulation of tensile and impact properties for the N.D. series of steels to BS. 2762 and to the related Lloyds Grades D and E, transition curves and representative microstructures. (A9m, M27, N8g, Q-general; ST)

544-A. A Look at Steel in Japan. T. J. Ess. Iron and Steel Engineer, v. 38, Oct. 1961, p. 71-87.

Survey of steel production in Japan including ore sources, production methods, productivity, capacity and economic factors. (A-general; ST)

545-A. Beryllium and Its Uses in Other Light Metals. Light Metals, v. 24, Oct. 1961, p. 264-265.

Effects of Be additions on oxidation rate, workability, gas porosity, thermal stability, dross formation and activity of Mg-Al alloys. 18 ref. (A-general; Be, 10-54)

546-A. Aluminum 2219--New Alloy for High-Strength Welded Structures. F. R. Collins, F. G. Nelson and I. B. Robinson. Metal Progress, v. 80, Nov. 1961, p. 82-87.

A heat treatable alloy which retains its high strength at temperatures of 450-700^{O} F., Al 2219, also has demonstrated superior weldability. Weldments perform well at subzero and at elevated temperatures. (A-general, K9s, Q-general; Al-b)

547-A. Properties and Applications of Malleable Iron Castings (Data Sheet). Metal Progress, v. 80, Nov. 1961, p. 96-B.

Mechanical properties and applications of 35018, 32510, 45010, 45007, 48004, 50007, 53004, 60003 and 80002 castings. Recommended cutting conditions for turning 32510, 48004, 60003 and 80002. (A-general, G17, Q-general; CI-s, 5, 17-57)

SECTION B

RAW MATERIALS and ORE PREPARATION

1-B. (French.) Ore Crushing. Pt. 1. A. Masson. Revue Universelle des Mines, de la Metallurgie, de la Mecanique, v. 16, Aug. 1960, p. 341-349.

Theory of crushing with reference to characterization of size of crushed product and power requirements for a given reduction. 14 ref. (B13)

2-B. Magnetic Roasting of Iron Ores in a Traveling Grate Roaster. H. H. Wade and N. F. Schulz. Mining Engineering, v. 12, Nov. 1960, p. 1161-1165.

Continuous roasting of low-grade Fe ores in an experimental traveling grate roaster using a continuous gas-permeable bed at 1250-1300° F. (B15, W15a; Fe)

3-B. Pure Beryllium Via the Fluoride Process. N. P. Chopey. Chemical Engineering, v. 67, Oct. 31, 1960, p. 82-85.

Processing of beryl ore into Be ingots by precipitation with NaOH, slurrying with ammonium bifluoride, vacuum salting and reduction with Mg. Ingots are vacuum cast to remove impurities. (B-general, C-general; Be)

4-B. (Russian.) Use of Preheated and Oxygen-Enriched Air in Sintering of Iron Ores. N. E. Sidorov, V. K. Antonov, N. M. Myshchenko and F. F. Pilipaitis. Stal', Oct. 1960, p. 878-883.

Use of preheated air enriched by 3-4% oxygen to reduce coke consumption, improve grain quality of the sintered cake and increase production rates. (B16a; Fe)

5-B. Beneficiation of Iron Ore by Conductivity Separation. M. B. Mairs. Iron and Steel Engineer, v. 37, Oct. 1960, p. 167-169.

High tension process for beneficiation of nonmagnetic Fe ores using a grounded rotor in a static field to separate high conductivity minerals such as hematite or magnetite from poor conductors such as silica. 3 ref. (B14n; Fe)

6-B. (Norwegian.) Flotation of Copper Ore With Silver Nitrate. Anders M. Heltzen. Tidsskrift for Kjemi, Bergvesen og Metallurgi, v. 20, Sept. 20, 1960, p. 183-184.

Effect of $AgNO_3$ on the Cu concentration after flotation of ores containing 3.5% Cu and a concentrate with 14.6% Cu. (B14h, 2-66; Cu)

7-B. Beneficiation of Domestic Chromium Ores. Lloyd H. Banning and William A. Stickney. Paper from "Electric Furnace Proceedings, 1959", v. 17. American Institute of Mining, Metallurgical and Petroleum Engineers, Inc., New York, 1960, p. 157-174.

Beneficiation research on sinkfloating, tabling, flotation and electrostatic separation of Cr ores. Use of flotation to treat Cr pulps in the presence of slime and of high tension electrostatic processes to treat table middlings. (B14; Cr)

8-B. Arizona Copper Silicates Respond to Segregation. Engineering and Mining Journal, v. 161, Nov. 1960, p. 86-87.

Crushed and calcined minus 10-mesh ore is heated at 1400-1500° F. with NaCl and coke in a segregation process to produce fine metallic Cu which is recovered by flotation. (B14, C26; Cu)

9-B. Alumina From Anorthosite--A Report From California. Engineering and Mining Journal, v. 161, Nov. 1960, p. 93.

Recovery of alumina from anorthosite by the lime-soda sinter process in which ore is mixed with limestone and soda ash so that dicalcium silicate and sodium aluminate are formed during sintering. A caustic solution dissolves the latter from the

insoluble silicate and alumina is recovered by precipitation. (B16a, C19n; Al, Si)

10-B. (Japanese.) Sintering Tests of Hematite Foreign Fine Ores in Production of Self-Fluxing Sinter. Takiji Sanematsu, Shizuo Kiriyama and Hiroki Toyozawa. Sumitomo Metals, v. 12, Apr. 1960, p. 380-386.

Productivity of ore sintering operations and properties of the sinter obtained from charges containing 10-20% screened fires of Temangan, Dungun, Goa and Indian ores with 4% coke addition. (B16a; Fe)

11-B. (Italian.) Sintered Ores With Flux Addition. G. Sironi. Metallurgia Italiana, v. 52, Sept. 1960, p. 607-614.

An ore-lime mixture containing 51.19% Fe, 8.37% SiO_2, 2.60% Al_2O_3, 4.20% CaO, 2.50% MgO, 0.76% Mn and 0.675% S is sintered experimentally and reduced in a hydrogen stream at 850° C. Effect of lime additions on basicity and permeability of the sinter ore. 9 ref. (B16a, C-general; Fe, Al, Mg)

12-B. (Translation-ConBur.) Industrial Methods of Processing Poor Uranium Ores. G. E. Kaplan, B. N. Laskorin and B. V. Nevskii. Soviet Journal of Atomic Energy, v. 6, Sept. 1960, p. 57-64.

Review of mechanical enrichment, radiometric sorting, flotation enrichment, pyrometallurgical and hydrometallurgical processes, leaching and sorption methods as processes for treatment of low-grade uranium ore. 28 ref. (B-general, C-general; U)

13-B. (Russian.) Ore Dressing of Oxidized, Finely Dissimilated Tin Bearing Ore. Tyan Chzhun-Chen and I. N. Plaksin. Tsvetnaya Metallurgiya, May 1960, p. 30-36.

Extraction method for tin ores containing finely dissimilated cassiferrite and considerable amounts of gangue, comprising centrifugal separation of the gangue fraction, jigging, magnetic roasting and separation by electromagnetic vibrator and gravitation concentration techniques. 8 ref. (B14, B15; Sn)

14-B. (Russian.) Chemico-Metallurgical Methods of Treating Oxidized Lead-Zinc Ores. A. V. Astafeva, M. D. Ivanovskii and S. K. Shabarin. Tsvetnaya Metallurgiya, May 1960, p. 49-57.

Test beneficiation methods, including chlorination with sodium chloride to sublimate Pb, Au and Ag; leaching by solution of chlorides, or by sulphatizing in ammonium sulphate and leaching by H_2SO_4. 6 ref. (B14; Pb-b, Zn-b)

15-B. (Japanese.) Sintering of Iron Ores. Pt. 1. Koji Sanborgi, Nobunao Nishida and Akikazu Suzawa. Tetsu-to-Hagane (Iron and Steel Institute of Japan, Journal), v. 46, Nov. 1960, p. 1527-1532.

Influence of air flow, coke content and moisture content on the temperature distribution of the sintering bed and the rate of movement of the sintering zone studied for GOA hematite and Larap magnetite ores. 8 ref. (B16; Fe)

16-B. Effects of Structure and Unsaturation of Collector on Soap Flotation of Iron Ores. Strathmore R. B. Cooke, Iwao Iwasaki and Hyung Sup Choi. AIME Transactions, Society of Mining Engineers, v. 214, 1959, p. 920-927.

Flotation tests on ore wash tailings containing hematite, goethite and quartz using fatty acid collectors varying in degree of unsaturation and chain length. Iron oxide is floated from gangue or gangue is activated and floated above the iron oxide. 6 ref. (B14h; Fe)

17-B. The Reduction of the Iron Values of Ilmenite to Metallic Iron at Less Than Slagging Temperatures. R. H. Walsh, H. W. Hockin, D. R. Bradt, P. L. Dietz and P. R. Girardot. Metallurgical Society of AIME, Transactions, v. 218, Dec. 1960, p. 994-1003.

New Jersey, Florida and Canadian ilmenites are reduced with hydrogen or coke under various experimental conditions and the phase changes occurring in the ilmenite upon reduction are studied by microscopic examination of polished sections and X-ray diffraction. Effect of the type of ilmenite, temperature, time and reducing agent on the type of product formed. 49 ref. (B15, P1n, M-general; Fe-b, Ti-b)

18-B. Magnetite-Hematite Ore Concentrated With Separators and Spirals at New Swedish Mill. Sven E. Sjoberg. Mining World, v. 23, Jan. 1961, p. 29-31.

Design of a new magnetic and gravity concentration mill in which magnetite-hematite ore is processed in magnetic

separators to remove the magnetite portions and in shaking tables, cyclones and Humphreys spirals to remove hematite concentrates. (B14, W15r; Fe)

19-B. (Russian.) Suspension Roasting of Copper-Zinc Concentrates Using Oxygen Blowing. M. I. Kochnev, A. I. Okunev, P. A. Myasnikov, S. A. Vermenichev, B. I. Sergin and G. F. Strizhov. Tsvetnye Metally, Oct. 1960, p. 20-23.

Technique for production of sulphide Cu-Zn concentrates using oxygen enriched blowing at 970-1140° C. 4 ref. (B15; Cu, Zn)

20-B. (Russian.) Pyrite Behavior During the Roasting of Sulphide Gold-Bearing Concentrate. V. V. Lodeishchikov, I. K. Skobeev and S. I. Khrachmenko. Tsvetnye Metally, Oct. 1960, p. 44-51.

Temperature dependence of structural transformations in pyrite. Optimum temperature parameters for roasting operation are developed with consideration of possible overheating due to the oxidation reaction heat. Computation of overheating value based on relation to desulphurizing rate and heat exchange. 7 ref. (B15; Au)

21-B. Electric-Arc Furnace Produces Pig-Iron From Steel Scrap. Commonwealth Engineer, v. 48, Oct. 5, 1960, p. 46-47.

Production of pig iron, spheroidal graphite iron and nonmagnetic gray cast iron from mild steel scrap in a 3 ton electric furnace having a refractory lined shell with three triangularly spaced electrodes projecting vertically through the roof. (B23, D5)

22-B. Experiments in Concentrating Iron Ore From the Pea Ridge Deposit, Missouri. M. M. Fine and D. W. Frommer. American Institute of Mining, Metallurgical and Petroleum Engineers, Transactions, v. 214, 1959, p. 325-328.

Magnetic separation and flotation of hematite and magnetite ores to obtain concentrates of 60-71.4% Fe at recoveries of 89.9-97.6%. (B14j, B14h; Fe)

23-B. Processing California Bastanite Ore. Charles J. Baroch, Morton Smutz and Edwin H. Olson. American Institute of Mining, Metallurgical and Petroleum Engineers, Transactions, v. 214, 1959, p. 315-319.

98% rare earth recovery from an ore containing 10% rare earth oxides (La, Ce, Nd, Pr, Sn) is achieved by calcination, leaching with 57% HNO_3 and solvent extraction with tributyl phosphate. (B15, C19n; EG-g45)

24-B. Beneficiation of Autunitic Ores. William C. Aitkenhead and John A. Jaekel. American Institute of Mining, Metallurgical and Petroleum Engineers, Transactions, v. 214, 1959, p. 66-67.

An aqueous emulsion of stearic acid, sodium oleate and kerosene is used as a collector in the froth flotation of autunite from low (0.12-0.39%) and high (1.27-1.49%) uranium ores. (B14h; U)

25-B. Concentration of a Nickel Ore From New Caledonia. S. B. Hudson. Commonwealth Scientific and Industrial Research Organization, Australia, Report no. 593, Apr. 1960, 4 p.

Test evaluation of electrostatic and magnetic separation methods for yielding a 3% Ni concentration in ore samples assaying 2.7% Ni after crushing, classifying and tabling treatment with magnetic separation proving more effective. (B14; Ni)

26-B. The Significance of Microscopic Investigation in the Course of Beneficiation of the "Brunswick Ore". George Aletan. Canadian Mining and Metallurgical Bulletin, v. 53, Dec. 1960, p. 945-952.

Effect of crystal structure, grain size, flotation selectivity and oxidation sensitivity of ore bodies on beneficiation of Cu and Pb ores, as determined by microscopic examinations and statistical counts. 3 ref. (B14, 2-59, M27; Cu, Pb)

27-B. Slime Coatings in Galena Flotation. A. M. Gaudin, D. W. Fuerstenaus and H. L. Miaw. Canadian Mining and Metallurgical Bulletin, v. 53, Dec. 1960, p. 960-963.

The effect of pH and positively charged slime coatings and particles composed of Fe_2O_3, Al_2O_3 and CaF_2 on the flotation of galena. 9 ref. (B14h; Pb)

28-B. (Swedish.) Ore Grinding in the Vassbo Mine. Per H:son Fahlstrom. Teknisk Tidskrift, v. 90, Dec. 9, 1960, p. 1237-1245.

Lead ore containing 6.9% galena, 0.8% zinc blende, 2.0% pyrite and 85%

quartz is ground and sorted by special equipment. Relationship between size of ground ore and Pb content. (B13; Pb)

29-B. Gravity, Dense Media, Magnetic and Electrical Separation. G. A. Cox. Mine & Quarry Engineering, Nov. 1960, p. 480-486.

Review of papers presented at the International Mineral Processing Conference held in London in 1960. Topics include electrostatic separation of low conductivity minerals, electrical high tension minerals beneficiation, wet separation of parmagnetic materials and magnetizing reduction, tabling, jigging and gravity and dense media separation of various Fe ores. (B14, 10-54; Fe)

30-B. Sinter in Focus. Iron & Steel, v. 34, Jan. 1961, p. 11, 15.

Sintering of low phosphorus Fe ore (65% Fe) at new single-strand continuous sinter plant in Norway. Plant is designed to produce 12,500 tons of self-fluxing sinter per week. (B16a; Fe)

31-B. (English.) The Thermal Reduction of Magnesium Oxide. J. M. Toguri. Kjemi, Bergvesen og Metallurgi, v. 20, Nov. 18, 1960, p. 211-214.

Ore or raw material containing Mg as $MgCO_3$ or $MgCl_2$ is subjected to oxidizing roasting. MgO formed is reduced by C, Si, CaC_2 or Al. Description of individual processes. 23 ref. (B15, C26; Mg, 14-68)

32-B. Gold Is Where You Find it. Oilways, v. 27, Jan. 1961, p. 15-20.

Description of processing methods for Al, Cu and steel scrap including cutting by hydraulic machine, flame cutting, briquetting and melting. (B23; Al, Cu, ST)

33-B. Ferrograde Concentrates From Arkansas Manganiferous Limestone. M. M. Fine. American Institute of Mining, Metallurgical and Petroleum Engineers, Transactions, v. 214, 1959, p. 810-812.

Beneficiation of low grade Mn ores by tabling, flotation and leaching. (B14; Mn)

34-B. High-Intensity Magnetic Separation of Iron Ores. O. E. Palasvirta. American Institute of Mining, Metallurgical and Petroleum Engineers, Transactions, v. 214, 1959, p. 1244-1248.

Principles of rotor-induced separation in a high intensity field. Design of magnetic circuits, pole pieces, rotor surfaces and drive and feed mechanisms in a magnetic separator. Application to separation of specularite and hematite ore. (B14j, W15r, 17-57; Fe)

35-B. Chemistry and Mining. E. T. Pinkney. South African Industrial Chemist, v. 14, Oct. 1960, p. 191-199.

Review of the hydrometallurgy of Cu, Sn, Zn, Hg, Fe, Au and Ag. Development of the flotation technique, differential flotation, electrolytic refining, electrolytic winning and liquid-liquid extraction. (B14h, C19; Ag, Au, Cu, Fe, Hg, Sn, Zn)

36-B. (Russian.) Fluidized Magnetic Enrichment of Iron Ores. V. V. Chukin and V. Ya. Miller. Stal', Nov. 1960, p. 965-971.

Fluid bed roasting of ore containing 35-37% Fe, 0.23% FeO and 26-28% SiO_2 in a laboratory furnace with rapid heating to 700-900° C in a slightly reducing atmosphere containing 3% CO. Data are given for productivity and fuel economy of the process. (B15q; Fe)

37-B. New Trends in the Beneficiation of Ferrous and Nonferrous Metal Ores. O. S. Bogdanon, R. B. Shapiro and E. V. Danilova. Paper from "Contemporary Problems of Metallurgy". Consultants Bureau, Inc., New York, 1960, p. 29-42.

Review of ore dressing, roasting and sintering processes on Fe, Mn, Cu, Pb, Zn, Sn and other ores. Concentration methods include gravity and magnetic separation, flotation tabling and jugging, desliming and washing, agglomeration filtration and heavy media suspension. 8 ref. (B-general, 10-54; Fe, Mn, Cu, Pb, Sn, Zn)

38-B. The Beneficiation of Minerals. Mining Journal, v. 256, Jan. 13, 1961, p. 41-42.

Review of papers covering theory of grinding; flotation theory and practice, with emphasis on sulphides, Mn ores and beach sands containing zircon, ilmenite and monazite; heavy media separation; phase separation methods applied to coal and graphite and methods of chemical processing. (B13, B14; Mn)

39-B. (German.) Effect of Uniform Grain Distribution on Temperature Progress in Strand Sintering. Otto Steinhauer and Klaus Zehe. Stahl und Eisen, v. 81, Jan. 19, 1961, p. 88-95.

Production testing during Dwight-Lloyd sintering of basic Bessemer sinter, with temperature measurements being made by thermocouples without interrupting test operations. Correlations between temperature, gas permeability and draft; segregation phenomena in charging raw mixture. (B16; Fe)

40-B. (German.) Influence of Return Sinter on Downdraft Sintering of Iron Ores. Hans Rausch and Fred Cappel. Stahl und Eisen, v. 81, Jan. 19, 1961, p. 96-102.

Test sintering of various Fe ore and return sinter mixtures in a sintering pan with 0.17 m^2 draft area. Dumping and drum tests are used to evaluate sinter strength and reductibility by CO reduction at 950° C. Measurements of microporosity are used to evaluate influence of return sinter on sinter properties. (B16a; Fe)

41-B. Treatment of Dump Ore From Webb's Silver Mine, Emmaville, New England District, N. S. W. J. S. Henkel. Commonwealth Scientific and Industrial Research Organization and the Mining Dept., University of Melbourne, Ore-Dressing Investigations, Rept. no. 594, Apr. 1960, 10 p.

Concentration of valuable metals by flotation from a partly oxidized dump material assaying 0.48% Cu and 9.3 oz. per ton Ag. Recovery of 62% of the Cu and 68% of the Ag in a concentrate assaying 5.1% Cu and 112 oz. per ton Ag. (B14h; Cu, Ag)

42-B. Investigation of Cyanidation Residues From Hill 50 Gold Mine N. L., Mount Magnet, W. A. G. H. Muskett, E. Tasker and R. A. Hobson. Commonwealth Scientific and Industrial Research Organization and the School of Mines of Western Australia, Kalgoorlie, Ore-Dressing Investigations, Rept. no. 713, May 1960, 9 p.

Straking, amalgamation, screen sizing analysis and flotation testing on samples of cyanidation residues and ore samples to determine distribution of Au in the milled products and behavior of the Au under certain flotation conditions. (B14h; Au)

43-B. (Italian.) Use of Leucite in Alumina Production. Aldo Spada. Industria Mineraria, v. 11, Oct. 1960, p. 711-729.

Flotation concentration methods and production by reaction with HCl, HNO_3, H_2SO_4 or a base. Utilization of by-products. (B14h, C19; Al)

44-B. Blending Iron Ore at Stanton. Mining Journal, v. 256, Feb. 10, 1961, p. 152-153.

Design of a layout for crushing and blending Fe ores and sintering the fines to obtain blast furnace burdens of even chemical compositions. (B13, B16a; Fe)

45-B. Methods and Costs of Producing Brown Iron Ore at Two Small Southern Missouri Mines. H. D. Kline. U. S. Bureau of Mines, Report of Investigations 7983, 1960, 18 p.

Open pit mining and washing methods for producing a brown ore containing 35-58% Fe. Review of deposit history, location and physical features, geology, prospecting and exploration techniques, transportation and cost factors in ore production. 6 ref. (B12, B14f, A4; Fe, RM-n)

46-B. Chemical Copper Chalks Up First Customer. Chemical Week, v. 88, Feb. 11, 1961, p. 35-36.

In a new process which eliminates the usual smelting and refining steps, low-grade ores (one having 25% Cu, another 16% Cu) are converted into a 99.95% pure Cu powder which is then made into high-quality strips, tubing and wire. Ore is concentrated by crushing and flotation techniques, then pressurized under ammonia and air at 125 psi. The resulting solution is thickened, distilled and reduced to the powder. (B13, B14h, C26; Cu)

47-B. Semi-Taconite Yields Iron. Steel, v. 148, Mar. 13, 1961, p. 107.

Processing of semi-taconite, an ore containing 25-38% Fe, by roasting at 1300° F. in a revolving, horizontal kiln. Magnetic separators remove iron bearing particles from waste rock. (B15; Fe)

48-B. Minerals Beneficiation. L. J. Bechaud, Jr. Mining Congress Journal, v. 47, Feb. 1961, p. 60-64.

Survey of process developments including autogenous grinding and direct reduction of iron ores, application of hydrometallurgy to Pb ores, Cu and Ag segregation and developments in reagents for flotation. (B14, B15, 10-54)

49-B. Fluid Bed Roasting of Nickel Sulphide. W. Curlook and H. J. Roorda. Canadian Mining and Metallurgical Bulletin, v. 54, Feb. 1961, p. 152-156.

Fluid bed roasting process for the continuous production of coarse, granular nickel oxide from fine sulphide concentrate. Sulphide concentrate is pelletized and then roasted at 2000° F. Description of the 4 ft. diameter roaster and pilot plant development of the process. (B15q; Ni)

50-B. (German.) Industrial Methods for Processing Low-Grade Uranium Ores. Ge. E. Kaplan, B. N. Laskorin and B. V. Nevskij. Kernenergie, v. 2, Oct-Nov. 1960, p. 956-964.

Ore dressing by mechanical methods, flotation and radiometric separation and uranium production by wet metallurgical methods such as sorption from solutions by exchanger resins, leaching and extraction by liquid extractors. (B14h, C19; U)

51-B. (Translation-Brutcher no. 4942.) Investigation of Effect of Gas Vibrations Upon the Reduction of Iron Oxides. H. Schenck and J. Cloth. Stahl und Eisen, v. 80, no. 22, 1960, p. 1453-1457.

Exploration of possibilities of accelerating the reduction of Fe ores by vibrating the reducing gas (CO and H) and the reaction gases in general. Vibration frequencies and gas pressure amplitudes used in experiments. Effect of various vibration frequencies ranging from 0.6-430,000 cps. and gas flows on rate of reduction with dense and porous ores. (B15p; Fe)

52-B. (German.) History of Draft Sintering (Agglomerating) of Iron Ores. W. Troeller. Revue Technique Luxembourgeoise, v. 52, Oct-Dec. 1960, p. 227-229.

Development of Fe and Pb ore, calcined pyrite and flue dust sintering in converter processes (Job converter, Huntington-Heberlein converter) and on sinter strands (Dwight-Lloyd strand). (B16)

53-B. (German.) Control of Sinter Plant Operation. Bernhardt Weilandt and Nikolaus Petrusch. Stahl und Eisen, v. 81, Feb. 16, 1961, p. 235-238.

Method and equipment for control of sintering process by measurement of amount, temperature and composition (CO, CO_2 and H_2O content) of waste gas. Control of optimum humidity and fuel content of sinter. (B16a)

54-B. Beneficiating Manganese Oxide Ores From the Butte-Philipsburg Federal Stockpile. R. C. Bush, G. V. Sullivan and W. A. Stickney. U. S. Bureau of Mines, Report of Investigations 5728, 1961, 19 p.

Continuous circuit flotation used to concentrate straight oxide ore and mixed oxide-carbonate ore by an oil emulsion scheme to produce a concentrate for sintering to meet requirements for smelting using less flux. Evaluation of chemical composition and physical properties. (B14h, B16a; Mn)

55-B. Iron Ore Agglomeration--Sintering and Pelletizing. Alan English. Iron and Steel Engineer, v. 38, Mar. 1961, p. 113-119.

Comparison of sintering to pelletizing for applicability in blast furnace burdening practices, the sintering process being flexible, with utilization of a variety of materials whereas the pelletizing process uses a finely divided material. Plant layout and design and production methods for pellets and sinter, with attention to self-fluxing materials. (B16a, B16b, D1a; Fe)

56-B. New Sinter Line Increases J & L's Blast Furnace Capacity. Iron and Steel Engineer, v. 38, Mar. 1961, p. 151-152, 155-156.

An automatic sintering plant is used to produce self-fluxing sinter composed of flux dust, mill scale, iron ore, limestone and dolomite for use in a blast furnace. (B16a, 1-52; Fe)

57-B. (English.) Milling Low Grade Tin Ore at Kamativi Tin Mines Limited. C. J. A. Van Lummel. Geologie en Mijnbouw, v. 39, Oct. 1960, p. 560-564.

Concentration of cassiterite ores using treatment on Humphrey's spirals for recovering grains between 0.8 mm.

and 37 microns. Recovery of undersize grains by cycloning and jigging. (B14; Sn)

58-B. The Dry Concentration of Ores and Minerals. R. A. Kipp. Canadian Mining and Metallurgical Bulletin, v. 54, Mar. 1961, p. 241-243.

Dry concentration of materials such as wolfram, chrome, zircon, rutile, sands, diamonds and Sn tailings with air flotation table and electrostatic separator. Effect of particle shape, size, speed and friction on separation efficiency. (B14)

59-B. Some Reasons for Selectivity in Copper Activation of Minerals. C. H. G. Bushell, C. J. Krauss and G. Brown. Canadian Mining and Metallurgical Bulletin, v. 54, Mar. 1961, p. 244-251.

Activation of sphalerite, marmatite and pyrrhotite with copper sulphate in the flotation process for extraction of Pb, Zn and Fe. Effect of solution pH and oxygen and nitrogen content on recovery efficiency. Thermodynamic analysis of the process. (B14h; Pb, Zn, Fe)

60-B. (Japanese.) Reduction of Iron Oxide. Preparation Temperature of Ferric Oxide and Reduction Efficiency. Seiichi Takagi. Nagoya Institute of Technology, Bulletin, Dec. 1960, p. 329-333.

Reduction of ferric oxide as produced by the roasting of ferrous oxalate at 700-1200° C. with town gas. Effect of temperature on crystal and powder grain size, acid solubility, chemical reactivity, porosity and reduction rate. 16 ref. (B15p; Fe-b)

61-B. (German.) Sintering of Ore Fines by the Shaft Sintering Process. Werner Wenzel and Hermann Schenck. Stahl und Eisen, v. 81, Mar. 30, 1961, p. 404-407.

Test sintering of Fe ores in a pilot transverse flow shaft furnace. Strength, reducibility and degree of oxidation of sinter are compared to sinter-pan method products. (B16a, 1-52; Fe)

62-B. Chlorination of an Idaho Ilmenite. E. C. Perkins, H. Dolezal and R. S. Lang. U. S. Bureau of Mines, Report of Investigations 5763, 1961, 16 p.

Chlorination of an ilmenite containing 46.5% TiO_2 and 35.6% Fe at 1000° C. in a quartz tube using Cl_2, NaCl, coke and caustic as reagents to produce $TiCl_4$. Calculation of production rate and chlorination efficiency. 102 ref. (B15r; Ti-b, Fe)

63-B. Effect of Particle Size Upon the Green Strength of Iron Oxide Pellets. R. P. Jewett, C. E. Wood and J. P. Hansen. U. S. Bureau of Mines, Report of Investigations 5762, 1961, 15 p.

Balling tests on crushed magnetite and hematite ore concentrates containing 47.9-69.4% Fe. Effect of moisture content, surface diameter, particle size, porosity and density on green crushing strength. (B13, B16b, H11n; Fe-b)

64-B. Flotation of Beryl From Northeastern Pegmatites. J. E. Shelton. U. S. Bureau of Mines, Report of Investigation 5767, 1961, 10 p.

Direct, cationic and anionic flotation of ground pegmatites containing 0.43-1.16% BeO using reagents of H_2SO_4, NaOH, HCl, NaF, H_2SiF_6, HF and acetic acid. (B14h; Be)

65-B. (German.) Use of Flame Coal and Hot Blast on Sintering Strands in Sintering Minette Ores. Karl Heyden. Stahl und Eisen, v. 81, Apr. 13, 1961, p. 498-501.

Sintering of basic Bessemer sinter (41-42% Fe) from minette ore fines and minette flue dust using flame coal (80% of fuel) as fuel with a hot blast. Fuel and heat savings are compared to sintering with cold blast. (B16a; Fe)

66-B. (German.) Results in Briquetting of Flue Dust. Wilhelm Wolf and Helmut Wysocki. Stahl und Eisen, v. 81, Apr. 27, 1961, p. 559-561.

Procedure and mechanical equipment for production of blast furnace burden briquets from flue dust and openhearth slag with sulphide liquor as the binder. Quality control by cold compression and drop testing of the briquets after annealing in blast furnace waste gas, with subsequent smelting trials in the blast furnace as up to 25% of the burden. (B16d, D1a; Fe)

67-B. Beneficiation of Red Iron Ore Fines From Pyne Mine, Bessemer, Ala. W. E. Lamont, I. D. Feld and B. H. Clemmons. U. S. Bureau of Mines, Report of Investigations 5779, 1961, 16 p.

Refining of red iron ore by gravity concentration, flotation and pyrometallurgical treatment. 14 ref. (B14, C21; Fe)

68-B. Recent Progress in Milling and Gold Extraction at Giant Yellowknife Gold Mines, Limited. R. J. C. Tait. Canadian Mining and Metallurgical Bulletin, v. 54, Apr. 1961, p. 302-314.

Recovery of Au from pyrite, arsenopyrite, stibnite and antimony sulphosalts by flotation, roasting of flotation concentrate and subsequent cyanidation of the calcine. (B14h, B15, C19p; Au)

69-B. Fluid Bed Roasting--Principles and Practice. R. B. Thompson and G. Roesner. Paper from "Extractive Metallurgy of Copper, Nickel and Cobalt". Interscience Publishers, Inc., New York 1, 1961, p. 3-32.

Extraction of nonferrous metals from sulphide concentrates of Cu, Co and Ni by fluid bed roasting. Types of reactors and bed design and fluidization characteristics are reviewed with examples for hydrometallurgy and pyrometallurgy of Cu concentrates. 14 ref. (B15q, B15r; Cu, Co, Ni)

70-B. (Portuguese.) Sintering Degree and Reducibility of Sintered Ore. Tharcisio D. de Souza Santos and Sergio Bresciani. Boletim da Associacao Brasileira de Metais, v. 17, no. 62, 1961, p. 133-144.

The degree of sintering of ore used in the preparation of ferronickel is determined by rotating the sinter in drums and measuring the quantity of fines obtained after 1000 rotations. A reducibility index is found by holding known quantities of sinter ore and charcoal in a recipient for 4 hr. at 800° C. and subsequent melting in a laboratory furnace. Computation from the Ni contained in the sinter, the Ni content of the ferronickel obtained, the quantity of reduced sinter and the quantity of ferronickel. 6 ref. (B16a; Fe, Ni)

71-B. (Russian.) Magnetic Conversion of Krivoi-Rog Quartzites by Roasting in Fluidized Bed. V. A. Sorokin, V. I. Karmazin, L. G. Katsen, A. I. Ivanov and P. E. Ostapenko. Stal', Dec. 1960, p. 1057-1060.

Iron ore containing 63.45% particles of a diameter less than 1 mm. is fluid-bed roasted in a stream of a mixture of 10% coke oven gas and 90% blast furnace gas, serving as a reducing agent and subsequently subjected to magnetic separation. A concentrate containing 67% Fe is obtained. 5 ref. (B15q; Fe)

72-B. (Russian.) Processing of a Fe-V Concentrate Obtained From Volkov Ores. D. G. Khokhlov, A. I. Pastukhov, S. A. El'kin, V. A. Shamarin, I. E. Ruchkin, A. I. Bychin and K. B. Khusnoyarov. Stal', Dec. 1960, p. 1061-1063.

Sintering of Volkov and other concentrate with coke and limestone additions. Composition, basicity, reducibility and degree of sintering of the product obtained. (B16; Fe, V)

73-B. Reduction of Low Grade Iron Ore With Carbon: Influence of Time and Temperature. Francis J. Lecznar. Journal of Scientific & Industrial Research, v. 20D, Mar. 1961, p. 85-90.

Influence of time and temperature on reduction of limonite sand with charcoal. Optimum temperatures for obtaining Fe_3O_4, FeO and Fe are 700-800, 800-900 and 900° C. respectively. Reduction time decreases with temperature increase. 19 ref. (B15p; Fe)

74-B. Flotation Studies on Copper-Nickel Sulfide Ores From Deposits Near Rockport, Maine. John E. Shelton. U. S. Bureau of Mines, Report of Investigations 5793, 1961, 17 p.

Beneficiation tests on pyrrhotite disseminated in talc and hypersthene using selective Cu and Ni flotation with sulph-hydric collectors in an alkaline circuit. Data are given for Ni and Cu content of the concentrates. (B14h; Cu, Ni)

75-B. (English.) Investigation of Behavior and Recovery of Rhenium on Roasting of Molybdenite Concentrates in Fluidized-Bed Furnaces. A. N. Zelikman, V. I. Bibikova, V. M. Petrov, S. V. Postnikova, G. I. Abashin, V. F. Pritulo and L. N. Nikitina. Planseeberichte fur Pulvermetallurgie, v. 8, Jan. 1961, p. 166-172.

Roasting of preroasted and nonpreheated Mo concentrate with 0.025-0.04% Re at 540-630° C. in a fluidized bed and in a tubular rotary furnace. Subsequent recovery of Re from flue dust by electrofilter and gas washer. (B15q, B15r; Mo, Re)

76-B. A Review of Iron Ore Sintering. J. H. Porteus. Iron and Steel Engineer, v. 38, May 1961, p. 144-155.

Use of concentrates, ore fines and fluxes in sinters. Sintering, pelletizing and briquetting processes. Equipment for materials handling, screening, sintering and cooling operations. (B16a; Fe)

77-B. Factors in the Life of Open Hearth Refractories. Pt. 2. W. S. Debenham. Industrial Heating, v. 28, May 1961, p. 977-978, 980, 982, 984.

Effect of composition of refractories for roofs, walls and bottoms on performance characteristics and life in furnaces. Importance of furnace operating conditions. (B19d; RM-h, 17-57)

78-B. Experimental Extraction of Strategic Components From S-816 Alloy Scrap. H. Kenworthy, V. A. Nieberlein and A. G. Starliper. U. S. Bureau of Mines, Report of Investigations 5786, 1961, 27 p.

Study of the recovery of Ni, Co and Cr from S-816 Co alloy scrap. Methods investigated include size degradation by steam jet granulation, catastrophic, direct and selective oxidation using vanadium pentoxide, molybdenum trioxide, nickelic oxide or an oxygen jet; carbonyl treatment, selective carburization, roasting, leaching and electrolytic corrosion in acidic, alkaline or salt medium. (B23; Co-b)

79-B. (Portuguese.) Experimental Sintering of Garnierite. Tharcisio D. de Souza Santos and Sergio Bresciani. Boletim da Associacao Brasileira de Metais, v. 17, no. 62, 1961, p. 103-116.

Garnierite fines containing 2.68% NiO, 5.55% moisture and 10.6% volatile materials are charged in a sintering furnace after addition of 6-12% charcoal powder. Effect of water addition (up to 18%) and charge composition on the furnace efficiency. Temperature and development of gaseous substances as a function of time. (B16a; Fe, Mg, Ni)

80-B. Mincon BeO Process Uses Domestic Ores. Sidney Levine. Nonmetallic Minerals Processing, v. 2, May 1961, p. 15-19.

Heat flotation method of extraction which includes the sintering of raw ore and calcination of the finished oxide is used for recovery of BeO from low-grade Be ore. Operation, equipment and flow diagram of processing plant. (B14h; Be)

81-B. (Slovak.) Kinetics of the Reducing Roasting of Albanian Hematite. Viktor Jesenak and A. Jantula. Hutnicke Listy, v. 16, Apr. 1961, p. 266-269.

Dehydrated hematite containing 1.38% NiO is reduced in a hydrogen-steam mixture of varying composition from 560-700° C. to find the optimum temperature and hydrogen concentration for the manufacture of Fe_3O_4 and Ni. 13 ref. (B15; Fe)

82-B. Magnesium Producer Shuns Electrolysis. B. E. Barnes. Chemical Engineering, v. 68, May 29, 1961, p. 70-72.

Production of Mg based on the calcining of dolomite ore, mixing the calcine with a ferrosilicon reducing agent and fluospar and thermally reducing the mixture to yield pure Mg. (B15, C26; Mg)

83-B. Laboratory Concentration of Seven Titanium-Bearing Ores of the Pacific Northwest. J. W. Town and C. W. Sanders. U. S. Bureau of Mines, Report of Investigations 5771, 1961, 12 p.

Results of testing Ti ores for amenability to various beneficiation techniques. Magnetic and electrostatic separation, chlorination, gravity concentration, flotation and roast-leach magnetic separation. Sizing studies. Application of a sulphurization process for upgrading Ti content. (B14, B13, B15r; Ti, RM-n)

84-B. The Chlorination of Ilmenite. I. B. Ketteridge. British Chemical Engineering, v. 6, June 1961, p. 405, 407.

Design parameters for fluid bed reactors for the manufacture of rutile are expressed in terms of retention times, reaction rates and reactor efficiency. (B15q, 1-52, 17-51; Ti)

85-B. The Agglomeration of Iron Ores and Concentrates. D. J. Hains. Canadian Mining and Metallurgical Bulletin, v. 54, June 1961, p. 430-436.

Review of principles and process parameters for ore dressing and pelletizing and sintering production of blast furnace burdens from ore fines and concentrates. 5 ref. (B13, B16; Fe)

86-B. (Russian.) Neutralization of Ores at Blast Furnace and Agglomeration Plants. E. S. Glikman. Izvestiya VUZ--Chernaya Metallurgiya, Feb. 1961, p. 191-196.

Development of a standard method for calculating necessary size of areas where ores are crushed and mixed before entering blast furnaces and agglomeration plants in order to obtain the most effective mixing of ores and thereby avoid variations in chemical composition and sizes. 6 ref. (B13)

87-B. (Japanese.) Heat Transfer During the Sintering Process. Pt. 2. Study of the Sintering of Iron Ores. Koji Sanbongi and Nobunao Nishida. Tetsu-to-Hagane (Iron and Steel Institute of Japan, Journal), v. 47, May 1961, p. 687-692.

Temperature distribution and rate of heat transfer during sintering of Goa hematite and Larap magnetite ores by heating with hot air at 800° C. Effect of air flow rate and charge moisture content on heat and flame front rates in sintered and nonsintered layers and on temperatures in the combustion zone. 5 ref. (B16; Fe)

88-B. Flotation Used to Concentrate Beryllium Ore. Chemical & Engineering News, v. 39, July 3, 1961, p. 46.

Various ores, especially bertrandite (a hydrated beryllium silicate) are processed by drying, crushing and grinding, followed by concentration in a series of flotation cells. Special reagents are used, producing a 3.5% BeO concentration from 0.8% ore. (B14h; Be)

89-B. (Translation-Brutcher no. 4857.) Secondary Breaking of Iron Ores by High Frequency Current. M. I. Agoshkin and A. S. Voronyuk. Izvestiya Akademii Nauk, OTN Metallurgiya i Topliva, Jan. 1960, p. 138-144.

Description of two methods--magnetic technique and its application to ores with magnetic characteristics; contact method with merits of breaking in drift, scraping or screening entries. (B12; Fe)

90-B. Space Uses Push Beryllium Development. Chemical & Engineering News, v. 39, June 26, 1961, p. 21-22.

The concentration of domestic low grade Be ores is discussed in its commercial applications in nuclear, electronic and missile industries. Domestic and foreign sources of Be ores are reviewed. (B14h, A11a, 17-57; Be)

91-B. (Translation-Brutcher no. 5037.) Investigation of the Reduction Kinetics of Ferrous Oxide by Solid Carbon at Temperatures Above 1400° C. V. V. Kondakov, D. I. Ryzhonkov and D. M. Golenko. Izvestiya VUZ--Chernaya Metallurgiya, Apr. 1960, p. 23-28.

Effect of charge weight on rate and completeness of reduction of FeO; effect of temperature on reduction rate; data on rate coefficient and activation energy. (B15p; Fe)

92-B. (Translation-Brutcher no. 5104.) Combustion of Carbon During the Sintering of Iron Ores. A. A. Sigov and V. A. Shurkhal. Izvestiya VUZ--Chernaya Metallurgiya, Dec. 1960, p. 23-30.

Laboratory experiments on sintering wet sand and coke fines; temperatures, combustion products composition, sintering of Krivoi-Rog (hematite + 10% magnetite and brown) ore. (B16a; Fe)

93-B. (Translation-Brutcher no. 5181.) Some Peculiarities of the Reduction of Hardened Pellets From Southern Concentrates by Gases. G. V. Gubin. Izvestiya Akademii Nauk SSSR, OTN Metallurgiya i Topliva, Jan. 1961, p. 147-149.

Comparative study of hardened pellets from Southern U.S.S.R. (chiefly hematite) concentrates for reducibility in natural gas (98.3% CH_4), dry and moist, hydrogen and carbon monoxide. Effect of reduction time and temperature on degree of reduction by the three gases. (B15p; Fe)

94-B. (Translation-Brutcher no. 5054.) Production of Sinters of Increased Basicity and Smelting Them in the Blast Furnace. L. von Bogdandy. Stahl und Eisen, v. 81, Jan. 1961, p. 12-22.

Advantages to be gained by the production and use of self-fluxing sinters. Production of increased basicity sinters, fuel consumption, relation of coke rate to CO_2 content in limestone. Statistical evaluation of operating data from numerous blast furnaces. (B16a, D1)

95-B. (Translation-Brutcher no. 5063.) Effect of Uneven Particle Size Distribution on the Strand-Sintering Temperature of Iron Ores. O. Steinhauer and K. Zehe. Stahl und Eisen, v. 81, Feb. 1961, p. 88-95.

Previously abstracted from original. See item 39-B, 1961. (B16a; Fe)

96-B. (Translation-Brutcher no. 5157.) Study of Reducibility of Sinter. J. Willems and G. Quade. Stahl und Eisen, Sept. 1961, p. 552-558.

Previously abstracted from original. See item 336-D, 1961. (B16a; Fe)

97-B. (Translation-ConBur.) Study of Reducing Roasting of Zinc and Magnesium Sulphate. V. V. Pechkouskii. Journal of Applied Chemistry of the USSR, v. 33, May 1960, p. 1020-1024.

Mixtures containing 0.5-8 moles of carbon per mole of dehydrated $ZnSO_4$ or $MgSO_4$ are roasted in a current of pure dry N_2 or in a current of N_2 containing 7.5% SO_2 from 550-900° C. in a tubular furnace. Effect of temperature and carbon content in the charge on the degree of reduction. Influence of roasting time and temperature and additives MgO, ZnO, CaO and Mn_2O_3 on the degree of conversion of sulphate S into sulphide form. 14 ref. (B15p; Zn-b, Mg-b, S)

98-B. (Translation-ConBur.) Investigation of the Combustion of Copper-Zinc Concentrates in a Current of Oxygen. S. A. Vermenichev, V. I. Deev and M. I. Kochnev. Journal of Applied Chemistry of the USSR, v. 33, May 1960, p. 1030-1035.

Laboratory studies of the combustion of CuS-ZnS concentrates in a current of O_2 are conducted in a vertical reaction chamber of a resistance furnace from 900-1200° C. Determination of the effects of varying O_2 excess on the dust yield, solid oxidation product yield and the elemental distribution in the products. 14 ref. (B15n; Cu-b, Zn-b, S)

99-B. (Japanese.) The Fluidizing and Selective Chlorination Roasting of Pyrite Cinders. Pt. 3. Study of Dry Decopperizing of Pyrite Cinders. Kazuhisa Okajima, Michio Inouye and Kokichi Sano. Tetsu-to-Hagane (Iron and Steel Institute of Japan), v. 47, June 1961, p. 795-800.

Removal of Cu, Zn and S from pyrite cinders by roasting in chlorinating atmospheres from 500-1050° C. for various times. Effect of particle size and roasting time and temperature on Fe and impurity content. (B15q, 2-61, 3-67, 3-73; Fe-b, Cu, Zn, S)

100-B. Platinum Mining at Rustenburg. C. B. Beath, R. J. Westwood and C. A. Cousins. Platinum Metals Review, v. 5, July 1961, p. 102-108.

Geology of Pt deposits, mining methods and stopping practice and metallurgical treatment of the ore. (B-general, A11a; Pt)

101-B. Beneficiation of Ferruginous Sandstones of the Northampton Sand Ironstone Formation. G. E. Davies. Iron and Steel Institute, Journal, v. 198, July 1961, p. 282-289.

Classification by screening and magnetic separation after low-temperature reduction roasting removes silica and increases Fe concentration from 20-50%. 8 ref. (B13d, B14j; Fe)

102-B. (Russian.) Concentration of Molybdenum Ores. V. K. Apollonov. Tsvetnye Metally, Feb. 1961, p. 5-10.

Concentration of an ore containing 57% quartz, 28% microcline, 5% plagioclase, 5% muscovite, 2% sericite and 1% molybdenite, powellite or pyrite by flotation. About 8-14% of the total Mo contained in the ore is present in the form of oxides. Effect of two-stage grinding in ball mills on concentration. 9 ref. (B14h, B13; Mo)

103-B. (Russian.) Separation of Collective Cu-Pb-Zn-Pyrite Concentrates Containing Secondary Sulphides and Oxides of Copper. V. A. Nagaenko. Tsvetnye Metally, Mar. 1961, p. 1-4.

Selective hydrometallurgy and flotation of ore containing 3.03% Cu, 15.18% Pb and 30.51% Zn. The results are a Pb concentrate containing approx. 39% Pb, 11-12% Zn and 4% Cu and a Zn concentrate with approx. 47% Zn, 4% Pb and 1% Cu. (B14h, C19; Pb, Zn, Cu)

104-B. (Russian.) Final Treatment of Unconditioned and Crude Bulk Concentrates. V. A. Skorov. Tsvetnye Metally, Mar. 1961, p. 4-10.

Concentrates containing 67.85-70.56% WO_3, 1.42-2.02% As, 1-1.32% Sn, 0.48-0.65% S, 0-0.04% P, 0-2% SiO_2, 0-0.04% Cu and 0-5.52% MnO are treated by magnetic separation, roasting and flotation to obtain a W concentrate with 68.43% WO_3, 0.10% Sn, 2.15% As and 0.035% P, a Sn concentrate with 53.84% Sn and 1.15% WO_3; and sulphide mixture containing 25.4% As, 0.71% WO_3 and 0.20% Sn. (B14; W, Sn, S)

105-B. (Russian.) Fluid Bed Roasting of Nickel Concentrate Obtained in the Selective Flotation of Converter Matte. Zh. R. Nadzhar'yan and V. G. Bryndin. Tsvetnye Metally, Mar. 1961, p. 52-55.

Concentrates containing 68-69% Ni, 3.5-4% Cu, 1% Co, 22% Si, 3-3.5% Fe and 7.5% moisture are roasted to obtain a product containing 67-68% Ni, 4% Cu, 1-1.2% Co and 2-2.5% S. The sulphur content is determined as a function of particle size. (B15q; Ni)

106-B. The Treatment of Tin Ores in the Rooiberg Concentrator. R. C. M. van der Spuy. South African Institute of Mining and Metallurgy, Journal, v. 61, May 1961, p. 468-488.

Crushing, washing, concentration and regrinding. Description of the tube mill, slime plant, dressing plant and regrind plant. Production and by-products and extraction and recovery statistics. (B-general; Sn)

107-B. (Czech.) Partial Replacement of the Solid Fuel With Another Source of Heat in the Sintering of Iron Ores. Emil Seidler. Hutnicke Listy, v. 16, May 1961, p. 307-311.

Operational and economic advantages of gaseous fuel injection during sintering of an ore-coke mixture. Temperature, reducibility and compressive strength of sintered ore as functions of sintering time and solid-gaseous fuel ratio. 4 ref. (B16a, Q28g; Fe, RM-n)

108-B. (Swedish.) Titanium Tetrachloride and Iron From Ilmenite. A. Bergholm. Jernkontorets Annaler, v. 145, Apr. 1961, p. 205-221.

Partial reduction, partial chlorination and total chlorination methods. Review of the inherent possibilities of these several routes. 34 ref. (B15r; Fe, Ti)

109-B. (Translation-ConBur.) Chlorination in the Metallurgy of Rare and Nonferrous Metals. I. S. Morozov. Journal of Applied Chemistry of the USSR, v. 33, Aug. 1960, p. 1669-1682.

Chlorination processes for Cb_2O_5, TiO_2 and ZrO_2. Physicochemical principles of purification and separation of rare-metal chlorides. Review of work done in 1958-1959 on chlorination of Zr, Hf, BiO, W, Mo, Re, Ta-Cb concentrates and various ores. 57 ref. (B15r, 10-54; Zr, Hf, Be, W, Mo, Re, Ta, Cb)

110-B. (Translation-Brutcher no. 5194.) Pelletizing Iron Ore Fines Preparatory to Strand Sintering. S. Zielinski, A. Maslanka and M. Kowalewski. Hutnik, v. 28, Feb. 1961, p. 44-49.

Economic reasons for the pelletizing of fine sinter mixes prior to sintering; best pellet sizes compared with size of pellets for use directly in blast furnace. Theory underlying the formation of pellets out of sinter mixes. (B16b; Fe)

111-B. (German.) Laboratory Investigation of Reduction of Domestic Iron Ores in the Fluidized Bed. Kurt Sauberlich and Ulrich Rabe. Neue Hutte, v. 6, June 1961, p. 333-342.

Investigation of reduction behavior of "Buchenberger" iron ore in the fluidized bed (grain size 0-2 mm.) at 600-800° C. in a laboratory furnace using blast furnace waste gas, water gas and pure CO as reducing agents. (B15q; Fe)

112-B. (Russian.) Sulphating Fluid Bed Roasting of Iron Ores. L. A. Petrov, E. K. Fedorov and L. M. Tsylev. Izvestiya Akademii Nauk SSSR, Otdelenie Tekhnicheskikh Nauk, Metallurgiya i Toplivo, Jan. 1961, p. 31-38.

Russian ores containing Cu and Co are experimentally fluid-bed roasted at 525-625° C. in a mixed stream of SO_2 and O and subsequently leached in water of a 3% H_2SO_4 solution. Effects of SO_2 contained in the gas, roasting temperature and time, particle size and rate of gas stream on the relative quantity of Cu and Co extracted in leaching. 12 ref. (B15, C19n; Fe)

113-B. (Russian.) Increase of the Effectiveness of Hydroxyl Collectors in Flotation. L. A. Barskii, I. N. Plaksin and V. I. Tyurnikova. Izvestiya Akademii Nauk SSSR, Otdelenie Tekhnicheskikh Nauk, Metallurgiya i Toplivo, Jan. 1961, p. 152-158.

Flotation of tailings containing 0.011% Mo. Effect of surface active substances such as sodium tridecylate and sodium alkyl sulphate added to the pulp on collector dispersion and final Mo concentration. 14 ref. (B14h; Mo)

114-B. First International Agglomeration Symposium. Journal of Metals, v. 13, Aug. 1961, p. 571-574.

Summaries of papers presented at the First International Symposium on Agglomeration held in Philadelphia, Pa., April 12-14, 1961, including an evaluation of the properties of dolomites affecting self-fluxing sinter rates; advances in balling and pelletizing; hat briquetting of partially reduced iron oxide ores and dusts; properties of sinter smelted in the electrothermic zinc furnace. (B16; Fe, Mg)

115-B. Some Aspects of Airflow Through Sinter Beds. D. W. Mitchell. Iron and Steel Institute, Journal, v. 198, Aug. 1961, p. 358-363.

Correlation of measured and calculated values based on flow, bed area, bed height, applied suction, turbulence, Reynolds number, voidage, fluid density, fluid volumn, fluid viscosity and particle surface area. 15 ref. ($B15_q$)

116-B. (Ukranian.) Flotation of Iron Ore From Waste Rock Minerals With the Aid of Combined Depressor. F. N. Belash and P. A. Hontarenko. Dopovidi Akademii Nauk Ukrainskoi SSR, May 1961, p. 640-643.

Flotation of Fe ore from Fe quartzites by combined depressor consisting of thallic oil soap, water glass and small additions of sulphuric acid and sodium bichromate. 4 ref. (B14h; Fe)

117-B. (Italian.) Plastic Refractory Bricks of Silicon-Alumina. I. Ferro. Fonderia, v. 10, July 1961, p. 295-298.

Data on plastic refractory bricks and a comparison with traditional refractories. Preparation, control and applications of plastic refractories. (B19, 2-60; RM-h40, Al, Si, NM-d)

118-B. The Second Challenge to the Lake Superior District. M. O. Holowaty and G. H. Craig. Blast Furnace and Steel Plant, v. 49, Sept. 1961, p. 883-890.

Utilization of nonmagnetic taconites and semitaconites; roasting, pelletizing and beneficiation; and production of synthetic scrap of uniform quality are discussed as solutions to the problem of providing Fe rather than oxides to the market. (B-general, A11b: Fe)

119-B. (English.) Manufacture of Coke for Special Pig Iron. Pt. 1. Coke for Low Phosphorous Pig Iron. Menoiu Nakahara, Kazuto Takesue and Takashi Shibata. Yawata Technical Report, no. 231, June 1960, p. 89-94.

Factors in selection of coking coal suitable for producing low-phosphorus coke. Comparison of phosphorus contents in American and Japanese coals and effect of coke composition on compositions of various Bessemer and openhearth steels. (B18n)

120-B. (Translation-ConBur.) Heat Transfer From a Fluidized Bed of Granular Material to a Heat-Exchange Surface. Pt. 3. D. C. Traber, V. B. Sarkits and I. P. Mukhlenov. Journal of Applied Chemistry of the USSR, v. 33, Oct. 1960, p. 2167-2174.

Influence of bulk density and specific heat of the solid phase (vanadium, alumina-nickel, iron-magnesia and Fe-Cr catalysts, silica gel, marble, quartz, chamotte and coke) on heat transfer under various hydrodynamic conditions. 7 ref. ($B15_q$)

121-B. (Translation-ConBur.) Heat Transfer From a Fluidized Bed of Granular Material to a Heat-Exchange Surface. Pt. 4. I. P. Mukhlenov, D. G. Traber and V. B. Sarkits. Journal of Applied Chemistry of the USSR, v. 33, Oct. 1960, p. 2175-2180.

Derivation of equations for calculating maximum coefficients of heat transfer and the corresponding optimum gas velocities from fluidized beds based on vanadium, alumina-nickel and Fe-Cr catalysts, silica gel, marble, quartz, chamotte and coke. 16 ref. ($B15_q$)

122-B. (Translation-ConBur.) Reduction of Ferric Oxide and Magnetite by Mixtures of Hydrogen and Carbon Monoxide at Low Temperatures. A. G. Maskvicheva and G. I. Chufarov. Journal of Applied Chemistry of the USSR, v. 33, Oct. 1960, p. 2181-2184.

CO and H mixtures of varying concentrations are used to reduce iron oxides at 275° C. under 240-260 mm. pressure. At low temperatures the most active reducing agent for Fe_2O_3 is CO and H for Fe_3O_4. 6 ref. ($B15_p$; Fe)

123-B. (Japanese.) Operating Conditions a Pilot Plant Fluidizing Roaster. Pt. 1. Pilot Plant Tests on the Selective

Chlorination Roasting of Pyrite Cinders. Kazuhisa Okajima, Michio Inouye and Kokichi Sano. Tetsu-To-Hagane (Iron and Steel Institute of Japan, Journal), v. 47, Aug. 1961, p. 1137-1143.

The pressure drop through the bed and variation of particle size distribution of overflow cinders are determined for chlorination and roasting of various pyrites at 525-1050° C. at different pressures and gas velocities. 9 ref. (B15q; Fe-b)

124-B. Pilot Milling of Bagacay Copper-Zinc Ore. R. B. Quicho, L. O. Pedron and F. C. deLeon. U.S. Bureau of Mines, Philippines, Manila, Report of Investigation no. 30, May 1961, 9 p.

Feasibility of producing bulk concentrate assaying 14.14% Cu and 15.55% Zn at 65.5% recovery for Cu and 67.7% for Zn using Z-200 as collector-frother at pH 10. Differential flotation of a bulk concentrate containing 12.03% Cu and 10.58% Zn preground to 95% minus 325-mesh produces a Cu concentrate assaying 21.19% Cu and 10.38% Zn and a Zn concentrate assaying 15.24% Zn and 18.58% Cu. (B13c, A9j; Cu, Zn)

125-B. Screw Feeder Raises Ore Yield. Iron Age, v. 188, Sept. 14, 1961, p. 186.

Flotation process using sodium fluoride powder additions controlled by screw feeder to separate Fe from crude martite ore. (B14h, 1-52; Fe)

126-B. (Translation-Brutcher no. 5172.) Use of Bituminous Coals and Hot Blast in the Strand Sintering of Minette Iron Ores. K. Heyden. Stahl und Eisen, v. 81, no. 8, 1961, p. 498-501.

Previously abstracted. See item 65-B, 1961. (B16a; Fe)

127-B. Oxygen Boosts Risdon's Zinc Output. R. W. Pickering and D. J. Gaffney. Engineering and Mining Journal, v. 162, Sept. 1961, p. 106-107.

Use of byproduct oxygen from ammonium sulphate production in Zn hearth, flash and fluid-bed roasting plant to reduce sulphide content of calcine while maintaining high ratio of oxidation. Process achieves full economy and high Zn solubility while holding low Fe solubility in the furnaces. (B15, A11c; Zn)

128-B. (Russian.) Increased Output of Electric Separators. N. M. Karnaukhov and T. B. Tarasova. Tsvetnye Metally, Apr. 1961, p. 3-8.

Separation of sintered concentrate containing TiO_2, SiO_2 and ZrO_2 by an electric separator employing corona discharge and electrostatic field; influence of rotation rate of grounded electrode and of the thickness of the fed sinter layer on the output of the separator. 4 ref. (B14n, 1-69; Si, Ti, Zr, 14-68)

129-B. (Russian.) Obtaining Metallic Columbium From Carbide-Oxide Mixture. H. P. Shveikin and P. V. Held. Tsvetnye Metally, Apr. 1961, p. 39-42.

Processes for obtaining carbide-oxide mixture of Cb in the presence of CO, H and Ar and for obtaining metallic Cb from a carbide-oxide mixture of Cb by briquetting and calcining in a vacuum furnace. 6 ref. (B15, B16b, 1-73; Cb, 14-68)

130-B. How Magnesium Is Produced in Alabama. Southern Power & Industry, v. 79, Sept. 1961, p. 22-23.

Production of high purity Mg from calcined dolomite ore, blended and briquetted with ferrosilicon and a small amount of fluorspear. Mg is liberated from the briquetted material by a vacuum distillation process. (B-general, C22, 1-73; Mg)

131-B. (Russian.) Fluosolids Roasting of Sulphide Gold-Bearing Concentrates. I. I. Kershanski and H. S. Hubaidullin. Tsvetnye Metally, June 1961, p. 45-50.

Roasting and desulphurization in a newly designed furnace with Silit heaters using hot compressed air. Rust is recovered by sleeve filters. 8 ref. (B15; Au)

132-B. J & L Operating Largest Single Strand Iron Ore Sintering Line. Industrial Heating, v. 28, Sept. 1961, p. 1682-1686, 1688, 1690.

Equipment, layout and operation of the world's largest iron ore sinter line, capable of producing more than 225,000 net tons per month of high quality feed for blast furnace at the Aliquippa, Pa., works of Jones & Laughlin Steel Corp. (B16, W15a, 1-52; Fe, RM-n)

133-B. (Translation-ConBur.) Reduction of Sulphide Ore With Petroleum Gas-Steam Mixtures. V. P. Rozhdestvenskii

and S. S. Krivolapov. Journal of Applied Chemistry of the USSR, v. 33, Dec. 1960, p. 2588-2592.

Study of the reduction of a rich sulphide Fe ore concentrate containing 1.1% S at 950° C. in a flow-type laboratory unit with a fixed permeable bed of ore. Effects of steam and reducing gas concentrations on the degree of reduction, carbon formation and removal of sulphur from the ore. 7 ref. (B15q; Fe-b, S)

134-B. Roasting Rates and Elementary Mechanisms. E. Peters. Canadian Mining and Metallurgical Bulletin, v. 54, Aug. 1961, p. 580-584.

Reaction mechanisms between solid phases and with furnace atmospheres during roasting including heat transfer, gas-solid interactions with accompanying mass transfer between the bed and furnace atmosphere, vapor phase transport processes in solid-solid interactions and solid phase diffusion processes. Effect of composition, sintering time and temperature on the composition of the sinter product and on the decomposition rate. 5 ref. (B15, B16a, 2-60, 2-61)

135-B. Multiple Hearth Roasting of Sulphides in the Zinc Roasting Plant of the Hudson Bay Mining and Smelting Co., Ltd. Flin Flon, Manitoba. Ben Schneider. Canadian Mining and Metallurgical Bulletin, v. 54, Aug. 1961, p. 585-588.

The split-draft process is used for controlling the amount of sulphation and the hearth temperature and limiting the formation of Zn ferrite by regulating the draft. Layout and operation of the roasting plant and the multiple hearth wedge furnaces. (B15, W15a; Zn)

136-B. Suspension Roasting of Zinc Concentrate at Trail, British Columbia. R. E. Eyre. Canadian Mining and Metallurgical Bulletin, v. 54, Aug. 1961, p. 589-594.

Suspension roasting of marmatite concentrates by the Cominco process, drying, grinding and calcine machining. Consideration is given to the composition and fineness of the concentrate, temperature and time for roasting, oxygen concentration in the roaster and gas recirculation techniques. (B15n, 2-60, 2-61, 3-73; Zn)

137-B. Fluid Bed Roasting Practice in the Red Lake Camp. K. P. Wright. Canadian Mining and Metallurgical Bulletin, v. 54, Aug. 1961, p. 595-600.

Autogenous fluid-bed roasting of a flotation concentrate for subsequent Au recovery by cyanidation. Roaster operations and calcine roasting and cyanidation techniques used by three mining companies. (B15q, C19p, 1-52; Au)

138-B. The Falconbridge Iron Ore Process. P. G. Thornhill. Canadian Mining and Metallurgical Bulletin, v. 54, Aug. 1961, p. 601-608.

Feed preparation, reduction and precipitation process and calcine leaching used in a sulphate roast-leach method for recovering Ni, Cu and Co from nickeliferous pyrrhotite ore. Design and operation of fluid-bed roasters with consideration of corrosion and erosion effects on its stainless steel components. 8 ref. (B15q, C19n, W15a, 1-52; Ni-b, Cu, Co)

139-B. Roasting in the Iron and Steel Industry. H. U. Ross. Canadian Mining and Metallurgical Bulletin, v. 54, Aug. 1961, p. 609-614.

Review of gas-solid chemical reactions occurring in roasting. Study of roasting of siderite, pyrite and pyrrhotite; magnetic roasting of limonite, goethite and hematite and removal of sulphur by sintering. (B15, B16a, 10-54; Fe)

140-B. Experimental and Commercial Magnetic Roasting. R. L. Cavanagh and A. J. Last. Canadian Mining and Metallurgical Bulletin, v. 54, Aug. 1961, p. 615-622.

Production of magnetic oxides using shaft, rotary kiln, fluid bed, traveling grate, rotating hearth and flash roasters. Application to processing of hematite, limonite and siderite. (B15, W15a, 1-52; Fe)

141-B. Roasting Practices at International Nickel. R. R. Saddington, W. Curlook and H. J. Roorda. Canadian Mining and Metallurgical Bulletin, v. 54, Aug. 1961, p. 623-630.

Fluid bed and multiple hearth roasting of Ni concentrates and pyrrhotite. Effects of furnace temperature, gas velocity and sulphide concentration on process efficiency. 12 ref. (B15, W15a; Ni, Cu, Fe)

142-B. Application of the Jones Wet Magnetic Separator to the Beneficiation of Iron Ore. W. J. D. Stone. Canadian Mining and Metallurgical Bulletin, v. 54, Sept. 1961, p. 677.

Results of tests on various types of Fe deposits using separator which functions on a frequency of 10-15 cycles per min. (B14j; Fe, RM-n)

143-B. (Russian.) Sintering Process and Structure of Tungsten Carbide-Cobalt and Tungsten Carbide-Nickel Alloys Characterized by Carbon Deficiency. I. N. Chaporova and E. I. Shchetilina. Izvestiya Akademii Nauk SSSR--Metallurgiya i Toplivo, Mar. 1961, p. 37-41.

Vacuum roasting of WC-Co and WC-Ni alloys at 1350-1500° C. followed by cooling at various rates. Crystal heterogeneity is evaluated as a function of carbon deficiency prior to roasting and carbonization after roasting. 7 ref. (B15, B16, 2-60; W, Co, Ni)

144-B. (Russian.) Shrinkage Intensification During Powder Roasting. H. A. Meyerson and I. V. Vitagni. Izvestiya Akademii Nauk SSSR--Metallurgiya i Toplivo, Mar. 1961, p. 42-49.

Reduction, briquetting and sintering of Ni and Mo oxides. Shrinkage is measured as a function of composition. Strength and density are tested by electric resistance. 6 ref. (B16, 1-52, S11c; Ni, Mo. 14-68)

145-B. Pelletizing of Iron-Ore Blue Dust. S. Jayaram, D. D. Bhuptani and V. G. Paranjpe. Tisco (Tata Iron & Steel Co., Journal), v. 8, Oct. 1961, p. 210-219.

Effects of process variables including rolling method and duration, disk angle, pellet size and distribution, rotation speed, moisture content and nature and amount of additives. Pellet hardening and influencing factors such as moisture evaporation and temperature. 26 ref. (B16b, 1-52)

146-B. Processing the Rammelsberg Ores. Mine & Quarry Engineering, v. 27, Oct. 1961, p. 452-461.

Production of Zn, Fe and Pb-Cu concentrates by crushing, grinding, xanthate flotation, thickening and filtering ores of galena, zinc blende, copper pyrite and pyrite containing barytes and carbonates. Equipment design and plant operation are given for separate processing of massive and banded ores at two mills. (B-general, 18-67; Cu, Fe, Pb, Zn)

147-B. Ore Dressing in Europe and North America. K. S. Blaskett. Mining & Chemical Engineering Review, v. 53, Aug. 15, 1961, p. 49-54.

Review of mining methods and separating processes including crushing and grinding, flotation, gravity concentration, magnetic and electrostatic separation, filtration and instrumentation. Use of higher strength metals and improved design and control. (B-general, B14, 17-51, 17-57)

148-B. The Flotation of Slimes. William E. Foreman. Canadian Mining Manual, 1961, p. 98-101.

Froth flotation is used to beneficiate metallic and nonmetallic particles of less than 10 microns in size. Settling rates in the collection zone are increased by the use of centrifugal force, having an adverse effect on collection and tending to give better grade of float but a poor recovery. (B14h)

149-B. (Slovak.) Use of Oxygen in Some Metallurgical Processes. Jaroslav Malkovsky, Juraj Schmiedl, Julius Holeczy and Frantisek Sehnalek. Hutnicke Listy, v. 16, Aug. 1961, p. 573-581.

Use of oxygen in the roasting of ores and concentrates containing CdS, PbS or CuS in their smelting and refining of mattes in converters. Effects of air stream rate and oxygen enrichment on roasting speed and of the oxygen in the blast or blow, respectively, on converter or furnace efficiency. 6 ref. (B15, C21, 1-52; Cd, Cu, Pb)

150-B. St. Lawrence Columbium Project Starts Production in Quebec. Engineering and Mining Journal, v. 162, Oct. 1961, p. 99-104.

Equipment, plant layout and process flowsheet for the production of high grade Cb-bearing pyrochlore concentrates. Geology of the deposit, tabulation of waste-ore tonnage and chemical analysis of the produced concentrate. (B-general, 1-52; Cb)

151-B. New Methods, New Ore Sources Attract Aluminum Industry Research Efforts. Finn B. Domaas. Engineering and Mining Journal, v. 162, Oct. 1961, p. 105-109.

Report of progress in the laboratory and pilot-plant research projects covering the direct reduction of Al and the extraction of high-grade alumina from materials other than bauxite. Flowsheets are given for Aluminium Ltd.'s direct reduction process, Perchiney's reduction circuit and low stack furnace, Kretzschmar's reduction scheme which produces no wastes and Anaconda's alternate methods of treating crude alumina with caustic soda or soda sinter. (B-general, 10-54; Al)

152-B. African Alumina Plant Reshapes Bayer Process to Optimize Profits From Low-Grade Ore. Chemical Engineering, v. 68, Oct. 2, 1961, p. 42-44.

Plant development data with modified flowsheet illustrating process steps from raw bauxite to finished alumina. (B13, B14, 1-52)

153-B. Blast Furnace Refractory Resists Carbon Monoxide. Steel, v. 149, Oct. 30, 1961, p. 70, 72.

Development of a low Fe aggregate, high alumina castable material which resists carbon monoxide disintegration. Density, thermal shock resistance, dimensional stability, workability and rebound loss properties of refractory usable up to 2800° F. (B19d, P10, Q10a, Q23q, 2-66; RM-h40)

154-B. (Russian.) The Effect of Caustic Soda on Beryllium Mineral Surface When Preparing It for Flotation. I. N. Plaksin and V. I. Solnyshkin. Izvestiya VUZ--Tsvetnaya Metallurgiya, Mar. 1961, p. 28-35.

Use of infrared spectroscopy to study the surface structure of Be, rutile, ilmenite, Zr and magnetite ore particles treated by caustic soda and deposited on NaCl plates. 19 ref. (B14h, M21g; RM-n, Be, Zr)

155-B. Copper Segregation Process Shows Promise at Lake Shore Mine. G. A. Freeman, Carl Rampacek and L. G. Evans. Mining Engineer, v. 13, Oct. 1961, p. 1152-1155.

Oxidized and mixed oxide sulphide Cu ore is selectively ground and heated with NaCl and coke at 1400-1500° F. in a segregated reactor with subsequent grinding and flotation producing concentrates of 65% Cu. Process mechanics and plant layout with emphasis on reactor design. (B14h, 1-52; Cu)

SECTION C

NONFERROUS EXTRACTION and REFINING

1-C. (German.) Production of Very Pure Metals From Their Iodides. Robert F. Rolsten. Zeitschrift fur Anorganische und Allgemeine Chemie, v. 305, Aug. 1960, p. 25-39.

Method and apparatus for production of Cr, Cu, Fe, Si, Ti, Ta and Cb by thermal decomposition of their volatile iodides in a simplified De Boer bulb at temperatures from 223-2000° C. Microstructure and hardness of the deposited metals. (C1p, M27a, Q29n; Cr, Cu, Fe, Cb, Si, Ti, Ta)

2-C. (Italian.) An Improved Apparatus for Purification of Metals by the Zone Melting Method. D. Gelli and T. Federighi. Alluminio, v. 29, Sept. 1960, p. 403-409.

Purification of Al and other low melting point metals in a zone melting apparatus controlled by an automatic programming device. 12 ref. (C28k; Al)

3-C. High-Purity Electrolytic Chromium. M. J. Ferrante, P. C. Good, F. E. Block and D. H. Yee. Journal of Metals, v. 12, Nov. 1960, p. 861-865.

Kilogram quantities of high-purity, ductile Cr are prepared by electrodeposition from chromic acid solutions at high temperature. Deposit has a lower Sn and oxygen content than metal from fluoride electrolytes. 22 ref. (C23, 2-62; Cr)

4-C. Consumable Electrode Melting of Reactive Metals. S. J. Noesen. Journal of Metals, v. 12, Nov. 1960, p. 842-849.

Effect of melting temperature and pressure on the purity of vacuum arc melted Ta, Mo, Cb, W, Cu and Cr-Mo-Ni steel. 17 ref. (C5h, 1-73, D8m, 2-61, 3-74; Cb, Cu, Mo, Ta)

5-C. (German.) Continuous Casting of Nonferrous Metals. Pt. 1. Copper and Its Alloys. E. Herrmann. Metall, v. 14, Nov. 1960, p. 1098-1105.

Horizontal continuous casting of round stock composed of gray cast iron and Cu alloys using water-cooled graphite molds. Microstructure after casting. (C5q, M27; Cu-b, CI-n)

6-C. (German.) Thermodynamics of the Reduction of Uranium-Tetrafluoride by Magnesium. I. M. Dubrovin and A. K. Evseev. Kernernergie, v. 3, June 1960, p. 577-579.

Computation of free enthalpy, equilibrium constant and equilibrium vapor pressure of Mg during reduction of UF_4 by Mg assuming that the system U-Mg-$MgFe_2$-UF_4 can be taken as unvariant at 1400° C. (C26, P12; Mg, U)

7-C. Reactive Metal Melting Furnace Eliminates Water Cooling Hazard. M. L. Torti and John L. Ham. Mining & Chemical Engineering Review, v. 52, Sept. 15, 1960, p. 74-75.

Vacuum arc skull melting of Ti alloy castings using a rapid melting vacuum arc furnace with a heavy skull which acts as a heat sink. (C5h, W18s, 1-73; Ti-b, 5)

8-C. (Japanese.) Applications of Thorium and Rare Earth Atoms. Takeshi Kojima. Metals, v. 30, Aug. 1, 1960, p. 46-48.

Separation of Th from monazite sand by solvent extraction or adsorption. Mechanical properties of Mg alloys containing Th or rare earth metals. 9 ref. (C28, Q-general; Th, Mg-b)

9-C. (German.) Influence of Alloying Elements on Casting Structure of Aluminum

and the Behavior of Aluminum During Recrystallization. Franz Lihl, Eduard Nachtigall and Gertraud Piesslinger. Zeitschrift fur Metallkunde, v. 51, Oct. 1960, p. 580-589.

Casting of pure Al and Al alloyed with Fe, Si, Ti, Cr, Cu, Mg, Mn or Zn at 680-1000° C. Effect of alloying elements and casting temperature on recrystallization of cold worked and annealed specimens. (C5, N5, 2-60, 2-61; Al-b, Cr, Cu, Fe, Mg, Mn, Si, Ti, Zn)

10-C. Thermoelectric Alloy Has High Efficiency. Electronics, Oct. 7, 1960, p. 80.

Production of a thermoelectric alloy composed of Ag, Sb and Te by direct fusion and zone refining. Data are given for microstructure and thermal properties. (C28k, M27, P11; Ag-b, Sb, Te)

11-C. Casting and Cold Extrusion of Aluminium Bar Stock. Australasian Manufacturer, v. 45, Oct. 15, 1960, p. 44-49.

Production of Al alloy rod and bar stock using a continuous single-strand, horizontal billet casting machine and cold extrusion presses of varying capacities. (C5q, G5; Al, 4-55)

12-C. (French.) Purification of High Purity Copper by the "Floating Zone Melting Technique". Jacques Le Hericy. Comptes Rendus, v. 251, Oct. 10, 1960, p. 1509-1511.

Pure Cu (99.99%) is purified by levitation melting, rolled and wire-drawn to 1 mm. diam. and annealed under vacuum for 14 hr. at 500° C. Purity of wire is determined by measurement of electrical resistivity at 20° C. and at temperature of liquid hydrogen and is compared with purity obtained by conventional zone melting technique. 8 ref. (C28; Cu)

13-C. (French.) Preparation of Calcium by Distillation of Liquid Aluminum-Silicon-Calcium Alloys. E. Bonnier, P. Poyet and R. Caboz. Comptes Rendus, v. 251, Oct. 10, 1960, p. 1512-1514.

Ratios of average speeds of distillation of Al and Si to distillation of Ca make it possible to select, from combinations of commercial Al-Ca and Si-Ca alloys, ternary starting compositions which provide Ca of greater purity at a higher rate of extraction than by distillation of the binary compounds. Theoretical calculations are compared with some experimental results. 9 ref. (C22; Ca-b, Al, Si)

14-C. (French.) Investigation of the Coprecipitation of Palladium and Tellurium. Comparison of Coprecipitates to Alloys Formed by a Heating Process. M. Segu-Cros and H. Triche. Comptes Rendus, v. 251, Sept. 5, 1960, p. 1127-1129.

Heating of Pd and Te under vacuum at 900° C. and reduction of mixed solutions of palladium chloride and sodium tellurite in a solution of hydrazine sulphate with HCl concentration of 0.1-2N. Analysis of phases in alloys and coprecipitates and formation of solid solutions of Te and Se in Pd. 5 ref. (C27, 1-73, N-general; Pd-b, Te, Se)

15-C. (French.) Purification of Copper by the Zone Melting Method. Jacques Le Hericy. Comptes Rendus, v. 251, Oct. 3, 1960, p. 1385-1387.

Zone melting of OFHC Cu in argon atmosphere and graphite vessel of nuclear purity, with inverse segregation of Fe toward head of ingot and massing of impurities near tail. Electrical resistivity of OFHC wire in cold worked condition and of zone-melted specimens annealed between 500 and 1050° C. under vacuum and in current of pure-dry hydrogen is compared. 3 ref. (C28k, P15g, 2-64, 3-68; Cu)

16-C. (Czech.) Intensification of Vanadium Extraction by Leaching. Drahomir Trojka. Hutnicke Listy, v. 15, Oct. 1960, p. 781-791.

Slags containing 2.60-6.07% vanadium are leached in water at 20-100° C. Effects of the addition of 1-30% Na_2CO_3, H_2SO_4 or NaOH to the water and of temperature. Influence of HCl and NaCl quantities present on the precipitation of vanadium compounds. 3 ref. (C19n; V)

17-C. (Japanese.) Zone Refining of Pure Copper. Tomisaburo Nara and Yoshito Yamada. Japan Institute of Metals Journal, v. 24, July 1960, p. 460-464.

Vacuum melted Cu ingots are refined by zone melting. Purity and distribution coefficients are determined by spectrographic analysis, with electrical resistivity measurements being made on the ingots and on annealed, cold drawn wire specimens. 22 ref. (C28k; Cu-a)

18-C. Operations at Canadian Copper Refiners, Limited. G. Bidgstock, E. M. Elkin and S. S. Forbes. Canadian Mining and Metallurgical Bulletin, v. 53, Oct. 1960, p. 773-787.

Refining of Cu, Ag, Au, Se, Te and $CuSO_4$. Design of equipment used in sampling, melting, roasting and casting. 4 ref. (C-general, 1-52; Cu)

19-C. Experiences in Induction Vacuum Melting. Industrial Heating, v. 27, Nov. 1960, p. 2354-2356, 2358, 2360.

Induction vacuum melting of heat resisting Ni-Cr alloys, Cu-Be alloys and soft magnetic alloys based on Ni-Fe. Design and operation of 40 lb. capacity tilting furnace. (C5j, 1-73, W18a; Ni-b, Cu-b, Fe-b, SGA-h)

20-C. Developments in the Consumable Electrode Melting of Reactive Metals. S. J. Noesen. Paper from "Electric Furnace Proceedings, 1959", v. 17. American Institute of Mining, Metallurgical and Petroleum Engineers, Inc., New York, 1960, p. 27-45.

Vacuum melting and purification of Mo, W, Ta, Cb, Zr and Ti. Data for electrode melt-off rate as a function of current strength and crucible diameter and for composition of the purified ingots. 18 ref. (C5h, 1-73; Cb, Mo, Ta, Ti, W, Zr)

21-C. Degassing of Steel in Vacuum for Use in Aircraft Castings. John K. Dietz. Paper from "Electric Furnace Proceedings, 1959", v. 17. American Institute of Mining, Metallurgical and Petroleum Engineers, Inc., New York, 1960, 1. 223-225.

Degassing of high Ni-high Co base alloy and stainless steel melts using a degassing chamber with induction furnace. (C5m, D9s, 1-73; Co-b, Ni-b, SS)

22-C. Recent Developments in Strategic-Udy Smelting Processes. Murray C. Udy. Paper from "Electric Furnace Proceedings, 1959", v. 17. American Institute of Mining, Metallurgical and Petroleum Engineers, Inc., New York, 1960 p. 301-315.

Applications of the Strategic-Udy pyrometallurgical process, a smelting technique using combinations of rotary kilns, reverbatory furnaces and electric furnaces in the recovery of metallic values from ores, concentrates or waste products. (C21; RM-n)

23-C. Report of Symposium on Refractory Metals (Methods of Melting and Purification). Industrial Heating, v. 27, Nov. 1960, p. 2367-2368, 2370, 2372, 2376, 2378, 2382.

Electron beam melting, vacuum arc melting, vacuum sintering and other method of melting and purifying of Cb, Mo and Ta. Control of melting parameters to achieve high degree of purity. (C5, 1-73; Cb, Mo, Ta)

24-C. Iron Ore Reduction--Kinetics and Thermodynamics. Pt. 2. Industrial Heating, v. 27, Nov. 1960, p. 2406, 2408.

Kinetics of the hydrogen reduction of hematite at 350-700° C. are measured with a thermal conductivity cell. (C26; Fe, RM-n)

25-C. Contribution to the Theory of the Electrolytic Production of Aluminum. R. Pion telli. Metallurgia Italiana, v. 52, Aug. 1960, p. 469-477 and 546.

Phenomena of overvoltage, anodic effect and concentration polarization discussed in relation to laboratory experiments and basic laws governing operation of cell for production of Al. 12 ref. (C23, 10-51; Al)

26-C. (Italian.) Use of Electrolytic Processes in Titanium and Zirconium Metallurgy. M. Socci. Metallurgia Italiana, v. 52, Aug. 1960, p. 547-550.

Thermal processes in use on industrial scale for production of metallic Zr and Ti; electrolytic process still in experimental stage. Electrolytic refining of otherwise unusable Ti and Zr scrap; possible adaptation of this process for electrolytic extraction of these metals from oxides and other compounds. (C23; Ti, Zr)

27-C. (Italian.) Electrowinning of Manganese. G. Scacciati. Metallurgia Italiana, v. 52, Aug. 1960, p. 551-560, 564.

Electrochemical and technological problems and operating conditions imposed thereby; types of electrolytic cells in use; characteristics of metal produced; power consumption. 21 ref. (C23n; Mn)

28-C. (English.) Electrowinning and Electrorefining of Titanium. Some Proposals in Recent Patent Literature. C. A. Goethals. Metallurgia Italiana, v. 52, Aug. 1960, p. 561-564.

Problems of composition of electrolyte, cell construction and removal of

deposited metal from cell. 54 ref. (C23; Ti)

29-C. (Italian.) Manufacture of Lithium by Igneous Electrolysis. Applications of Lithium. C. Merli. Metallurgia Italiana, v. 52, Aug. 1960, p. 565-569.

Physical and chemical properties of Li; uses of Li metal and Li compounds in chemical, petroleum, pharmaceutical, atomic energy and metallurgical industries. Electrowinning of Li. Influence of Li on mechanical properties of metals to which it is added as an alloying element. 56 ref. (C23n, P-general, Q-general; Li, 17-57)

30-C. (Italian.) Production and Use of Magnesium. S. Zanier and M. Enrici. Metallurgia Italiana, v. 52, Aug. 1960, p. 570-576.

Preparation of raw materials for electrolytic production of metallic Mg, with special reference to process based on sea water. Thermal reduction processes using carbon, calcium carbide and ferrosilicon as reducers. Industrial and experimental furnaces for silicothermic process. 11 ref. (C-general, W18; Mg)

31-C. (Italian.) Production of Foundry Silicon. M. Cavigli. Metallurgia Italiana, v. 52, Aug. 1960, p. 577-583.

Thermodynamic reactions during production of metallic Si. Principal features of electrothermal process in smothered-arc furnace. Methods of controlling purity of product. 4 ref. (C21d; Si)

32-C. Process Shakeup Brewing in Aluminum. Chemical Engineering, Oct. 17, 1960, p. 90-91.

Partial description of a new method for producing Al in which Al_2O_3 is reduced to metal in the presence of all the impurities in the ore and the metal is distilled out. (C-general; Al)

33-C. (Translation-PERA.) A New Method of Obtaining Products and Tubes Directly From Molten Metal. A. V. Stepanov. Russian, Nov. 1959, p. 35-37.

Tubes, plate and bars of Zn, brass, Al alloys, plastics, intermetallic and organic compounds are produced directly from the molten state by a molding process using capillary action are described. (C52; Al-b, Cu-n, Zn, 14-60)

34-C. Preparation and Crystal Structure of Americium Metal. D. B. McWhan, J. C. Wallmann, B. B. Cunningham, L. B. Asprey, F. H. Ellinger and W. H. Zachariasen. Journal of Inorganic and Nuclear Chemistry, v. 15, Sept. 1960, p. 185-187.

Preparation of Am by reduction of AmF_3 with Ba vapor or by reduction of AmO_2 with La metal; subsequent X-ray diffraction analysis. (C26, M22g, M26; Am)

35-C. (Russian.) Autoclave Leaching of Gold and Silver From Products of Complex Composition. A. I. Sinelnikova and I. N. Pcaksin. Tsvetnaya Metallurgiya, May 1960, p. 95-98.

Technological parameters for oxygen autoclave process of flotation concentration. Effect of ammonia concentration in leaching solution, time, temperature and partial oxygen pressure on the rate of dissolution of useful metal particles and on percentage of Au and Ag extraction. 11 ref. (C19n, B14h, Ag, Au)

36-C. Separation of Sulphur, Selenium and Tellurium From Arsenic. J. M. Whelan, J. D. Struthers and J. A. Ditzenberger. Electrochemical Society, Journal, v. 107, Dec. 1960, p. 982-985.

Investigation of vacuum sublimation, sublimation in hydrogen and distillation from Pb solution as methods for obtaining semiconductor-grade As. 10 ref. (C19a, C22, N15g; As, S, Se, Te)

37-C. Electrolytic Vanadium and Its Properties. D. H. Baker, Jr., and J. C. Ramsdell. Electrochemical Society, Journal, v. 107, Dec. 1960, p. 985-989.

Vanadium is produced by a fused salt electrorefining technique using an NaCl electrolyte containing VCl_2. Data for mechanical and physical properties of arc melted, cold rolled and annealed ingots. (C23p, P-general, Q-general; V)

38-C. Electrodeposition of Pure Copper. Sidney Barnartt. Electrochemical Society, Journal, v. 107, Dec. 1960, p. 1004-1006.

Description of a one-step electrodeposition process which yields Cu of 99.999+ 90 purity without subsequent melting. (C23; Cu-a)

39-C. Methods for Improving Quality of Ti Sponge Produced by the Kroll Process. W. M. Mark, S. Yih, C. L. Lo and D. H. Baker. U. S. Bureau of Mines, Report of Investigations 5665, 1960, 29 p.

High-quality, ductile Ti sponge with a Brinell hardness number of 110 is produced by the Kroll Process, which involves purification of crude $TiCl_4$ with H_2S, degassing, fractional distillation, filtration and reduction with Mg in a pot-type reactor at 690-710° C. (C26; Ti, 6-74)

40-C. Aluminium Production at Hirakud. Research and Industry, v. 4, Sept. 1959, p. 224-227.

Design and operation of a new Al smelter in India which has capacity of 10,000 tons per year. Main units are electrolytic cells (pots), furnaces and paste plant. Raw material and power requirements. (C21, C23, 1-52; Al)

41-C. (Japanese.) Effects of Added Elements on the Removal of Copper in Liquid Lead by Addition of Sulphur. Hisato Hagiwara. Japan Institute of Metals, Journal, v. 24, Sept. 1960, p. 601-603.

Effects of As, Sb, Ag and Sn on the removal of Cu from liquid Pb studied at 500-800° C. Relation of Cu and S activity coefficient in Pb. 10 ref. (C28, P12b, 2-60; Pb, Cu, S)

42-C. (Japanese.) Magnesium Deposits Produced by Reduction of Dolomite With Fe-Si Alloy. Hisashi Ito and Masao Ikeda. Japan Institute of Metals, Journal, v. 24, Sept. 1960, p. 549-552.

The crystal size of Mg deposited in vacuum at 1050-1200° C. is studied to determine temperature range of condensation and impurity distribution. 5 ref. (C26, 1-73, M26; Mg)

43-C. (Russian.) Refining of Beryllium by Vacuum Distillation. V. E. Ivanov, V. M. Amonenko, G. F. Tikhinsky and A. A. Kruglykh. Fizika Metallov i Metallovedenie, v. 10, Apr. 1960, p. 581-585.

Production of high purity Be (99.987%) using vacuum distillation method with condensation of vapors on the heated surface at 900-1200° C. Hardness measurements for Be of various purities. Reduction of plasticity attributed to presence of oxygen and carbon in produced metal. 16 ref. (C22h, Q29, Q23p, 3-69; Be)

44-C. (German.) Preparation of Iron Single Crystals by Zone Melting. Hans Hillmann and Albrecht Mager. Zeitschrift fur Metallkunde, v. 51, Nov. 1960, p. 663-666.

Cylindric rods of carbonyl iron of 0.04% impurity are induction heated in a mixture of argon and humid hydrogen, with the molten zone advancing at a rate of 0.3 to 6 mm./min. High purity single crystals with 6 ppm. oxygen, 1-2 ppm. nitrogen and no more than 1 ppm. carbon are obtained. Data for orientation and delta-alpha transformation. 13 ref. (C28k; Fe, 14-61)

45-C. Purification Factor Characterization of Zone Refining. Louis Gold and Virginia Johnson. Franklin Institute, Journal, v. 270, Nov. 1960, p. 367-381.

The purification factor which defines the potential state of purity realizable in a specimen that has undergone zone-refining is evaluated for various distribution coefficients and zone dimensions involving a maximum of 10 passes. 3 ref. (C28k)

46-C. (Spanish.) Manufacture of Aluminum Castings. D. Iturrioz. Metalurgia y Electricidad, v. 24, Oct. 1960, p. 73-82.

Casting of conventional and interlocking Al ingots. Layout and preparation of patterns and pattern plates. (C5; Al)

47-C. (Rumanian.) Preparation of Metallic Calcium From Industrial Calcium Alloys. Stefan Mantea and Nicolae Petrescu. Studii si Cercetari de Metalurgie, v. 5, no. 3, p. 365-370.

Vacuum distillation of Ca-Si alloys containing 30-40% Al and 27-30% Fe at 1100-1200° C. Effect of Al and Fe on purity of Ca obtained. 6 ref. (C22, 1-73, 2-60; Ca-b, Al, Fe, Si)

48-C. Process Changes Brewing in Aluminum Making. Metalworking Production, v. 104, Nov. 23, 1960, p. 74.

Al_2O_3 is reduced to metal in the presence of all the impurities in the ore in a process which by-passes the usual alumina-from-bauxite extraction step. Al is then distilled out in a reactor operating at 1000-1200° C. and 1 atm. pressure. (C26, C22; Al)

49-C. (Russian.) Refining of Nickel Concentrates Containing Iron. Yu. V. Alekseev. Tsvetnye Metally, Sept. 1960, p. 42-46.

Reduction of Fe in a powdered Ni-concentrate by melting the concentrate in a vacuum crucible at 700-1200° C. and dividing the molten concentrate

into a S-Ni layer and an Fe containing layer. Influence of melting temperature and soaking time on separability of Fe. (C26, 2-61; Ni, Fe)

50-C. (Russian.) New Composition of Electrolyte for Magnesium Electrolytic Cell. Kh. L. Strilets and N. V. Bondarenko. Tsvetnye Metally, Sept. 1960, p. 62-66.

Electrolytic production of Mg using a solution of $MgCl_2$, NaCl, KCl and $BaCl_2$ as electrolyte. Effect of $BaCl_2$ on electroconductivity, viscosity, specific gravity and surface tension of the solution on the deposition of Mg upon the cathode. 5 ref. (C23; Mg)

51-C. Ingot Casting. Metal Industry, v. 97, Nov. 26, 1960, p. 443-444.

Casting of Zn ingots and slabs using a molten metering pump to deliver accurate quantities of metal from the holding furnace to the mold. Ingots are stacked automatically with each layer arranged in a predetermined pattern and with the bottom layer forming a pallet for lifting by fork truck. (C5; Zn)

52-C. (Japanese.) Vacuum Arc Melting of Molybdenum. Kazuo Tsuya. Japan Institute of Metals, Journal, v. 24, Oct. 1960, p. 625-629.

Consumable-electrode vacuum-arc melting of arc cast Mo ingots using carbon as the deoxidant. Effect of deoxidation on grain size, hardness and microstructure. 3 ref. (C5h, 1-73, M27, Q29; Mo)

53-C. New Pulsating Burner Saves Fuel and Operating Overhead. Industrial Gas, v. 39, Dec. 1960, p. 3-4.

Melting of Al in a reverberatory furnace using a pulsating gas burner to prevent incomplete combustion and prolong life of furnace lining. (C5; Al)

54-C. (German.) Materials of High Purity. H. Psille. VDI Berichte, no. 46, 1960, p. 31-34.

Production of 99.99% pure Al by three layer electrolysis and subsequent zone refining, 99.99% pure Zn by electrolysis of $ZnSO_4$, pure Ge and Si by reduction with hydrogen and subsequent zone refining, very pure Fe by zone refining, 99.999% Cu by electrolysis or sintering and 99.995% pure Se by sublimation of SeO_2 and Si. Properties, applications and testing of very pure materials. (C-general; Al, Cu, Fe, Ge, Se, Si, Zn)

55-C. A Vertical-Flow Reactor. W. A. Lloyd and N. R. Amundson. I/EC (Industrial and Engineering Chemistry), v. 53, Jan. 1961, p. 19-22.

Use of the reactor for reduction of powdered Fe oxide. When most of the ferric oxide is reduced to magnetite, a new period occurs where reduction rate is accelerated. 9 ref. (C26, 1-52; Fe)

56-C. A Tubular Reactor. I. G. Dalla Lana and N. R. Amundson. I/EC (Industrial and Engineering Chemistry), v. 53, Jan. 1961, p. 22-26.

Use of the reactor for reduction of powdered Fe oxide. Special attention given to complications resulting from large particle sizes. 11 ref. (C26, 1-52; Fe)

57-C. Vacuum Melted Materials Trim Space Age Forging Problems. Lynn E. Sprague. Steel, v. 148, Jan. 9, 1961, p. 62-64.

Vacuum melting of high-strength, high-temperature alloys and superalloys to reduce surface tearing, increase center soundness of billets, increase yield and equalize high values of mechanical properties in all directions. (C25; SGB-a, SGA-h)

58-C. (Czech.) Arc Zone Melting. Josef Zboril. Hutnicke Listy, v. 15, Nov. 1960, p. 861-864.

A rod-shaped sample of CSN 12020 Cu in a water cooled tube, also comprised of Cu, is zone melted by an arc produced with a tungsten electrode. After zone melting the average amount of impurity change with distance is measured from the end of the sample. 5 ref. (C28k; Cu)

59-C. Refractory Metal Powders. T. P. Whaley and W. J. McCreary. Inorganic Syntheses, v. 6, 1960, p. 47-50.

Method of reducing refractory Ti oxide using freshly cut Na metal and anhydrous calcium chloride. (C26; Ti)

60-C. The Preparation and Properties of Barium, Barium Telluride and Barium Selenide. Edward Miller, Kunt Komarek and Irving Cadoff. Metallurgical Society of AIME, Transactions, v. 218, Dec. 1960, p. 978-980.

Purification of Ba by equilibration with Ti and determination of melting point at 726.2° C. by thermal analyses. X-ray diffraction determination of lattice parameter at room temperature of BaSe and BaTe specimens, with electrical resistivity measurements at 300-830° K. and melting point determinations by visual observation at 1830 and 1510° C., respectively. 11 ref. (C26, M26, P-general; Ba, Se, Te, Ti)

61-C. Metallurgy in Nuclear Power Technology. Pt. 5. Fuel Element Canning Materials. J. C. Wright. Metal Treatment and Drop Forging, v. 27, Dec. 1960, p. 511-517.

Extraction and refining, melting and casting, powder metallurgy and fabrication of Be and Cb. (C-general, T11g; Be, Cb)

62-C. (German.) Magnesium Losses in Undereutectic AlSi Cast Alloys. Maja Krumnacker. Giesserei-Technik, v. 6, Oct. 1960, p. 306-307.

Investigation of melting losses during 5 and 10 min. chlorination in a gas furnace and during melting in an electrical furnace of G AlSi 10 Mg and G AlSi 5 Cu 1 alloys. Influence of melting temperature (675-780° C.) and killing time. (C5; Al-b, Si)

63-C. Development Procedures in the Production of Ultra High Strength Cast Steel. K. D. Holmes. Current Engineering Practice, v. 3, Sept. 1960, p. 10-16.

Production of 4340 cast steel having high tensile strength at required ductility and toughness levels by vacuum melting and casting. Influence of heat treatment, type of furnace and composition on tensile and yield strength, ductility, elongation and impact resistance. (C5, D8m, 1-73, Q27a, Q-general, 2-64; ST)

64-C. (Translation-ConBur.) Aspects of the Metallurgy of Uranium and Constructional Metals. G. A. Meerson. Soviet Journal of Atomic Energy, v. 6, Sept. 1960, p. 69-72.

Methods of uranium production including reductive melting, casting, pressure treatment and powder metallurgy; Zr metallurgy including new data on the technological scheme, nature of sponge and dimensions of ingots; production of the new constructional metals, Cb and V by metallothermal, vacuum carbothermal and electrolytic refining; production of Be tubes for fuel element sheaths; use of Zr hydride as a moderator and of Zr, U and H alloys for fuel element cores. (C-general, T11; Be, Cb, U, V)

65-C. (Book.) Zone Refining and Allied Techniques. N. L. Parr. 179 p. 1960. George Newnes Ltd., Lower House, Southampton St., Strand, W. C. 2, England.

The solidification process; molten zone refining; practical considerations in zone refining; choice and design of zone refining equipment; manipulation of high purity materials. Review of floating-zone, continuous zone and other techniques. (C28k)

66-C. (French.) Most Favorable Conditions for the Preparation of High-Purity Tin by Zone Melting. Robert Reich and Frederic Montariol. Comptes Rendus, v. 251, Nov. 21, 1960, p. 2350-2352.

To test the contamination by the container material one Sn bar is zone melted in a sheath of pyrex glass and another in a sheath of graphite. Purity is determined by measurement of the electrical resistivity. 3 ref. (C28k; Sn-a)

67-C. (Russian.) Increasing Efficiency in Copper Production. D. Kh. Baybulov and G. A. Komlev. Tsvetnye Metally, Oct. 1960, p. 24-26.

Charge preparation in the treatment of Cu concentrates and cinders for obtaining higher productivity of shaft furnaces, more complete extraction of Cu in the matte and increased amounts of Au containing quartz. Jigging operation with subsequent sintering of the fine fraction for decrease of dust losses and better gas permeability of the charge. 3 ref. (C5f, B-general; Cu)

68-C. (Russian.) Complex Treatment of Uchalinskii Pyrite Concentrates. V. S. Gulin. Tsvetnye Metally, Oct. 1960, p. 26-30.

Method for pyrometallurgical extraction of S, Fe and nonferrous and noble metals from pyrite concentrates of Cu-Zn ores. Technique for fluidized bed roasting, magnetic separation, sintering and treatment of nonmagnetic fraction. (C21, B-general)

69-C. (Russian.) Protective Layer Against Heat Losses from the Electrolyte

Surface During Copper Refining. M. L. Pertsovskii and E. G. Volkov. Tsvetnye Metally, Oct. 1960, p. 31-34.

Means for preventing reduction of electrolyte temperature caused by evaporation. Effect of transformer oil layer, its thickness and additions of surface active substances, as well as protective layers of glass, cork or froth plastic on the rate of heat losses is investigated. 3 ref. (C23p; Cu)

70-C. (Russian.) Material and Heat Balances of Pechenganickel Plant Ore-Smelting Furances. Ya. Kh. Osipov, G. I. Talovikov, Ya. L. Serebryanyi and V. A. Sudarkina. Tsvetnye Metally, Oct. 1960, p. 35-38.

Experimental smelting of Ni ores in electric furnaces of 20.5, 23.0 and 25.0 megawatt power capacity. Heat efficiency, output, power consumption, bath height, electrode consumption, extraction of Ni in matte and depth of electrode submersion are investigated in relation to various furnace power capacities. (C21d; Ni)

71-C. (Russian.) Effect of Chromospinelides on Smelting of Silicate-Nickel Ores. A. Ya. Macevskii. Tsvetnye Metally, Oct. 1960, p. 38-44.

Interference with the blast furnace smelting process by excess of Cr_2O_3 (over 1.7%) content resulting in formation of chromospinelide layer on slag and matte interface and Cr_2O_3 crust deposition on the furnace walls. Alleviation of condition by mixing ores of rich and lean Cr_2O_3 concentration. (C21a, 2-60; Ni, RM-n, 14-68)

72-C. (Japanese.) Recent Development of Uranium Ore Processing and Metal Production at Atomic Fuel Corporation. Yoshiki Imai. Atomic Energy Society of Japan, Journal, v. 2, Nov. 1960, p. 685-697.

Review of ore dressing and extraction and refining techniques in pilot plants of Tokai Refinery, Atomic Fuel Corp., Tokaimura, Ibaraki, in the production of uranium, including acid leaching, solvent and amine extraction, solid-liquid separation and ion exchange, ionic cell and electrolytic methods. 3 ref. (C-general, B-general, A9; U)

73-C. (Japanese.) Study of Staining on Primary Aluminum. Minoru Takemoto, Taro Yoshimoto, Kyuya Oida and Kiyomi Yanagida. Light Metals, July 1960, p. 7-18.

Effect of holding time on the staining of Al ingots. Correlation of data for appropriate holding time with ratio of the surface area to the amount of molten metal. 9 ref. (C5n; Al, 5-59)

74-C. (Japanese.) Study of Staining on Primary Aluminum. Minoru Takemato, Taro Yoshimoto, Kyuya Oida and Kiyomi Yanagida. Light Metals, July 1960, p. 19-24.

Study of the behavior of Na, Al carbide and alumina in primary molten Al to determine whether the small particles of metal oxide produced from these compounds during holding and diffused into the metal are the cause of staining. 25 ref. (C5n, 2-60; Al)

75-C. Electrodeposition of Cobalt-Molybdenum Alloys. Albertine Krohn and Theodore M. Brown. Electrochemical Society, Journal, v. 108, Jan. 1961, p. 60-61.

Use of a pyrophosphate bath containing hydrazine sulphate to deposit alloys composed of 56% Mo, 37% Co and 7% nonmetallic material. Effect of plating variables on deposit composition and quality. 10 ref. (C23p; Mo-b, Co-b)

76-C. Electrodeposition of Nickel-Cobalt Alloys From the Pyrophosphate Bath. Vasanta Sree and T. L. Rama Char. Electrochemical Society, Journal, v. 108, Jan. 1961, p. 64-70.

Results of studies on alloy composition, cathode efficiency and potential are used to determine optimum conditions for obtaining alloy plates of 10-91% Ni. Structures of the deposits are determined by X-ray diffraction. (C23p, N12d, M22g; Ni-b, Co)

77-C. Preparation of High-Purity Vanadium Metal by the Iodide Refining Process. O. N. Carlson and C. V. Owen. Electrochemical Society, Journal, v. 108, Jan. 1961, p. 88-93.

Preparation of vanadium of 99.95+% purity through the formation and decomposition of the volatilized iodide. Effect of retort composition, feed material composition and temperature on impurity content of the final product. 9 ref. (C1p; V)

78-C. Preparation of Nickel Polyhedra by Reduction in Fused Salt Systems. Robert A. Lefever. Electrochemical Society, Journal, v. 108, Jan. 1961, p. 107-108.

Preparation of Ni powders containing uniform polyhedra by reduction of $NiCl_2$ in KCl. Effects of various reducing agents, temperature, reaction time and other variables on particle size and surface. 6 ref. (C23p; Ni, 6-68)

79-C. Twin Structures in Silver Dendrites. J. W. Faust, Jr., and H. F. John. Electrochemical Society, Journal, v. 108, Jan. 1961, p. 109-110.

Evidence is presented to show that a twin mechanism can contribute to the growth of Ag dendrites during electrodeposition. (C23, M27, Q24b; Ag)

80-C. (Rumanian.) Preparation of High-Purity Silicon for Semiconductors. Pt. 1. P. Roman and Gh. Mozes. Revista de Chimie, v. 11, Aug. 1960, p. 464-468.

$LiAlH_4$ is prepared by reacting LiH with $AlCl_3$. The reaction $SiCl_4 + LiAlH_4$ gives SiH_4 from which metallic Si is obtained by thermal decomposition at 1000° C. 18 ref. (C1n; Si)

81-C. Forgeable Tungsten. Metal Industry, v. 97, Dec. 30, 1960, p. 543-544.

Development of an electron-beam processing technique which, when combined with composition control, results in tungsten and Mo alloy ingots of reduced grain size, better workability, increased shock resistance and improved ultimate strength. (C5k, F22, 17-52; Mo, W, 5-59)

82-C. Metallurgy of Process of Drossing and Sulphur Treatment of Lead Bullion. Pt. 1. S. Sarkar. Indian Journal of Applied Chemistry, v. 23, Feb. 1960, p. 81-83.

Purification of Pb bullion by removal of sulphur dross through the addition of fluxing agents using a 90 lb. capacity electric blast furnace pilot plant. Resin and blast furnace granulated slag additions are most effective. (C-general; Pb)

83-C. Low Pressure Metallurgy. Vacuum as an Inert Atmosphere. A. S. Darling. Metallurgia, v. 62, Nov. 1960, p. 187-191.

Discussion of contamination during vacuum melting of Fe, Ni and U and of vacuum oxidation processes in the solid state. Data are given for the dissociation pressures of several metallic oxides and compared with the oxidizing potential of vacuum systems. (C25, D8m, R1h, 1-73; Fe, Ni, U)

84-C. Modern Plant Produces Oxygen-Free Copper. Dragoslav Janicijevic. Metal Progress, v. 79, Feb. 1961, p. 112-115, 126, 128, 130, 132, 134, 136, 138.

The entire output of oxygen-free Cu at this Yugoslav plant is cast as wire bars in a continuous casting machine. Contamination of molten cathode Cu is prevented by melting and holding the metal in enclosed induction furnaces and by protecting it with an atmosphere composed of carbon monoxide and nitrogen. (C5q; Cu-a)

85-C. Refractory Metals. Clifford A. Hampel. I/EC (Industrial and Engineering Chemistry), v. 53, Feb. 1961, p. 90-96.

Methods of reclaiming W, Mo, Re, Ta and Cb from their ores and working them into sheet, wire and foil to provide chemically inert metals with high hot strength and high melting points. 15 ref. (C-general, R6, R7, P12n; Cb, Mo, Re, Ta, W)

86-C. Chromium and Vanadium. Earl T. Hayes. I/EC (Industrial and Engineering Chemistry), v. 53, Feb. 1960, p. 105-107.

Electrolysis of chromium chlorides and Ca reduction of vanadium chloride to produce high purity ductile metal. Data are given for physical and mechanical properties, corrosion resistance and alloying characteristics. (C23, C26, P-general, Q-general, R6, R7; Cr, V)

87-C. Titanium in the Aeroplane Industry. W. Schweisheimer. Australasian Engineer, Nov. 1960, p. 93-94.

Double melting of Ti by a consumable electrode process to eliminate brittleness caused by hydrogen content. Applications of Ti in aircraft industry. Sources of Ti. (C5h, T24; Ti, 17-57)

88-C. Present State of the Problem of the Use of Oxygen-Enriched Air in Nonferrous Metallurgy. D. D. Chizhikov. Paper from "Contemporary Problems of

Metallurgy". Consultants Bureau, Inc., New York, 1960, p. 349-369.

Theoretical principles and the result of experimental investigation of pyrometallurgical and hydrometallurgical processes using oxygen-enriched air applications during oxidation roasting of sulphide materials, reduction smelting of oxidized products and oxidizing refining of crude ores. Treated materials include Cu, Pb, Zn, Ni and noble metals. 48 ref. (C-general, B15n; O, 17-57)

89-C. The Electrolysis of Fused Slags. O. A. Esin. Paper from "Contemporary Problems of Metallurgy". Consultants Bureau, Inc., New York, 1960, p. 370-380.

Cathodic precipitation of Fe, Co, Mn, Cr, Si, Al, ferrovanadium and ferrophosphorous from fused slag systems by electrolysis. Application of electrolysis to the electrochemical desulphurization and deoxidation of Fe and steel. 23 ref. (C-general; RM-q)

90-C. (Translation-ConBur.) The Electrolytic Recovery of Lead From Factory Crudes and Bismuth Containing Drosses by the Use of Fused Electrolytes. I. D. Panchenko and Yu. K. Delimarskii. Journal of Applied Chemistry of the USSR., v. 33, Jan. 1960, p. 147-150.

Experiments with factory crudes are made on ternary eutectics of Pb, Na and K chlorides and eutectics of $PbCl_2$ and PbO. Two drosses containing 5 and 13% Bi are also tested. Electrolysis is at 500° C. with 25, 50 and 75% recovery as cathodic Pb. 6 ref. (C23; Pb)

91-C. (Translation-ConBur.) Extraction of Radioactive Cesium With Mixed Heavy Metal Ferrocyanides. V. V. Pushkarev, L. D. Skrylev and V. F. Bagrestsov. Journal of Applied Chemistry of the USSR., v. 33, Jan. 1960, p. 78-81.

Study of the extraction of Cs from aqueous solutions by sorption on heavy metal ferrocyanides and subsequent isolation of the solid phase by foam formation. 6 ref. (C19a; Cs)

92-C. (Translation-ConBur.) An Investigation of the Electrochemical Production of Gallium. N. I. Eremin and V. M. Gus'kov. Journal of Applied Chemistry of the USSR., v. 33, Jan. 1960, p. 151-156.

Problems in the electrodeposition of Ga from aluminate-gallate solutions of low gallate content. 6 ref. (C23; Ga)

93-C. (Translation-ConBur.) Extraction of Metals With Alkyl Acid Phosphates. A. S. Chernyak and M. L. Navtanovich. Journal of Applied Chemistry of the USSR., v. 33, Jan. 1960, p. 82-85.

Study of the ionic mechanism of metal extraction by alkyl acid phosphates to show possibilities for use in strong and weak acid solutions. Emphasis is placed on methods of synthesizing the phosphates. 8 ref. (C19)

94-C. (Translation-ConBur.) Electrolysis of Lead Concentrates in Fused Salts. I. T. Gul'din, A. V. Buzhinskaya, V. P. Baiseg'yan and V. K. Ruppul'. Journal of Applied Chemistry of the USSR., v. 33, Feb. 1960, p. 374-378.

Development of a large-scale (1500 amp.) electrolyzer for production of Pb concentrate in fused salts at a liquid Pb cathode. Pb extraction obtained is 96-97%. 6 ref. (C23; Pb)

95-C. (Translation-ConBur.) Melting of Chromium in the Suspended State. N. V. Ageev, A. A. Fogel, T. A. Sidorova and V. A. Trapeznikov. Journal of Applied Chemistry of the USSR., v. 33, Feb. 1960, p. 330-333.

Crucible-less fusion of electrolytic and iodide Cr suspended in an electromagnetic field by induction heating in an atmosphere of purified He. Data are given for nitrogen and oxygen impurity content in the metal and mechanical properties. 5 ref. (C5j, Q-general; Cr)

96-C. (Translation.) Purification of Tellurium by the Zone Melting Method. N. F. Shvartsenaur. Soviet Physics--Solid State, v. 2, Nov. 1960, p. 797-799.

Degree of purity obtainable by zone melting of Te. Measurement of electrical resistance and Hall effect at liquid nitrogen and room temperature. (C28k, P15, 2-61; Te)

97-C. Melting and Casting of the Refractory Metals Molybdenum, Columbium, Tantalum and Tungsten. W. H. Johnson. Defense Metals Information Center, Battelle

Memorial Institute, DMIC Rept. 139, Nov. 18, 1960, 30 p. (Available as PB 151098 from U. S. Office of Technical Services, Washington 25, D. C.)

Powder-metallurgy and arc, electron-beam and induction melting techniques for consolidating refractory metal powder or sponge. Application of these methods to production of ingots and shaped castings. 33 ref. (C5, H15; Cb, Mo, Ta, W)

98-C. (German.) Kinetics of Indirect Reduction. Hermann Schenck and Hans-Peter Schulz. Archiv fur das Eisenhuttenwesen, v. 31, Dec. 1960, p. 691-702.

Use of circulating CO/CO_2 gas mixtures for indirect reduction of natural and synthetic annealed or sintered hematite at varying gas flow rates and 850° C. Reduction rate as a function of specimen size and shape, concentration of reduction gas, pressure and temperature. (C26; Fe, RM-n)

99-C. (English.) Distillation Process of Zinc, Lead and Cadmium From Black Ores With Iron Reduction. Hachie Sawamoto, Takeo Sugiura and Akira Nishina. Nagoya University, Memoirs of the Faculty of Engineering, v. 11, Nov. 1959, p. 171-174.

Extraction of Zn, Pb and Cd from sulphide ores by Fe reduction and vacuum distillation. Effect or reaction temperature and ratio of ore to Fe powder on the purity and percentage yield. (C22g; Cd, Pb, Zn, RM-n)

100-C. Reducibility of Salem Magnetite Ore. M. Subramaniam and P. P. Bhatnagar. Journal of Scientific and Industrial Research (India), v. 19, Dec. 1960, p. 620-624.

Reducibility of Salem (India) magnetite Fe ore in hydrogen gas studied at 700-1000° C. on lumps and briquettes of the ore to determine effect of H_2 flow rate, ore mesh size and temperature on the rate of reduction. 8 ref. (C26; Fe, RM-n)

101-C. Laboratory Casting High-Temperature Metals. P. G. Clites and E. D. Calvert. Journal of Metals, v. 13, Feb. 1961, p. 136-138.

Development of modified arc melting ingot furnace for studying the application of skull casting techniques to production of small Ti, Zr, Ta, Hf, Cb, Mo, W, Cr, Cu and Fe castings. (C5, W18s; SGA-h)

102-C. Cold-Crucible Induction Melting of Reactive Metals. G. H. Schippereit, A. F. Reatherman and D. Evers. Journal of Metals, v. 13, Feb. 1961, p. 140-143.

Induction melting of Ti billets in a newly designed water-cooled Cu crucible. Power, water cooling requirements and electrical operating characteristics are measured to determine the commercial feasibility of the process. (C5j; Ti, 4-52)

103-C. Removing Volatile Metals From Lead and Tin by Vacuum Distillation. H. S. Caldwell, Jr., M. J. Spendlove and H. W. St. Clair. U. S. Bureau of Mines, Report of Investigations 5703, 1960, 12 p.

Vacuum distillation of Pb and Sn to remove Cd, Zn, Mg, Te, Sb and Bi. Rate and selectivity of distillation are found to depend primarily on volatility, molal ratios and chemical activity of the alloy metals. (C22, 1-73; Pb, Sn)

104-C. Metallic Reduction of Thorium Tetrachloride. P. C. Good and F. E. Block. U. S. Bureau of Mines, Report of Investigations 5702, 1960 12 p.

Purification of crude Th tetrachloride by double vacuum distillation at 800-900° C., then reduced to Th metal by metallic Na or Mg and consolidated to ingot form by vacuum arc melting. Data are given for physical and chemical properties. (C26, P-general; Th)

105-C. Separation of Hafnium From Zirconium by Anion Exchange. J. L. Hague and L. A. Machlan. Journal of Research--Physics and Chemistry, v. 65A, Jan-Feb. 1961, p. 75-77.

Study of the elution of Hf and Zr in diluted H_2SO_4 and in solutions of HCl and H_2SO_4 in water. Data characterize the behavior of the sulphate anion complexes of these elements on a strong quaternary-amine anion-exchange resin column. 12 ref. (C19s; Hf, Zr)

106-C. New Plant for Refining Nickel at Clydach--Mond Carbonyl Process. Australasian Engineer, Dec. 1960, p. 59.

Grinding, calcination and reduction of sintered Ni oxide concentrate produces Ni carbonyl which is decomposed by heating to produce Ni pellets. (C1m; Ni)

107-C. Why High Purity Zinc (99.99+%) Is Vital to Zinc Die Cast Products. Asarco Nonferrous Metals Digest, v. 2, Feb. 1961, p. 3-4.

Reducing and refining Zn ore to produce high-purity Zn castings. Properties of Zn which favor its use in die castings. Effect of additions on intercrystalline corrosion of high-purity Zn. (C-general, E13, R2h; Zn)

108-C. Copper, Nickel and Iron Alloys for the Quantitative Recovery of the Platinum Metals in Ores and Concentrates. M. E. V. Plummer, J. M. Kavanagh, J. C. Hale and F. E. Beamish. Metallurgical Society of AIME, Transactions, v. 221, Feb. 1961, p. 145-150.

The atomic and molecular structure and bonding mechanism of Fe-Cu-Ni alloys with the platinum metals are investigated to show that the Fe-Cu-Ni content of Pt concentrates may be reduced by carbon to form a collecting alloy for the Pt metals in a manner exactly analogous to the formation of the Pb fire assay button. Pd and probably some of the other Pt metals form solid solutions with these alloys for efficable extractions. 39 ref. (C-general, P13c; EG-c, Fe-b, Ni, Cu, 17-57)

109-C. Philippines Gets New Copper Plant. Chemical & Engineering News, v. 39, Feb. 13, 1961, p. 46-47.

Establishment of a new Cu plant in the Philippines for the meltless production of Cu, Zn and $(NH_4)_2SO_4$. Ore is converted into Zn metal, $(NH_4)_2SO_4$ and Cu powder by leaching in ammonia, oxidation at 470-400° F. with 700 psi. of pressure and H_2 reduction (400 psi.) Cu powder is then fabricated into Cu strip at 1976° F. and 60,000 psi. pressure on compacting rolls. (C26, H14j; Cu)

110-C. Production and Availability of Some High-Purity Metals. Defense Metals Information Center, Battelle Memorial Institute, DMIC Memo. 76, Dec. 1960, 58 p. (Available as PB 161226 from U. S. Office of Technical Services, Washington 25, D. C.)

Electrolysis, leaching, vacuum distillation and reduction of Be, B, Cr, Cb, Fe, Mo, Ni, Re, Ta, Ti, W, V and Zr and the effect of the method of preparation on the purity of the product. (C-general)

111-C. (Russian.) Arc Furnace With Electrode in the Molten Metal. P. V. Serheev and H. A. Sidorenko. Vestnik Electropromishlennosti, Oct. 1960, p. 45-48.

Melting of nonferrous metals in an electric arc furnace with submersion of the electrode into the melt. Design of protective tubing, isolation air chamber for arc, electrode and mechanism for adjustment of the depth of submerged electrode. Reduction of metal loss due to burning. (C5h, W18s)

112-C. Application of Sorption and Solvent Extraction Processes in the Hydrometallurgy of Uranium. B. S. Kolychev. Soviet Journal of Atomic Energy, v. 6, Dec. 1960, p. 368-380.

Review of sorption processes, particularly for recovery of uranium from pulps. Comparison of organophosphorus compounds and amines as extraction solvents. Solvent extraction processes as influenced by surface tension of effluent, concentration of extraction solvents and type of acid. (C19a; U)

113-C. (Translation.) Rare-Earth Elements and the General Method of Their Production. D. I. Ryabchikov, Yu. S. Sklyarenko and M. M. Senyavin. Rare Earth Elements, 1959, p. 7-26.

Separation and purification of rare earths by fractional crystallization, electrolytic reduction and ion-exchange chromatography. Rare earth elements are extracted from monazite (66%), parisite (63%), xenotime (62%), fluocerite (80%), apatite (17%) and titanite (5%) deposits. 70 ref. (C19, C23; EG-g45)

114-C. Degassed Nickel and Nickel Alloys for the Electron Tube Industry. Richard P. Waugh. Wire and Wire Products, v. 36, Jan. 1961, p. 61-63.

Degassing of "A" and "D" Ni wire by long time, high temperature (800-1000° C.) annealing in wet hydrogen or dissociated ammonia atmosphere. Effect of gas content on microstructure and physical properties. Application in power, rectifier and cathode ray tube. (C5m, Q-general, Ti; Ni, 4-61, 17-57)

115-C. Production of Aluminum Redraw Rod by the Southern Electrical Company

Method. T. E. Colston and C. M. Fredrickson. Wire and Wire Products, v. 36, Jan. 1961, p. 69, 72, 114.

Production of high quality Al redraw rod for electrical wire and cable production from Al pig by low frequency induction melting, continuous horizontal casting and subsequent rolling in a ten stand tandem rod mill after preheating. (C5j, C5q, F23; Al, 4-55)

116-C. Coil Design in Levitation Melting. W. J. Slater, J. W. Barton and R. Taggert. Philips Science and Industry, v. 7, Mar. 1960, p. 89-96.

Investigation of electromagnetic field configuration within a levitation coil and effect on field of inserting solid metallic charge within coil. Arbitrary determination of levitation force for various coil configurations. Design of a levitation coil which supports a molten metallic charge of up to 36 grams Ti permitting the charge to be chill cast. 11 ref. (C28, 17-51; Ti)

117-C. (Italian.) Segregation and Control of the Distribution of Impurities in the Production of Germanium and Silicon. J. Goorissen. Alluminio, v. 29, Dec. 1960, p. 567-575.

Two variants of the zone melting method for the production of Ge and Si monocrystals, permitting the preparation of a product in which the concentration of impurities is constant in each zone. 7 ref. (C28k, 9-69; Ge, Si, 14-61)

118-C. A New Acid Alumina Process. T. R. Scott. Research Applied in Industry, v. 14, Feb. 1961, p. 50-54.

Production of pure alumina from low grade bauxite ore by hydrolyzing the ore at 220° C. with sulphuric acid and using bauxite to partially neutralize the digestion liquors. (C19n; Al)

119-C. (French.) Fiftieth Anniversary of the Advent of Aluminum Nitrate. R. Pitaval. Journal du Four Electrique, v. 65, May 1960, p. 213-214.

Review of Al extraction processes, with attention to principles of the Serpek process of direct chemical reduction of bauxite. Comparison of the Serpek process with the Bayes and Heroult processes. (C19; Al)

120-C. (Japanese.) Behavior of Sn in Liquid-Liquid Extraction of Nb and Ta. Sanji Nishimura, Jyoichiro Moriyama and Isao Kushima. Japan Institute of Metals, Journal, v. 24, Dec. 1960, p. 798-802.

The distribution coefficients of Sn, Cb and Ta in the extractive systems HF hexone, HF-HCl hexone, HF-H_2SO_4 hexone and HF-HNO_3 hexone are measured to determine solvent efficiency in separating Sn from Ta and Cb and in producing Ta and Cb of high purity from Ta_2O_5, Cb_2O_5 and tantalite concentrates containing SnO_2 and other metallic oxides. 13 ref. (C19n, 2-60; Cb, Ta, Sn)

121-C. (Russian.) Effect of Catalysts on the Reduction With Graphite of Nickel and Cobalt Oxides and Ferrites. M. G. Zhuravleva, V. N. Bogoslovskii and G. I. Chufarov. Zhurnal Fizicheskoi Khimii, v. 34, Dec. 1960, p. 2704-2708.

Graphite reduction process at 700-950° C. as affected by additions of Na_2CO_3 and K_2CO_3. 8 ref. (C26; Co, Ni, 14-68)

122-C. Aluminum Bar Casting and Rod Rolling. A. H. Tessman. Wire Industry, v. 28, Feb. 1961, p. 162-163.

Continuous casting of Al using a highly finished, lubricated Cu mold. Mold friction is reduced so that there is no tearing of the initially formed solid skin and cooling rate is sufficient to prevent any surface remelting, without being high enough to cause internal cracking or shrinkage porosity. (C5q; Al)

123-C. (German.) The Zone Melting Process and Its Application to Metals. H. Hillmann. Metall, v. 15, Feb. 1961, p. 102-113.

Melting of very pure metals by zone refining is discussed in terms of reaction mechanism depending on solidification interval of alloy. Method and apparatus for repeated and continuous zone melting and for zone melting without crucible. Degrees of purity obtained for Al, Fe, Cu, Sb, Sn, Ge, Si, Ti, V, Co, Zn, Ga, U, Re, Bi, Mo, Pt, Ru and Ir. (C28k)

124-C. (German.) X-Ray Investigation of Setting of Silver-Tin Amalgams. Pt. 2. H. Winterhager and H. Dreiner. Metall, v. 15, Feb. 1961, p. 114-123.

Setting of 50-70% Ag containing amalgams specimens with and without

traces of Zn is X-ray investigated after 30 sec. trituration of specimens. Hardening of amalgam is examined by X-ray intensity vs. time curves. Time law of setting process. Influence of trituration time. (C29; Ag-b, Sn-b, Zn)

125-C. Continuous Casting of Aluminum Bar. A. H. Tessman. Machinery (London), v. 98, Feb. 15, 1961, p. 390-391.

Operating sequence and sectional diagrams of equipment developed for continuous casting of Al bar 2 1/4 in. diameter at a rate of 80 in. per min. (C5q; Al)

126-C. Copper Concentrates to Metal Shape in Marinduque's New Philippine Plant. George O. Argall, Jr. Mining World, v. 23, Mar. 1961, p. 31-33.

Production of Cu wire, tubing and strip from low tonnage Cu concentrate by a new process involving chemical leaching with ammonia and gaseous reduction of concentrate to Cu powder with H_2 and CO_2. Powder is then compacted, sintered, annealed, rolled and shaped into final products. All smelting is eliminated. (C19n, C26, H14, H15, F26, F23; Cu)

127-C. Aluminum Sheet Fabricator Starts With Molten Metal. Steel, v. 148, Mar. 20, 1961, p. 107.

Continuous casting and sheet rolling are combined to produce Al sheet. Continuous strip from the casting rolls is reduced on a four high, single stand mill. (C5q, F23; Al)

128-C. Electrorefining Chromium. F. R. Cattoir and D. H. Baker. U.S. Bureau of Mines, Report of Investigations 5682, 1960, 15 p.

Electrolysis of fused molten NaCl-$CrCl_2$ electrolytes at 820° C. in a Ni lined electrolytic cell to produce Cr of low O and N content. Data are given for ductility, hardness, crystal structure and content of Fe and other impurities. (C23p, Q-general, 2-60; Cr)

129-C. (French.) Vacuum Melting of Some Nonferrous Metals. R. Syre. Revue de Metallurgie, v. 57, Dec. 1960, p. 1107-1116.

Consumable-electrode, skull-melting and electron-bombardment vacuum melting of Be, Ti and Zr (reactive metals) and Cb, Mo, Ta and W (reactive and refractory metals). (C5, 1-73, C25; Be, Ti, Zr, Cb, Mo, Ta, W)

130-C. (Russian.) Method of Calculating Optimum Parameters for a Continuous Self Roasting Aluminum Electrolyzer Anode. M. A. Korobov. Tsvetnye Metally, Dec. 1960, p. 33-38.

Effect of electrode holder spacing and number and the related coule effect on thermal balance and electrode efficiency in the electrolytic refining of Al. Dependence of anodic potential drop on dimensions of anode, electrode holders, resistance and current density. 3 ref. (C23p; Al)

131-C. (Russian.) Decomposition of Loparitovyi, Perovskitovyi and Sfenovyi Concentrates by H_2SO_4. Ya. G. Goroshchenko, D. L. Motov and G. V. Trofimov. Tsvetnye Metally, Dec. 1960, p. 38-42.

Decomposition of Ti ore concentrates by H_2SO_4 containing ammonium sulphate salt at 230-300° C. Dissociation rate and yield as a function of particle size, concentrate composition and amounts of H_2SO_4 and $(NH_4)_2SO_4$ used. 3 ref. (C1q; Ti)

132-C. (Russian.) Electrolytic Refining of Be. G. F. Silina and L. L. Grinberg. Tsvetnye Metally, Dec. 1960, p. 47-53.

Electrolytic purification of Be using Be anodes, Ni cathodes and a KCl-$BeCl_2$-NaCl electrolyte. Dependence of Be purity on per cent BeCl and purity of electrolyte. Effect of current and electrolysis time on amount of Be refined. (C23p; Be)

133-C. Vacuum Melting Produces Cleaner, Better Performing High Temperature Brazing Alloys. C. R. Benson. Welding Journal, v. 40, Mar. 1961, p. 232-236.

Advantages and industrial application of vacuum melting process in the production of brazing alloys, including increased cleanliness, lower gas content, vaporizing of impurities, closer composition control, uniform brazing temperatures and improved erosion resistance. 5 ref. (C5, 1-73; SGA-f)

134-C. (Translation-ConBur.) Electrolytic Production of Metallic Chromium From

Chromium Sulphate Solutions. S. E. Gurevich. Journal of Applied Chemistry of the USSR, v. 33, Mar. 1960, p. 656-661.

Determination of optimum current density, pH and electrolyte temperature for production of Cr in a diaphragm cell with separation of anolyte and catholyte. 13 ref. (C23; Cr)

135-C. (Translation-ConBur.) Influence of Organic Additions on the Rate of Reduction of Nickel in Acid and Alkaline Solutions. A. I. Lipin and M. M. Livshits. Journal of Applied Chemistry of the USSR, v. 33, Mar. 1960, p. 662-665.

Nature of the organic additive, number of carboxyl and methylene groups and the presence of amino or hydroxy groups in the molecule as they affect reduction rate. 3 ref. (C26; Ni)

136-C. (Translation-ConBur.) Electrolytic Refining of Tin in Solutions Containing Aminosulphites. A. E. Levin and Chang Kuo-heng. Journal of Applied Chemistry of the USSR, v. 33, Mar. 1960, p. 672-678.

Determination of optimum tin aminosulphite content, electrolysis temperature and glue per beta-naphthol additive proportions for Sn refining. Calculated difference of potentials through the bath show the main consumption of energy is in the ohmic resistance of the solution and cathodic polarization. 12 ref. (C23p; Sn)

137-C. (Japanese.) Pyrometallurgical Processing of Nuclear Fuels. Masayoshi Kanno. Atomic Energy Society of Japan, Journal, v. 2, Dec. 1960, p. 767-778.

Comprehensive review of recycling of U-Th fuel, including evaporation, oxide slagging or drossing, solvent and molten salt extraction, fractional crystallization, pyrozinc, hermex, electrolytic, zone-melting, de Boer and cyclic oxidation-reduction methods. (C-general, 10-54; U, Th)

138-C. (German.) Precipitation of Titanium Metal by Fused Salt Electrolysis. Hubert Kuhnel, Paul Ehrlich and Rolf Dieter Uihlein. Zeitschrift fur Anorganische und Allgemeine Chemie, v. 306, Nov. 1960, p. 246-259.

Construction and operation of an electrolytic cell (capacity 2 kg.) for precipitation of solid metals under inert gas atmosphere at temperatures up to 1000° C. Precipitation of coarse Ti crystals from a NaCl melt containing 1.5-4% Ti chlorides. Influence of current conditions on obtained Ti dendrites. (C23; Ti)

139-C. (English.) Preparation of High-Purity Zinc Dusts. Hiromu Imai. Kansai University, Technology Reports, Mar. 1959, p. 57-64.

High-purity Zn is obtained by chemical treatment with potassium bichromate and aqueous ammonia solution containing ammonium chloride. The treated Zn dust has good resistance to oxidation even in moist air. 4 ref. (C19, R1h; Zn)

140-C. Oxygen Refined Ferroalloys. Journal of Metals, v. 13, Mar. 1961, p. 215.

Intermediate grade ferrochrome (68-71% Cr, 5-6% C, 2-3% Si, 0.07% S), which is tapped from a submerged arc furnace, is oxygen refined by a vertical water cooled Cu lance having a blowing rate of less than 1000 cu. ft. per min. and requiring from 30-40 min. The refined ferrochrome is 58-65% Cr, 4.25% C, 1% Si and 0.03% S. (C21d; Cr-b, Fe)

141-C. Oxygen Jetting Secondary Copper. W. S. Nelmes, J. A. Charles and A. G. Cowen. Journal of Metals, v. 13, Mar. 1961, p. 216-220.

Experimental work is being done on a top-jetting oxygen process in an air blown Peirce-Smith converter which is designed to replace the conventional method of converting black Cu to rough Cu. Research is done to determine whether the present converters could be replaced by a smaller vessel using oxygen. Advantages of an oxygen process over the conventional air blown converter process are given. (C21b; Cu)

142-C. Philippines' First Copper. F. Weston Starratt. Journal of Metals, v. 13, Mar. 1961, p. 221-222.

Cu powder is produced from a Cu-Zn concentrate in an integrated ammonia leach-hydrogen reduction process in which the concentrate is treated by continuous NH_3-air leaching at 180° F. and 100 psi., solid separated, purified by a combined oxidation and hydrolysis operation and reduced with H_2 in a series of seven autoclaves at 400° F. at a total pressure of 650 psi. The resulting Cu

powder is roll compacted, sintered and hot rolled into strip. (C19n, C26; Cu)

143-C. Production of Uranium, Thorium, Plutonium and Their Compounds. Reactor Fuel Processing, v. 3, Oct. 1960, p. 48-52.

Production processes for uranium trioxide, dioxide and tetrafluoride, uranium metal, thorium tetrachloride and thorium metal, including denitration, reduction, electrolysis, fluidized and moving-bed and distillation techniques. 17 ref. (C-general; Pu, Th, U)

144-C. (Russian.) Obtaining Very Pure Se and Te. A. V. Novoselova, A. S. Rashinkin and B. A. Ropovkin. Zhurnal Vsesoyuznogo Khimicheskaya Obshchestva, v. 5, May 1960, p. 557-561.

Literature review of methods for purifying Se and Te including distillation, precipitation and reduction processes. Application of special techniques such as zone refining. 83 ref. (C-general, C28k; Se, Te)

145-C. Zone Refining. E. F. G. Herington. Endeavour, v. 19, Oct. 1960, p. 191-196.

Review of the principles and techniques involved in zone refining with application to the purification of Ge, Si, Ga, In, organic compounds and H_2O, the results of zone refining being followed with radioactive isotopes, Na^{22}, Sr^{90}, S^{35} and P^{32}. 12 ref. (C28k, 1-59, 10-54)

146-C. Electron Beam Melting: What it Does for Metals. Donald Peckner. Materials in Design Engineering, v. 53, Mar. 1961, p. 101-106.

Principles of the electron beam melting process and effects of electron beam melting on the mechanical properties of Be, Hf, V, W, Cb, Ta and Co metals and alloys. Influence of melting rate and deoxidants. (C25, Q-general, 2-60; Be-b, Cb-b, Co-b, Hf-b, Ta-b, V-b, W-b, EG-d37)

147-C. Specialty Steel Producer Modernizes Melting Shops. Steel, v. 148, Apr. 3, 1961, p. 90, 93.

Vacuum arc remelting of alloy, stainless, bearing and high strength steel and super alloys at 8500° F. arc temperature using a consumable electrode to produce materials having improved hot and cold workability, mechanical properties and chemical homogeneity. Solidification control is used to improve ingot soundness, eliminating pipes and center porosity. (C5, E25q, 1-73, Q-general, 2-60; ST, SGA-h)

148-C. Production of Bimetal-Reduced Hafnium. Dale W. Richardson. U. S. Bureau of Mines, Report of Investigations 5734, May 1959, 21 p.

Reduction of $HfCl_4$ in a protective atmosphere using Mg-Na as a bimetal reducing agent. The resulting Hf sponge is cast into an ingot and rolled to form Hf strip. 7 ref. (C26; Hf)

149-C. (Japanese.) Behavior of Ti in Liquid-Liquid Extraction of Cb and Ta. Sanji Nishimura, Joichiro Moriyama and Isao Kushima. Japan Institute of Metals, Journal, v. 25, Jan. 1961, p. 27-30.

Distribution coefficients of Ti, Ta and Cb in the extraction systems, Hf-hexone, Hf-HCl-hexone, Hf-H_2SO_4-hexone and Hf-HNO_3 hexone are measured to determine the extent to which Ti can be separated from Ta_2O_5, Cb_2O_5 and tantalite concentrates containing TiO_2. Effect of Ti on the Co extraction of Ta and Cb and influence of the acidity of the liquid solvent solution is found to effect extraction efficiency. 3 ref. (C19n; Ta, Cb, Ti)

150-C. (Rumanian.) Electrolytic Production of Metallic Zirconium. Viorica Craiu, Paula Anghel and A. Calusharu. Revista de Chimie, v. 11, Sept. 1960, p. 509-514.

Electrolytic deposition of Zr from the molten salts of K_2ZrF_6-NaCl in an Ar atmosphere. Data for current and metal yield as a function of current density, temperature, the K_2ZrF_6/NaCl ratio and the form and nature of the cathode. Radiographic analysis of the product. 9 ref. (C23, S11q; Zr)

151-C. (Hungarian.) Electrolytic Refining of Commercial Antimony. Frantisek Kupka. Chemicky Prumysl, v. 10, Dec. 1960, p. 620-623.

Electrolytic precipitation of arsenic in commercial antimony using flowing sulphate-fluoride as an electrolyte. 12 ref. (C23; Sb)

152-C. Oil-Fired Furnaces. J. A Taylor. Metal Industry, v. 98, Mar. 10, 1961, p. 183-186.

Melting of Al, Al alloys, gunmetal, brass, phosphor bronze and Cu alloys

prior to casting by heating in a crucible or rotary furnace. Loss of metal and excess fuel consumption is prevented by using a heating system that does not overheat the charge and by recirculating the heated air. 8 ref. (C5k; Al-b, Cu-b)

153-C. (English-French.) Production of Cobalt Metal, Oxides and Salts. Paper from "Cobalt". Societe Generale Metallurgique de Hoboken, Belgium. 1961, p. 16-23.

Extraction of CoO from heterogenite and carrollite ores. Subsequent reduction of the oxide to form Co metal and powder. (C-general; Co)

154-C. Titanium Casting Technology. R. A. Beall, S. L. Ausmus and F. W. Wood. Metal Industry, v. 98, Mar. 24, 1961, p. 223-227.

Considerations of furnace design and mold materials for consumable electrode skull casting of Ti, Zr and other reactive metals. 5 ref. (C5, 1-73, C25; Ti, Zr)

155-C. (Czech.) Zirconium. Vaclov Spacek. Chemicke Listy, v. 55, Jan. 1961, p. 16-25.

Steps in the preparation from the ore: concentration by gravity, electromagnetic and electrostatic processes; thermal dissociation of ZrO_2 at 1800-2126° C.; leaching in acids after roasting; decomposition of ZrO_2 by melting with a sulphate, fluoride or hydroxide; preparation of $ZrCl_4$; chemical and electrolytic preparation of Zr and its manufacture by thermal dissociation of ZrI_4. 41 ref. (C-general; Zr)

156-C. Rare Metals Are a Challenge to Metallurgy. Pt. 11. Australasian Manufacturer, v. 45, Mar. 11, 1961, p. 54-55.

Various methods of converting rutile and ilmenite to Ti tetrachloride in the production of Ti. Production of Mo, Ta and Cb. (C-general; Cb, Mo, Ta, Ti)

157-C. Refractory Usage in Zinc Smelting. W. H. Dennis. Refractories Journal, v. 36, Sept. 1960, p. 263-268.

Properties of silica, silicon carbide and fireclay refractories; production methods and application in horizontal and vertical retort furnaces. Technology of Zn smelting by horizontal and vertical processes with attention to development of the vertical process with consequent improved technical index as a result of the availability of refractories with improved properties. (C21; Zn, RM-h, 17-57)

158-C. (French.) Highly Intensive Purification of Tellurium. N. Peterescu, M. Protopopescu and D. Drimer. Revue Roumaine de Metallurgie, v. 5, Feb. 1960, p. 227-237.

Vacuum distillation and zone refining; purity of the product. 5 ref. (C22h, C28k, 1-73; Te)

159-C. Mechanism of Electrodeposition of Cobalt From Liquid Ammonia Solutions of Spin-Paired Cobalt (III) Complexes. Evidence for a Trans Effect in Octahedral Complexes. George W. Watt and Joe W. Vaughn. Electrochemical Society, Journal, v. 108, Apr. 1961, p. 351-354.

Cathode current efficiency data for the electrolysis of liquid NH_3 solutions of certain cobaltammine nitrates are interpreted as supporting a bimolecular ligand substitution followed by a dissociative process which gives rise to the electrochemically active species. 17 ref. (C23; Co)

160-C. The Mechanism of Electrolytic Deposition of Titanium From Fused-Salt Media. Walter E. Reid, Jr. Electrochemical Society, Journal, v. 108, Apr. 1961, p. 393-394.

Static electrode-potentials of Na, Mg and Ti are measured in molten Li, K and Na chlorides against a porcelain electrode. It is concluded that Ti deposition probably occurs as a primary electrode reaction. 10 ref. (C23; Ti)

161-C. Research and Development on Fuel Processing. Reactor Fuel Processing, v. 4, Jan. 1961, p. 19-45.

Separation, purification and recovery of U, Th, Pu, La, Nd, Sm, Ru, Zr, Am, Cm, Pm and Y by solvent extraction, ion-exchange process, fused salt process, fluorination melt refining and liquid metal and salt processes. 68 ref. (C19, T11g)

162-C. (Russian.) Obtaining High Purity Magnesium by Electrolytic Refining. O. A. Lebedev and K. D. Muzhavlev. Tsvetnaya Metallurgiya, June 1960, p. 80-86.

Design of the device for electrolytic refining of raw Mg. Two and three-layer

method of electrolysis. Composition of electrolyte and necessary temperature and current density. Comparison of the purity of Mg obtained by electrolysis with that obtained by vacuum distillation. (C23p; Mg)

163-C. Some Aspects of the Production of Uranium Powder by Calcium Reduction of the Oxide. R. H. Myers and R. G. Robins. Paper from "Australian Atomic Energy Symposium". Melbourne University Press, Melbourne, Australia, 1958, p. 111-114.

Report on production of uranium powder by the Ca reduction of uranium dioxide. Results indicate that 30% excess Ca reductant is needed for effective reduction. Effects of time and temperature of heating of reaction products and size of reaction vessel on nature of the powder. 3 ref. (C26; U)

164-C. The Production of Uranium Metal Powder by Electrolysis in Molten Chlorides. R. G. Canning. Paper from "Australian Atomic Energy Symposium". Melbourne University Press, Melbourne, Australia, 1958, p. 115-121.

Process for converting uranium oxides to chlorides in molten chloride medium in which Cl absorption efficiency is dependent on temperature and uranium concentration in the melt. Recovery of uranium metal powder is achieved by controlled precipitation with Mg metal followed by electrorefining onto a Mo cathode. 4 ref. (C26; U)

165-C. Metallothermic Reduction of Vanadium Chlorides. F. E. Block, R. R. Brown and M. J. Ferrante. U. S. Bureau of Mines, Report of Investigations 5722, 17 p.

Processes for the metallic reduction of vanadium chlorides to facilitate large-scale plant production of high-quality vanadium metal. Metal is prepared by reducing the anhydrous chlorides with molten Mg or mixtures of Mg and Na under an argon atmosphere. 8 ref. (C26; V)

166-C. Thorium. T. H. H. Skeet. Mine & Quarry Engineering, v. 27, Apr. 1961, p. 179-184.

Review of occurrences and reverses of Th minerals, extraction processes and present and future application of Th and its compounds. (C-general; Th)

167-C. (Translation-ConBur.) Thermodynamics of Uranium Tetrafluoride Reduction by Magnesium. Soviet Journal of Atomic Energy, v. 7, Mar. 1961, p. 858-861.

Review of thermodynamic values and phase transitions of UF_4 reduction by Mg including calculation of equilibrium constants at different temperatures and changes in free energy. (C26; U)

168-C. Recovering Tin From Hardhead by Selective Oxidation of Iron. D. A. Wilson and P. M. Sullivan. U. S. Bureau of Mines, Report of Investigations 5756, 17 p.

Recovery of Sn from an Fe-Sn alloy (hardhead) by oxidation processes using air, steam, H and CO_2-CO mixtures. Tests indicate that temperature, use of siliceous flux and control of amount and rate of air delivery affect optimum recovery. 11 ref. (C28j; Fe-b, Sn)

169-C. (Japanese.) Refinement of Uranium With Benzyldodecylamine. Yoshinaga Oka, Taro Yamasaki, Shigeki Matsuo and Mihoko Abe. Atomic Energy Society of Japan, Journal, v. 3, Feb. 1961, p. 28-34.

Study of the effect of such variables as uranium loading and acid and sulphate ion concentration on U extraction from an acidic aqueous sulphate system by use of benzyldodecylamine. Efficient extraction is achieved in the concentration range of 0.1-1.0 M/1 sodium sulphate in the acidity range of 0.1-1.0 N. 5 ref. (C19; U)

170-C. (German.) Newer Information on Continuous Casting of Nonferrous Metals. Pt. 2. Aluminum and Aluminum Alloys. E. Herrmann. Metall, v. 15, Mar. 1961, p. 201-210.

Review of design and operation of modern continuous casting and related metalworking equipment such as single and multiple horizontal and vertical continuous casting machines for rods and tubes, cast-rolling machines for sheet and wire, horizontal strip casting machines and auxiliary devices. (C5q, 1-52; Al-b)

171-C. Separation Engineering on the Moon. A. M. Gaudin. Metallurgical Society of AIME, Transactions, v. 221, Apr. 1961, p. 210-220.

Theoretical survey of ore and mineral beneficiation and pyrometallurgical technique and chemical extraction,

distillation, reduction and refining methods with attention to limitations imposed by lunar gravitation, surface temperature and lack of water vapor, oxygen and nitrogen in the atmosphere. 3 ref. (C-general, B-general, 10-51, 10-54)

172-C. Molybdenum by Direct Thermal Dissociation of Molybdenum Disulphide. W. G. Scholz, D. V. Doane and G. A. Timmons. Metallurgical Society of AIME, Transactions, v. 221, Apr. 1961, p. 356-364.

Mo of high purity is produced by direct dissociation of commercial molybdenite in vacuum at 1600-1700° C. Analyses of ingots arc-cast from commercial Mo powder, hydrogen-reduced from ammonium molybdate and from thermally dissociated MoS_2 show the levels of chemical impurities to be similar. 8 ref. (C1; Mo)

173-C. (Russian.) Isolation of Weighable Quantitites of Pure Protactinium-231. I. Spitain and R. A. Dyachkova. Doklady Akademii Nauk SSSR, v. 134, May 1960, p. 1111-1114.

Concentration and isolation of Pa using sorption and ion-exchange. Precipitation of Pa and certain impurities from the original mixture with impurity removal by sorption with MnO_2. Final ion-exchange product is examined spectroscopically and by radiation measurements. 19 ref. (C19s, C27; Pa)

174-C. Olin Research Moves One Step Closer to Aluminum From Clay. Modern Metals, v. 17, Apr. 1961, p. 59.

Leaching of alumina containing clay with H_2SO_4 and separation of iron and aluminum sulphate by crystallization result in crystals 1/8 to 1/16 in. diameter. (C19n; Al)

175-C. (German.) Problems in Electrolytic Production and Raffination of Metals From Aqueous Solutions. Oskar Emert. Chemie-Ingenieur-Technik, v. 33, Feb. 1961, p. 93-95.

Review of process parameters for precipitation of metal powder and metal films and production of very pure metals and semiconductors including Cu and Zn production with insoluble electrodes; deposition of Ni and Co alloys by electrolysis and production of Zn, Cd and semiconductor metals by amalgam electrolysis using liquid Hg electrodes. (C23, C19)

176-C. High-Purity Nickel. Metal Industry, v. 98, Mar. 31, 1961, p. 246.

Equipment and techniques used to produce gas-free, high-purity Ni ingots by melting down sintered slugs in dry hydrogen in a controlled atmosphere furnace. (C5; Ni)

177-C. (German.) Investigation of Titanium Raffination Using Oxygen-18. Hans Jurgen Hein. Chemie-Ingenieur-Technik, v. 33, Feb. 1961, p. 103-105.

Fused salt electrolysis of 0-18 oxidized Ti at 850° C. using NaCl as carrier salt, Na_2TiCl_4 as electrolyte and pure Ti as cathode with oxygen analysis and hardness examination of the refined Ti to determine oxygen pick-up during raffination. (C23, R1h, 1-59; Ti)

178-C. (Italian.) Control of Zone-Purification Process by Radioactive Zinc Tracer. D. Gelli and M. Robba. Alluminio, v. 30, Jan. 1961, p. 3-8.

Redistribution of Zn in a zone-purified Al ingot is investigated using Zn^{65} radioisotpes. Effect of translation rate, number of passes and of anodic oxide layer on process. 4 ref. (C28k, 1-59; Zn)

179-C. Vacuum Techniques. T. Thorley. Metal Industry, v. 98, Apr. 7, 1961, p. 263-267.

Vacuum melting of reactive metals in induction furnaces or arc melting furnaces. Vacuum is maintained at low pressures by joint seals of Cu sheet or Au wire. Leaks are detected by a mass spectrometer. (C25)

180-C. (German.) Use of the Electro Furnace in Melting of Nonferrous Metals. C. Reschke and K. D. Fritzsche. Metall, v. 15, Apr. 1961, p. 328-330.

Design and operation of electric furnaces with emphasis on use of continuous electrodes for melting (of Cu and Ni matte), slag enrichment and selective reduction (production of Mn and Ti slag concentrates and simultaneous melting of pig iron) and reduction (production of Cu, Co, Sn and Zn). (C5h; Cu, Co, Mn, Ni, Sn, Zn)

181-C. (German.) Electrolytic Precipitation of Titanium Metal From Salt Melts

by a Soluble Anode. P. Ehrlich, R. D. Uihlein and H. Kuhnl. Chemie-Ingenieur-Technik, v. 33, Feb. 1961, p. 92.

Production of pure Ti from 99.7% Ti turnings by fused salt electrolysis in Ar atmosphere at 820° C. using $TiCl_2$ containing NaCl as electrolyte. Quality assessment of Ti by hardness measurements of current on crystal shape of the Ti deposits. (C23, C27; Ti)

182-C. Consolidation and Purification of Tungsten in High Vacuum. Industrial Heating, v. 28, Feb. 1961, p. 296.

Various methods of preparing massive shapes of tungsten for high temperature conditions include vacuum consumable and nonconsumable electrode process, powder metallurgy method and d-c. tungsten arc process. (C25, H10; W)

183-C. (German.) Problems in Electrolytic Production of Metals From Fused Salts, Discussed in Terms of Fused Salt Electrolysis of Aluminum. H. Ginsberg. Chemie-Ingenieur-Technik, v. 33, Feb. 1961, p. 80-84.

Review of theory and technology in terms of solubility and dissolution mechanisms in the molten systems $NaF-AlF_3$ and $Na_3AlF_6-Al_2O_3$; thermodynamics of reactions during electrolysis; the "anode effect" (unsteady change of current and voltage); carbon consumption; and heat and energy balance. (C23, C27; Al)

184-C. (Swedish.) Trends in Aluminum Manufacture. Odd Strandberg. Teknisk Tidskrift, v. 91, Mar. 17, 1961, p. 237-241.

Survey of processes for the extraction and refining of Al including nitride production from bauxite, the Quebec method and the Johnson process. Methods are given for current consumption and cost reduction during electrolytic extraction. (C23, C-general; Al)

185-C. (Italian.) Preparation of Magnetic Ferronickel Alloys of High Permeability by Vacuum Melting and Sintering. G. Brossa, A. Ferro and G. Venturello. Metallurgia Italiana, v. 53, Jan. 1961, p. 17-23.

Preparation of mumetal and Permalloy C using electrolytic Ni and electrolytic, Armco and ductile Fe with direct additions of Cu, Cr and Mo powder. Comparison of permeability characteristics. 12 ref. (C5, H15, P16q, 1-73, 2-60; Ni-b, Fe, SGA-n)

186-C. Silicon Yields to Horizontal Zone Refining. Chemical & Engineering News, v. 39, May 1, 1961, p. 46.

Purification of Si by horizontal zone refining using water-cooled quartz containers which do not react with molten Si. Resulting resistivity and product quality compare favorably with those obtained by floating zone method. (C28k; Si)

187-C. (Swedish.) Beryllium Preparation by the Sulphide Process. Teknisk Tidskriff, v. 91, Apr. 14, 1961, p. 387-389.

Precipitation of heavy metals such as Cu, Ni and Fe in Be-containing materials by ammonium sulphide with an ammonium-beryllium compound crystallizing at 50° C. The ammonium is driven off at 900° C. in an induction furnace to produce high-purity Be. 4 ref. (C27; Be)

188-C. Solid State Electrolysis in Yttrium Metal. J. M. Williams and C. L. Huffine. Nuclear Science and Engineering, v. 9, Apr. 1961, p. 500-506.

Purification of yttrium by heating to 1230-1370° C. for 200 hr. in static Ar using direct current. Chemical and metallographic analysis with cold rolling tests indicate improved ductility with increase of purity near the cathode as a consequence of oxygen and metallic impurity ingration to the anode. 8 ref. (C23p, Q23p, 2-60; Y-a)

189-C. (German.) Preparation and Testing of High-Purity Gallium. E. Papp and K. Solymar. Acta Chimica Academiae Scientiarum Hungaricae, v. 24, Apr. 1960, p. 451-474.

Electrowinning of Ga by two stage electrolysis of the concentrated extract obtained in the Bayer Al process after leaching, a stainless steel electrode and a Ni electrode being used. Purity tests by colorimetric spectrographic and polarographic methods and resistivity and activity measurements. 42 ref. (C23n, S11; Ga)

190-C. Ion Exchange for Gold Recovery. Mining Journal, v. 256, Apr. 14, 1961, p. 409, 411.

Twenty dimethylamine anion resins including a De Acidite H resin containing 24% strong base groups are tested for efficiency in recovery of Au by ion exchange. Data are included for competing Fe, Cu and Ni ions. (C19s; Au, NM-d37, 17-57)

191-C. Production of Uranium Metal. F. L. Cuthbert. Paper from "Australian Atomic Energy Symposium". Melbourne University Press, Melbourne, Australia, 1958, p. 102-110.

Uranium extraction, purification and residue recovery processes with emphasis on the use of pulse plate liquid-liquid extraction columns and tributyl phosphate-kerosene solvent. UF_4 is reduced to massive uranium metal ingots suitable for use as reactor fuel elements. 16 ref. (C19; U)

192-C. The Lower Halides of Niobium and Zirconium. I. E. Newnham. Paper from "Australian Atomic Energy Symposium." Melbourne University Press, Melbourne, Australia, 1958, p. 128-131.

New processes for separating Hf from Zr and Ta from Cb involving the differential reduction of the mixed tetrahalides of Zr and Hf and of the mixed pentahalides of Ta and Cb. Reduction occurs at 190-650° C. using atomic H_2. 17 ref. (C1p; Cb, Hf, Ta, Zr)

193-C. Bronze Alloys Electric Melting and Quality Control. R. V. Barone, T. F. Godfrey and R. A. Rosenberg. Modern Castings, v. 39, Mar. 1961, p. 103-110.

Low frequency induction melting of bronze alloys leading to close metallurgical control, decreased production costs and improved physical properties. Use of an X-ray fluorescence unit to monitor Zn content. (C5, Q-general, 2-60; Cu-s)

194-C. Apparatus for Zone Refining Highly Reactive Metals. G. E. Spangler. Franklin Institute (Air Force Office of Scientific Research). U. S. Office of Technical Services, PB 161929, July 1960, 12 p. $.50.

An improved apparatus for the purification of highly reactive metals by the floating zone technique. The apparatus consists of a hermetically sealed, all-glass system using a static inert atmosphere which is internally gettered. (C28k)

195-C. Discharge Behavior in Vacuum Arc Melting. F. W. Wood and R. R. Lowery. U. S. Bureau of Mines, Report of Investigations 5749, 1961, 32 p.

Investigation of anomalies in electrical-discharge behavior during consumable-electrode arc melting of Ti by measuring crucible temperature, arc potential and current, arc light intensity and furnace pressure. Formulation of theories for crucible rupture mechanism and explosive reactions in the furnace caused by displaced skittering arcs. (C5h, 1-73; Ti)

196-C. Gas-Fired Vacuum Retort for Distilling Metals. H. S. Caldwell, H. W. St. Clair, J. W. Bilbrey and M. J. Spendlove. U. S. Bureau of Mines, Report of Investigations 5764, 1961, 11 p.

Distillation of Zn alloys containing impurities of Al and Fe in a graphite retort with a liner of 304 stainless steel at 450-1000° C. under vacuum. Determination of relationship between evaporation rate and temperature. (C22h, 1-52, 1-73, 2-61; Zn-b, Al, Fe)

197-C. Aluminium Alloy Slab Casting and Sawing Installation. Engineer, v. 211, Apr. 21, 1961, p. 666.

Semicontinuous casting of Al alloy to form ingots for producing sheet, slip and coil. Grain size can be controlled by changing casting speed. (C5; Al-b)

198-C. A Survey of the Literature on the Use of Organometallic Compounds in the Preparation of Ultrapure Metals. W. A. G. Graham. Arthur D. Little, Inc. U. S. Office of Technical Services, PB 171097, July 1960, 38 p. $1.25.

Possible recovery methods studied include thermal decomposition, photolysis, electrolysis and hydrogenolysis. (C-general)

199-C. (Translation.) Adaptive Automatic Control System for Obtaining Aluminum by the Electrolytic Process Using a Computing Device. E. P. Sarkisyan, M. M. Agababyan and P. S. Saakyan. Automation and Remote Control, v. 21, June 1960, p. 563-567. (Translated from Avtomatika i Telemekhanika, Dec. 1960.)

Automatic control system constructed with digital computor elements for the electrolytic process of obtaining Al from fused alumina-cryolite bath. (C23; Al)

200-C. Electric Smelting of Montana Chromite Concentrates. W. L. Hunter and Lloyd H. Banning. U. S. Bureau of Mines, Report of Investigations 5775, 1961, 30 p.

Production of ferrochromium with varying carbon and Si content from

chromite ore. Electrical energy, flux and electrode requirements are given for high, medium or low-carbon ferrochromium. (C21d; Cr)

201-C. Refining Crude Aluminum by the Subhalide Reaction. Leland A. Yerkes and Oliver C. Fursman. U. S. Bureau of Mines, Report of Investigations 5773, 1961, 19 p.

Effect of pressure, temperature, vapor flow rate and charge composition on the efficiency of refining Al from crude alloys using $AlCl_3$ vapor. 17 ref. (C19r; Al)

202-C. (Japanese.) Lead Extraction Metallurgy by Electrolysis of Lead Sulphide in $PbCl_2$ Salt Bath. Kiyoshi Azuma, Takeo Furukawa, Hisashi Ishikawa and Yoshio Mizuniwa. University of Tokyo, Engineering Research Institute, Annual Report, v. 19, Mar. 1961, p. 90-97.

Technological parameters for extraction of Pb, with recovery of Au, Ag, Cu, Zn, S, Bi and Fe as byproducts, by electrolysis of chlorinated sulphide ores, with combined volatilization and vacuum evaporation of impurities. (C23; Pb)

203-C. (French.) Application of Electrolytic Processes in the Metallurgy of Titanium and Zirconium. M. Socci. Journal du Four Electrique, Jan. 1961, p. 21-22.

Thermal and electrolytic production of Ti and Zr. Principles of Kroll and Donegani processes for production of metal crystals. (C23; Ti, Zr)

204-C. (French.) New Physical and Chemical Properties of Metals of Very High Purity Obtained by Zone Refining. Georges Chaudron. Bulletin de la Societe Chimique de France, Jan. 1961, p. 18-25.

Purity, crystal structure, electric conductivity, mechanical strength and corrosion of zone refined Al and Fe. 21 ref. (C28k; Al, Fe)

205-C. (French.) Production of Beryllium and Its Alloys. Work of Paul Lebeau. Present Processes. Emile Pruvot. Bulletin de la Societe Chimique de France, Jan. 1961, p. 172-176.

Production of crude Be. Purification by fractionated sublimation and electrolysis to produce highly purified Be. (C-general; Be)

206-C. (Portuguese.) Calculation of the Correct Charge Composition for Lead Smelting Furnaces. Tharcisio D. de Souza Santos. Boletim da Associacao Brasileira de Metais, v. 17, no. 62, 1961, p. 119-130.

Calculation of the slag composition from the weight of charge components. Determination of the flux to be used from the SiO_2/CaO, FeO/SiO_2 and CaO/FeO ratios of the ore or sintered ore. 4 ref. (C21; Pb)

207-C. Using Molten Zinc to Extract Aluminum From Aluminum-Silicon Alloys: A Progress Report. H. S. Caldwell, Jr., and M. J. Spendlove. U. S. Bureau of Mines, Report of Investigations 5781, 1961, 15 p.

Effect of temperature, time, pressure, particle size and alloy composition on the efficiency of leaching Al from Al-Si alloys using volatile Zn. 7 ref. (C19n; Al-b, Si)

208-C. Treatment of Nickel-Copper Matte. Kelvin Sproule, G. A. Harcourt and L. S. Renzoni. Paper from "Extractive Metallurgy of Copper, Nickel and Cobalt". Interscience Publishers, Inc., New York 1, 1961, p. 33-54.

Processes for separating $CuSO_4$ and precious metals from $NiSO_4$ including conversion, casting and slow cooling, milling, flotation, metallic recovery, direct electrorefining of matte anodes and product treatment. Grain structure and phase diagrams of Bessemer Ni-Cu mattes. 17 ref. (C21b, C23p, B-general, M-general; RM-n, Cu, Ni, S)

209-C. Chibuluma Cobalt Plant. W. R. N. Snelgrove. Paper from "Extractive Metallurgy of Copper, Nickel and Cobalt". Interscience Publishers, Inc., New York 1, 1961, p. 55-66.

Plant equipment and production processes for a Cu-Co matte including flotation, roasting, smelting and gas disposal procedures. Laboratory test results for matte composition and grain structure. 4 ref. (C21, B-general, M-general; RM-n, Cu, Co)

210-C. Cobalt-Nickel Separation by Solvent Extraction. J. E. Magner. Paper from "Extractive Metallurgy of Copper, Nickel and Cobalt". Interscience Publishers, Inc., New York 1, 1961, p. 67-73.

Co, Ni and Cu separation by a solvent extraction process which includes feed

pretreatment and stripping and recovery of Co and Ni. Solvents utilized are H_2S, sulphonic acid, HCl and H_2SO_4. (C19n; Cu, Ni)

211-C. Separation of Cobalt and Nickel Through Volatilization of Their 2, 4-Pentanedionates. Patrick Grimes. Paper from "Extractive Metallurgy of Copper, Nickel and Cobalt". Interscience Publishers, Inc., New York 1, 1961, p. 75-83.

Recovery of Ni and Co from solution through precipitation of their 2, 4-pentanedione chelates. Separation of the two metals by sublimation or distillation, utilizing the difference in volatility of the chelates with subsequent decomposition by hydrolysis. 16 ref. (C19q, C27; Ni, Co)

212-C. Reverberatory Furnace and Converter Practice at the Noranda and Gaspe Smelters. J. N. Anderson. Paper from "Extractive Metallurgy of Copper, Nickel and Cobalt". Interscience Publishers, Inc., New York 1, 1961, p. 133-158.

Design and operation of a wet-charge Cu smelting reverberatory furnace. Comparative technical indexes for wet-charge and hot-charge practice and converter practice in smelting. 3 ref. (C21b, C21c, 1-52; Cu)

213-C. Smelting Practices of Phelps Dodge in Arizona. M. G. Fowler. Paper from "Extractive Metallurgy of Copper, Nickel and Cobalt". Interscience Publishers, Inc., New York 1, 1961, p. 159-203.

Review of development of Cu smelting practices and converter design and operation from 1880 to the present. Analysis of raw ore, slags, magnetic control, fluxing problems and Cu production. 6 ref. (C21b, 10-54; Cu)

214-C. Certain Limiting Factors in the Design and Operation of Pierce-Smith Copper Converters. W. J. de Villiers, R. C. Bohme, N. Gibson and W. A. Kealy. Paper from "Extractive Metallurgy of Copper, Nickel and Cobalt". Interscience Publishers, Inc., New York 1, 1961, p. 205-224.

Design and operating factors limiting capacity of a Cu converter including blast and automatic air control systems and pressure-volume characteristics. Technical index for conversion of a Cu-bearing silicious ore containing about 70% silica. (C21b, 1-52; Cu)

215-C. Copper Converting Practices at Chino Mines Division of Kennecott Copper Corp. M. K. Nicholson, P. L. Lockridge and G. C. Beals. Paper from "Extractive Metallurgy of Copper, Nickel and Cobalt". Interscience Publishers, Inc., New York 1, 1961, p. 225-238.

Increased efficiency and production of Cu smelting operations achieved by converter modification and installation of mechanical tuyere punchers. Comparative data for smelting operations with reverberatory furnaces. (C21b, C21c; Cu)

216-C. Electric Smelting of Sulfide Ores. Otto Barth. Paper from "Extractive Metallurgy of Copper, Nickel and Cobalt". Interscience Publishers, Inc., New York 1, 1961, p. 241-262.

Comparison of electric and reverberatory furnace smelting of sulphide ores. Design and fabrication of an electric furnace and its application to treatment of Cu, Ni and Co concentrates. (C21c, C21d, 1-52; Cu, Ni, Co)

217-C. Production of Ferronickel at Riddle, Oregon. E. E. Coleman and D. N. Vedensky. Paper from "Extractive Metallurgy of Copper, Nickel and Cobalt". Interscience Publishers, Inc., New York 1, 1961, p. 263-286.

Mining, ore beneficiation, calcining, electrofurnace smelting, refining and casting production of ferronickel derived from low-grade lateritic Ni ore. 3 ref. (C21d, B-general; RM-n, Fe-b, Ni)

218-C. Ferronickel Smelting in New Caledonia. C. G. Thurneyssen, J. Szczeniowski and F. Michel. Paper from "Extractive Metallurgy of Copper, Nickel and Cobalt". Interscience Publishers, Inc., New York 1, 1961, p. 287-300.

Electrometallurgical smelting process for producing ferronickel from unbeneficiated Ni ore. (C21d; RM-n, Fe-b, Ni)

219-C. Leaching and Electrowinning of Copper From Nchanga Oxide Concentrate. F. H. Chapman and E. W. Page. Paper from "Extractive Metallurgy of Copper, Nickel and Cobalt". Interscience Publishers, Inc., New York 1, 1961, p. 317-345.

Flotation, thickening, classification, filtering, washing and purification processes for sulphide leaching of Cu ores. Procedures and plant layout for electrowinning acid Cu sulphate solutions. (C19n, C23n; Cu)

220-C. Leaching of Chuquicamata Oxide Copper Ores. J. A. McArthur and C. Leaphart. Paper from "Extractive Metallurgy of Copper, Nickel and Cobalt". Interscience Publishers, Inc., New York 1, 1961, p. 347-361.

Extraction of Cu from oxide ores by sulphuric acid leaching in vats using batch percolation, dechloridizing and SO_2 processes. (C19n; Cu)

221-C. Pressure Leaching of Nickeliferous Laterites With Sulfuric Acid. E. T. Carlson and C. S. Simons. Paper from "Extractive Metallurgy of Copper, Nickel and Cobalt". Interscience Publishers, Inc., New York 1, 1961, p. 363-397.

Technological parameters for extraction of Ni and Co from nickeliferous lateritic ore pressure leaching with H_2SO_4 with auxiliary processes including high-pressure slurry pumping, agitation, heat exchange, flow control, concentrate preparation and refining. 14 ref. (C19n; Ni, Co)

222-C. Industry Report on Modern Copper Tank House Practice. J. H. Schloen and S. S. Forbes. Paper from "Extractive Metallurgy of Copper, Nickel and Cobalt". Interscience Publishers, Inc., New York 1, 1961, p. 401-431.

Summary of current operating practices and process factors in electrolytic Cu refining including cell construction material, solution lines, laundry, electrolytic heating, circulation, purification methods, section inspection, anode replacement, power requirements, addition agents and cathode quality. 4 ref. (C23n, 10-54; Cu)

223-C. Dialysis in Modern Tank House Practice. S. B. Tuwiner and John R. Smith. Paper from "Extractive Metallurgy of Copper, Nickel and Cobalt". Interscience Publishers, Inc., New York 1, 1961, p. 433-448.

Utilization of dialysis as a supplement to liquor purification systems in Cu refining tank houses for the separation of acids which dissolve impurities from commercial anodes. Advantages include acid recovery and reduction of acidity of the solution containing metal salts. 9 ref. (C23n, C19n; Cu)

224-C. The Electrolytic Tank House Operation and Cell Room Practice at Chuquicamata, Chile. J. A. McArthur and B. J. Ledeboer. Paper from "Extractive Metallurgy of Copper, Nickel and Cobalt". Interscience Publishers, Inc., New York 1, 1961, p. 449-468.

Cu extraction from oxide ore through electrowinning deposition and refining operations. (C23n; Cu)

225-C. Production of Refined Nickel Sulphides at Asarco's Perth Amboy Plant. D. A. Busch, John R. Stone and Geza Chiszar. Paper from "Extractive Metallurgy of Copper, Nickel and Cobalt". Interscience Publishers, Inc., New York 1, 1961, p. 469-474.

Extraction of $NiSO_4$ from electrolyte solutions used in electrowinning of Cu blister by leaching, precipitation and evaporation methods. (C19n, C27; Ni-b, S)

226-C. Electrolytic Cobalt Recovery in Katanga. M. A. Bouchat and J. J. Saquet. Paper from "Extractive Metallurgy of Copper, Nickel and Cobalt". Interscience Publishers, Inc., New York 1, 1961, p. 475-501.

Extraction of Co and Cu from oxidized ores through sulphide flotation and electrolytic H_2SO_4 leaching. Pyrometallurgical refining of Co cathodes. 8 ref. (C19n, C23; RM-n, Co, Cu)

227-C. Application of Pressure Hydrometallurgy to the Production of Metallic Cobalt. V. N. Mackiw and T. W. Benz. Paper from "Extractive Metallurgy of Copper, Nickel and Cobalt". Interscience Publishers, Inc., New York 1, 1961, p. 503-534.

Pressure hydrometallurgy processes for recovery of Co from Ni-Co-Cu sulphide ore including air and acid leaching and the soluble cobaltic ammine and Ni preferential reduction techniques. 12 ref. (C19; Co)

228-C. Production of Electrolytic Cobalt at Inco's Port Colborne Nickel Refinery. L. S. Renzoni and W. V. Barker. Paper from "Extractive Metallurgy of Copper, Nickel and Cobalt". Interscience Publishers, Inc., New York 1, 1961, p. 535-545.

Process for recovery and electrorefining of Co from Ni-Cu-Fe sulphide ores based on continuous selective oxidation and hydrolysis. 4 ref. (C19, C23; Co)

229-C. Bibliography on the Extractive Metallurgy of Copper, Nickel and Cobalt

Excluding Ore Dressing and Patents, 1946-1960. Ken G. Robb. Paper from "Extractive Metallurgy of Copper, Nickel and Cobalt". Interscience Publishers, Inc., New York 1, 1961, p. 547-633.

Compilation of 1190 literature sources including 109 references on general extractive metallurgy, smelting and related thermodynamic and thermochemical reactions; 256 references for hydrometallurgy including leaching and metal recovery from solution and 329 references on refining including electrochemical, chemical and thermal methods. (C-general, 11-65; Co, Cu, Ni)

230-C. Large-Scale Lead Smelting. C. C. Downie. Mining Journal, v. 256, Apr. 21, 1961, p. 447, 449.

Refining of galena, drosses and other Pb-bearing residues using an oil fired reverberatory hearth. (C21c; Pb)

231-C. (French.) Laboratory Tests on Cyanidation of Auriferous Minerals. A. Suttor. L'Ingenieur Chimiste, v. 43, Jan. 1961, p. 7-32.

Operations involved in dissolution of Au minerals and decantation, filtration and precipitation of purified metal. 4 ref. (C19p; Au)

232-C. Latest Developments in Aluminium Reduction. Paul H. Muller and Roland E. Oehler. NML (National Metallurgical Laboratory) Technical Journal, v. 3, Feb. 1961, p. 29-36.

Production of Al by reduction in electrolytic cells with prebaked and self-baking anodes of carbon and calcined carbon. Current consumption, current density and Faraday efficiency are given. Use of Al bus bars. 13 ref. (C23; Al)

233-C. Present Trends in Methods of Production of Aluminium Alloy Slabs and Billets for Working. M. R. Reeve. NML (National Metallurgical Laboratory) Technical Journal, v. 3, Feb. 1961, p. 46-55.

Melting in an induction furnace, gas removal with chlorine, deoxidizing with flux, grain refining with Ti and B, chill casting, continuous casting and semi-continuous casting to produce slabs and billets. Production of rod and strip with casting wheel. 6 ref. (C5; Al-b)

234-C. The Role of the National Metallurgical Laboratory in Research and Development of Light Metal Industry in India. B. R. Nijhawan. NML (National Metallurgical Laboratory) Technical Journal, v. 3, Feb. 1961, p. 56-72.

Developments in the production of Al, Ti, Mg, Be, Zr, Al-Si alloy and Al-Mg alloy from bauxite, ilmenite, magnesite, dolomite, beryl and zircon respectively by electrolytic extraction, chlorination, reduction and catalytic distillation. Tensile strengths and corrosion resistances given. 10 ref. (C-general; Al, Be, Mg, Ti, Zr)

235-C. Electrowinning of Copper From Cuprous Chloride. G. C. Mitter, B. K. Bose, S. G. Dighe, Y. W. Gokhale and B. P. Choudhury. Journal of Scientific & Industrial Research, v. 20D, Mar. 1961, p. 114-116.

Electrowinning of Cu from Cu_2Cl_2 electrolyte at room temperature with current density of 1.45 amp. per sq. diameter recovers 99.9% pure Cu. 10 ref. (C23n; Cu)

236-C. Application of Vacuum Casting Technique for the Production of Heavy Forgings. V. Scalise. Paper from "Conference on Internal Steel Quality and Methods of Its Assessment". West of Scotland Iron and Steel Institute, Journal, v. 68, 1960-1961, p. 127-152.

Vacuum casting technique for heavy forgings as related to avoidance of defects, elimination of hydrogen and hair cracks and annealing methods. Tabular data on casting processes and test results. (C5, 1-73; 4-51)

237-C. A Process for the Recovery of Pure Metals by a Solid State Reduction of Salt Crystals. Prem Behari Mathur. Indian Journal of Applied Chemistry, v. 23, Apr. 1960, p. 179-180.

Selective recovery of pure metals at room temperature by reduction of salt powders or crystals utilizing foreign electrolytes. Process applied to Cu, Ag, Mg, Zn and Ni. (C23; Ag, Cu, Mg, Ni, Zn)

238-C. (Japanese.) Effect of Melting Atmosphere on High-Temperature Properties of 60 Cr-25 Fe-15 Mo Type Alloys. Pt. 3. Studies of Cr-Base Heat-Resisting Alloys. Renpei Yoda, Heitaro Yoshida and Kiyoshi Mukaidani. Japan Institute of Metals, Journal, v. 25, Feb. 1961, p. 108-112.

Specimens prepared by air melting in a Tammann furnace and by air or low-pressure melting in a high-frequency induction furnace are tested for effects of melting conditions and of 10% Cr and 2% Ti additions on as-cast and aging (1100-1250° C.) hardness, creep strength, microstructure and hot workability. 8 ref. (C5, M27, Q-general, 2-60, 2-64; Cr-b, Fe, Mo, Ti)

239-C. (Japanese.) Behavior of Iron in Liquid-Liquid Extraction of Columbium and Tantalum. Sanji Nishimura, Jhoichiro Moriyama and Isao Kushima. Japan Institute of Metals, Journal, v. 25, Feb. 1961, p. 112-116.

Distribution coefficients and separation factors are determined for Fe, Ta and Cb in liquid-liquid solvent extraction using HF, HF-HCl, HF-HNO_3 and HF-H_2SO_4 hexone systems, Ta_2O_5, Cb_2O_5 and tantalite concentrates containing small quantities of FeO, TiO_2, SnO_2, SiO_2 and MnO. 4 ref. (C19a; Ta, Cb, Fe)

240-C. (Japanese.) Electron-Beam Melting of Refractory Metals. Kazuo Tsuya and Noriyoshi Aritomi. Japan Institute of Metals, Journal, v. 25, Feb. 1961, p. 124-128.

Investigation of electron-beam melting technique and resultant properties for Ta, Cb, Mo, W, Hf and Zr. Hardness, ductility, workability and impurity content are compared for electron-beam floating zone refined, arc-melted and sintered specimens. 7 ref. (C28, Q-general, 2-60; Ta, Cb, Mo, W, Hf, Zr, EG-d37)

241-C. (Japanese.) Appropriate Composition of Catalysts for Hydrometallurgical Processes at High Pressure. Hideo Sugawara and Saburo Shimodaira. Japan Institute of Metals, Journal, v. 25, Feb. 1961, p. 155-159.

Catalytic reduction efficiency and hydrogen consumption are investigated for catalysts used in extraction of powder metals from leaching solutions. Metal specimens include Ni-Al, Ni-Cu-Al, Ni-Fe-Al, Ni-Zn, Cu-Al and Fe-Al alloys and aluminized Ni. 6 ref. (C19; Ni-b, Cu-b, Al-b, Fe-b, Zn-b)

242-C. Vacuum Melting of Beryllium by Electron Bombardment. H. T. Sumison and C. O. Matthews. Lockheed Aircraft Corp. U. S. Office of Technical Services, PB 171521, Dec. 1959, 43 p. $1.25.

Smooth, homogeneous ingots 3 in. in diameter and essentially free of casting defects can be produced by this process. Vaporization loss during melting is not prohibitive for successful production. Ingots produced show improved cast structures and better machinability than induction-melted, vacuum-cast material. (C28, 1-73; Be)

243-C. Reduction of Niobium-Oxygen Solid Solutions by Alkaline Earth Metals. O. Kubaschewski. Institute of Metals, Journal, v. 89 Apr. 1961, p. 295-296.

Specimens of Cb-O (0.2-4% O) are equilibrated with Ca, Mg or Ba in bombs at 1000° C. for 4-7 hr., leached and degassed with composition analysis by chemical and vacuum-fusion methods as part of an investigation of thermodynamics and kinetic relations in the system. Experimental equilibrium concentration of oxygen as reduced by the method are compared to calculated values. 7 ref. (C26, S11f, P12; Cb-b, O)

244-C. The Rare Metals. Clifford A. Hampel. Chapter 1 from "Rare Metals Handbook". Reinhold Publishing Co., New York 22, 1961, p. 1-14.

Occurrence and sources of metals. Concentration, electrolytic and hydrogen reduction processes. Decomposition and melting using arc and electron-beam methods. 12 ref. (C-general; EG-c, EG-d, EG-g)

245-C. Vanadium by Metallic Reduction of Vanadium Trichloride. F. E. Block and M. J. Ferrante. Electrochemical Society, Journal, v. 108, May 1961, p. 464-468.

V_2O_5 is chlorinated with Cl_2 in the presence of C to yield VCl_4 which is decomposed to VCl_3 and separated from oxychlorides by refluxing. VCl_3 is reduced with Mg or Mg-Na to produce vanadium sponge which is purified from excess reductant and byproducts by vacuum distillation, then arc melted to produce vanadium containing 0.2% impurities which can be cold rolled to thin sheets. 7 ref. (C26; V)

246-C. Not-So-Rare Earths Take Aim on New Uses. Chemical Week, v. 88, May 13, 1961, p. 59-61.

Application of rare earth metals with improved purity in glass polishing, and as alloying agents in steelmaking and production of nonferrous alloys and thermoelectric materials. Survey of methods of separation and purification including fractional distillation, ion exchange, electrolysis and Ca reduction. (C-general; EG-g, 17-57)

247-C. Electrorefining Zirconium. D. H. Baker, Jr., J. R. Nettle and H. Knudsen. U. S. Bureau of Mines, Report of Investigations 5758, 1961, 12 p.

Refining of Zr scrap, off-grade sponge and alloys using a sodium chloride electrolyte at 830° C. Impurities are reduced as follows: Fe from 0.27 down to 0.02%; Sn, 1.36-0.001%; Cr, 0.12-0.003%; and Ni, 0.02-0.001%. (C23p; Zr-b)

248-C. (English.) Recovery of Tungsten and Molybdenum From Sodium Molybdate and Tungstate Solutions by Means of Hydrogen Pressure Reduction. A. N. Zelikman and Z. M. Lyapina. Planseeberichte fur Pulvermetallurgie, v. 8, Jan. 1961, p. 148-155.

Precipitation of tungsten from sodium tungstate solutions of various tungsten contents (5-40 g per l.), pH-values (2-7.68) and temperatures (100-200° C.) at a hydrogen pressure of 40 atm. Selective precipitation of tungsten and Mo from solutions containing sodium tungstate or molybdate at 200° C. and hydrogen pressures of 20 and 60 atm. (C26; Mo, W)

249-C. Automation for the Casting Shop. H. Henry Sinason. Iron and Steel Engineer, v. 38, May 1961, p. 92-96.

Mechanics, advantages and disadvantages of a fully continuous casting method. Comparison of semicontinuous and continuous machines. (C5q, D9q, 18-74)

250-C. Analog Simulation of Zone Melting. H. L. Mason. Journal of Research, National Bureau of Standards, Engineering and Instrumentation, v. 65C, Apr-June 1961, p. 97-99.

An analog computer is used to simulate zone melting of small-diameter tungsten rods of 0.2-1 cm. Heat balance equations take account of electron bombardment, heat capacity, radial and axial conduction and surface radiation. Diagrams are given for the chosen spatial subdivision and for the computer mechanism. (C28k; W)

251-C. Continuous Melting and Direct Roll Casting of Aluminum Alloy Sheet at New Plant of Consolidated General. Industrial Heating, v. 28, May 1961, p. 868-872.

New plant and equipment at Houston, Texas, features gas-fired reverberatory melting and holding furnace which contains 40,000 lb. of Al alloy at all times. Sheet is wound into 4000 lb. coils, "cold reduced", annealed and rolled to desired gage. Finished products are roll formed and stamped. (C5q, J23, F23; Al-b, 4-53)

252-C. New Philippine Plant Will Produce Copper From Ore to Shapes by Powder Metallurgy. Industrial Heating, v. 28, May 1961, p. 890, 892, 894, 896.

Equipment and operations for the proposed integrated Cu, Zn and ammonium sulphate plant which will convert ores into Cu powder by chemical leaching and gaseous reduction. Plant will produce strip, tubing and wire from the Cu powder. (C19n, C26, 1-52, F23; Cu)

253-C. (Translation-Chemical Society.) Extraction of Hafnium by Tributyl Phosphate. S. S. Korovin, E. N. Gribenik and L. N. Komissarova. Russian Journal of Inorganic Chemistry, v. 5, Aug. 1960, p. 910-913.

Extraction of Hf from a nitric acid solution by a solution of tributyl phosphate in dibutyl ether. Effect of nitric acid, metal and tributyl phosphate concentrations and time of mixing of the phases on efficiency. 11 ref. (C19; Hf)

254-C. (Rumanian.) Extraction of Indium From Metallurgical By-Products of Zinc in Romania. M. Petrescu, E. Ilinescu, I. Toth and I. Voiculescu. Studii si Cercetari de Matalurgie, v. 5, Apr. 1960, p. 527-546.

Laboratory and pilot-plant extraction by hydrometallurgy and wet purification of In from Pb resulting from Zn refining. 9 ref. (C19; In)

255-C. Production of Zirconium by the Semicontinuous Reactor Process. James E. Mauser. U. S. Bureau of Mines, Report of Investigations 5759, 1961, 17 p.

Pure Zr is produced by a process in which $ZrCl_4$ is reduced with Na and Mg beneath a molten byproduct salt in a semicontinuous reactor. Data are given for impurity content and hardness of the purified billets. 11 ref. (C26; Zr)

256-C. Proper Metal Preparation Cuts Costs in Non-Ferrous Foundries. Australasian Manufacturer, v. 46, May 13, 1961, p. 80-83.

Melting, alloying, pouring and materials selection techniques to improve casting structure and reduce scrap loss during production of Al and Cu-base alloy ingots. (C5; Al-b, Cu-b)

257-C. (Spanish.) Induction Melting of Light Metals. Walter Savonitti. Instituto del Hierro y del Acero, v. 14, Jan. 1961, p. 63-72.

Melting of alloys used in sand mold casting, permanent mold casting and die casting of automotive parts in furnaces of the characteristics: power-supply voltage 220-12000, frequency 50 cycles, transformer voltage 380-500, automatic current control, efficiency 25-330 Kw. power supply amperage 70-750, temperature 710-750° C., automatic metal dosage in casting. (C5j; EG-a39)

258-C. (French.) Tantalum and Columbium--Metals of the Future. B. Tougarinoff. Revue de la Societe Royale Belge des Ingenieurs et des Industriels, Feb. 1961, p. 45-53.

Extraction and refining method for ores composed of niobate and tantalate of Fe and Mn including mixing with NaOH and Na_2CO_3, roasting from 900-1000° C. with Sn and W salts extracted in water and Fe and Mn removal by leaching in H_2SO_4. Treatment with hydrofluoric acid and methyl isobutyl ketone; reduction of oxides by C, Na, or electrolytically, and subsequent sintering and resistance melting. (C-general; Cb, Ta)

259-C. (Translation-ConBur.) Electrolytic Production of Finely Divided Iron Powder. N. T. Kudryavtsev and N. I. Mikhailov. Journal of Applied Chemistry of the USSR, v. 33, June 1960, p. 1342-1346.

Effect of current density, $FeSO_4$ concentration and electrolyte pH on the current efficiency and dispersity of the powder produced by electrolysis of a FeO_4 solution saturated with K_2SO_4. 13 ref. (C23; Fe)

260-C. Electric Mobilities in Molten Alloys. Paper from "Physical Chemistry of Process Metallurgy". Pt. 1. v. 7. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1959, p. 447-460.

An empirical criterion for predicting the relative direction of motion of the components of molten metallic alloys under the influence of an electric field. The equation developed for electric mobility from this criterion yields quantitative predictions of better than order-of-magnitude accuracy. 16 ref. (C23; 14-60)

261-C. (French.) The Copper Refineries of Olen, Belgium. Pt. 1. Robert Sevin. Journal du Four Electrique et des Industries Electrochimiques, v. 66, Apr. 1961, p. 119-121.

Melting of blister copper in reverberatory furnaces using powdered coal as a fuel and refining by blowing compressed air through the melt. Excess oxygen is removed by puddling. Casting of anodes, electrolytic refining and casting of the 99.96% pure Cu into wire bars, cakes or ingots. (C-general; Cu)

262-C. A Theory on the Reduction of Titanium Chlorides by Metallic Sodium. T. A. Henrie and D. H. Baker, Jr. Paper from "Physical Chemistry of Process Metallurgy". Pt. 2. v. 8. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1959, p. 721-744.

Theoretical and experimental evidence that sodium reduction of titanium tetrachloride in fused sodium chloride occurs in two main stages, the first being the reduction of the tetrachloride to titanium dichloride and trichloride and the second being the reaction of the titanium subchlorides in the salt bath with Na which is dissolved in sodium chloride producing metallic Ti. The reaction is determined to be electrochemical in nature and of a galvanic type. 14 ref. (C26; Ti)

263-C. A New Development in the Production of Titanium by Reaction in the Gaseous Phase. S. Takeuchi, M. Tezuka, T. Kurosawa and S. Eda. Paper from "Physical Chemistry of Process Metallurgy". Pt. 2. v. 8. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1959, p. 745-769.

Production of high-purity Ti by gaseous phase reaction between $TiCl_4$ and Mg vapors. Large massive Ti in crystalline form is deposited with high efficiencies of 98% for $TiCl_4$ and 80% for Mg. Data are given for hardness and tensile and Charpy impact properties of the Ti crystals. 12 ref. (C26, Q-general; Ti, 14-61)

264-C. Reduction of Iron Halide Salts to Filamentary Metals. Paul D. Gorsuch. Paper from "Physical Chemistry of Process Metallurgy". Pt. 2. v. 8. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1959, p. 771-811.

Growth of Fe whiskers by hydrogen reduction of Fe halide salts through complex chemical process requiring presence of specific impurities in the halide salt and/or the hydrogen. Effect of amount of impurity on quantity of whiskers produced, their size, shape, orientation and surface perfection. Growth behavior at temperatures above and below the melting point of the halide salt. 33 ref. (C1p; Fe-b, 14-61)

265-C. A Process for Direct Leaching Zinc Sulfide Concentrates With Sulfuric Acid and Oxygen Under Pressure. F. A. Forward and H. Veltman. Paper from "Physical Chemistry of Process Metallurgy". Pt. 2. v. 8. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1959, p. 1255-1276.

Commercial zinc sulphide concentrate is oxidized in an autoclave from 110-115° C. for 2-4 hr. to produce a substantially quantitative amount of elemental sulphur and to extract 95-99% of the Zn in a single stage leach giving a leach solution high in zinc sulphate. The solution is subjected to conventional purification and electrolysis producing cathodic Zn and sulphuric acid for recycling. 18 ref. (C19n; Zn, S)

266-C. Observations on the Kinetics of the Reduction of $NiSO_4$ in Aqueous Solutions. W. G. Courtney and F. A. Schaufelberger. Paper from "Physical Chemistry of Process Metallurgy". Pt. 2. v. 8. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1959, p. 1277-1290.

Reaction kinetics in the hydrogen reduction of nickel sulphate from aqueous sulphuric acid and ammonia-ammonium sulphate solutions at 150-200° C. Variation of rate of nucleation and of growth and conglomeration with the partial pressure of hydrogen, agitation and solution concentrations. 10 ref. (C26; Ni, S)

267-C. Electrowinning Molybdenum: Preliminary Studies. H. J. Heinen and J. B. Zadra. U. S. Bureau of Mines, Report of Investigations 5798, 1961, 8 p.

Electrowinning of Mo directly from pure or impure MoO_3 by fused bath electrolysis in an open graphite cell at a current density of 20-26° amp. and from 750-1050° C. Fused electrolyte consists of sodium pyrophosphate, sodium tetraborate, sodium chloride and MoO_3. Effect of temperature and current density on current efficiency, yield and purity of metal. (C23n, 2-61; Mo)

268-C. The Vacuum Casting of Uranium. Industrial Heating, v. 28, June 1961, p. 1107, 1110, 1112, 1114, 1116.

Procedures and equipment for casting billets and bars. Details as to the vacuum heating unit, mold container and vacuum system. (C5, 1-73; U)

269-C. The Melting of Malleable Nickel and Nickel Alloys. C. G. Bieher and R. F. Decker. Metallurgical Society of AIME, Transactions, v. 221, June 1961, p. 629-636.

Systematic additions are made of 0.5% or less of most of the elements of the periodic table to Ni to determine the effects of minor constituents on the malleability and other mechanical and physical properties Ni alloys, the effects being related to the atomic diameter, valence and position on the periodic table. The basic methods for removal or neutralization of deleterious elements are reviewed with practical methods for melting and refining Ni alloys related to minor constituent control. 29 ref. (C-general, A-general, P-general, Q-general, 2-60; Ni-b)

270-C. Optimum Conditions for Zone Refining. J. D. Harrison and W. A. Tiller. Metallurgical Society of AIME, Transactions, v. 221, June 1961, p. 649.

Equations are derived for determining the rate of zone passage and number of passes required to produce a given degree of refining in minimum time. Calculations are made in terms of normalized growth velocity, taking in account the thickness of the diffusion boundary layer at the freezing interface and the

diffusion coefficient of the solute in the melt. (C28k)

271-C. (German.) Electron Beam Melting of Metals. Pt. 1. Processes. Helmut Gruber. Zeitschrift fur Metallkunde, v. 52, May 1961, p. 291-309.

Methods and apparatus for electron beam melting with particular reference to electron guns with accelerator anodes separated from the melt. Use of a combination of inclined electron guns for large scale production. 77 ref. (C28)

272-C. (French.) Copper, Cobalt and Germanium Plants in Olen, Belgium. Yvonne Prax. Chimie & Industrie, v. 85, Feb. 1961, p. 168-176.

Methods and equipment for melting and refining of Cu, Co and Co oxide and Ge. (C-general; Cu, Co, Ge)

273-C. (French.) Beryllium. Journal du Four Electrique, v. 66, Mar. 1961, p. 98-99.

Preparation of metallic Be from its ore by leaching, fusion at 1625° C., quenching, reaction with H_2SO_4, roasting at 1700° C., reaction with a fluorine compound from 700-1000° C., dissolution of the fluoberyllates in water and precipitation of Be hydroxide with NaOH or reaction with Cl in the presence of C. The Be chloride formed is electrolyzed in the presence of NaCl at 320° C. (C-general; Be)

274-C. Development of a 10,000-Ampere Cell for Electrorefining Titanium. F. P. Haver and D. H. Baker, Jr. U. S. Bureau of Mines, Report of Investigations 5805, 1961, 42 p.

High-purity metal is produced from impure Kroll sponge and mill scrap. Refined metal is deposited at the cathode in the form of coarse (85% plus 34-mesh), hexagonal crystals of alpha Ti when the cell is operated at 850° C. A cathode current density of 1000 amp. per ft. and a molten NaCl electrolyte containing approximately 5% by weight of soluble Ti is used. (C23p, W18e)

275-C. (Translation-Brutcher no. 5169.) Continuous Casting of Nonferrous Metals and Alloys Under Vibration. G. F. Balandin and Yu. P. Yakovlev. Tsvetnye Metally, v. 14, Jan. 1961, p. 75-78.

Factors influencing crystal structure and grain size of continuous castings. Static casting experiments with a vibrated pouring device; pouring over a vibrated runner into a continuous casting mold; special devices, in part cooled, for vibrating the melt in the crater of continuously cast billets. (C5q; Al, Zn)

276-C. (Translation-ConBur.) Mechanism of the Reaction Between Titanium Tetrachloride and Magnesium and the Optimum Temperature Conditions for the Reduction Process. R. A. Sandler. Journal of Applied Chemistry of the USSR, v. 33, May 1960, p. 1009-1014.

Reduction of $TiCl_4$ by Mg in an airtight stainless steel reactor from 760-950° C. under purified argon atmosphere. Effects of $TiCl_4$ feed rate and argon partial pressure on the chemical composition of condensate on H_2O cooled tubes. Optimum temperature for the reduction is 930-940° C. Intermediate products include $TiCl_3$ and $TiCl_2$. 6 ref. (C26, 2-61; Ti, Mg)

277-C. (Japanese.) Preparation of High Purity Silicon. Kyoshu Hata, Sadao Yasudra, Sizuo Yamada, Sizuki Nakamura and Motoari Akiyama. Tokai Technical Journal, v. 36, Feb. 1961, p. 14-23.

Preparation of pure Si by hydrogen reduction of trichlorosilane at 1100° C. Relationship between rectification of trichlorosilane and resistivity of prepared Si. Effect of reactant gas flow rate and mole ratio and of reaction temperature on yield of the reaction. (C26, P15g, 2-60, 2-61, 3-67; Si)

278-C. Technical Factors in the Production of Iron by Methods Other Than the Blast Furnace. J. Taylor. Paper from "West of Scotland Iron and Steel Institute, Journal", v. 67, 1959-1960, p. 211-227.

Conditions necessary for efficient separation of Fe from gangue produced in the reduction of iron oxide. Description of alternative methods to the blast furnace which involve production of solid Fe by gaseous reduction with H_2 and CO or by reduction with solid C or the production of liquid Fe. (C26, C28; Fe, 14-60)

279-C. (Translation-ConBur.) Rate of the Reaction Between Titanium Tetrachloride and Magnesium. R. A. Sandler. Journal of Applied Chemistry of the USSR, v. 33, July 1960, p. 1456-1460.

Gaseous $TiCl_4$ is mixed with Mg in a reactor vessel to determine rate of reaction as a function of vessel temperature and $TiCl_4$ concentration. The activation energy is calculated and used to explain the kinetics of the process. (C26, P13b; Ti, Mg)

280-C. Continuous Cast Rod and Tube. Metal Industry, v. 98, June 30, 1961, p. 515-516.

Production of phosphor bronze and gunmetal rods, tubes and shapes by continuous casting. Plant layout and sequence of operations. Mechanical properties of the castings. (C5q, Q-general; Cu-b, Cu-s, 4-55, 4-57, 4-60)

281-C. (Russian.) Criteria of Overblowing in the Blast Furnace Reduction of Oxidized Nickel Ores and Sintered Lead Ores. I. D. Reznik. Tsvetnye Metally, Feb. 1961, p. 30-38.

Reduction with air blast or oxygen enriched blast. Criteria of overblowing are a high oxygen content (up to 7%) and temperature of waste gases, hanging of the furnace charge and rising of the combustion center. Overblowing is avoided by correct distribution of charge and coke, providing for a sufficient coke quantity in the combustion center, charge preparation and furnace design. 21 ref. (C21n; Pb, Ni)

282-C. (Russian.) New Continuous Process for the Removal of Copper From Crude Lead. Ya. Z. Malkin, M. P. Smirnov, V. Ya. Sergienko, G. I. Kozhevnikova, E. I. Kalnin and N. G. Tarkhov. Tsvetnye Metally, Mar. 1961, p. 15-22.

Treatment in a water cooled reverberatory furnace with temperature control. The upper layers of the melt are held at 900° C. and the temperature is allowed to drop gradually to the bottom layers held from 370-450° C. Cu removal is accomplished by addition of sulphide concentrate, together with Na_2S or Na_2CO_3. (C21e, 2-61; Pb, Cu)

283-C. (Russian.) Starting a 32,000 Kvolt-Amp. Smelting Furnace. M. D. Sudarev, N. A. Komnatnyi, E. V. Berdennikov and N. V. Sobolev. Tsvetnye Metally, Mar. 1961, p. 23-31.

Smelting of a Cu-Ni ore concentrate in an arc furnace with atomized charging and electrode feed, a system of vents providing for gas removal. Construction and operation characteristics. (C21d, 1-52; Cu, Ni)

284-C. (Russian.) Copper Smelting With Oxygen Enriched Blast. K. I. Arfamonov, N. I. Lebedev, E. E. Ergaliev, A. K. Lesechko, M. N. Yakushin, V. N. Kazakov, N. G. Bryukhanov, L. I. Nikitina and F. I. Khvesyuk. Tsvetnye Metally, Mar. 1961, p. 32-39.

Effect of oxygen enrichment on the melting efficiency, coke consumption and waste gas temperature of a Cu smelting blast furnace. 11 ref. (C21a, 1-52; Cu)

285-C. The Preparation and Properties of Some II-V Semiconducting Compounds. G. A. Silvey, V. J. Lyons and V. J. Silvestri. Electrochemical Society, Journal, v. 108, July 1961, p. 653-658.

Purification and single crystal growth of Cd_3As_2, $CdAs_2$, CdSb, Zn_3As_2, $ZnAs_2$ and ZnSb prepared from the elements by directional freezing, vacuum distillation and zone refining. Crystallographic and solid-vapor equilibria data are obtained. 52 ref. (C22, C28k; Cd-b, Zn-b, As, Sb, EG-j31)

286-C. (German.) Detection of Losses in Production of the Valuable Element Rhenium--An Example for the Application of Radioisotopes in Metallurgy. Gunter Graf. Freiberger Forschungshefte, no. B 60, 1961, p. 31-46.

The production of Re from Pb-Zn flue dust is investigated during individual processing steps using the radioactive isotopes Re^{186} and Re^{188} such as leaching of filter oxides, thickening by evaporation, removal of Cd by cementation, precipitation of Re as sulphide and roasting of sulphide to determine metal losses during production. (C-general, 1-59; Re)

287-C. Some Practical Examples of the Use of Vacuum in Nonferrous Metallurgy. B. Tougarinoff. Vacuum, v. 10, Dec. 1960, p. 466-473.

Vacuum techniques employed in the dezincification of Pb; remelting of U; degassing, sintering and fusion of Cb and Ta; and purification of Si and Ge. (C-general, 1-73; Pb, U, Cb, Ta, Si, Ge)

288-C. Factorial Design in the Study of Acid Leaching of Pegmatitic Uranium Ores. D. G. Fisher, A. B. Van Cleave, R. G. McIntosh and R. L. Eager. Canadian Journal of Chemical Engineering, v. 39, June 1961, p. 139-144.

Effect of leaching time and temperature, particle size and oxidizing agents on uranium recovery using acid-cure and percolation leaching processes. (C19n; U)

289-C. Review of Carbon Cyanidation. Frank A. Seeton. Mines Magazine, v. 51, July 1961, p. 13-15.

Comparison of carbon cyanidation to conventional cyanide treatment. Application of carbon cyanidation in the extraction of Au and Ag not recoverable by flotation in a method that permits reuse of the carbon. 4 ref. (C19p; Au, Ag)

290-C. A Study of the Effect of Electron Beam Melting on Compounds and Metals. R. M. Martin. Reactive Metals Inc. (Wright Air Development Division). U. S. Office of Technical Services, AD 258588, Jan. 1961, 89 p. $2.25.

Ductile Co sheet can be obtained from electron beam melted Co ingots and the reduction is demonstrated of the interstitial and sulphur contents of Co by electron beam melting. Materials studied include B, B-C alloys, B-Si alloys, tantalum carbide, titanium carbide, zirconium dioxide, Hg, W, Co, V and Be. The electron beam melting process reduces the interstitial content of all the metals studied. (C25; SGA-h, EG-d37, 14-68)

291-C. Gas Reduction--New Route to Copper Refining. Chemical Engineering, v. 68, June 12, 1961, p. 100-102.

Use of reformed natural gas, or methane, to reduce O containing Cu in rotating anode furnaces. The gas is first converted to H and CO by reformer apparatus and then introduced into the molten Cu bath. (C26; Cu)

292-C. (Translation-ConBur.) Thermal Reduction of Magnesium Oxide by a Mixture of Ferrosilicon and Calcium Carbide and by Aluminum-Silicon Alloy. A. Yu. Taits. Journal of Applied Chemistry of the USSR, v. 33, Aug. 1960, p. 1696-1700.

Production of Mg from its oxide by the vacuum thermic process using ferrosilicon and CaC_2 and an Si-Al alloy as reducing agents. Comparison of the two techniques with particular reference to materials index. 5 ref. (C26, 1-73; Mg)

293-C. (Translation-ConBur.) Method for Production of Potassium From Lead--Potassium Alloy Made by an Electrolytic Process. S. A. Zaretskii and V. B. Busse-Machukas. Journal of Applied Chemistry of the USSR, v. 33, Aug. 1960, p. 1808-1812.

Investigations of various electrolytes for production of Pb-K alloys indicating that an alloy can be obtained with a current efficiency of about 80% using a liquid Pb cathode and fused KCl at an electrolysis temperature of 850° C. Vacuum distillation method for production of potassium from these alloys. 13 ref. (C23, C22, 1-73; K-b, Pb)

294-C. (Translation-ConBur.) Electrolytic Refining of Lead in Molten Silica Electrolytes. Yu. K. Delimarskii, I. G. Pavlenko and Yu. E. Kosmatyi. Journal of Applied Chemistry of the USSR, v. 33, Aug. 1960, p. 1819-1822.

Concentrates of Pb, containing small amounts of Bi, are electrolytically refined in electrolytes with compositions which varied by additions of Na_2O, PbO and $PbCl_2$ which vary the relationship between the electrochemical properties of Pb and the metallic impurities and, consequently, vary the refining power. 5 ref. (C23p; Pb)

295-C. (Russian.) Amalgam Method of Obtaining Thinly Dispersed Metals. A. T. Nijnik. Doklady Akademii Nauk SSSR, v. 137, Feb. 1961, p. 366-368.

In and Ga are extracted from mixtures by amalgamation with metals more electronegative i.e., In with Zn-Hg, Ga with Na-Hg. In and Ga amalgams are collected in sulphuric electrolytic solution. Hg is evaporated at 50° C. over 5 hr. 19 ref. (C29; In, Ga)

296-C. (French.) Results of Industrial Application of Refining by Certain Dissociable Salts in the Aluminum Foundry for Rolling Stock. M. Scheidecker, F. Santini and J. Herenguel. Revue de Metallurgie, v. 58, Apr. 1961, p. 339-343.

Refining of wrought Al-Mg alloys and Cu-bearing metals using fluozirconate,

KF, KCl, NaCl and ZrF_4 at 700-760° C. in an induction furnace. (C19a; Al-b, Mg, Cu)

297-C. Reduction of Barium Oxide With Aluminum. Hachie Sawamoto, Takeo Oki and Teruyoshi Umemura. Nagoya University, Faculty of Engineering, Memoirs (Japan), v. 12, May 1960, p. 123-129.

Influence of temperature on the reduction mechanism and the reaction conditions for maximum Ba yield. 4 ref. (C26; Ba, Al, 17-57)

298-C. A Study on Metallurgy of Metallic Beryllium Reducing Beryllium Oxide With Calcium. Hachie Sawamoto, Takeo Oki and Akira Nishina. Nagoya University, Faculty of Engineering, Memoirs (Japan), v. 12, May 1960, p. 130-135.

Reduction with excess Ca yielding a Ca-Be alloy from which the Be is extracted by removal of Ca and CaO with NH_4Cl, the product being Be powder of high purity. 4 ref. (C26; Be, Ca, 17-57)

299-C. Vacuum Techniques and Metal Properties. L. Habraken. Vacuum, v. 10, Dec. 1960, p. 412-434.

A survey of vacuum melting and refining techniques and equipment and the effect of their use on gas content, composition control, metal cleanliness, porosity, segregation, workability, mechanical and magnetic properties of alloys and metals. Application to the production of superalloys, steels, refractory metals and alloys difficult to produce by standard techniques. 24 ref. (C25, D8m, 10-54; SGA-h, ST, EG-d37)

300-C. Experimental Extraction of Gold and Silver From California and Nevada Ores. A. L. Engel and H. J. Heinen. U. S. Bureau of Mines, Report of Investigations 5790, 1961, 30 p.

Laboratory-scale treatment of ores including products of previous plant processing to determine the efficiency of various beneficiation and extraction methods such as gravity concentration, corduroy tabling, amalgamation, flotation, leaching reduction and cyanidation. (C19, B-general; Ag, Au)

301-C. Reclamation of Zinc From Galvanizers' Dross. P. K. Chakravarty, S. Visvanathan and J. S. Vatchagandhy. Tisco (Tata Iron & Steel Co., India), v. 8, July 1961, p. 129-136.

Separation of Zn by liquation and distillation in molten Pb and Al at 700° C. Tests determine effect of Pb content and immersion time on reaction between steel in the dross and molten Zn. 12 ref. (C22, C26; Zn-b)

302-C. (Russian.) Reduction of Grain Size in Beryllium and Chromium by Exposure to Ultrasound During Arc Melting. B. E. Popov, S. F. Kovtun and V. M. Amonenko. Fizika Metallov i Metallovedenie, v. 10, Dec. 1960, p. 853-856.

Arc melting of a Be or Cr electrode in an Ar atm. of 400 mm. pressure with and without simultaneous exposure to ultrasonic vibrations of 10-30 kcps. frequency. Comparison of microstructures obtained. 9 ref. (C5h, 1-74, M27c; Cr, Be)

303-C. The New Reduction Processes. Light Metals, v. 24, July 1961, p. 192-193.

Review of chemical, smelting and electrolytic methods for producing alumina and Al from bauxite, clay and Russian nepheline ore including the Bayer process, the Hall-Heroult process, Pechiney carbothermic reduction and an electrothermic process developed in Russia. (C-general; Al)

304-C. (German.) The Electron Beam Melting Process. W. Scheibe. Elektrowarme, v. 19, June 1961, p. 236-241.

Principles of the process and design and operation of commercial electron beam furnaces with up to 60 kw. power consumption for vacuum melting and casting of high-melting point metals such as Cb, W and Mo. (C5k, 1-52, 1-73; Cb, W, Mo)

305-C. Electrolytic Production of Sintered Titanium From Titanium Tetrachloride at a Contract Cathode. R. B. Head. Electrochemical Society, Journal, v. 108, Aug. 1961, p. 806-809.

Ti is deposited electrolytically from fused alkali chlorides by use of a contact cathode in an atmosphere of $TiCl_4$ and H_2. Temperature of the cathode hot spot rises to about 1300° C. while the graphite cell remains at low temperature. Reduction of

$TiCl_3$ and deposition of Ti take place simultaneously at the single cathode. 10 ref. (C23, 1-53; Ti)

306-C. Britain Declassifies Protactinium Extraction. Chemical & Engineering News, v. 39, Aug. 7, 1961, p. 48-49.

A 12-stage process is used to produce a 125-gram supply from ether sludge accumulated during pitchblende processing at Britain's Atomic Energy Authority. (C19; Pa)

307-C. (Spanish.) The Van Arkel Purification of Metals by Use of Incandescent Filaments. Pt. 1. Jose Terraza Martorell and Manuel Lopez Rodriguez. Instituto del Hierro y del Acero, v. 14, Jan.-Mar. 1961, p. 232-252.

A Zr or Ti specimen is vaporized over a filament causing decomposition of iodides and other compounds and deposition of purified metal around the filament. Effects of temperature, time, iodine quantity, type of iodides and pressure on metal deposition. (C1q; Zr, Ti, I)

308-C. Even Alloys Are Oxygen Blown. Union Carbide Metals Review, v. 4, Summer 1961, p. 9.

Refining of ferrochrome by blowing with oxygen to reduce carbon and Si content after tapping from a submerged arc furnace into ladles. Refined chrome contains 58-65% Cr, maximum 4.25% C and maximum 1% Si and is used in the melting of stainless and other alloy steels and the production of toolsteels, steel castings and cast iron. (C26; Cr-b, Fe)

309-C. Production of Copper Powder by Hydrogen Reduction Techniques. D. J. I. Evans, S. Romanchuk and V. N. Mackiw. Canadian Mining and Metallurgical Bulletin, v. 54, July 1961, p. 530-539.

Recovery of Cu in the form of specification Cu powders from sulphidic Cu concentrates and byproduct Cu sulphides. Process includes ammonia pressure leaching and hydrogen reduction from solution. Control of physical properties of Cu powder. 18 ref. (C19n, C26; Cu, 6)

310-C. (German.) Investigation of Chemically Prepared Iron and Iron-Nickel Powders. F. Eisenkolb and G. Ehrlich. Monatsberichte der Deutsche Akademie der Wissenschaften zu Berlin, v. 1, Jan. 1959, p. 12-20.

Preparation of metal and oxide powders by decomposition of Fe and FeNi salts (oxalate, formate, carbonate, nitrate and sulphate) in air and nitrogen at 350-800° C. and subsequent reduction in hydrogen at 300-400° C. X-ray investigation of lattice structure, particle size, compound formation and solubility. (C1, H11h, M22g, M26, P12e; Fe, Ni)

311-C. Recovery of Lead From Zinc Plant Residues by Brine Leaching and Electrodeposition. D. D. Marsden. South African Institute of Mining and Metallurgy, Journal, v. 61, June 1961, p. 522-534.

Method of extracting Pb by leaching with sodium chloride solutions, washing with acidified brine and recovering the dissolved Pb by electrodeposition or by chemical precipitation. Determination of optimum leaching conditions and solution composition. Effects of solute to Pb atomic ratio and acid additions to the solution on percentage of Pb recovered. 5 ref. (C19n; Pb)

312-C. Investigation of Refractory Metals Processing (Rhenium). I. R. Lane Jr. Report of NRL (Naval Research Laboratory) Progress, July 1961, p. 25-26, (Available as PB 171315 from U. S. Office of Technical Services, Washington 25, D. C.)

Method for consolidating Re powder and fabricating it into sheet form. Procedures include arc melting, cold working and pressing, followed by a stress relief anneal at very high temperatures (1650-2200° C.) in a very pure environment. (C5h, F23, 1-66, 1-67, 1-73; Re, EG-d37)

313-C. (Russian.) Kinetics of Electrical Reduction of Iron on a Mercury Drop Electrode. V. F. Ivanov and Z. A. Iofa. Doklady Akademii Nauk SSSR, v. 137, May 1961, p. 1149-1152.

Investigation of the degree of irreversibility of the reaction during the reduction of bivalent Fe ions on a Hg drop electrode using a calomel reference electrode. Influence of the Fe and hydrogen ion concentration. 8 ref. (C23, P13; Fe)

314-C. (German.) Use of Radioactive Isotopes in Nonferrous Metallurgy. Chr.

Fischer-Bartelk. Monatsberichte der Deutschen Akademie der Wissenschaften zu Berlin, v. 1, Dec. 1959, p. 780-782.

Applications include investigation of the interference of Fe and As in the electrolysis of Zn and of the role of other interfering elements in other metallurgical processes; detection of Re loss in Re extraction; and chemical analysis. (C23, 1-59, S11g)

315-C. Pilot Quantities of Columbium-Base Alloys by Vacuum Arc Melting. S. J. Noesen. Paper from "Columbium Metallurgy". v. 10. Metallurgical Society of AIME. Interscience Publishers Inc., New York 1, 1961, p. 147-172.

Description of raw materials used and of the method by which the consumable electrodes are fabricated. The macrostructure of the arc cast ingots is typically columnar, although the grain size is much finer than that usually produced in pure refractory metals. The microstructure is strongly dendritic. Results of solution treatments of the cast structure performed in an effort to reduce the degree of coring in the dendritic structure. Methods by which the ingots are prepared for subsequent fabrication. (C5h, 1-73, M-general; Cb)

316-C. The Fabrication and Mechanical Properties of Some Columbium Alloys for Use in Pressurized Water Reactors. D. J. Maykuth and R. I. Jafee. Paper from "Columbium Metallurgy". v. 10. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1961, p. 223-256.

A number of binary and ternary alloys of interest in an alloy development program for pressurized-water reactor applications are prepared using an electron beam refined Cb base, by arc melting and fabricated to sheet. Comparative fabricabilities of these alloys and their hardnesses, tensile, creep and stress-rupture properties at temperatures up through 1500° F. (C5, F-general, Q-general, 2-61, T11; Cb-b, 17-57)

317-C. Improved Facilities for Continuous Casting of Encon Copper-Base Bearing Alloys. Machinery (London), v. 99, Aug. 1961, p. 315-316.

Use of 500-lb. capacity rocking arc melting furnaces in the production of rods, tubes and bars from phosphor bronze, leaded phosphor bronze, gunmetal. (C5q, W18s; Cu-b, 4-55, 4-60)

318-C. Gaseous Reduction of Oxygen-Containing Copper. Leonard Klein. Journal of Metals, v. 13, Aug. 1961, p. 545-547.

Techniques and equipment used to reduce Cu by passing into a bath of the molten oxidized Cu a stream of hydrogen and carbon monoxide reformed from natural gas. Process is compared to reduction by wood poles and by electric power in terms of safety, simplicity and economy. (C26; Cu)

319-C. Scandium Recovery From Uranium Solutions. L. D. Lash and J. R. Ross. Journal of Metals, v. 13, Aug. 1961, p. 555-558.

Processes and reagents used to recover high purity Sc_2O_3 from dodecyl phosphoric acid employed in solvent extraction of uranium. A fluoride strip system is used to recover Sc from the solvent in concentrated form and high purity Sc_2O_3 is prepared in multipound lots by chemical separation techniques. 12 ref. (C19a, C28; Sc)

320-C. Extractive Metallurgy of Vanadium. Blair Burwell. Journal of Metals, v. 13, Aug. 1961, p. 562-566.

Techniques of vanadium recovery from uranium, phosphate, Fe, Pb and Zn ores including roasting, acid leaching, solvent extraction and precipitation with H_2SO_4 or NH_4Cl. (C-general; V)

321-C. Preparation of Copper Powder by the Fluidized Technique. A. V. Ramana Rao and A. A. Krishnan. Journal of Scientific & Industrial Research, v. 20D, June 1961, p. 242-243.

Hydrogen reduction of CuO powder by a fluidized bed technique, complete reduction of the oxide being achieved in 10 min. under a hydrogen flow rate of 5 liters per min. at 200° C. The size, shape and distribution of particles depend on corresponding properties of the oxide. Compacted and sintered specimens of the produced powder are tested for deformation resistance. (C26, B16q; Cu)

322-C. New Process for Purifying Aluminum Sulphate Key to Economy in Aluminum Production. Industrial Heating, v. 28, Aug. 1961, p. 1484, 1486.

An economical acid extraction, controlled crystallizatization and thermal decomposition process for the production of alumina from clay and shales. (C19n, 1-52; Al, 14-68)

323-C. (German.) Production of Pure Europium and Samarium. E. Meckelburg. Metall, v. 15, Aug. 1961, p. 778-780.

Method and apparatus for production of pure Sm and Eu by reduction of the oxides Sm_2O_3 and Eu_2O_3 by Zr at 900° C. under vacuum or by reduction by Ce and Al. (C26, 1-73; Eu, Sm)

324-C. Refractories Usage in Copper Smelting. W. H. Dennis. Refractories Journal, v. 37, July 1961, p. 205-210.

Processing of copper sulphide minerals requires resistance to destruction of refractory linings. Clay brick, silica brick and magnesite brick refractories are evaluated in terms of applications in roasting, reverbratory smelting, conversion and refining for casting anodes. (C21, 17-57; Cu, RM-h)

325-C. Electrowinning of Copper From Cuprous Chloride. Research & Industry, v. 6, June 1961, p. 196-197.

Semipilot scale experiments indicate that room temperature electrolysis will yield Cu deposits of 99.99% purity. Process may form part of a cyclic operation for recovery of Cu and sulphur from copper pyrite ore. (C23n; Cu)

326-C. (Translation-ConBur.) Preparation of High-Purity Selenium. D. M. Yuktanov and N. B. Pleteneva. Journal of Applied Chemistry of the USSR, v. 33, Sept. 1960, p. 1932-1937.

Preparation of Se with a purity suitable for use in rectifiers by the oxide, sublimation, reduction with SO_2 and distillation. 4 ref. (C-general; Se)

327-C. (Translation-ConBur.) Possibilities of Increasing the Degree of Utilization of the Reducing Agent in Production of Potassium by the Silicothermic Process. A. S. Mikulinskii and A. P. Selyanskii. Journal of Applied Chemistry of the USSR, v. 33, Sept. 1960, p. 1961-1964.

The effect of the Fe-Si-KCl molar ratio on the Fe-Si consumption during the reduction of KCl is studied at 900° C. A new method for investigating the kinetics of alkali metal production is used in which the weight increase of the metal per unit time is a measure of the rate. (C26, 2-60; EG-e38)

328-C. (Translation-ConBur.) Thermal Decompsotion of Antimony and Germanium Hydrides. D. S. Konovalov and E. N. Migotina. Journal of Applied Chemistry of the USSR, v. 33, Sept. 1960, p. 1974-1979.

The reaction is shown to be self-accelerating and heterogeneous and is accelerated by the active reaction products formed as the result of chemisorption. Variations of the monomolecular rate constants with temperature, pressure and degree of decomposition are given. 18 ref. (C1n; Sb, Ge)

329-C. (Translation-ConBur.) Cathodic Behavior of Manganese Dioxide and Lead Dioxide in Alkali Solutions and Melts. G. A. Martinyuk and P. D. Lukovtsev. Journal of Applied Chemistry of USSR, v. 33, Sept. 1960, p. 2036-2042.

Electroreduction of MnO_2 and PbO_2, deposited on graphite and Pt electrodes respectively, is studies in KOH-NaOh melts at 20-280° C. 24 ref. (C23; Mn, Pb, 14-68)

330-C. Refining Lead. Pt. 2. J. F. Holmes. Metal Industry, v. 99, Aug. 18, 1961, p. 124-126.

Survey of methods for removal of Bi from Pb including electrolytic processes. (To be continued.) 74 ref. (C-general, C23; Pb, Bi)

331-C. Continuous Casting of Aluminium Alloys. W. M. Doyle. Metal Industry, v. 99, Aug. 18, 1961, p. 132-133.

Advantages and limitations of processes and equipment for production of Al slabs and strip in various sizes and thicknesses. 9 ref. (C5q, 1-52; Al-b)

332-C. Copper Recovery From Segregation-Flotation Concentrates by Ammoniacal Ammonium Carbonate Leaching. M. H. Stanczyk and P. A. Bloom. U.S. Bureau of Mines, Report of Investigations, 5826, 1961, 6 p.

Determination of the influence of various concentrations of ammonia and CO_2 on Cu extraction from segregation-flotation concentrate containing up to 20.43% Cu. A metallic Cu powder assaying 98% Cu, 0.87% SiO_2, 0.10% MgO, 0.54% CaO and 0.41% R_2O_3 is obtained after leaching, filtering, washing, calcination and H_2 reduction. (C19; Cu)

333-C. Technology of Gallium Arsenide. F. Cunnell, J. Edmond and W. Harding. Solid-State Electronics, v. 1, May 1960, p. 97-106.

Preparation of semiconductor grade GaAs single crystal by zone purification. Evaluation of the efficiency of zone refining and of the influence of some impurities on the electrical properties of the material. (C28k; EG-j31, Ga-b, As)

334-C. Research and Development on Fuel Processing. Reactor Fuel Processing, v. 4, July 1961, p. 16-47.

Solvent extraction, ion exchange processes, volatility and fused salt processes and pyrometallurgical processes for the recovery of uranium from irradiated reactor fuel. Review of programs for the study of plant and equipment corrosion as a result of uranium recovery processes. 91 ref. (C19, C21, R-general, T11g, 10-54; U)

335-C. Production of Uranium, Thorium, Plutonium and Their Compounds. Reactor Fuel Processing, v. 4, July 1961, p. 58-64.

Refined UF_6 is obtained by fluorination in fluidized-bed reactors. UO_2 is obtained by fluid-bed reduction of UO_3 $(NO_3)_2$ or by electrodeposition of uranyl chloride. Methods of producing uranium carbides and uranium metal and of recovery of uranium scrap metal are reviewed. Th is prepared by reducing thorium tetrachloride. (C-general, T11g, 1-52, 10-54; U)

336-C. Recovery of Zinc From Dross and Tin From Hardhead by Amalgam Electrolysis. P. M. Sullivan and D. H. Chambers. U.S. Bureau of Mines, Report of Investigations, 5827, 1961, 17 p.

Extraction of Zn (99.99%) from galvanizer's dross with a recovery efficiency of 98% and extraction of Sn (99.90-99.99%) with an efficiency of 81%. 13 ref. (C23, C29; Zn, Sn)

337-C. Zone Purification of Beryllium. W. R. Mitchell, J. A. Mullendore and S. R. Maloof. Metallurgical Society of AIME, Transactions, v. 221, Aug. 1961, p. 824-826.

Metallic impurities of Al, Fe and Si and BeO as found in commercially pure hot pressed Be powder are experimentally reduced to lower concentrations by zone-purification techniques. Reduction in the concentration of Al to extremely low levels (10 ppm.) is noted, Al being considered a major factor contributing to the hot tearing of Be during fusion welding. A method is suggested for producing Be of improved weldability by zone melting. 4 ref. (C28k, K9s, 2-60, 3-69; Be-a, Al, 6-71)

338-C. Thermodynamic Considerations in the Chlorination of Different Oxides Constituting Columbite (Niobite) and Tantalite. G. V. Jere, C. C. Patel and V. Krishnan. Metallurgical Society of AIME, Transactions, v. 221, Aug. 1961, p. 866-872.

Standard free energy and standard enthalpy changes as a function of temperature are calculated for the chlorination reactions of Cb_2O_5, Ta_2O_5, FeO, Fe_2O_3, TiO_2, SnO_2 and MnO by Cl, CCl_4 and CoCl at 573-1773° K. in the presence of C. The data are used to predict the ease of separation of Cb and Ta from the ore constituents and from each other. 35 ref. (C26, P12, 2-60, 2-61; Cb, Ta, 14-68, NM-a34)

339-C. Dependence of Segregation of Impurities on the Crystallinity of Gallium. Leonard R. Weisberg and P. R. Celmer. Metallurgical Society of AIME, Transactions, v. 221, Aug. 1961, p. 889.

Purification of Ga by growth of single crystals through directional freezing with Sn, Pb, Cu, Ag, Si, Al and Mg impurities being segregated in the tail. The dependence of the segregation on crystalline perfection is attributed to the anisotropic thermal conductivity of Ga. Results are compared favorably above zone refining. 8 ref. (C28, M26c, N3r, 3-69, 3-72, 9-69; Ga-a)

340-C. Continuous Casting of Aluminum Alloys. W. M. Doyle. Metal Industry, v. 99, Aug. 11, 1961, p. 102-104.

Properzi, Rigamonti, Hunter-Douglas and Hazelett Processes are discussed in terms of the alloy type and product form and size. 4 ref. (C5q, 1-52; Al)

341-C. Refining Lead. J. F. Holmes. Metal Industry, v. 99, Aug. 11, 1961, p. 110-112.

Technological parameters of pyrometallurgical and electrolytic methods of removing with special emphasis on the Kroll-Betterton process. 30 ref. (C-general, C23, B15r; Pb, Bi)

342-C. Vacuum Processes Set for Boom. Steel, v. 149, Sept. 18, 1961, p. 100-103.

Application of vacuum techniques to melting, refining, degassing, heat treatment, brazing, soldering and diffusion bonding. Vacuum treatment imposes the least interference with basic properties of metals. (C-general, J-general, K-general, 1-73)

343-C. (French.) Applications of a New Cobalt Alloy in Metallurgical Furnace Components. Mines et Metallurgie, Mar. 1961, p. 139-141.

Co is alloyed with low-carbon ferrochromium in an induction furnace with magnesite lining. Two types of UMCo 50 alloy with different carbon contents are obtained. Deoxidation by silicocalcium additions in the ladle at approximately 1600° C. Density, thermal expansion and conductivity, electrical resistivity, tensile properties, hardness and impact strength in the cast and forged states. (C26, P-general, Q-general; Co-b)

344-C. (German.) Extraction Metallurgy of Uranium. N. P. Galkin. Kernenergie, v. 4, June 1961, p. 468-476.

Review of uranium production by reduction of oxides or halides, fused salt electrolysis and thermic decomposition of compounds with emphasis on reduction of oxides and UF_4 by Mg. Survey of vacuum casting and alloying techniques. (C-general, 10-54; U)

345-C. Continuous Casting of Aluminum Alloys. W. M. Doyle. Metal Industry, v. 99, Aug. 4, 1961, p. 82-85.

Production of ingot rod and strip is discussed in terms of casting speeds, pouring temperatures and cooling water rates, as they affect porosity and segregation. (C5q, E25, 1-52, 9-68, 9-69; Al-b)

346-C. (Translation-AIP.) Preparing Monocrystals of Molybdenum and Tungsten by Crucibleless Zone Melting. N. A. Brillaintov, L. S. Starostina and O. P. Fedorav. Soviet Physics--Crystallography, v. 6, Sept-Oct. 1961, p. 202-204.

Application of a high vacuum apparatus for preparing single crystals of metals by zone melting using a focused beam of electrons without a crucible. Monocrystals of W, Mo and Cu are prepared with structures substantiated by X-ray diffraction. 4 ref. (C28k, M26, N3r; W, Mo, Cu, 14-61)

347-C. Annual Summary Research Report in Metallurgy--July 1959-June 1960. Ames Laboratory. Iowa State University of Science and Technology. U.S. Office of Technical Services, IS-193, Dec. 1960, 119 p. $2.25.

Preparation and purification studies of V, Cb, Th, Y, U, Ta and their alloys. (C-general; V, Cb, Th, Y, U, Ta)

348-C. Production of Plutonium Metal. Elspeth W. Mainland, D. A. Orth, E. L. Field and J. H. Rodke. IEC (Industrial and Engineering Chemistry), v. 53, Sept. 1961, p. 685-694.

Flow diagrams of ion exchange for concentration and purification, precipitation of Pu as the peroxide and production of plutonium fluoride and subsequent reduction to the metal. Process chemistry and description of equipment and operations at Du Pont's Savannah River works. 9 ref. (C19s, C27, 1-52; Pu)

349-C. (Translation-ConBur.) Removal of Small Amounts of Copper, Lead and Zinc From Nickel and Cobalt Chloride Solutions by Ion Exchange. N. P. Kolonina. Journal of Applied Chemistry of the USSR, v. 33, Nov. 1960, p. 2442-2446.

Reduction of impurity content in the solutions is obtained by using anion exchange resins to adsorb anionic chloride complexes formed with Cu, Pb and Zn while leaving Ni and Co in solution in the cationic form. 17 ref. (C19s)

350-C. (Translation-ConBur.) Some Theoretical Aspects of the Contact Reduction of Metals From Nonaqueous Solutions. B. V. Drozdov and E. S. Postnikova. Journal of Applied Chemistry of the USSR, v. 33, Nov. 1960, p. 2495-2499.

Theoretical determination of the acidity, conductivity, oxidation, potential and dielectric constant of solutions as they affect deposition rate. Results are illustrated by contact reduction on Al using $CuCl_2$ solutions. 6 ref. (C23, 1-53; Al, Cu)

351-C. (French.) The Olen (Belgium) Plants of the Hoboken Metallurgic Society. Robert Sevin. Journal du Four Electrique, v. 66, 1961, p. 165-168.

Production of Co from a 30% Fe-15% Cu-45% Co alloy which is ground and

dissolved in hot H_2SO_4. The Fe in solution is precipitated by adding lime milk with the Mn being precipitated by NaClO addition. The solution is treated with Na_2CO_3 to precipitate CO carbonate which is oxidized by roasting at 720-800° C. and further reduced. A process is also reviewed for extraction of Ge from its ores. (C19; Co, Ge)

352-C. Refining Crude Aluminium by the Subhalide Reaction. Leland A. Yerkes and Oliver C. Fursman. Mining Journal, v. 257, Aug. 11, 1961, p. 135.

Thermodecomposition of Al in crude Al-Si alloy in which the Al is reacted with vaporized Al trichloride at 6-25 mm. Hg and 900-1200° C. forming Al monochloride which reverts to Al and Al chloride when cooled. Spectrographic analysis of the products indicates a maximum Al recovery of 64.3%. (C1p, 2-62, 3-74; Al, Si)

353-C. (Russian.) Zinc Purification Using Rectification. V. V. Krpukhin, L. H. Povedskaya and S. A. Ershova. Tsvetnye Metally, June 1961, p. 23-27.

Removal of Cd and Pb inclusions in a fractioning column consisting of a series of graphite plates. Purity of Zn is determined by spectrography and colorimetry. 8 ref. (C-general, S11; Zn, 9-69)

354-C. (Russian.) Melting High-Purity Cathode Zinc. D. P. Zosimovitch and N. A. Shvab. Tsvetnye Metally, June 1961, p. 27-32.

Fluxless melting, using nitrogen as protective medium. Design, operation cycle and controls of an induction furnace for melting and an automatic device for pouring into molds. 8 ref. (C5j, 1-52; Zn)

355-C. (Russian.) Study of Zirconium Decomposition by Sintering With Limestone. H. E. Kaplan, T. D. Uspenskaya and T. V. Prianishnikova. Tsvetnye Metally, June 1961, p. 59-61.

Zr (98-99%) is recovered at 800-900° C. by preliminary fine grinding and mixing in the ball mill and introducing CaF_2, Na_2SiF_6 salts and feldspar into the charge. Effect of various salt additions and of granularity of concentrate on recovery percentage. 6 ref. (C1, B16a, 2-59, 2-60; Zr)

356-C. Large-Scale Lead Smelting. C. C. Downie. Canadian Mining Manual, 1961, p. 103-104.

Use of a cylindrical rotary furnace with its hearth lined with Mg for smelting Ph and Pb ores, drosses and battery plates. Charging, slag removal and Pb tapping by a chain-belt system. (C5g, 1-52; Pb)

357-C. The Partition of Power in High-Current Low-Pressure Metal Vapor DC Arcs. A Theoretical Interpretation Based on Arc Melting Experiments on Tungsten. Heinz G. Sell. Paper from "Vacuum Metallurgy Conference, Transactions, 1960". Interscience Publishers, Inc., New York 1, 1961, p. 15-47.

Analysis of parameters affecting the process of power partitioning between the electrodes (i.e., the lower temperature of one of the electrodes and the substantially higher energy dissipation of the other) during vacuum melting including arc characteristics, electrode power balance, thermionic electron emission of the cathode, vapor pressure, thermal ionization and positive ion current. Correlation of theory with parameters for melting of tungsten, and comparison with data, as a function of physical constants, for melting Al, Cu, Mo, Fe, Ta, W, Zircaloy, Hg, Ti and Fe-Si. 16 ref. (C5h, 1-73; W)

358-C. The Oscilloscopic Analysis of Arc Behavior in Consumable Electrode Furnaces. T. E. Butler and R. P. Morgan. Paper from "Vacuum Metallurgy Conference, Transactions, 1960". Interscience Publishers, Inc., New York 1, 1961, p. 49-63.

Arc modes and voltage effects examined for a-c. and d-c. arc melting of Ti, Cb, Ta, W and other metals in a cold mold vacuum arc furnace. Effect of arc length and current change and pressure on voltage characteristics. 13 ref. (C5h, 1-73; Ti, Cb, Ta, W)

359-C. The Vacuum Arc Melting of Tungsten-Molybdenum Alloys and Pure Tungsten Using DC Straight Polarity as the Power Source. A. E. Marche. Paper from "Vacuum Metallurgy Conference, Transactions, 1960". Interscience Publishers, Inc., New York 1, 1961.

Sintered consumable electrodes of 1-70% Mo-W alloys and pure W are melted in cold mold arc furnaces yielding ingots of 2.5-8 in. diameter of high

density and fine grain size. Macro and microstructures are examined metallographically with a binary phase diagram being constructed. Data are given for Rockwell B hardness with evaluation of workability, weldability and shock resistance. Properties and compositions of the ingots are related to process variables. 7 ref. (C5h, 1-73, M-general, Q-general, 2-60; Mo-b, W-b)

360-C Shaped Titanium Castings. Russell G. Hardy. Paper from "Vacuum Metallurgy Conference,Transactions, 1960". Interscience Publishers, Inc., New York 1, 1961, p. 83-98.

Vacuum arc skull melting and vacuum centrifugal casting of commercial purity Ti and 6Al-4V, 5Al-2 1/2 Sn and 8Zr-4Al-4Sn-2V Ti alloys in various ranges of complexity and dimensional tolerances using molds of a special graphite ramming mix with gates and risers welded to the consumable electrode. Data are given for physical and mechanical properties and applications of the castings with comparison to austenitic stainless steels for corrosion resistance and strength. Application of the method is suggested for Zr and Zircaloy. 6 ref. (C5h, 1-73; Ti-b)

361-C. New Development in the Vacuum Melting and Casting of Uranium in Tonnage Quantities. H. M. Eikenberry, J. W. Mahaffey and R. B. Steck. Paper from "Vacuum Metallurgy Conference,Transactions, 1960". Interscience Publishers, Inc., New York, 1961, p. 101-108.

Vacuum induction melting and casting of uranium charges in the form of derbies, briquettes and scrap. Summary of modifications in furnace-vacuum system and mold design, including flame coating of molds with Mg Zirconate, use of a gun-barrel-type graphite mold, improvement of pour-plug knock-out slide assembly and providing for mold heating. Effect of technique modification on ingot quality, particularly of outgassing effects on surface defect occurrence. 4 ref. (C5j, 1-73; U)

362-C. The Effect of Furnace Pressure on Uranium Ingot Chemistry and Metal Quality. R. B. Steck, H. M. Eikenberry and D. Detrow. Paper from "Vacuum Metallurgy Conference, Transactions, 1960". Interscience Publishers Inc., New York 1, 1961, p. 109-117.

Statistical analysis of vacuum induction remelted and cast ingots. Effect of furnace pressure on H, O, N and C impurity levels and segregation. (C5j, 1-73, S12; U)

363-C. Production and Properties of the Superalloy Udimet-700. W. J. Boesch and J. F. Radavich. Paper from "Vacuum Metallurgy Conference, Transactions, 1960". Interscience Publishers Inc., New York 1, 1961, p. 119-130.

Vacuum induction melting of an Al-Ti hardened B-bearing Ni-base superalloy. Effect of chemistry control during melting,various heat treatments at 1400-2150° F. and conversion process on microstructure and mechanical properties. Data are given for tensile and creep properties at 1200-1900° F., workability and machinability with observation of precipitation and segregation and transformation microstructures. (C5j, Q-general, 2-60, 2-64; SGA-h, Ni-b)

364-C. Precision Control of Boron-10 Isotope in a Modified Type 304 Stainless Steel. Marlin S. Walmer. Paper from "Vacuum Metallurgy Conference, Transactions, 1960". Interscience Publishers, Inc., New York 1, 1961, p. 131-142.

Vacuum induction melting is used to produce 304 stainless steel containing 0.50-0.90% B-10 for reactor applications using previously vacuum melted 304 stainless containing 2% B as the raw material. Deboronization, particularly surface depletion of boron, is observed in forged billets and rolled strip after heating for various times in oxidizing atmospheres at 215 and 2150° F. Effect of heat treatment and composition on neutron absorption cross section. 5 ref. (C5j, 1-73, P18j, 2-60, 2-64; SS, B)

365-C. Precision Control of Boron-10 Isotope Analysis in a Modified 304 Stainless Steel. Pierre P. Turillon and Harold B. Canada. Paper from "Vacuum Metallurgy Conference, Transactions, 1960". Interscience Publishers, Inc., New York 1, 1961, p. 143-149.

Application of vacuum induction melting and vacuum deoxidation to chemistry control in alloying 304 stainless with 0.37% B-10. Wet

chemical and spectrographic analysis are used to determine boron content, impurity and minor element concentration, gaseous impurity removal, homogeneity and composition. 4 ref. (C5j, 1-73; SS, B)

366-C. Production of Superior Quality Ultra-High-Strength Steel Castings by Vacuum-Induction Melting. Philip S. Schaffer. Paper from "Vacuum Metallurgy Conference, Transactions, 1960". Interscience Publishers, Inc., New York 1, 1961, p. 151-190.

Physical chemistry reactions occurring in vacuum induction melting, refining and casting are reviewed with evaluation of process advantages over air melting and casting. Application to production of 4330 and 4340 high strength steel with metallographic observation of structure before and after 68-2200° F. heat treatment, chemical analysis and mechanical testing to determine ingot quality. 6 ref. (C5j, 1-73, M-general, Q-general, 2-60, 2-64; ST, SGB-a)

367-C. Segregation of Intermetallic Phases in Low-Nickel High-Iron Age-Hardenable Austenitic Alloys. C. R. Benson. Paper from "Vacuum Metallurgy Conference, Transactions, 1960". Interscience Publishers, Inc., New York 1, 1961, p. 191-208.

Effect of solidification rate and composition balance on microstructural defects and mechanical properties of vacuum induction melted high temperature alloys, M-308 and V-57. Comparison with A-286, Inco 901, Waspaloy, Rene 41, 15 Tl and 12 Tl alloys by chemical analysis, mechanical testing or micro-emission X-ray spectrographic and X-ray diffraction methods. Elimination of intermetallic phase segregation by consumable electrode vacuum arc remelting and by alloy Ti or Al additions. (C5, 1-73, M27, Q-general, 2-60, 9-69; SGA-h Fe-b, Ni)

368-C. Vacuum Casting Techniques. W. A. Matejka. Papers from "Vacuum Metallurgy Conference, Transactions, 1960". Interscience Publishers, Inc. New York 1, 1961, p. 209-222.

Survey of vacuum and inert atmosphere casting methods for vacuum induction melted high temperature alloys including static pouring in preheated ceramic molds, chilled casting, centrifugal casting, controlled solidification and ingot spinning, oscillation and vibration technique. Effect of solidification conditions and casting technique on grain structure and mechanical properties. 12 ref. (C5, 1-73, M27, Q-general, 2-60; SGA-h)

369-C. The Zone Purification of Yttrium. William C. Necker. Paper, from "Vacuum Metallurgy Conference, Transactions, 1960". Interscience Publishers, Inc., New York 1, 1961, p. 289-298.

Application of the floating zone technique to refining of rod specimens. Effect of zone length, ingot length and diameter, vacuum atmosphere conditions, number and rate of zone passes of surface tension of the metal and liquid-solid interface conditions on impurity concentration, microstructure and mechanical properties. Design and operation of vacuum induction heating equipment for the process. (C28k, 1-52, 1-73; Y)

370-C. The Role of Vacuum Metallurgy in the Consolidation of Some Zirconium-Rare Earth Alloys. L. Ianniello and D. Lam. Paper from "Vacuum Metallurgy Conference, Transactions, 1960". Interscience Publishers, Inc. New York 1, 1961, p. 299-312.

Vacuum consumable electrode arc melting and floating zone leveling are compared for producing binary alloys of Zr with 0.5-4.0% Y, 1.0-6% Nd, 4.0% Dy, 4.0% Ho or 5% Er. Composition, microstructures and physical and mechanical properties are examined for specimens after vacuum degassing, cold deformation and heat treatment. Effect of physical properties and atomic structures of materials on alloying characteristics and solute strengthening. 7 ref. (C5, C28k, M27, P-general, Q-general, 2-60, 2-64, 3-68; Zr-b, EG-g45)

371-C. (French.) Nuclear Purity and Manufacture of Metallic Uranium. P. Vertes. Energie Nucleaire, v. 3, May-June 1961, p. 199-209.

Leaching of ore concentrate in nitric acid, purification of the solution, refining of the uranium nitrate by making it pass from the aqueous solution into an organic solvent and re-extraction with pure water. Formation of UO_3 by heating the nitrate solution using ammonia

or H_2O_2. Reduction of UO_3 to UO_2 and fluorination to UF_4. Treatment of UF_4 with Ca or Mg. (C-general; U)

372-C. (Italian.) Information on the Behavior of Cupola Furnaces. Fonderia, v. 10, Aug. 1961, p. 317-323.

Parameters governing cupola furnace melting including specification of height of taphole, coke size and quality, air volume, charge distribution, height of coke bed, size of scrap material, slag control and analysis and repair of linings. (C5, W18d, 17-51, 17-52)

373-C. (Italian.) Refining of Hypereutectic Alloys Containing Silicon. Fonderia, v. 10, Aug. 1961, p. 336.

Casting, fusing and refining of eutectic and hypereutectic Al-alloy having 16-20% of Si. Refining is done by adding Na, Cu, KCl, $TiCl_2$ or phosphor which increases wear resistance and lowers the expansion coefficient. (C5, P11g, Q9n, 2-60; Al-b, Si)

374-C. Preparation of High-Purity Nickel. K. K. Kershner, F. W. Hoertel and J. C. Stahl. U. S. Bureau of Mines, Report of Investigations 5840, 1961, 15 p.

Procedure for purifying Ni solutions by precipitating and filtering off impurities and use of the purified solutions as electrolytes in depositing high-purity Ni (99.99%). Co, Cu and Fe are precipitated by $NaC_2H_5OCS_2$ and $(C_6H_5)_4$ AsCl. Pt anode and Ti cathode are employed in electrolyzing purified Ni solutions. (C23; Ni, Co, Cu, Fe)

375-C. Separation of Rare Earths by Fractional Crystallization. Robert M. Healy and Howard E. Kremers. Chapter 3 from "The Rare Earths". John Wiley & Sons, Inc., New York 16, 1961, p. 29-37.

Review of classical rare-earth separation methods including fractional crystallization, fractional precipitation and thermal reactions. Fractional crystallization enhances separation by changing the solubility of the salt, varying the temperature or the nature of the solvent, or by evaporation. 15 ref. (C-general, 10-54; EG-g45)

376-C. Separation of Rare Earths by Liquid-Liquid Extraction. D. F. Peppard. Chapter 4 from "The Rare Earths". John Wiley & Sons, Inc., New York 16, p. 38-54.

Fractionation of rare earths, fission products of rare earths and trivalent members of the actinide series. Acidic sulphate esters, organic sulphonic acids, neutral and acidic phosphonates and esters of pyrophosphoric acid are used as extractants. 36 ref. (C19a; EG-g45)

377-C. Separation of Rare Earths by Ion Exchange. Jack E. Powell. Chapter 5 from "The Rare Earths". John Wiley & Sons, Inc., New York 16, 1961, p. 55-73.

Displacement chromatography and elution chromatography are used for separating mixtures of rare-earth metal ions. The separation mechanism is based on sorption of the ions on a suitable ion-exchange medium followed by differential displacement of the individual rare-earth ions with an elutriant solution. Complexing agents consist of hydroxy acids, aminopolyacetic acid, nitrilotriacetate and EDTA. 56 ref. (C19s; EG-g45)

378-C. Preparation of the Rare Earth Fluorides. O. N. Carlson and F. A. Schmidt. Chapter 6 from "The Rare Earths". John Wiley & Sons, Inc., New York 16, 1961, p. 77-88.

Anhydrous fluorides are prepared by reacting the rare-earth oxides with anhydrous HF, NH_4F, precipitation of the fluoride from aqueous solution and the passage of anhydrous HF through a molten fluoride salt at 300-850° C. 18 ref. (C1q; EG-g45)

379-C. Rare-Earth and Yttrium Halides for Metal Production--Chlorides, Bromides, Iodides. F. E. Block and T. T. Campbell. Chapter 7 from "The Rare Earths". John Wiley & Sons, Inc., New York 16, 1961, p. 89-101.

High-purity metals are prepared by thermal reduction, metallic reduction and electrolysis of rare-earth chlorides, bromides and iodides. Review of practical methods for preparing anhydrous rare-earth halides. 40 ref. (C1p, 10-54; EG-g45)

380-C. Metallothermic Preparation of Rare-Earth Metals. A. H. Daane.

Chapter 8 from "The Rare Earths". John Wiley & Sons, Inc., New York 16, 1961, p. 102-112.

Preparation by reacting halides with Na, K, Ca, Mg or Al at 300-2200° C. Metallothermic reduction is conducted in a Ta crucible under a high vacuum. Purification by distillation is discussed. 13 ref. (C22, C26; EG-g45)

381-C. Metallothermic Preparation of Yttrium Metal. O. N. Carlson and F. A. Schmidt. Chapter 9 from "The Rare Earths". John Wiley & Sons, Inc., New York 16, 1961, p. 113-125.

Methods include the direct reduction of YF_3 with Ca in a Ta crucible, the reduction of YCl_3 with Li or Na and the reduction of YF_3 with Ca or Li to form a low-melting Y-Mg intermediate alloy. 14 ref. (C26; EG-g45)

382-C. Rare-Earth Electrolytic Metals. E. Morrice and R. G. Knickerbocker. Chapter 10 from "The Rare Earths". John Wiley & Sons, Inc., New York 16, 1961, p. 126-144.

Commerical production of misch metal, Ce, La and Dy metals by electrowinning of molten rare-earth salt baths at 535-1000° C. 51 ref. (C23n; EG-g45)

383-C. Refining and Purification of Rare Earth Metals. C. L. Huffine and J. M. Williams. Chapter 11 from "The Rare Earths". John Wiley & Sons, Inc., New York 16, 1961, p. 145-162.

Metallic impurities (Ca, Mg, Li, Zn, Fe, Ta, Ti, Zr) are removed from rare-earth metals by distillation, solid-state electrolysis, zone refining, vacuum processing and by the hot wire or iodide deposition process. 37 ref. (C-general; EG-g45)

384-C. Mechanical Fabrication of Rare-Earth Metals. K. M. Bohlander. Chapter 12 from "The Rare Earths". John Wiley & Sons, Inc., New York 16, 1961, p. 163-174.

Review of fabrication techniques for ingots and billets including melting (900-2400° F.), casting, extrusion, forging, hot and cold rolling, swaging, joining, turning, milling, drilling and sawing. 13 ref. (C5, F24, F25, G17, K-general; EG-g45)

385-C. (Translation-ConBur.) Investigation of the Products of Alumino and Silicothermic Reduction of Potassium and Mechanism of the Reactions. N. M. Zuev. Journal of Applied Chemistry of the USSR, v. 33, Dec. 1960, p. 2583-2587.

Determination of the reaction equations from data obtained by X-ray and chemical investigation of the metallic potassium, slag and sublimed salts formed during thermal reduction of potassium. 7 ref. (C26; K, Al, Si, 17-57)

386-C. (Translation-ConBur.) Precipitation of Red Mud From Aluminate Solutions by the Bayer Process. T. T. Buravlev and I. T. Slyusarev. Journal of Applied Chemistry of the USSR, v. 33, Dec. 1960, p. 2593-2597.

Investigation of the electrical and hydrophilic properties of the red mud formed during the Bayer process to determine the cause of the stability of the red mud suspension in aluminate and effects on yield efficiency for Al. 19 ref. (C19n; Al)

387-C. (Translation-ConBur.) Method and Experimental Verification of Electrochemical Purification of Electrolytes. A. L. Rotinyan and G. S. Semikozov. Journal of Applied Chemistry of the USSR, v. 33, Dec. 1960, p. 2677-2682.

Study of the variation of the electrolyte purification factor with time and number of cells during the refining of Cu and Ni. Comparison of continuous and batchwise purifications. Effect of stirring on the convective diffusion rate constant for the impurity ions. (C23p, 3-69; Cu, Ni)

388-C. (Translation-ConBur.) Synthesis of HgSe and HgTe. P. V. Usachev, A. V. Golubkov and N. S. Volosatova. Journal of Applied Chemistry of the USSR, v. 33, Dec. 1960, p. 2735-2736.

Fusion of Se and Te powders with Hg at 675-800° C. to produce HgTe and HgSe. Data are given for melting points. (C29; Se-b, Te-b, Hg)

389-C. (Translation-ConBur.) Conditions for Electrolytic Formation of Metal Powders. A. T. Vogramyan, V. N. Kudryavtsev and V. N. Kuznetsova. Journal of Applied Chemistry of the USSR, v. 33, Dec. 1960, p. 2683-2687.

Conditions for deposition of Fe and Ni powders including current density and concentration of the discharging

ions near the electrode. The transition boundary between compact and powdery deposits at various current densities is given as a function of electrolysis time. 9 ref. (C23; Fe, Ni, 6)

390-C. Low Pressure Metallurgy. A. S. Darling. Metallurgia, v. 64, Aug. 1961, p. 71-78.

Low-pressure carbon reduction processes are employed for refining pure Fe and its alloys and Ni, Cu, Mo, Cr and Cb with suggested application to Co, V, Tr, W and U. (C26,3-74)

391-C. (Swedish.) Slate as a Raw Material for the Preparation of Uranium. Olof Hormander, Paul Forsgren and Erik Strandell. Teknisk Tidskrift, v. 91, Apr. 21, 1961, p. 405-408.

Swedish slate containing 0.03% uranium is crushed, aged for some weeks to remove methane and to increase the oxidation potential, concentrated by a wet process and leached in H_2SO_4. After adjusting the acidity to 2pH, hexavalent uranium is extracted from the solution in absorption towers. (C19, 1-52; U)

392-C. (Russian.) Refining of Thallium by Crystallization. T. I. Darvoid, V. N. Vihdorovich and N. A. Jordanskaya. Izvestiya Akademii Nauk SSSR--Metallurgiya i Toplivo, Mar. 1961, p. 55-62.

Inclusions are classified according to the effectiveness with which they can be separated by partial recrystallization and analyzed by spectrographic, chemical and tracer methods. Effect of electromagnetic mixing during solidification. (C28k, S11; EG-b42)

393-C. Production of Low Carbon Ferro-Chrome From High Carbon Ferro-Chrome. Kalyani Banerjee. NML (National Metallurgical Laboratory) Technical Journal, v. 3, May 1961, p. 19-27.

Methods of carbon removal include mixing molten high carbon ferrochrome with ferrosilicon to produce low carbon chrome silicide and subsequent desiliconization by smelting with Cr-rich slag. Comparison of this method with the Swedish process. 26 ref. (C26, C21, 1-52; Cr, Fe)

394-C. Preparation of Single-Crystal Boron. Claude P. Talley. Journal of Applied Physics, v. 32, Sept. 1961, p. 1787-1788.

Preparation of single crystals of boron of millimeter size using zone melting by electron bombardment at low pressure and 2300° K. A chemical vapor plating method is also used to grow smaller crystals. 8 ref. (C28k, N15g, 1-54; B, 14-61)

395-C. (German.) New Column-Type Apparatus for Uranium Extraction. L. Ziehl and F. Ploger. Chemie-Ingenieur-Technik, v. 33, Aug. 1961, p. 533-535.

Development of a new extraction plant for production of enriched aqueous solutions of uranium salts by liquid-liquid extraction using nonstationary mixers which permit extraction, washing and re-extraction. Design of plant; mode of operation. (C19a, 1-52; U)

396-C. The Electrolytic Removal of Oxygen, Sulphur,Selenium, and Tellarium From Molten Copper. R. G. Ward and T. P. Hoar. Institute of Metals, Journal, v. 90, Sept. 1961, p. 6-12.

Impurity O, S, Se and Te contents are reduced to less than 0.001% by cathodic treatment of molten Cu under molten barium chloride at 1400° C. The current efficiency of the laboratory, process is between 60 and 80%. Analysis of the electrochemical reactions on the process and the purity of the resultant Cu crystals. Possible application in the treatment of blister Cu run to electrolyzing cells direct from the converter. 15 ref. (C23, 1-53; Cu, 14-60)

397-C. (Norwegian.) Electrolytic Preparation of High-Melting Metals. Jomar Brun. Tidsskrift for Kjemi, Bergvesen og Metallurgi, v. 21, June 30, 1961, p. 128-133.

Review of electrorefining techniques for pure Ti and Zr using fused alkali metal chlorides or alkaline earth metal chlorides as electrolytes, graphite anodes and perforated steel plates as cathodes. Summary of process kinetics and effect of electrochemical reactions on purity of materials. (C23p, 10-54; Ti, Zr)

398-C. (French.) Capillarity Leaching of Uranium Ores. P. Mouret and P. Poffier. Energie Nucleaire, v. 3, July-Aug. 1961, p. 251-260.

Ores containing Si, Al, Fe, Na, K or Mg are ground and leached by a new method making use of the capillarity phenomenon. Leaching solutions used

contain ferric sulphate, H_2SO_4, demineralized water or sodium carbonate. Concentration of uranium compounds as a function of leaching time. 5 ref. (C19n, 1-52; Al, Fe, K, Mg, Na, Si, U)

399-C. Oxygen Enriched Air in Lead and Zinc Smelting. L. Landucci and F. T. Fuller. Journal of Metals, v. 13, Oct. 1961, p. 759-763.

Utilization in suspension, Zn roasters and blast and slag-fuming furnaces. Process advantages including increased sulphur elimination, SO_2 content of exit gas and heat recovery, steadier control of operation, flexibility and reduced coke consumption. (C21, 1-52; Pb, Zn)

400-C. Bunker Hill Uses Stainless Steel Valves in Critical Process Control Points. S. H. Keller. Engineering and Mining Journal, v. 162, Oct. 1961, p. 96-97.

Aloyco 20 stainless steel double disk gate valves are used in three critical areas of an electrolytic zinc processing plant. A detailed flowsheet is given for the processing of metal and by-products. (C23, 1-52, T28; Zn)

401-C. Commercial Recovery of Vanadium by the Liquid Ion Exchange Process. R. R. Swanson, H. N. Dunning and J. E. House. Engineering and Mining Journal, v. 162, Oct. 1961, p. 110-112, 115.

A liquid ion-exchange process, using a reagent capable of extracting metallic anions from both acidic and alkaline media, is applied to a V-Cr recovery technique. Data include a flowsheet and graphs showing the influence of pH and chloride and nitrate ions on the extraction process. 6 ref. (C19s, 1-52; V, Cr)

402-C. (English.) Mold for Titanium Castings. Pt. 4. Titanium Castings Using the Expendable Carbon and Oxide Mold. Motoyuki Nakamura, Soichiro Tachibana and Katsutoshi Hobo. Government Industrial Research Institute (Nagoya), Report, v. 10, Aug. 1961, p. 467-473.

Analysis of mold reaction contamination on hardness and appearance as affected by high temperature and vacuum. Molds utilized include carbon powder or zirconea with pitch as a binder; and zirconia, alumina or zirconsand with water glass as a binder. 8 ref. (C5, W19c, 1-53, 17-57)

403-C. Mines et Fonderies de Zinc de la Vieille-Montagne. Metal Industry, v. 99, Oct. 6, 1961, p. 273-276.

Equipment and operations of an integrated Zn and Pb smelter and refinery designed to recover by-products in a closed curcuit system. Method of recovering Cd, Ag, Bi, Hg, Tl, Ge and copper sulphate. (C-general, A11c, 1-52; Pb, Zn, Ag, Bi, Cd, Ge, Hg, Tl)

404-C. Societe Generale Metallurgique de Hoboken. Metal Industry, v. 99, Oct. 6, 1961, p. 277-280.

Description of equipment, layout and operations of an electrolytic copper refinery which includes an anode foundry, an electrolysis unit and a foundry for the conversion of Cu cathodes into commercial products. Methods of melting blister Cu and scrap and casting Cu anodes, of electrolytic refining and recovery of by-products and of further remelting and casting the Cu cathodes into ingots, slabs or billets. (C5, C23, 1-52, 18-67; Cu)

Optimum temperature ranges for intensified reduction of Re, Mo and In sulphides, injecting an oxygen and nitrogen mixture; effect of temperature, roasting time and gaseous oxygen on the efficiency of reduction. 13 ref. (C28j, 1-53, 2-61, 3-67; Re, Mo, In, 14-68)

406-C. (Russian.) Study of Zinc Ferrite Reduction. V. D. Karoleva and F. M. Loskutov. Izvestiya VUZ--Tsvetnaya Metallurgiya, Mar. 1961, p. 57-66.

Decomposition of zinc ferrite in a mixture of CO, CO_2, H and N at 600-900° C.; dependence of Zn solubility on gas composition, temperature and time of reduction. 14 ref. (C26, 1-53, 2-61, 2-66, 3-67; Zn, 14-68)

407-C. (Russian.) Electrolytic Extraction of Beryllium and Zinc at Temperatures Below 1000° C. I. F. Nichkov and M. V. Smirnov. Izvestiya VUZ--Tsvetnaya Metallurgiya, Mar. 1961, p. 105-107.

Interaction of Be and Zn at temperatures below 1000° C. in a closed electrolyzer with an electrolyte consisting of chlorides of Be, Ca and Na and a Zn electrode. 9 ref. (C23, 1-53; Be, Zn)

408-C. (Russian.) The Modern Conditions of Technological Reworking of Uranium Ores. A. P. Zefirov, B. N. Laskorin and B. V. Nevskii. Atomnaya Energiya, v. 11, Feb. 1961, p. 153-169.

Survey of modern processes for uranium ore reworking with consideration of plant operations in various countries. Topics include comminution, leaching, separation methods, extractive reagents and economic factors. Effects of type and concentration of ore on processing. 34 ref. (C-general; U)

409-C. The Application of Solvent Extraction to the Recovery of Uranium From El Sherana Ore. A. I. Bellingham. Australasian Institute of Mining and Metallurgy, Proceedings, no. 198, June 1961, p. 85-112.

Sulphuric acid leaching and solvent extraction of uranium ore using a solvent of triamine in kerosene modified with 4% alcohol and a stripping agent of NaCl solution. Equipment design and operating principles for the extraction and chloride and carbonate stripping stages. 7 ref. (C19n; U)

410-C. The Recovery and Separation of Scandium, Yttrium, Thorium and Lanthanides by Solvent Extraction. R. G. Canning. Australasian Institute of Mining and Metallurgy, Proceedings, no. 198, June 1961, p. 113-151.

Equipment design and operating principles of solvent extraction processes for recovering Sc, Y, Th and heavy lanthanides from waste sulphate liquor. Effect of ferric ions, time, 2-ethylhexyl phosphoric acid concentration, pH and phase variation ratio on extraction percentages. 21 ref. (C19n, 1-52, 2-60, 2-66, 3-67; EG-b44, EG-h43)

411-C. Ion Exchange Processes in the Atomic Industry. T. V. Arden. Australasian Institute of Mining and Metallurgy, Proceedings, no. 198, June 1961, p. 153-206.

Review of processes including water treatment and effluent disposal, metal recovery and purification, new ion exchange resins and equipment and use of membrane cells for demineralization. 105 ref. (C19s; EG-g45)

412-C. Thermodynamics and Kinetics of the Deoxidation of Thorium by Calcium. David T. Peterson. Metallurgical Society of AIME, Transactions, v. 221, Oct. 1961, p. 924-926.

Reduction of Th by Ca metal at 1000-1200° C. with the reaction kinetics being determined and related to the diffusion coefficients of O in Th. The solubility of O in Th, the minimum oxygen concentration and the diffusion coefficient are determined at reaction temperatures. The process results in the lowest oxygen concentrations reported for Th metal. (C26, C28j, 2-60, 2-61; Th, Ca)

413-C. Observations Concerning Zone Refining and Thermal Treatment of Molybdenum From Low Temperature Resistance Measurements. E. Buehler and J. E. Kungler. Metallurgical Society of AIME, Transactions, v. 221, Oct. 1961, p. 957-961.

High purity Mo is heat treated, melted and zone refined and the physical and chemical changes produced by these processes are studied by resistance ratio R4.2/R27 3° K. measurements. Grain growth, microstructure, lattice defects and impurity concentration effects are associated with recrystallization, melting and zoning reactions. 9 ref. (C28k, M-general, N-general, P15g, 2-60, 2-63, 3-69; Mo-a)

414-C. Horizontal Induction Zone Melting of Refractory Metals and Semiconductor Materials. A. Berghezan and E. Bull Simonsen. Metallurgical Society of AIME, Transactions, v. 221, Oct. 1961, p. 1029-1031.

A simple and general method is described for melting and zone refining metals by induction heating on a specially shaped, water-cooled horizontal Cu crucible, consisting of either a Cu plate or a flattened tube or of several parallel small diameter tubes with the charge being on it or is suspended about it. Various atmospheres can be used; no contamination

is detected from the Cu crucible. Purification is obtained both by selective evaporation of impurities and by zone refining. Successful applications include refining of Si, Fe, Ni, Co, Cr, Ti, Zr, Cb, Mo, Ta, W, Al and Sn. (C28k, 1-69; EG-d37, EG-j, Al, Sn, Fe, Ni, Co, Cr, Ti, Zr)

415-C. (Russian.) Acquisition and Several Properties of Metallic Scandium. I. Spitsyn, L. N. Komissarova and A. A. Menkov. Doklady Akademii Nauk SSSR, v. 139, Apr. 1961, p. 903-906.

Preparation of metallic Sc from $SnCl_3$ by reduction with Ca at 900° C., with subsequent solutioning and vacuum purification. Microhardness, crystal structure and lattice parameter are measured. Rate of oxidation in air and reaction with HCl vary with temperature of air, HCl concentration and time. 16 ref. (C26, M26, Q29q, R1h, 2-61, 2-66; Sc)

416-C. (German.) Experiments on Electrolytic Production of Metallic Chromium From Ammonious Chromic Alum Solutions. Y. Kodama. Elektrie, v. 14, Aug. 1961, p. 237-242.

Method and apparatus for electrolysis of Cr from ammonious Cr-alum solutions. Cathode-potential-current measurements for various pH values. Evaluation of reaction mechanism and Cr precipitation as influenced by pH and current density. (C23p, C27; Cr)

Dependence of sulphide impurity content of steel on the sulphur content in limestone used for basic steelmaking. Limestone is burned using coke fines, lighting gas, slack coal and generator gas as fuels to determine effect of the fuel on S and SiO_2 content in the limes. 6 ref. (D-general, 1-65, 2-60; RM-q)

4-D. (German.) Metallurgy, Heat Balance and Economy of Converter Processes. Theo Kootz. Bergakademie, v. 12 Sept. 1960, p. 484-491.

Comparison of heat balances of basic converter with openhearth processes in relation to pig iron analysis; process metallurgy; scrap, ore and Mn additions; and furnace wear and efficiency. 19 ref. (D2, D3, D11k)

5-D. (French.) Hydraulic Control of Bessemer Converters. M. Sanson. Metallurgie et la Construction Mecanique, v. 92, Sept. 1960, p. 647-648, 651-653.

Design and operation of a hydraulic mechanism for control of the metal charge in Bessemer converters. (D3a, W18q, 1-52)

6-D. Continuous Casting Gains Abroad. Steel, v. 147, Nov. 21, 1960, p. 106-108.

Siegfried Junghans casting process for continuous casting of steel strands by pouring molten steel through a heated tundish into water-cooled bottomless molds. (D9q)

7-D. New Induction Furnaces Offer Composition Control. Steel, v. 147, Nov. 21, 1960, p. 112, 115.

Control of composition of cast iron during holding in an induction furnace having an electrically heated forehearth through which corrective compounds are added. The metal is stirred by electromagnetic action caused by induction. Data for furnace design and performance characteristics. (D6, W18a, 1-52)

8-D. Computer Tightens Control of L-D Steelmaking Process. Steel, v. 147, Nov. 21, 1960, p. 115.

Proportions of cold scrap, hot metal and lime for charging furnace are determined by analog computer for producing steels which may be finished within specific temperature ranges. (D10a, X14j, 1-52)

9-D. Kaldo Moves in a New 110-Ton Unit in France. F. Weston Starratt. Journal of Metals, v. 12, Nov. 1960, p. 853-856.

Oxygen steelmaking using a large scale industrial Kaldo furnace to produce a steel containing 0.05-0.07% C, 0.280-0.400% Mn, less than 0.017% P, less than 0.018% S and about 0.002% N. (D10c)

10-D. A Prepared Discussion on "Consumable Electrode Melting of Reactive Metals", a Paper by S. J. Noesen. E. W. Johnson. Journal of Metals, v. 12, Nov. 1960, p. 850-852.

Temperature and pressure factors are related to the vacuum melting of steel. Effect of vacuum pressure over the melt and electrode surface on purity. (D8m, 2-61, 3-74; ST)

11-D. (Japanese.) Home Made Bearing Steel--Its Production and Quality. Toshiichi U-e-Sugi. Metals, v. 30, Aug. 1, 1960, p. 53-59.

Melting, deoxidizing, killing and soaking processes in the production of bearing steel from pig and scrap iron. Forming and heat treatment processes. Microstructure and mechanical properties at high temperatures. (D-general, F-general, J-general, M27, Q-general, 2-62; ST, SGA-c)

12-D. (Italian.) The Rotary Ladle: a New Metallurgical Tool for the Desulphurization of Cast Iron. F. Gauzzi. Fonderia Italiana, v. 9, July-Aug. 1960, p. 321-324.

Description of ladle which permits desulphurization of molten Fe without addition of external heat. Desulphurization with powdered lime and calcium carbide compared on basis of variation of temperature produced in bath by each material. Possibility of combining desulphurization with lime (an endothermic reaction) with an exothermic reaction such as deoxidation with ferrosilicon, calcium silicide or Al. 5 ref. (D9m, D11n; CI)

13-D. A New Concept in Desulphurization. Engineer and Foundryman, v. 26, Sept. 1960, p. 32.

A continuous process of desulphurization which reduces total reaction time by using a horizontal rotating drum to produce rapid contact between slag and metal. (D11n)

14-D. Electrolytic Production of Sulphur-Free Iron. W. T. L. Neal, J. F. Duke and H. R. Sullivan. Iron and Steel Institute, Journal, v. 196, pt. 2, Oct. 1960, p. 131-134.

Iron with sulphur content of less than 0.0005% produced by electrolysis across an ion exchange membrane. Equipment for production of 500 grams of Fe in 7 hr. 3 ref. (D8p)

15-D. Defects in Steel. Metal Progress, v. 78, Dec. 1960, p. 190, 192, 194.

A direct correlation exists between the incidence of splits caused by upsetting and peculiarities noted on the surface of billets. This surface condition is termed "slag" because nonmetallics are sometimes visible on scarfed billets. The silicon's facing used on hot tops is the source of the "slag" found at or near the surface of killed steel billets. (D9; ST, 9-69)

16-D. (Czech.) Investigation of the Effect of Deoxidizing Elements on the Desulphurization of Iron, Using the Isotope S^{35}. Liu-Su-Cen, Jiri Skala and Miroslav Mandl. Hutnicke Listy, v. 15, Oct. 1960, p. 755-762.

Desulphurization of Fe-C-S systems containing Al, Si or Mn in the presence of $CaO-Al_2O_3-MgO$ and $CaO-SiO_2-Al_2O_3$ slags. Effect of Si, Al, Mn and slag composition on desulphurization velocity. 25 ref. (D11n, 1-59)

17-D. (Czech.) Use of Steam to Intensify the Openhearth Process. A. Bichler. Hutnicke Listy, v. 15, Oct. 1960, p. 778-781.

To intensify the working of a 200 ton furnace fired with an oil-enriched mixture of blast furnace gas and coke gas, steam of 250-300° C. temperature and 8-10 atm. pressure is supplied to the flame at the rate of 0.7-1.3 tons per hr. Effect of steam supply on fuel and ore consumption, service life of furnace and phosphorus and hydrogen content of steel. 6 ref. (D2h)

18-D. (Russian.) Melting of Low Sulphur Iron at the Magnitogorsk Iron Works. I. P. Bardin, I. S. Kulikov, V. M. Sudin, L. M. Zilev, H. A. Sokolov, A. L. Halatonov, N. N. Babarikin and I. I. Hultyay. Stal', Oct. 1960, p. 865-869.

Use of fluxed iron ore sinter, increased furnace temperature and pressure and

slag containing 10-12% MgO to desulphurize Fe to 0.022% in a blast furnace. (D11n)

19-D. (Russian.) Influence of Increased Gas Pressure on Chemical Composition of Iron. V. N. Andronov. Stal', Oct. 1960, p. 869-877.

Comparison of theoretical and practical data on the influence of CO pressure in the blast furnace on Si, Mn, C and S content in pig iron, taking into account the nonisothermic nature of the blast furnace process. 12 ref. (D1, 3-74)

20-D. (Russian.) Melting Chromium-Nickel Steels Using Nickel Monoxide Additions in Large Tonnage Open Hearth Furnace. B. H. Petushkov and P. K. Morokov. Stal', Oct. 1960, p. 892-896.

Effects of pelletized NiO additions to the melt on mechanical properties of the steel and tap-to-tap time during melting. Comparison with results obtained using metallic Ni additions. (D2a; AD-q)

21-D. (Russian.) Use of Furnaces With Highly Refractory Basic Roofs to Improve Quality of Chrome Steel. I. A. Andreev, L. Ya. Hluskin, V. D. Litvinov, V. A. Kovachich, I. A. Frumkin, Ya. I. Moshchuk, V. I. Kolbilkin, P. A. Romanov and A. B. Boyko. Stal', Oct. 1960, p. 896-898.

Chrome steel with low C, P and S content is obtained by melting the steel in a furnace lined with magnesite-chromite, removing slag during melting and using ferrochromium, ferrosilicon and manganese-silicon preheated to 800-1000° C as reducing agents. (D2g)

22-D. (Russian.) Treatment of Ball Bearing Steel With Synthetic Slag. S. H. Voinov and A. H. Shalimov. Stal', Oct. 1960, p. 902-904.

Use of a receiving ladle lined with synthetic calcareous-aluminum slag to reduce content of S, O and other nonmetallic inclusions in ball bearing steels. Effect of ferrochromium and ferrosilicon additions to the melt and several slag removals during melting on the composition of the steel. (D5, D9)

23-D. (Russian.) Stator for Induction Stirring of Metal in Arc Furnace. D. F. Hladkiy, A. Ya. Kovalenko and N. V. Okorokov. Stal', Oct. 1960, p. 905-910.

Electromagnetic stirring of the metallic bath in an arc furnace using an air cooled stator with an Al bar winding. (D5f, 1-52)

24-D. (German.) Extent of Carbon Monoxide Decomposition in the Blast Furnace. Hermann Schenck and Harald Barth. Stahl und Eisen, v. 80, Nov. 10, 1960, p. 1681-1689.

Measurement of the influence of sulphur content in coke on the decomposition of CO at 500-800° C. in the blast furnace. Shape of decomposed carbon particles is investigated by electron microscope. (D1, D11r)

25-D. (German.) Influence of Different Kinds of Lime on Refining in a Basic Bessemer Converter. Werner Kohler, Gerhard Tromel and Karl Heinz Obst. Stahl und Eisen, v. 80, Nov. 10, 1960, p. 1689-1695.

Refining cruves for C, P and Mn are measured under the same conditions for four different lime types in an oxygen enriched (35% O_2) basic bessemer converter. Influence of lime type on refining rate and dephosphorization after reaching maximum decarburization. (D3, D11n)

26-D. (French.) Influence of Oxidation of Iron in Agglomerates on Treatment in the Blast Furnace. F. Pesche. Revue de Metallurgie, v. 57, Sept. 1960, p. 771-773.

Effect of the degree of oxidation of the agglomerate on the weight of the load and amount of coke required during reduction of a charge composed of 60% crude ore and 40% agglomerate in a blast furnace. (D1, D11r)

27-D. (French.) Duplex Basic Bessemer Process. M. Brocard. Revue de Metallurgie, v. 57, Sept. 1960, p. 775-782.

Slag-metal reactions during the production of basic bessemer steel. Effect of process variables on steel composition. (D11n, 1-65)

28-D. (French.) Vacuum Techniques in Metallurgy. D. A. Degras. Revue de Metallurgie, v. 57, Sept. 1960, p. 805-814.

Vacuum degassing, melting, deoxidation and annealing of Fe, Al, steel and other metals to show the effect of vacuum treatment on purity of the ingot. 13 ref. (D-general, J23, 1-73)

29-D. (German.) Effect of Gas Vibrations on the Reduction of Iron Oxides. Hermann Schenck and Josef Cloth. Stahl und Eisen, v. 80, Oct. 27, 1960, p. 1453-1457.

Reduction tests in vertical and horizontal tube furnaces at temperatures from 650-1000° C. for pressed and unpressed iron oxide powders, ore mud (36.2% Fe, 17.9% Al_2O_3) and ore cubes, using oscillating CO and hydrogen reduction gas. Influence of oscillation on reduction rate and mechanism. (D-general)

30-D. (German.) Further Developments in Salzgitter Iron Ore Smelting. Heinz Schumacher. Stahl und Eisen, v. 80, Oct. 27, 1960, p. 1458-1468.

Procedures involved in smelting the Salzgitter ores, which are relatively low in Fe and high in SiO_2 (28% Fe, 27% SiO), such as separation of ore and gangue, melting of sinter, use of an electric probe in a pilot blast furnace to eliminate scab formation and utilization of blast furnace slag. 14 ref. (D1)

31-D. (German.) Use of Metallothermic Processes in Iron and Steel Fabrication. Anton Wimmer. Stahl und Eisen, v. 80, Oct. 27, 1960, p. 1469-1477.

Direct melting of steel in an almost slagless two-step process which involves preparation of ore-coal-flux briquets and subsequent electric melting in a converter or covered ladle. Composition of melting briquets; refining curves; mechanical properties and chemical analysis of produced steel. Description of a metallothermic plant in Spain. (D5g, B16d; Fe)

Review of new equipment and processes in the iron and steel industry, including open-coil gas annealing and alloying and oxygen blowing with natural gas additions in blast and openhearth furnaces. (D1h, D2g, J23)

42-D. (Polish.) Vacuum Casting of Transformer Steel. M. Markuszewicz, H. Zak and J. Groyecki. Prace Instytutow Hutniczych, v. 12, Apr. 1960, p. 167-179.

Modern methods of vacuum degassing and efficiency of vacuum in removing impurities in steel. Microstructure, chemical composition and gas content of ingots cast in vacuum and atmospheres and magnetic properties of cold rolled steel strip. 13 ref. (D9s, M27, P16, 2-60; ST)

43-D. Carbon Cooled by Air Slows Blast Furnace Hearth Wear. E. M. Summers. Steel, v. 147, Nov. 18, 1960, p. 123.

Use of air-cooled carbon hearths in blast furnaces to prevent penetration of the hearth bottom and furnace foundation by molten Fe. (D1h, 1-52)

44-D. (Russian.) Natural Gas in Metallurgy. M. I. Gromov. Priroda, v. 49 Sept. 1960, p. 59-60.

Theoretical discussion on addition of natural gas to the air or oxygen stream during blowing in the blast furnace as a method of supplying hydrogen to the air blast and maintain adequate temperature in the furnace throat. (D1h)

45-D. Control of Alloy Carryover in Melting. K. M. Shupe and P. Dufresne. Iron and Steel Engineer, v. 37, Oct. 1960, p. 114-116.

Controlling melting sequences during the production of high speed, tool, die and stainless steels to prevent carryover of Co, Cr, Ni and V to subsequent heats. (D-general)

46-D. Recent European Developments in Consumable Electrode Melting. Wylie J. Childs. Paper from "Electric Furnace Proceedings, 1959", v. 17. American Institute of Mining, Metallurgical and Petroleum Engineers, Inc., New York, 1960, p. 7-16.

Consumable electrode melting of austenitic and ferritic stainless steels, toolsteels, hardenable alloy steels, ball bearing steels, Ti and Zr. Design of furnaces; fabrication of electrodes. 4 ref. (D5a, C5h, W18a; AY, SS, Ti, TS, Zr, SGA-c)

47-D. Consumable Electrode Melting of Steel and High-Temperature Alloys. Russell C. Buehl and A. M. Aksoy. Paper from "Electric Furnace Proceedings, 1959", v. 17. American Institute of Mining, Metallurgical and Petroleum Engineers, Inc., New York, 1960, p. 51-59.

Gas content, cleanliness, segregation and center porosity of arc melted 52100, A-286 and M-252 steels and Ti. Design

of crucible, pump and electrode for electric arc furnaces. Methods for controlling arc length. 7 ref. (D5a, C5h; ST, Ti)

48-D. A Study of Hot Topping Practice. D. V. Roloff and K. V. Smith. Paper from "Electric Furnace Proceedings, 1959", v. 17. American Institute of Mining, Metallurgical and Petroleum Engineers, Inc., New York, 1960, p. 90-103.

Use of a hot top to confine the shrinkage cavity to a sinkhead at the top of the ingot and eliminate excessive chemical segregation during the production of killed steel. Methods for reducing hot top volume by improving sinkhead efficiency. (D9p; ST-c)

49-D. Effect of Various Deoxidizers on Cast Steel. Clarence E. Sims and Charles W. Briggs. Paper from "Electric Furnace Proceedings, 1959", v. 17. American Institute of Mining, Metallurgical and Petroleum Engineers, Inc., New York, 1960, p. 104-124.

Deoxidation of liquid steel by Mn, Al, Ti, Zr, misch metal and Se. Effect of oxidizing agent on the mechanical properties of the cast steel. (D11r, Q-general; ST, AD-s)

50-D. Melting Practice to Produce Extra Low-Sulphur Carbon Steel. A. J. Kiesler. Paper from "Electric Furnace Proceedings, 1959", v. 17. American Institute of Mining, Metallurgical and Petroleum Engineers, Inc., New York, 1960, p. 148-155.

Lowering of sulphur content in carbon steel to less than 0.005% by melting first with conventional slagging components to remove phosphorus and FeO, adding a slag containing lime, graphite and Si and finally blowing oxygen into the melt. (D5a; CN, S)

51-D. Reducing Agents for Submerged-Arc Manufacture of Ferroalloys. Alfred D. Gate and Herbert D. Wedge. Paper from "Electric Furnace Proceedings, 1959", v. 17. American Institute of Mining, Metallurgical and Petroleum Engineers, Inc., New York, 1960, p. 184-191.

Use of C, Si and Al for reduction of oxide ores during submerged arc smelting of steel in a refractory-lined, open-top electric furnace. (D5, W18s)

52-D. Ladle to Ladle Stream Degassing for Steel Castings. Edward Dyble and G. E. Danner. Paper from "Electric Furnace Proceedings, 1959", v. 17. American Institute of Mining, Metallurgical and Petroleum Engineers, Inc., New York, 1960, p. 212-223.

Vacuum degassing of steel melts using a four-stage steam ejector system. Mechanical properties of cast test bars poured from the degassed melt. (D9, 1-73, Q-general)

53-D. Degassing Treatment of Chromium-Nickel Alloys. E. M. Anger. Paper from "Electric Furnace Proceedings, 1959", v. 17. American Institute of Mining, Metallurgical and Petroleum Engineers, Inc., New York, 1960, p. 226-230.

Ladle stream degassing of heat resistant 28Cr-20Ni alloys in vacuum. Tensile properties of castings poured from the degassed metal. (D9, 1-73, Q27a; Cr-b, Ni, SGA-h)

54-D. Factors Affecting Temperature Drop Between Tapping and Teeming. N. L. Samways and T. E. Dancy. Paper from "Electric Furnace Proceedings, 1959", v. 17. American Institute of Mining, Metallurgical and Petroleum Engineers, Inc., New York, 1960, p. 268-283.

Statistical analysis of measured tapping and teeming temperatures in openhearth and basic oxygen shops to show the effect of bath temperature at the end of refining, bath composition, ladle and furnace additions, holding time, teeming time and temperature and ladle refractory temperature on temperature drop between teeming and tapping. (D9)

55-D. Correlation Between Tap Temperatures, Ladle Temperatures and Pouring Stream Temperatures. W. H. Burr and H. Green. Paper from "Electric Furnace Proceedings, 1959", v. 17. American Institute of Mining, Metallurgical and Petroleum Engineers, Inc., New York, 1960, p. 283-289.

Pouring stream temperatures obtained during casting of ingots are used to predict the microcleanliness and magnaflux quality of alloy forging steels. 5 ref. (D9, 2-61)

56-D. Effect of Melt-Shop Practice on Cleanliness for High-Speed Steels. Walter L. Havekotte. Paper from "Electric Furnace Proceedings, 1959", v. 17. American Institute of Mining, Metallurgical and Petroleum Engineers, Inc., New York, 1960, p. 316-341.

Effect of degree of slag reduction, $CaO-SiO_2$ ratio in tap slag, temperature, alloy additions and running time on the cleanliness of steels melted in Heroult electric furnaces. (D5a, 2-61, 9-69)

57-D. Rare Earth Alloys and Lithium as Additives to Steel. A. J. Nimeth. Paper from "Electric Furnace Proceedings, 1959", v. 17. American Institute of Mining, Metallurgical and Petroleum Engineers, Inc., New York, 1960, p. 353-354.

Effect of Li additions on the gas content of stainless steel slabs. Use of rare earth alloy additions to eliminate double conversion and conditioning. (D9r, D11h)

58-D. Special Additives in Stainless and Alloy Steels. S. J. Myford. Paper from "Electric Furnace Proceedings, 1959", v. 17. American Institute of Mining, Metallurgical and Petroleum Engineers, Inc., New York, 1960, p. 355-356.

Theory for the effect of Li additions on the gas content of 6260, 6263 and 430 stainless steel grades and of alloy steels. (D11h, 2-60)

59-D. Dry Air as a Substitute for Oxygen in the Blowing of Stainless Steel. John B. Bridges. Paper from "Electric Furnace Proceedings, 1959", v. 17. American Institute of Mining, Metallurgical and Petroleum Engineers, Inc., New York, 1960, p. 370-378.

Use of dry air to replace oxygen for blowing of 304 and 410 stainless steel melts. Data for tap to tap time, Cr recovery rate, steel cleanliness and furnace damage when using dry air. (D5g)

60-D. (Russian.) Deoxidation and Alloying of Chromium Steel in the Ladle by Silicochromium. B. G. Petukhov and P. K. Morokov. Metallurg, Oct. 1960, p. 12-14.

Melting of Cr-Ni, Cr-Si-Mn, Cr and other steels with deoxidation by ferrochromium in the openhearth furnace or by silicochromium in the ladle. Comparative data are given for process time, economy, reduction of Mn, Si and Cr fire losses, mechanical properties and structure and increase of furnace efficiency. (D2c, D9m; AD-r)

61-D. (Russian.) Combustion of Masut and Natural Gas in the Openhearth Furnace. A. G. Trifonov, Yu. B. Snegirev, E. V. Bal'piter. Metallurg, Oct. 1960, p. 14-19.

New rational method for supplying the fuel (masut or natural gas) through the end of a caisson instead of directly into the working area of the furnace. Time of the melting process and fuel consumption as a function of fuel supply method. (D2h)

62-D. (Russian.) Advantageous Method of Supplying Oxygen to the Openhearth Flame Jet. A. A. Dobrokmotov. Metallurg, Feb. 1960, p. 19-21.

Oxygen is supplied through a caisson at 12^{o} angle tuyere inclination and 150 mm. above the caisson bottom. Shortening of the melting process, better furnace efficiency and economy in fuel and oxygen consumption are attributed to the nozzle arrangement. (D2g)

63-D. Pneumatic Processes of Converting High-Phosphorus Iron. P. Coheur. Iron & Coal Trades Review, v. 181, Nov. 11, 1960, p. 1049-1054.

Comparative data and performance figures on bottom blowing, using atmospheric air, O_2-enriched air or an O_2H_2O mixture and top blowing as processes for converting high-phosphorus iron. (D3b)

64-D. The Practical Chemistry of Oxygen Steelmaking Processes. R. A. Hacking. Iron & Coal Trades Review, v. 181, Nov. 18, 1960, p. 1107-1114.

Use of tonnage oxygen in steelmaking techniques, including oxygen-enriched air blast, oxygen-steam blast, oxygen-carbon dioxide blast, top blowing and combined blowing with openhearth processes. (D-general; O, 17-57)

65-D. Combustion Control of Openhearth Furnaces. Iron & Coal Trades Review, v. 181, Nov. 18, 1960, p. 1119-1120.

Increase of furnace production rate and reduction of fuel consumption using a paramagnetic oxygen analyzer to control the air intake of an openhearth furnace. Determination of the optimum air requirement by means of a waste gas sampling system. (D2h)

66-D. (Italian.) Chemical and Physical Bases of the Steelmaking Process. Pt. 1. G. Violi. Metallurgia Italiana, v. 52, Sept. 1960, p. 231-243.

Thermodynamical computation of free energy, activity, coefficients and equilibrium constants during refining. Effect of Cr on the activities of oxygen and carbon. (D-general, P12, 2-60)

67-D. (French.) Metallurgical Study of Electric Furnaces. G. Grenier. Journal du Four Electrique et des Industries Electrochimiques, v. 65, Sept-Oct. 1960, p. 235-238.

Charge composition and slag control in melting and refining of carbon tool and cable steel, Cr-Ni structural and 18-8 austenitic stainless steel. (D5, W18s)

68-D. (Translation-Brutcher no. 4941.) Study of Metallothermic Process Applied to Iron and Steel Production. A. Wimmer. Stahl und Eisen, v. 80, 1960, p. 1469-1477.

Data on raw materials and their preparation for production of metal fuel; stage one required for reduction of iron oxides. Raw materials for second stage, the direct reduction of Fe ores to low and very low carbon steels, using the metal fuel from stage one. (D8j)

69-D. (Translation-Brutcher no. 5015.) New Technique of Deoxidizing Steel With Aluminum. A. R. Bazilevskii. Metallurg, Sept. 1960, p. 16-17.

Technique of introducing Al metal into steel held in ladle for most effective deoxidation. Comparative oxygen contents of steel treated with lump Al, 45% ferroaluminum and Al in the form of sleeves attached to ladle stopper rod in various amounts. (D9m; AD-r, Al)

70-D. (Translation-Brutcher no. 4945.) Furnace Deoxidizing Practice for Steel Casting. N. N. Dobrokhotov. Liteinoe Proizvodstvo, v. 9, Dec. 1958, p. 8.

Improvement of mechanical properties of cast steel by substitution of normalizing plus tempering; quenching plus tempering; or alloying, normalizing plus tempering for the customary anneal followed by furnace cooling. (D2c, Q-general; ST)

71-D. (Translation-Brutcher no. 4935.) An Economic Evaluation of the Use of Iron Ore Pellets in the Blast Furnace. I. S. Kagan, Kh. P. Zaitsev, N. S. Snagovskaya, E. N. Volkova and I. A. Volokh. Izvestiya VUZ-Chernaya Metallurgiya, June 1959, p. 145-154.

Economics of pellets from finely ground ore concentrates, compared with fluxed sinter, as blast furnace charge. Data on calculation of cost price of pellets and of sinter. Coke rates with pellets and sinters of different qualities. Basic cost factors of blast furnace smelting of pellets from beneficiated magnetite-quartzite concentrates. (D1a)

72-D. (Translation-Brutcher no. 5016.) Desulfurization of Pig Iron Outside the Blast Furnace. L. Ya. Shparber. Metallurg, Feb. 1960, p. 8-9.

Equipment developed at the Magnitogorsk Iron and Steel Works for routine desulphurization of the entire blast furnace production as well as individual batches. Operating results; design details; feeding of desulphurizing agent to metal. (D11n)

73-D. (Translation-Brutcher no. 4896.) Fundamentals on the Degassing of Steel by the Closed-Circuit Process. H. Maas. Berg- und Huttenmannische Monatshefte, v. 105, June 1960, p. 151-157.

Vacuum steel-degassing process developed by A. Lorenz for Ruhrstahl AG. Determination of degassing effect by two different methods for H-tin fusion and hot extrusion: cumulative frequency curves; variation of oxygen content during degassing contents of sulphides, silicates and alumina. (D9s, 1-73)

74-D. (Translation-Brutcher no. 4871.) Use of Top-Gas Composition for Analysis and Control of the Thermal Condition of Blast Furnace. A. N. Pokhvisnev and N. K. Zhilkin. Izvestiya VUZ-Chernaya Metallurgiya, Sept. 1960, p. 29-45.

Successful elimination of the usual delays in the control of the temperature distribution in blast furnaces when based on Fe composition, flushing slag temperature and working of the tuyeres, by adopting instead the composition of the top gas as a guide, the only prerequisites being dependable automatic gas analyzers and a computer. (D1b, S16)

75-D. (Translation-Brutcher no. 4895.) Practical Experience in the Vacuum Degassing of Openhearth Steel Heats. H. J. Darmann. Berg-und Huttenmannische Monatshefte, v. 105, June 1960, p. 144-149.

Vacuum lifter process. Degassing action as function of time; heat lost by steel in ladle during vacuum degassing and ways of

compensating for this loss. Reduction of residual oxide inclusions to one-third of the normal amount. Hydrogen content of finished steels. (D9s, 1-73)

76-D. (Translation-Brutcher no. 4889.) Coke Consumption in the Blast Furnace and Reactivity of Coke. Gerhard Hegnert, Werner Zischkale and Eberhart Schurman. Stahl und Eisen, v. 80, July 21, 1960, p. 981-990.
See item 450-D, 1960. (D1)

77-D. (Translation-Brutcher no. 4892.) Influence of Reduced Pressure on Steel Melting and Casting. E. Schwarz-Bergkampf. Berg-und Huttenmannische Monatshefte, v. 105, June 1960, p. 133-135.
See item 493-D, 1960. (D11r)

78-D. (Translation-Brutcher no. 4830.) Contamination of Steel Made in Top Blown Converter. V. I. Baptizmansky and Yu. A. Dubrovsky. Izvestiya VUZ-Chernaya Metallurgiya, Nov. 1959, p. 31-37.
See item 281-D, 1960. (D3d)

79-D. (German.) Dephosphorization in the Basic Bessemer Process With Special Reference to High P_2O_5 and CaO Contents in the Slag. Karl Georg Speith, Hans vom Ende and Gustav Mahn. Stahl und Eisen, v. 80, Nov. 24, 1960, p. 1759-1770.
A charge containing 27.6-44.4 tons of pig iron, up to 3000 kg. scrap, max. 1600 kg. ore and 3800-5800 kg. limestone is blown at up to 1640° C. After removing the first slag the melt is blown with powdered limestone and finished by blowing with air or a mixture of air and oxygen. Effects of Fe, P and Ca content in the slag on the dephosphorization. 29 ref. (D11n, 1-65, 2-60)

80-D. Iron Ore Reduction Studied With Grate-Kiln Systems. Steel, v. 147, Dec. 19, 1960, p. 114-117.
Laboratory reduction kiln also serves as a gas cracker or reformer, making external gas generation equipment unnecessary. Unused reducing gas and unreacted fuel are burned to provide reaction heat. Batch experiments produce pellets that are 91% reduced. (D8j)

81-D. Cyclic, Vacuum Degassing Unit is Evaluated at Crucible. Steel, v. 147, Dec. 15, 1960, p. 122-123.
Comparison of the Heraeus-Ruhrstahl, Siphon, Bochumer-Verein and cyclic degassing processes. The cyclic method is said to provide effective degassing because of complete mixing while it also permits addition of alloying elements. (D9s, 1-73)

82-D. Iron--How Is Direct Reduction Doing Commercially? Colin C. McAneny. Engineering and Mining Journal, v. 161, Dec. 1960, p. 84-99.
Comprehensive review of the basic principles, commercial possibilities and operating data for the principal direct reduction processes including H-iron, HYL, Krupp-Renn, Nu-Iron, Orcarb, Strategic-Udy, Wiberg-Soderfors, Hoganas and Dwight-Lloyd McWane processes. (D8j)

83-D. Steel Plant Will Tap Copper Wastes. Chemical & Engineering News, v. 38, Dec. 12, 1960, p. 32.
Report on the production of a pilot steel plant using the Strategic Udy process in which the blast furnace is replaced by a rotary kiln and electric furnaces and Cu slag is used as a raw material. Materials can be added at different process stages so that reactions are more closely controlled. (D8p, D11n)

84-D. The Influence of Rare Earth Elements and Compounds of Steel. D. S. Eppelseimer and Sukh Dev Sehgal. Indian Institute of Metals, Transactions, v. 13, Sept. 1960, p. 265-276.
Oxides and fluorides of rare earths tend to minimize the size of inclusions and distribute them more uniformly. Excessive rare earth additions cause inclusions to appear again. Effect of rare earth additions on desulphurization and grain refinement. 27 ref. (D11n; EG-g)

85-D. Pilot Plant Developments. Pt. 3. Low-Shaft Furnace Pilot Plant at the National Metallurgical Laboratory, Jamshedpur. Research & Industry (India), v. 4, Apr. 1959, p. 81-84.
Design and construction of a pilot low shaft furnace to establish the feasibility of utilizing low-grade noncoking coals and lignite for the smelting of low-grade Fe ore. (D8n)

86-D. Iron and Steel Industry in India--A Symposium. Research & Industry, v. 4, May 1959, p. 112-115.
Review of developments in the Fe and steel industry, including use of the L-D

process for steelmaking and development of pilot plants with low shaft furnace for smelting Fe ores with noncoking coals and research on sintering and pelletizing techniques for utilization of low grade Fe ores and fines. (D-general)

87-D. (Japanese.) The Melting Condition of Manganese Pearlitic Malleable Iron. Matsuo Suzuki, Azuchi Hiramatou and Nobuhisa Tsutsumi. Imono (Japan Foundrymen's Society, Journal), v. 32, Sept. 1960, p. 625-635.

Microstructure and fracture surface of pearlitic malleable iron produced by refining molten 0.85-1.10% Mn white iron in a Heroult electric arc furnace with acid lining. Effect of melting and pouring technique and various heat treatments on structure and pinhole defect formation. (D5, E25q, M27, 9-71; CI-s)

88-D. Application of the L-D Process to High-Phosphorus Iron. A. Bruno. Iron & Coal Trades Review, v. 181, Dec. 2, 1960, p. 1219-1223.

Treatment of high phosphorous Fe by the L-D process to give steel of open-hearth quality with low sulphur and nitrogen content. The process employs two-phase working with deslagging of a slag rich in phosphorous at the end of the first phase. Final working slag is retained in the hearth. (D10a)

89-D. The Kinetics of Sulphur Transfer From Iron to Slag. R. G. Ward and K. A. Salmon. Iron and Steel Institute, Journal, v. 196, Dec. 1960, p. 393-403.

Measurement of transfer rate of sulphur from carbon-saturated Fe to a range of 17 CaO-MgO-SiO_2-Al_2O_3-CaF_2 slags at 1400-1600° C. Determination of equation and rate limiting step for the reaction. Effects of temperature, slag pH and slag composition. Applications to iron and steel making processes. 24 ref. (D11n)

90-D. (German.) Development From Air-Refined Steel to Oxygen Top-Blown Steel in Modern Steel Industry. W. Boddeker. Technische Mitteilungen, v. 53, Oct. 1960, p. 419-421.

Review of trend in steelmaking from acid Bessemer refining to production of low-nitrogen steel by top-blowing with 99% oxygen (L-D process). Increase of L-D steel output from 1956 to 1960. (D-general)

91-D. Why Gas Beats Oil in Reverberatory Iron Melting. S. J. Michaels. Industrial Gas, v. 39, Dec. 1960, p. 5-7.

Melting pig and scrap Fe for production of ductile Fe using gas fuel rather than oil and a reducing atmosphere to control Si and C content in the Fe and prolong refractory life. (D-general)

92-D. Blast Furnace Stoves Relation of Operating Cycle, Blast Temperature and Efficiency. G. V. Ilyushchenko and M. G. Volkov. Iron & Coal Trades Review, v. 181, Dec. 9, 1960, p. 1259-1263.

Influence of heat exchange phenomena on efficiency of hot blast stoves. Stoves designed for a blast temperature of 550° C. are enlarged for 950° C. operation and changed from a 3 hr. to a 2 hr. cycle of operation to increase thermal efficiency of stoves and temperature of the blast. (D1b)

93-D. Tilting Furnace is Altered to Use Oxygen Efficiently. Steel, v. 148, Jan. 9, 1961, p. 68, 70.

Design and operation of modified tilting type openhearth furnaces equipped with steel consumable pipe oxygen lances. Gas outlets are made smaller to compensate for slag foaming. Oxygen is admitted through lances and burners and air intake is through the regenerators. (D10)

94-D. (German.) Production, Properties and Use of Semikilled Steel. Kurt Felichte and Hans-Joachim Eckstein. Neue Hutte, v. 5, Oct. 1960, p. 590-596.

Test melting of MSt1hb steel, MSt 2hb steel and MSt3hb steel in open-hearth furnaces with and without predeoxidation with FeSi in the furnace and with subsequent semikilling with FeMn, FeSi and Al in the ladle to obtain the following steel analysis: 0.1-0.2% C, 0.08% Si, 0.45% Mn, 0.035% P and 0.045% S. Data are given for rolling behavior, mechanical properties after various heat treatments and use in replacing Si-killed steel of the same carbon content. (D2, Q-general; ST-c)

95-D. (German.) Direct Use of Krupp-Renn Balls in Electro Steel Production. K. F. Ludemann. Neue Hutte, v. 5, Oct. 1960, p. 617-618.

Dephosphorization and desulphurization of high-phosphorus (0.25-0.49%)

and high-sulphur (up to 2.3% S) Krupp-Renn balls in a 100 kg. pilot arc furnace, by blowing lime powder into steel bath, to melt unalloyed steel directly (without blast furnace). (D5, D11n)

96-D. (Japanese.) Behavior of Some Impurities in the Electro-Refining of Iron. Takashi Mukaibo. University of Tokyo, Engineering Research Institute, Faculty of Engineering, v. 19, Sept. 1960, p. 38-41.

The behavior of ortho-phosphate, sulphate and Zn ions in the Mohr's salt bath and of Ag plated on anodes is studied by autoradiography using P-32, S-35, Zn-65 and Ag-110 radioactive tracers to determine the efficiency of impurity removal by electrolysis combined with washing. (D8p, 1-59)

97-D. Pilot Plant Developments. Pt. 5. Projects at the National Metallurgical Laboratory, Jamshedpur. Research & Industry, v. 4, Nov. 1960, p. 275-279.

Design and operation of pilot plants for electrolytic production of Mn dioxide and Mn, production of steel by the L-D process, production of pig iron in low shaft furnaces and beneficiation of low grade Mn ores in vertical and horizontal reduction furnaces. (D10a, C23, B14; Mn)

98-D. (German.) Plant Experiences With an IMSK 250-Type 250 kg. Medium-Frequency Furnace. Dieter Mollitor. Giesserei-Technik, v. 6, Oct. 1960, p. 297-299.

Acid furnace melting of acid resistant GS X 12 Cr-Ni 18-8 steel. Use of Bi to avoid oxidation of steel in ladle; improvement of melting efficiency by geometric changes of furnace lining. Data for Cr and Ni losses. (D6)

99-D. Quality Control of Refractories for Iron and Steel Industry. Sri D. N. Nandi. Indian Chemical Engineer, v. 2, July 1960, p. 61-66.

Refractoriness, load capacity at working temperatures, abrasion and thermal shock resistance, chemical reaction and consumption of refractories used in all phases of steelmaking in India. 14 ref. (D-general; RM-h, 17-57)

100-D. The Dynamics of the Blowing Process. T. Kootz. Iron and Steel Institute, Journal, v. 196, Nov. 1960, p. 253-259.

Equilibria and nonequilibria in the basic Bessemer converter and open-hearth furnace and the course of dephosphorization and carbon elimination. Characteristics of oxygen top-blowing process and possible effects of the oxygen jet on the bath and its reactions. Requirements and advantages of the rotor processes. 27 ref. (D3, D10)

101-D. Use of Models for Investigations of Oxygen Steelmaking Processes. B. S. Holmes and M. W. Thring. Iron and Steel Institute, Journal, v. 196, Nov. 1960, p. 259-261.

Use of models and necessity for similarity in determining optimum blowing parameters, such as top and bottom limits of oxygen flow rates and lance position and number. Theory of splashing and stirring mechanisms involving the oxygen jet criteria to account for excess splashing due to chemical action. 6 ref. (D10)

102-D. A Model Experiment to Study the Rate of Gas Evolution From the Bath of an LD Converter. J. M. van Langen. Iron and Steel Institute, Journal, v. 196, Nov. 1960, p. 262-264.

Flow pattern within the bath resulting from the interaction between gas and liquid in a scale model showing that stirring action of the gas jet is very small and that an acid top layer is formed gradually and grows until the whole solution is acid, the last basic liquid mixing suddenly with the acid, which gives an increased gas evolution. Recommended design parameters for bath diameter-depth relation and radial blowing angle for steel and disiliconizing vessels for achieving better stirring action. (D10, 1-54)

103-D. Aerodynamics of Open-Hearth Furnace Regenerators. C. Hulse. Iron and Steel Institute, Journal, v. 196, Nov. 1960, p. 264-274.

Technique for determining flow distribution in the regenerator by means of cold trials. Shows suitable placing of baffle walls which give improved flow distribution and increases efficiency of regenerator. Suggests location of bottom fantail flue on the same side of regenerator as the slag pocket. (D2)

104-D. A Model Study of Splashing. Kun Li. Iron and Steel Institute, Journal, v. 196, Nov. 1960, p. 275-280.

Investigation of means for reducing splash in an oxygen blown furnace by examining the splash patterns and the effects of lance angle, lance height and jet flow rate. Influencing factors include condition of the foam layer on the top of the liquid which affects the amount and size and distribution of droplets and the general production of far less splash by lancing than jetting. 5 ref. (D10)

105-D. Protection of Open-Hearth Furnace Roofs by an Auxiliary Jet. J. V. Edwards. Iron and Steel Institute, Journal, v. 196, Nov. 1960, p. 289-294.

Rate of erosion of roof reduced by using a jet near the junction of the furnace roof above the back wall, midway along the furnace length and firing toward the bath. This arrangement sometimes increases the rate of wear nearer the crown and around the jet, but by selection of the correct flow rate and the use of a compound jet, these difficulties are overcome. 6 ref. (D2)

106-D. Sulphide Capacities of Silicate Melts. Pt. 1. K. P. Abraham and F. D. Richardson. Iron and Steel Institute, Journal, v. 196, Nov. 1960, p. 309-312.

Measurement of the sulphur holding properties of slags made with mixtures of MnO + SiO_2 and MnO + SiO_2 + CaO at 1500 and 1650° C. to test an equation developed by Flood for the calculation of equilibrium constants for reactions involving complex metals, from the corresponding constants for the simple melts. 12 ref. (D11n)

107-D. Sulphide Capacities of Silicate Melts. Pt. 2. K. P. Abraham and F. D. Richardson. Iron and Steel Institute, Journal, v. 196, Nov. 1960, p. 313-317.

Measures capacity for a number of slags in the system CaO ± MgO + SiO_2 + Al_2O_3 at temperatures of 1500 and 1650° C. Results show that P_2O_5 is more effective for silica or Al in lowering the sulphide capacities. 19 ref. (D11n)

108-D. Physics of Oxygen Steelmaking. C. Holden and A. Hogg. Iron and Steel Institute, Journal, v. 196, Nov. 1960, p. 318-332.

Analysis of the factors controlling the process of mass transfer in a reaction between slag and metal in oxygen steelmaking. Theoretical and model study of various types of furnace and processes and the influences of carbon removal rate, specific oxygen consumption, loss of yield and refractory wear. Design parameters for optimum efficiencies achieved by either stirring the metal or injecting the oxygen uniformly through the melt. 28 ref. (D10)

109-D. Oil Injection in Blast Furnaces. Engineer, v. 210, Nov. 25, 1960, p. 909-910.

Blast furnace production from self-fluxing Fe ore is increased up to 18% by supplementing the coke fuel with oil supplied by injection nozzles. (D1)

110-D. (French.) Reduction of Iron Ores and Use of Sponge Iron or Reduced Ores in the Production of Steel. J. Astier. Revue de Metallurgie, v. 57, Oct. 1959, p. 867-880.

Principal processes for direct reduction of ores in solid state. Problems of charging and melting of reduced product in electric arc furnaces. Economics of steel production based on various types of intermediate products. 17 ref. (D8j, D5)

111-D. (French.) Application of L-D Process to Phosphorus-Rich Irons. Technique Used at Pompey Mills. G. Messin. Revue de Metallurgie, v. 57, Oct. 1960, p. 947-954.

Two-stage process with first deslagging at 20-25% P_2O_5 and recuperation of final slag, with lime being added in chunks. First-stage cooling is by additions of ore, the second is by scrap additions. Tapping time does not exceed 45 min. for one-ton charge. The steel product has low sulphur and N_2 content and is equivalent to corresponding open-hearth steel. 15 ref. (D10a)

112-D. Direct Reduction Process Provides Own Reaction Heat. Steel, v. 147, Dec. 26, 1960, p. 66.

A mixture of molten alumina, silica and Ti oxide in a high-carbon (20%) base is combined with Fe ore and ignited by a small charge of BaO_2, Al and Mg.

The heat of the ensuing reaction is sufficient to reduce the Fe oxides of the ore and produce mild steel. (D8j)

113-D. The VLN (Very Low Nitrogen) Steelmaking Process. Iron & Coal Trades Review, v. 181, Dec. 16, 1960, p. 1325-1326.

Production of steel and low nitrogen content by a steam-oxygen process in which nitrogen is excluded from the blast and temperature of the charge during blowing is controlled by the steam-oxygen ratio. (D10)

114-D. (French.) Study on the Cooling of Liquid Iron in Casting Ladles. Maurice Decrop and J. P. Aymard. Fonderie, Sept. 1960, p. 359-368.

Liquid Fe is cooled from 1430-1225° C. in hand-ladles of from 30-80 kg. to determine the effect of the thickness of wells, preheating, pocket capacity, quantity of metal and length of time in ladle on the cooling rate. Derivation of formulas expressing heat losses. (D9m)

115-D. How the Russians Are Using Ultrasonics in Metallurgy. Arthur B. Tesmen. Metal Progress, v. 79, Jan. 1961, p. 79-83.

In the Soviet Union, ultrasonic energy is being used to degas molten metals, speed diffusion processes (such as carburization), accelerate aging of Al alloys and improve weld quality. Other work with ultrasonics is also being done. (D9, E25n, J-general, 1-74)

116-D. Two Fundamentals of All Metallurgical Operations. Albert M. Portevin. Metal Progress, v. 79, Jan. 1961, p. 126, 128, 130.

Metallurgical operations which involve reactions between two phases, liquid, solid or gaseous, depend for extent and speed of reaction upon emulsion or dispersion. Emulsion reactions in Ugine-Perrin process, vacuum casting of steel. Dispersion processes in Allard process for desulphurizing pig iron, in manufacture of refractories and in making solid solutions of Si and Ge. (D-general, D11, B1g, N-general)

117-D. Reduction of Kalabagh Iron Ore (Containing Ferruginous Clay) With Sui Gas. S. I. Ali, M. Ismail, Latif Alimad, Sadrul H. Rizvi, M. M. Ourash and George Hadn. Pakistan Journal of Scientific and Industrial Research, v. 2, Oct. 1959, p. 197-209.

Fe ore from Kalabagh, Pakistan, is reduced by a fluidized bed process to sponge Fe at 600-1200° C. for 1-9 hr. by Sui gas (an earth gas of high caloric value found in Pakistan). X-ray diffraction patterns and analysis are given for the magnetic and nonmagnetic fractions. 6 ref. (D8p, B15q; Fe)

118-D. Burning Out of Converter Skulls. Iron & Coal Trades Review, v. 181, Dec. 23, 1960, p. 1365-1367.

Method for preventing the formation of skulls at the converter mouth or subsequently melting them away by oxygen enrichment of still partially unburnt gases in the converter hood. Method devised for automatic operation. (D3f)

119-D. Steelmaking: The Impact of Oxygen. Metallurgia, v. 62, Dec. 1960, p. 233-234.

Survey of growing use of oxygen in Britain in converters as the blow in openhearth and blast furnaces for enrichment of combustion air or as a jet to speed up production or assist in refining. Influence of availability and application of tonnage oxygen on productivity. (D1h, D2g, D3f, D10, 10-54)

120-D. Physical Properties and Constitution of Liquid Slags. B. T. Bradbury and D. J. Williams. Metallurgia, v. 62, Dec. 1960, p. 235-240.

Electrical conductivity, transport number, viscosity, thermal expansion, surface tension and density of binary silicate slag systems. 21 ref. (D11n)

121-D. Krupp-Renn Direct Reduction Process. M. J. Kennard. Mining Congress Journal, v. 47, Jan. 1961, p. 34-37.

Use of anthracite fines, coke breeze or carbonized char from high volatile fuels to reduce Fe ores having a wide range of physical characteristics without metallurgical coke. Fe is reduced to low carbon nodules containing 92% metallic Fe. (D8j)

122-D. The Changing Iron Ore Industry. Robert M. Lloyd. Blast Furnace and Steel Plant, v. 49, Jan. 1961, p. 51-57.

Review of developments in upgrading of low quality Fe ores, new metallurgical processes and direct reduction processes. Emphasis on economic aspects

of ore production and distribution. (D-general)

123-D. (German.) Observations on Melting in Vacuum Arc and Electron Beam Furnace. G. Ogiermann and W. Scheibe. Metall, v. 15, Jan. 1961, p. 3-8.

Melting techniques for Ti, Zr, Ni and Fe based alloys, ball-bearing steel, tool-steel and stainless steel in the vacuum arc furnace using flashing-off (melting-off) electrodes. Melting high-temperature metals such as Ta, Cb, W and their alloys and nonmetals in the electron beam furnace. Deoxidation by addition of deoxidizers and evaporation of mono-oxides. Surface quality, microstructure and purity of products. (D8m, D5, 1-73; Cb-b, Ni-b, Ta-b, Ti, Zr)

124-D. (Japanese.) Evolution of Longitudinal Cracks on the Billet Surface. Yoshio Aketa and Kiyoto Ushijima. Tetsu-to-Hagane (Journal of the Iron & Steel Institute of Japan), v. 46, Dec. 1960, p. 3-14.

Primary cooling conditions, corner radius, evenness of cooling, casting temperature and casting speed are related to ferrostatic pressure of the inner molten steel and thickness of the solid steel shell in a formula which explains the mechanism of crack evolution during continuous casting of steel. (D9q, Q26, E25q; 4-52)

125-D. (German.) Means of Improving Efficiency of a Blast Furnace Plant. Helmut Paul Weitzer. Berg- und Huttenmannische Monatshefte, v. 105, Nov. 1960, p. 256-261.

Effect of structural changes (enlargment of inner diameter and different arrangement of cooling boxes) of blast furnace, preparation of burden by sintering in Dwight-Lloyd plant and water vapor and oxygen additions to blast on melting efficiency. Thermodynamics of hydrogen and CO reduction. (D1, D11)

126-D. (German.) Novel Developments in the L-D Process (Basic Bessemer Oxygen Top Blowing). Rudolf Rinesch. Berg- und Huttenmannische Monatshefte, v. 105, Nov. 1960, p. 302-313.

Investigation of variations in refining conventional and special pig iron by oxygen top blowing in a 5 ton pilot L-D converter and in a 30 ton production L-D converter, including addition of coke, coal and lignite fines to increased scrap additions, neutral heating of refined steel for Cr alloying and pressing of auto and ship sheet steel by premelting in an electric arc furnace and L-D refining with additions of coke fines through nozzle. Hardenability (Jominy test), microstructure and heat treating data for test refined steels. (D10a)

127-D. Direct Reduction of Iron Ore and Its Future in Steelmaking. J. Mackenzie. British Steelmaker, v. 27, Jan. 1961, p. 18-24.

Basic chemistry of Fe oxide reduction. Description of several processes for direct reduction by hydrogen of Fe ore, concentrated ore and sinter. 8 ref. (D8j)

128-D. (Russian.) Charge Pressure in the Blast Furnace. V. K. Kropotov. Stal', Nov. 1960, p. 972-977.

Values for vertical pressure of charge materials on various sections of the shaft and equations for determination of the optimum weight of burden materials in the blast furnace are derived from laboratory experiments. 13 ref. (D1a)

129-D. (Russian.) Vacuum Treatment of Converter Steel. P. Ya. Sorokin. Stal', Nov. 1960, p. 988-991.

Vacuum and vacuum inert gas, degassing of melts in the ladle with agitation. Study of hydrogen content for various levels of the ladle. 7 ref. (D9s, 1-73; ST-g)

130-D. (Russian.) Reaction Between Heat Resistant Alloys and Oxide Refractory at High Temperature in Vacuum. V. M. Amonenko, K. G. Romanchenko and A. S. Tron'. Stal', Nov. 1960, p. 1002-1004.

Reaction between Ei617 alloy melt and crucible material (consisting of ZrO_2, BeO, MgO, Al_2O_3 and Al_2O_3 + TiO_2) during vacuum melting at 1450-1650° C. Mechanical properties, nonmetallic inclusions and hydrogen and oxygen content of the product alloy as affected by crucible composition, temperature and holding time. 8 ref. (D8m, Q-general, 2-60; AY)

131-D. (Russian.) Intensification of the Steelmaking Process in Arc Furnaces. F. P. Edneral. Stal', Nov. 1960, p. 1004-1007.

Recent developments in steelmaking technology and electric arc furnace productivity. Use of oxygen in production of structural, ball bearing and stainless steels with addition of alloy scrap, coke powder or Cr-Ni scrap to the charge. (D5)

132-D. (Russian.) Treatment of Molten Steel With Rare Earth Metals. E. D. Verbol'skaya, G. F. Zasetskii, I. V. Isakov and A. E. Khlebnikov. Stal', Nov. 1960, p. 1030-1033.

Induction melting of Cr-Ni-Mo steel (0.4% C) with addition of misch metal containing 40-50% Ce and 15-20% La. Favorable effect of misch metal additions on the rolling process, tensile and plastic properties, sulphur content and chemical uniformity of ingots. 3 ref. (D6, Q-general, 2-60; AY)

133-D. (English.) Investigation of Degassing Process in Treatment of Steel Drops Under Vacuum. L. Tiberg. Jernkontorets Annaler, v. 144, Oct. 1960, p. 757-770.

Oxygen decrease and removal rate during vacuum treatment of steel is investigated at 1570-1620° C. and at 30, 73 and 140 mm. Hg pressure for various times. Study of degassing during and after the boil in relation to temperature decrease and thermodynamic reactions during solidification and cooling. (D9s, 1-73, N12, P12; ST)

134-D. Advantages of Ladle Additions of Exothermic Ferrochromium. Robert L. Mickelson. Foundry, v. 89, Feb. 1961, p. 160, 162.

Cr content in steel and gray iron is adjusted by ladle additions of exothermic ferrochromium. Exothermic mixture disperses alloying agent throughout the melt and gives good Cr recoveries. (D9m, D9r)

135-D. Energy Requirements of the Ajax Steelmaking Process. A. Jackson. Institute of Fuel, Journal, v. 33, Dec. 1960, p. 580-584.

Description of the Ajax process in which steel is made in a modified openhearth furnace by oxygen lancing. Material consumption, furnace output, heat balance and thermal efficiency. (D10)

136-D. Flat Rolled Products Made From Oxygen Converter Steel. Tadashi Ikeda. Australian Institute of Metals, Journal, v. 5, Nov. 1960, p. 209-220.

Report on the rapid growth of oxygen converter steel in Japan. Reasons for the superiority, in many respects, of strip products manufactured from oxygen converter steel over those produced from openhearth steel. (D3)

137-D. Gas Injection for Blast Furnace. C. L. Kobrin. Iron Age, v. 187, Feb. 9, 1961, p. 107-109.

Use of gas injection to lower coke consumption, increase Fe production and smooth furnace operation. (D1h)

138-D. Protection of Openhearth Furnace Roofs by an Auxilary Jet. J. V. Edwards. Iron & Steel, v. 33, Dec. 19, 1960, p. 628-629.

Reduction of roof wear of openhearth furnaces caused by flow of furnace gases by installation of water cooled jet clusters which oppose upward gas flow. (D2g)

139-D. Effect of Flow Distribution on Air Preheat in the OH Furnace. J. Chapman and W. Montgomery. Iron & Steel, v. 33, Dec. 19, 1960, p. 640-645.

Measurement of general level of air preheat as affected by air infiltration, flow distribution in the flues, checkers, baffle systems, slag pockets and increased surface area of the checker filling. Application of effective preheat improvements and resultant reduction in fuel consumption. (D2h)

140-D. The Dynamics of the Blowing Process. T. Kootz. Iron & Steel, v. 33, Dec. 19, 1960, p. 671-673.

Oxidation and deoxidation equilibria, dephosphorization, decarburization and gas and slag metal reactions occurring in converter, oxygen openhearth and rotary furnace processes. Effect of jet speed impingement area, lance distance and blowing pressure on reaction rates. (D11, D2g, D3b, D10)

141-D. The Physics of Oxygen Steelmaking. C. Holden and A. Hogg. Iron & Steel, v. 33, Dec. 19, 1960, p. 673-677.

Thermochemical parameters of oxygen steelmaking by bottom blown converter and Linz-Donawitz, Oberhaussen, Kaldo, Ajax and Russian Rotor processes. Operational and experimental model data for influence of the oxygen on gas and particle entrainment, refining reactions

and splashing. Determination of optimum top blowing conditions and flow patterns. (D10, D11)

142-D. The Use of Models for Investigations of Oxygen Steelmaking Processes. B. S. Holmes and M. W. Thring. Iron & Steel, v. 33, Dec. 19, 1960, p. 678-679.

Theoretical analysis of refining mechanisms occurring in oxygen blown furnaces, with attention to splashing and development of Froude number. Applicability of models to determination of optimum blowing condition, such as top and bottom limits of oxygen flow rates and number of lances for most economic usage. (D2g, D3, 17-56)

143-D. Oxygen-Steam Converters Improve Steel's Ductility. Steel, v. 148, Feb. 13, 1961, p. 116.

Steelmaking by the very low nitrogen process, in which limited use of scrap in the charge and blowing with a steam-oxygen mixture result in a steel of low nitrogen content. Improved ductility of the steel is attributed to the process. (D3)

144-D. (German.) Formation and Precipitation of Deoxidation Products. M. Wahlster and E. Plockinger. Technische Mitteilungen Krupp, v. 18, Nov. 1960, p. 64-80.

Mechanism of the formation of oxide phases in molten steel based on the reaction between the oxygen in the Fe and Si, Al, Ti, Zr, MnSi, CaSi, FeAl and CaAl as observed in laboratory melts and melts in 3-ton electric arc furnaces. Quantitative investigation of precipitation processes in the casting ladle and in the ingot as dependent upon the chemical composition and the grain size and surface properties of the primary oxides as influenced by laminar and turbulent flow. 25 ref. (D5c, D9, D11r, N7; ST, 14-68)

145-D. The Use of a Combined Blast in Blast-Furnace Smelting. A. N. Ramm. Paper from "Contemporary Problems of Metallurgy". Consultants Bureau, Inc., New York, 1960, p. 51-79.

Method for calculating the influence of the composition of a combined blast on parameters of the process such as external heat loss, smelting intensity, development of reduction, blasts and combustion temperatures, furnace throat temperature, coke consumption, thermal balance and production economics. Application to blasts containing air, reducing gas, natural gas, coking gas and blast furnace waste gas with and without oxygen enrichment. 19 ref. (D1)

146-D. Prospects of Iron Smelting With an Oxygen Blast (90-95% O_2). M. A. Shapovalov and B. B. Gess. Paper from "Contemporary Problems of Metallurgy". Consultants Bureau, Inc., New York, 1960, p. 80-87.

Technology of smelting in low shaft furnaces. Effect of oxygen on heat exchange smelting index and combustion intensity. Calculation of process parameters for increasing tonnage and overcoming limitations of furnace design and height and excess fuel consumption using an oxygen enriched blow. 5 ref. (D8n)

147-D. Metallurgical Evaluation of Blast-Furnace Raw Materials. A. N. Pakhvisnev. Paper from "Contemporary Problems of Metallurgy". Consultants Bureau, Inc., New York, 1960, p. 88-97.

Development of a formula for determining thermal equivalents of blast furnace materials as an index of metallurgical value in smelting. Thermochemical calculations are made in terms of heat removal by the smelting products, blast and throat temperature, blast humidity, raw material composition and O, S and P contents. 5 ref. (D1a, D11k)

148-D. A New Representation of the Blast-Furnace Process. Yu Shu-P'ei. Paper from "Contemporary Problems of Metallurgy". Consultants Bureau, Inc., New York, 1960, p. 98-115.

Theoretical and experimental determination of parameters for increasing the adiabatic combustion temperature and smelting efficiency and consequent Fe output of blast furnaces using increased pressure and by wetting the blast. Thermochemical and thermodynamic calculations of thermal balance, phase changes during gaseous reduction and movement of heated gas through the charge. 23 ref. (D1, D11j, D11k)

149-D. The Equilibrium Distribution of Sulphur Between Iron and Blast-Furnace Slags. I. S. Kulikov, I. Yu. Kozhevnikov

and L. M. Tsylev. Paper from "Contemporary Problems of Metallurgy". Consultants Bureau, Inc., New York, 1960, p. 127-138.

The sulphur-distribution equilibrium and slag basicity index are determined and correlated for the system Fe-slag-carbon at 1330-1500° C. and 1 atm. pressure as a function of Ca-O activity temperature, desulphurization and endothermocity of the process. 27 ref. (D11n, 1-59, 2-60, 2-61)

150-D. Some Problems of Ferrous Metallurgy in Eastern Germany. M. K. Kramer. Paper from "Contemporary Problems of Metallurgy". Consultants Bureau, Inc., New York, 1960, p. 139-143.

Review of technology and production developments in blast furnace and low shaft furnace smelting openhearth practice, ore concentration and beneficiation, foundry practice and rolling of steel since World War II. (D-general, 10-54)

151-D. Metallurgical Processes in Low-Shaft Furnaces. K. F. Ludemann and G. Von Struve. Paper from "Contemporary Problems of Metallurgy". Consultants Bureau, Inc., New York, 1960, p. 145-157.

Investigation of low shaft furnace production of pig iron and spiegeleisen from lean, Si-containing ores. Thermochemical analysis of process parameters in terms of design features and operation of the furnaces; pig iron, slag and blast furnace gas composition; desulphurization and Si reduction reactions; and influence of charge preparation and oxygen content in the blast on the indirect reduction process. (D8n, W17h)

152-D. A Study of the Smelting Process for Pao-T'Ou Ores in an Experimental Blast Furnace. Chou-Jen, Tsou Yuan-si, Yen Tung-seng, Wu Tzu-liang, Wang Hou-tsi and Sun Chung-li. Paper from "Contemporary Problems of Metallurgy". Consultants Bureau, Inc., New York, 1960, p. 158-178.

Pilot plant studies of smelting with fluorine containing ores. Effect of fluorine on corrosion erosion of refractory bearings and steel equipment, slag analysis and properties, pig iron composition and the physical chemistry of the process. Design and operation of the experimental blast furnace with data for F and S distribution during smelting. 25 ref. (D1, D11)

153-D. The Wiberg Sponge-Iron Process. M. Wiberg. Paper from "Contemporary Problems of Metallurgy". Consultants Bureau, Inc., New York, 1960, p. 179-189.

Process for gaseous reduction of lump, sintered or pelletized Fe ore in a low-shaft furnace, or any furnace operating on the counter flow principle, using CO or a mixture of CO and H. Application of the sponge Fe produced in the process to steelmaking by CO-melting with pig iron in an electric furnace. (D8j, D5)

154-D. Blast-Furnace Operation at Increased Gas Pressures. V. G. Voskoboinikov and L. I. Slepushova. Paper from "Contemporary Problems of Metallurgy". Consultants Bureau, Inc., New York, 1960, p. 190-202.

Effect of increased throat pressure on smelting intensity, coke and fuel consumption, thermal balance, reduction rate, productivity and pig iron composition in the smelting process. Review of thermodynamic and thermochemical studies, evaluation of operating characteristics of experimental furnace and survey of applications in different countries. 29 ref. (D1h, D11, 3-74)

155-D. Blast-Furnace Smelting Under Pressure and the Problem of a Rational Shape. V. M. Shchednin. Paper from "Contemporary Problems of Metallurgy". Consultants Bureau, Inc., New York, 1960, p. 203-210.

Correlation between blast furnace shape and smelting conditions. Measurement of static gas pressure distribution in furnaces during smelting to determine the necessary degree of throat reduction and/or bosh and hearth widening for achieving maximum smelting intensity under increased pressure. 12 ref. (D1h, 3-74, W17g, 17-51)

156-D. Rational Method of Blast-Furnace Blast Humidification. N. N. Baborykin. Paper from "Contemporary Problems of Metallurgy". Consultants Bureau, Inc., New York, 1960, p. 211-223.

Influence of moisture content of the blast on thermochemical parameters of the smelting process including tuyere reducing gas enrichment by H and Co, coke consumption by O_2 and heat lost by water dissociation. Control of thermal balance in the furnace by adding steam or by drying the blast to values near the limits of normal atmospheric humidity variation. 20 ref. (D1h)

157-D. The Thermal State of the Hearth in Connection With an Investigation Into the Heating Process During the Smelting of Ferrosilicon and Foundry Iron. M. Ya. Ostroukhov and L. Z. Khodok. Paper from "Contemporary Problems of Metallurgy". Consultants Bureau, Inc., New York, 1960, p. 224-235.

Study of thermochemical parameters including gas composition and temperature in the heating zone, critical temperature and temperature changes in the hearth, slag composition and temperature and extent of the heating zone. Effect of Si content in the charge and additional heat and pressure of the blast on productivity and pig iron composition. 14 ref. (D1, D11)

158-D. The Economic Advantages of Large Types of Blast Furnaces. P. A. Shiryaev. Paper from "Contemporary Problems of Metallurgy". Consultants Bureau, Inc., New York, 1960, p. 236-239.

Technical indexes for smelting in Russian blast furnaces of 1033-2286 cubic meters size are correlated with construction, equipment and operating costs to determine comparative costs per ton for conversion of Fe. (D1, 17-53)

159-D. The Economics of Developing Iron Smelting in Electrical Furnaces in Eastern Siberia and in the Far East. A. E. Probst. Paper from "Contemporary Problems of Metallurgy". Consultants Bureau, Inc., New York, 1960, p. 240-246.

Technical indexes for low-shaft electrical furnaces using brown coal and coke breeze are compared to blast furnace smelting using metallurgical coke. Economic indexes favorable to electric furnace processes are derived on the basis of lower fuel and power costs. (D8n, D1, 17-53)

160-D. The Use of High-Sulphur Bauxites of the Urals in Blast Furnaces. V. I. Koratich, V. V. Mikhoilov and O. A. Arkhipor. Paper from "Contemporary Problems of Metallurgy". Consultants Bureau, Inc., New York, 1960, p. 247-255.

Agglomeration of bauxite ores (containing 4-11% sulphur) at 1400-1500° C. to remove 98-99% of the sulphur. Blast furnace smelting (and experimental ore-thermal electric furnace smelting) of self-fluxing agglomerates with coke breeze and metal additions, to produce pig iron of low sulphur content and high alumina slags for the Al industry. Data are given for thermochemical parameters of the processes. 4 ref. (D1, B14)

161-D. Continuous Steelmaking--Why Not? John F. Elliott. Paper from "Contemporary Problems of Metallurgy". Consultants Bureau, Inc., New York, 1960, p. 256-270.

Theoretical development of a possible continuous steelmaking process based on current technology consisting of iron ore smelting, scrap melting, desulphurization, deoxidation, alloying, oxidation of solute metals (Si, Mn and P) decarburization and casting. Conventional furnaces are used with hot metal flowing to each process stage by gravity. 11 ref. (D-general, 1-61)

162-D. The Continuous Casting of Steel. G. V. Gurskii. Paper from "Contemporary Problems of Metallurgy". Consultants Bureau, Inc., New York, 1960, p. 271-293.

Solidification and recrystallization phenomena in continuous cast steels as a function of meniscus mobility, cooling rate, temperature, mold lubrication and casting rate. Micro and macrostructures of rolled specimens taken from ingots and billets of low alloy, rimming, killed and transformer steels. Design and operational characteristics of continuous casting equipment. (D9q, W19)

163-D. A Radical Improvement in the Melting of Stainless Steel. A. M. Samarin. Paper from "Contemporary Problems of Metallurgy". Consultants Bureau, Inc., New York, 1960, p. 294-300.

Process for elimination of intercrystalline corrosion, increasing resistance to general corrosion and improving structure of Ni-Cr stainless steels by melting with ferrochromium produce in vacuum and containing less than 0.03% carbon. The steel is vacuum arc and vacuum induction melted without stabilizing agents and is produced to ingots by continuous casting. 8 ref. (D5, D6)

164-D. The Mechanism of Reaction Between Vanadium Iron and a Gaseous Oxidizing Agent. A. Yu. Polyakov. Paper from "Contemporary Problems of Metallurgy".

Consultants Bureau, New York, 1960, p. 301-307.

Oxidation reactions, with vanadium, metallic impurities and slag forming agents and resultant composition change in Fe-V-C melts as a function of carbon content and oxygen solubility. Sample melts containing 0.02-0.5% V, 0.01-4.0% C and small quantities of Mn, P, Si, O and Cr are soaked in air and blown with oxygen in a converter at 1200-1470° C. for various times. 3 ref. (D11r, D3)

165-D. A Study of the Absorption of Sulphur From Gaseous Fuel During Openhearth Melting. A. I. Osipov, V. F. Surov and L. A. Sh'vartsman. Paper from "Contemporary Problems of Metallurgy". Consultants Bureau, Inc., New York, 1960, p. 308-315.

Radioactive tracer study of sulphur absorption and concentration in the metal and slag during openhearth melting of steel with blast furnace and coke oven gases containing 0.25-1.0% sulphur. The radioactivity of the Co-45, Co-60-S-35 tracers is measured periodically to follow the sulphur transfer and desulphurization mechanisms. 6 ref. (D2, D11n, 1-59)

166-D. Experience in the Use of Limestone--Ore Briquettes in the Processing of Openhearth Pig Iron in a Converter With the Use of Oxygen. S. T. Zaikov and P. Yu. Kravtsov. Paper from "Contemporary Problems of Metallurgy". Consultants Bureau, Inc., New York, 1960, p. 316-322.

Acceleration of slag formation and temperature control in converter processing of steel by adding 42-70% limestone-ore briquettes to the melt. Effect of briquettes composition on slag analysis and steel composition. 3 ref. (D3a; RM-q)

167-D. New Developments in the Planning of Steel Plants. S. M. Andronʹev, G. A. Garbuz and G. T. Litvinesko. Paper from "Contemporary Problems of Metallurgy". Consultants Bureau, Inc., New York, 1960, p. 328-346.

Survey of three technological developments and related equipment in steelmaking including evaporation cooling of steelmaking furnaces, oxygen and steam blasting of molten Fe in the ladle prior to openhearth refining and continuous casting of steel, with subsequent rolling. Thermochemical data and process parameters are given with attention to productivity and efficiency achieved through mechanization and automation. (D-general, D9q, W10f, W18)

168-D. (Translation-ConBur.) Mineral Formation in the Silica Crucible of a Steel Smelting Induction Furnace. L. I. Katyakin and L. A. Tseitlin. Academy of Sciences of the USSR., Proceedings, Chemical Technology Section, v. 130-131, Jan-Apr. 1960, p. 29-32.

Macroscopic and microscopic investigation of mineralogical zones formed in the silica crucible of a 250 kg. capacity high frequency induction furnace after production of 30 steel melts containing 0.19-0.58% C, 0.5-1% Mn, up to 0.6% Si, up to 0.2% Cr and up to 0.5% Ni at 1530-1550° C. (D6)

169-D. Technical Control in Steel Foundries in North America. C. B. Jenni. Foundry Trade Journal, v. 110, Jan. 19, 1961, p. 69-77.

Review of American steel foundry control methods in analysis of raw materials and charges, control of melting, deoxidation and pouring procedures and slag and temperature control. (D-general, S-general)

170-D. Blast Furnace Enrichment Investigations. E. J. Ostrowski, G. Kesler and N. B. Melcher. Journal of Metals, v. 13, Jan. 1961, p. 25-30.

Description of an experimental blast furnace for Fe ore, designed to operate at temperatures above 2600° F. Effects of moisture, natural gas injections and oxygen enrichment on the blast temperature, production rate, coke rate, hydrogen utilization and furnace control. (D1h)

171-D. Blast Furnace Injections. J. A. Cordier. Journal of Metals, v. 13, Jan. 1961, p. 31-36.

Methods for calculating the optimum conditions for running blast furnaces charged with Fe ore when a new material is injected into the blast. Effects of injection on Fe quality, production rate, coke rate and quality of the gas produced. Industrial trials of fuel oil and natural gas injections. (D1h)

172-D. Injection Technique Investigated on Low-Shaft Furnace. E. P. Bonnaure

and M. L. Halbrecq. Journal of Metals, v. 13, Jan. 1961, p. 37-40.

Use of an experimental low-shaft blast furnace to test the effects of various injection techniques on the heat transfer and gas reactions in the shaft, the production rate and the coke rate. Techniques tested include injection of light fuel oil with oxygen enrichment of the blast and injection of fuel oil or rest-gas (60% CH_4) with superheating of the blast. (D1h)

173-D. Thermal Aspects of Blast Furnace Fuel Injection. A. M. Decker. Journal of Metals, v. 13, Jan. 1961, p. 41-44.

Methods for applying the results of fuel injection experiments in pilot-plant blast furnaces to commercial furnaces. Calculations are based on rco and rh (the mean fractions of metallic oxide reduced by CO and H_2, respectively) for each furnace. 16 ref. (D1h)

174-D. Ferromanganese Production With Oxygen Enrichment. J. M. Stapleton, R. J. Flanagan, R. L. Stephenson and D. A. Fletcher. Journal of Metals, v. 13, Jan. 1961, p. 45-48.

Increase of the oxygen concentration to 26.5% in blast furnaces melting ferromanganese ores, with a resulting increase in production and decrease in coke rate. Calculation of increased benefits from oxygen enrichment up to 38-40%. 4 ref. (D1h; AD-n31)

175-D. Coke-Oven Gas Injection Into the Blast Furnace. E. R. Dean and R. A. Powell. Journal of Metals, v. 13, Jan. 1961, p. 49-50.

Injection of coke-oven gas containing small amounts of H_2S into the tuyeres of a merchant iron blast furnace, with a resulting increase in metal production and decrease in coke consumption. (D1)

176-D. (French.) New Prospects for Metallurgy From Reactions Obtained by Injection of Powdered Materials Into Molten Metals. Marc Allard. Revue de Metallurgie, v. 57, Nov. 1960, p. 985-989.

Refining reactions obtained by blowing powdered lime, slag, Mg, B, Si or Cr into molten Fe or steel as in the Perrin process and the mechanical characteristics of basic Bessemer hot rolled sheets produced by the injection of lime powder. (D3f, Q-general, 2-60; ST-d)

177-D. (German.) Renn Lumps and Sponge Iron as Cooling Agents in the Oxygen Steelmaking Process. E. Plockinger and K. Borowski. Technische Mitteilungen Krupp, v. 18, Aug. 1960, p. 1-8.

Effect of fine grain Renn lumps and sponge iron additions in the L-D process on the thermochemistry of the process, blowing conditions and composition of the iron produced. Advantages over slag cooling. 6 ref. (D10a)

178-D. Present Trends in Direct Arc Electric Furnace Applications. Pt. 1. W. E. Lewis. Industrial Heating, v. 28, Jan. 1961, p. 90-94, 96, 98, 100.

Use of direct arc electric furnaces in the production of carbon steel ingots and iron and steel castings. Review of direct reduction processes to supplement furnace operations using steel scrap charges. (D5)

179-D. Alternative Iron Making Processes. Mining Journal, v. 256, Jan. 20, 1961, p. 65, 67.

Description of various ironmaking processes in which reduction may be effected in a vertical shaft, a rotating horizontal kiln, a static or fluidized bed or an electrically heated bath. Survey of factors such as fuel and power requirement which govern process selection. (D8)

180-D. (Czech.) Use of Oxygen in the Electric Furnace Process. Rostislav Krejci. Slevarenstvi, v. 8, Dec. 1960, p. 439-440.

Partial carbon oxidation and dephosphorization are achieved by adding ore to an electric arc furnace charge containing a higher amount of limestone than usual. After removal of the primary slag a new slag is produced by lime addition. Scale distributed on the surface causes the slag to foam which eliminates temperatures during subsequent heating. Then oxygen is introduced by steel tubes of 3/4-1 in. diameter. (D5g)

181-D. (Japanese.) Equilibria Between Dissolved and Gaseous Sulphur and Sulphur Dioxide in Molten Iron. Zen-ichiro Morita and Akira Adachi. Tetsu-to-Hagane (Iron

and Steel Institute of Japan, Journal), v. 47, Jan. 1961, p. 16-21.

Pressures of sulphur gases and sulphur dioxide in equilibrium with molten Fe and heats of vaporization of sulphur from the bath are determined from equilibrium relations established by thermodynamic calculations. 10 ref. (D11)

182-D. Steel From Copper Slags. E. J. Fitzgerald. Journal of Metals, v. 13, Feb. 1961, p. 135.

Steel is produced from waste Cu slags by a modified Strategic-Udy process in which preheated lime is charged with Cu slag, pyrites and coal into an electric matting furnace and resulting Fe-silica slag is refined in a smelting furnace to produce a semi-steel containing 1.00-1.25% carbon. (D8p, D11n)

183-D. The Ajax Furnace and Process. A. Jackson. Journal of Metals, v. 13, Feb. 1961, p. 148-152.

Review of the Ajax process in which oxygen blowing and a 100% hot metal charge are used to produce steel from phosphoric pig iron. Design of the Ajax furnace which basically operates an oxygen process designed to have the maximum thermal efficiency but retains the characteristics of the open-hearth for fettling and final refining of the charge. (D10)

184-D. Smelting Special Ores. Mining Journal, v. 256, Jan. 27, 1961, p. 97.

Techniques for smelting low grade siliceous ores, titaniferous ores, low grade Mn ores, slags from nonferrous smelting operations and Zn, Ni and Cr ores. Methods described include Krupp-Renn, Strategic-Udy, Ugine and Sturzelberg processes. (D-general)

185-D. The Hydrogen Reduction of a Low-Grade Siliceous Iron Ore. Franklin J. Hill and Theodore D. Tieman. Metallurgical Society of AIME, Transactions, v. 221, Feb. 1961, p. 68-72.

Sized fractions of Wisconsin Gogebic taconite are reduced with hydrogen at 600-1000° C. In general, the degree and rate of reduction increase with temperature, gaseous diffusion appearing to be significant as a rate controlling factor at certain stages. 14 ref. (D8j)

186-D. End-Point Temperature Control of the Basic Oxygen Furnace. W. J. Slatosky. Metallurgical Society of AIME, Transactions, v. 221, Feb. 1961, p. 118-130.

Mathematical equations are developed as the product of a thermochemical analysis of the process and are designed to calculate the required scrap, lime and hot metal additions and determine thermal balance, heat loss and tapping temperature in terms of a number of independent variables. Technical indexes are given for test heats using this technique. 9 ref. (D10, 1-65, D11)

187-D. Reduction Kinetics of Magnetite in H_2-H_2O-N_2 Mixtures. W. M. McKewan. Metallurgical Society of AIME, Transactions, v. 221, Feb. 1961, p. 140-145.

Dense magnetite pellets are reduced in hydrogen-water vapor-nitrogen mixtures at 400-500° C. at a pressure of 0.97 atm. The rate of reduction per unit area is found to be constant with time and directly proportional to the partial pressure of hydrogen at a constant ratio of water vapor to hydrogen. Water vapor poisons the oxide surface by an oxidizing reaction and markedly slows the reduction. The enthalpy of activation is found to be +13,600 cal. per mole. 6 ref. (D8j)

188-D. Oxygen Steelmaking for Flat Rolled Products. R. W. Evans. Paper from "Production of Wide Steel Strip". Iron and Steel Institute, London, England, May 1960, p. 21-33.

Reduction of nitrogen and phosphorus content of basic Bessemer steels is obtained by top or bottom oxygen blowing. Acid and basic converter, L-D, Kaldo and basic openhearth methods are also compared as to suitability of products for strip rolling. (D2g, D3f, D10)

189-D. Openhearth Steelmaking Practice for Flat Rolled Products. S. J. Dougherty and R. Duffett. Paper from "Production of Wide Steel Strip". Iron and Steel Institute, London, England, May 1960, p. 33-41.

Production of deep drawing rimmed steel, mechanically capped steel and Al-killed steel in oil and natural gas fired openhearth furnaces using oxygen blowing to reduce phosphorus content. Suitability of product for rolling is a result of this reduced phosphorus content. (D2g)

190-D. Production of steel with Extensive Use of Oxygen in the Openhearth Melting Shop at Cornigliano. M. Foresi and G. Massobrio. Paper from "Production of Wide Steel Strip". Iron and Steel Institute, London, England, May 1960, p. 42-51.

Production of steel by oxygen blowing in a basic roof openhearth furnace. Influence of oxygen blowing on refractory consumption, refining time, heat consumption, production rate, carbon and phosphorous content and surface quality of slab. (D2g)

191-D. Combustion and Heat Transfer in the Openhearth Furnace. C. Holden. Glass Technology, v. 1, Dec. 1960, p. 251-259.

Comparison of various fuels; effect of preheat level and use of combustion oxygen; factors affecting heat transfer including bath coverage and flame emissivity and temperature; effect of furnace design on the flow of gases within the chamber and their consequent influence on over-all heat transfer. 18 ref. (D2h)

192-D. (German.) Control of Oxygen Content in Mild Openhearth Steel During Refining. Walter Hess. Stahl und Eisen, v. 81, Jan. 19, 1961, p. 103-110.

Use of Al additions to control carbon-oxygen ratio during refining, pouring and ladling of mild (under 0.2%) openhearth steel. (D2)

193-D. (German.) Operation Experiences With Thin Walled Seamless Molds for Continuous Casting. Bruno Tarmann and Othmar Kleinhagauer. Stahl und Eisen, v. 81, Jan. 19, 1961, p. 111-119.

Continuous casting of alloy steel using thin, seamless tubes of Cu, brass or steel as molds. Data are given for heat conductivity and lifetime of mold and for heat transfer rate from mold to cooling water. (D9q, W19c; Cu-b, ST, 17-57)

194-D. The Swing to All-Basic Furnaces. J. H. Chesters. Glass Technology, v. 1, Dec. 1960, p. 243-250.

Economy of replacing silica roofs with basic chrome-magnesite brick utilizing faster driving involving greater fuel input rates with or without oxygen for combustion and lancing. Increased outputs are achieved with roof lives two or three times that of silica in spite of substantially higher operating temperatures. 16 ref. (D-general, W18r; RM-h38, 17-57)

195-D. The Theoretical Bases on Oxygen Steelmaking. J. Pearson. Iron & Coal Trades Review, v. 181, Dec. 30, 1960, p. 1407-1413.

Theoretical chemistry of steelmaking by the Thomas, L-D, Kaldo and Rotor processes, taking into consideration the role of oxygen and the oxidizing power of the slag at various stages of the process. (D3, D10)

196-D. New Lance Mixes Fuel and Oxygen. Iron & Coal Trades Review, v. 181, Dec. 30, 1960, p. 1419-1420.

Increased production of steel from an openhearth furnace is achieved with an oxygen lance which intensifies the mixing and burning of natural gas with oxygen to reduce the melt-down time. After melting is complete, a high oxygen input rate is maintained to speed up refining. (D2g)

197-D. (German.) Improvement of Efficiency of a Pilot Blast Furnace by Oxygen and Carbon Dioxide Additions to Blast. Rudolf Spolders and Werner Wenzel. Stahl und Eisen, v. 81, Feb. 2, 1961, p. 149-154.

Test melting of conventional blast furnace burden in a 0.6 m. diameter pilot blast furnace with CO_2 and oxygen enrichment (up to 16.6% CO_2 and up to 45% O_2) in blast. Temperature measurement and sampling of burden and gas in furnace during melting by vertical probes. Improvement of efficiency; costs. (D1h)

198-D. (German.) Reactions in Oxygen Top Blowing in Rotating Vessels. Pt. 1. Ernst Hardt, Gunther Vocke and Hermann Schenck. Stahl und Eisen, v. 81, Feb. 2, 1961, p. 155-163.

Oxygen refining of basic Bessemer pig iron in horizontal rotating pilot vessels with round or oval cross section to obtain hard low-phosphorus steels without recarburizing after refining. Decarburizing, dephosphorizing and desulphurizing as influenced by shape of vessel and rotating speed. (D2g)

199-D. (German.) Metallurgy of the "Phoenix-Lance" Process. Eberhard Schurmann, Karl-Kurt Aschendorff, Heinz Hofges and Egon Kohler. Stahl und Eisen, v. 81, Feb. 2, 1961, p. 163-172.

Refining of basic Bessemer pig iron in a 16 ton converter in three steps:

vertical blowing with air; after partial liquefying of lime oxygen, top blowing upon slag in horizontal converter and short-time air blowing in vertical converter to finish run. Investigation and metallurgical interpretation of refining in terms of decarburizing, dephosphorizing and sulphur, oxygen and nitrogen control. (D3)

200-D. (German.) Investigation of Gas Absorption and Release of Gas by the Steel Stream in Top-Pouring of Heavy Forging Ingots. Eberhard Schurmann, Martin Hater and Alfred Fricke. Stahl und Eisen, v. 81, Feb. 2, 1961, p. 172-183.

Measurement of oxygen pick-up during open and covered mold casting of 78 ton bars. Measurement of change of hydrogen, CO and CO_2 content in mold atmosphere during casting in enclosed mold to evaluate gas release by steel stream. Thermodynamic interpretation of results. (D9s)

201-D. Kaiser Steel, Fontana Plant. T. J. Ess. Iron and Steel Engineer, v. 38, Feb. 1961, p. K3-K25.

Production of iron from ore by reduction in blast furnace. Steelmaking in openhearth and oxygen furnaces. Rolling of ingots in numerous mills to produce sheet, strip, beams, pipe and butt welded tube. Production of tin plate. (D-general, F23, 18)

202-D. Oxy-Fuel Processes Increase Steelmaking Rates. E. F. Kurzinski and R. D. Jones. Iron and Steel Engineer, v. 38, Feb. 1961, p. 67-72.

Steelmaking in openhearth furnaces using oxygen and fuel injector lances. Influence of oxygen flow rate on production rate, decarbonization rate, fuel and oxygen consumption and heating efficiency. (D2g)

203-D. (French.) Metallurgical Study of Electrical Furnaces. G. Grenier. Journal du Four Electrique, v. 65, Nov-Dec. 1960, p. 273-277.

Survey of steels produced in the electrical furnace such as ferritic stainless with 13% Cr, 18-4-1 high-speed, Mn, Al and Si steel and steel for valves and magnets and high temperature applications. Compositions and some practical production suggestions for these steels. (D5, D6)

204-D. (Translation-Brutcher no. 5024.) The Deoxidation of Steel With Aluminum. G. S. Ovsyuk. Liteinoe Proizvodstvo, June 1960, p. 47-48.

Report on trial heats in acid-lined electric arc furnaces producing 0.15-0.20% carbon steels for castings in which the ferromanganese and ferrosilicon were added in the furnace while 0.10 and 0.15% Al are added in the ladle. (D3; AD-r, Al)

205-D. (Translation-Brutcher no. 5026.) Recent Vacuum Installations for the Degassing of Liquid Steel. G. Kaspar. Berg- und Huttenmannische Monatshefte, v. 105, 1960, p. 149-150.

Description of layout of an industrial-scale steel degassing plant designed on the four-post principle and put into operation in Nov. 1959. Operation; space requirement; best location. Degassing installation on the ladle-lift principle. Steel degassing plant designed after the balance-beam principle and suited chiefly for the degassing of smaller capacity ladles. (D9s, 1-73)

206-D. (Translation-Brutcher no. 5048.) Control of Industrial Processes by Computing Machines. A. B. Chelyustkin. Metallurg, May 1959, p. 4-6.

Promise of use of computing devices by the iron and steel industry. Automatic electronic potentiometer, its operation and possibilities. Electromechanical device for converting continuous variables into discrete ones. Computers for digital scanning systems; coke by-products plants; calculation of heat balance in zone of direct reduction of blast furnaces to deliver a corresponding volume of air; automatic control of delivery of metal by rolls of reversing mills. (D-general, X14)

207-D. Iron Offers Low Residuals. Steel, v. 148, Mar. 13, 1961, p. 122-123.

Applications of Sorelmetal, a ferrous material of low residual element content produced by a direct reduction process. (D8j; Fe, 17-57)

208-D. Process Made Feasible by Sale of Both Iron and Slag. Steel, v. 148, Mar. 13, 1961, p. 123-124.

Electric furnace reduction process starting with a mixed hematite and ilminite ore in which most of the iron

is recovered as the metal while slag, containing all the Ti, is sold to producers of Ti metal. Iron is separated as metal because iron oxide is not present in excess. (D6)

209-D. Rotor Steelmaking Furnace Minimizes Charged Scrap. Steel, v. 148, Mar. 13, 1961, p. 130.

Use of a rotating furnace with oxygen blowing into the bath through one lance and over the bath through another line. Steel quality is equal to that produced in basic openhearths while scrap consumption is reduced. (D10c)

210-D. Yugoslavs Prove Out Copper Process. Steel, v. 148, Mar. 13, 1961, p. 132.

Production of oxygen-hydrogen free Cu by melting under a controlled atmosphere in an induction furnace and continuous casting in a vertical reciprocating mold. (D5j, D5q; Cu)

211-D. Vacuum Degassing of Steel. D. E. Parsons and W. A. Morgan. Canadian Mining and Metallurgical Bulletin, v. 54, Feb. 1961, p. 163-169.

Review of techniques such as ladle degassing, vacuum stream droplet degassing, pipette lifting method of ladle degassing and vacuum pipette degassing. Operating pressures, reduction in gas contents and improvements in hydrogen segregation, steel cleanliness and mechanical properties obtained with the various techniques. Description of an experimental vacuum stream droplet degassing unit and some results obtained on laboratory steel melts. 18 ref. (D9s, 1-73)

212-D. (German.) Preparation of Burden and Its Effect on Blast Furnace Operation. Gerhard Heynert, Paul Ischebeck and Wilderich von Spee. Stahl und Eisen, v. 81, Jan. 1961, p. 1-12.

Burden preparation by ore crushing, screening and sintering to obtain completely graded and sintered burden. Influence of burden preparation on coke rate, flue dust production, blast and waste gas temperature, power and fuel economy and furnace output. Heat balance and economic efficiency. (D1a)

213-D. (German.) Production and Use of High-Basicity Sinters in the Blast Furnace. Ludwig von Bogandy. Stahl und Eisen, v. 81, Jan. 1961, p. 12-22.

Review of recent research results on production and melting of high-basicity sinter in terms of sintering technology and thermodynamic and mechanical properties of sinter. Theoretical and practical data obtained in melting of sinter include: coke rate as influenced by limestone additions; amount and caloritic power of waste gas; flow pattern; slag formation and efficiency of pig iron production. (D1)

214-D. (German.) Experiences With Hot Tops Made of Combustible Plates and Exothermic Feeder Heads for Ingot Molds. Alvis Schoberl and Rudolf Plessing. Stahl und Eisen, v. 81, Jan. 1961, p. 22-30.

Increase of billet output by use of hot tops lined with combustible plates or exothermic material rather than with fire-clay in casting of unalloyed and alloyed steel ingots. Influence of steel shrinkage during solidification on steel quality. (D9p)

215-D. Experiments on Blast Furnace Operation in Yawata Iron and Steel Works. K. Wada and A. Honda. Paper from "Symposium on Pilot Plants in Metallurgical Research and Development". Council on Scientific & Industrial Research, Jamshedpur, India, 1960, p. 169-181.

Outline of experimental research on the efficiency of blast and low shaft furnaces as affected by crushing and screening of raw materials, use of coalite coke and use of heating and desulphurizing agents. A complete chemical analysis of ores is made and tabulated with operational data. (D1)

216-D. The Low Carbonization and Smelting Process in Low Shaft Furnace. I. Reinfeld. Paper from "Symposium on Pilot Plants in Metallurgical Research and Development". Council on Scientific & Industrial Research, Jamshedpur, India, 1960, p. 266-270.

Development of a process using agglomerations of ore fines and other fine grained Fe bearing materials which due to their identical size are suited for a physical burden. Process makes it possible to bind in fine grained fuels which are generally unsuited for production of good metallurgical coke. Tests are run and the pig iron, top gas, coal, coke and briquette mixtures analyzed. (D8n, A9j)

217-D. Intensification of Openhearth Process by Compressed Air. N. Shirokov. Paper from "Symposium on Pilot Plants in Metallurgical Research and Development". Council on Scientific & Industrial Research, Jamshedpur, India, 1960, p. 266-270.

An openhearth process is intensified by the application of gaseous oxygen for both enrichment of the blast supplied for fuel burning and for the direct oxidation of the bath carbon. Data are given for the effects of enrichment of the oxygen blast on furnace output, fuel and ore consumption, dust content and furnace temperatures. (D2g, A9j)

218-D. (French.) Reduction of Magnetite in the Gaseous Phase. R. Zoja, M. Ferrero and G. Timo. Revue de Metallurgie, v. 57, Dec. 1960, p. 1073-1080.

Laboratory and blast furnace observations of the reduction of magnetite specimens from Mines de la Cogne. Dependence of reduction on oxygen potential of the atmosphere, Fe sponge, Fe + wustite, wustite, wustite + magnetite and unreduced magnetite being obtained according to this potential. (D1)

219-D. (French.) Rate of Mass Transfer Between Metal and Slag During Steel Production, Studied on Models. P. Roquet and J. Adam-Gironne. Revue de Metallurgie, v. 57, Dec. 1960, p. 1081-1089.

Study of the kinetics of steel production in a rotary furnace by investigating analogous processes taking place at room temperature and between oleic acid in xylene and aqueous lime solution. A general formula for refining time is derived as a function of the dimensionless numbers involved in the diffusion process occurring at the metal-slag interface, which is assumed to be rate governing. 9 ref. (D10c, D11n, 17-56)

220-D. Infrared Film Helps Design a Better Oxygen Lance. Iron Age, v. 187, Mar. 23, 1961, p. 80-81.

Infrared film is used to record lance performance inside the furnace. Photographs show the stage in the heat cycle most erosive to the lance case. (D1h)

221-D. The Potential and Limitations of High Blast Temperatures. T. L. Joseph. Blast Furnace and Steel Plant, v. 49, Mar. 1961, p. 239-246.

Review of experimental results on the influence of blast temperature on the coke rate, size of combustion zone and temperature drop in insulated or screened blowpipes. Details of a special chromel-alumel thermocouple for measuring the temperature drop along insulated blowpipes. (D1b)

222-D. One of the Largest Continuous Casting Plants in the World. Aciers Fins & Speciaux Francais, Dec. 1960, p. 36-38.

Pouring, molding, continuous casting and cooling practices used in production of stainless, high temperature, valve and high speed steels at a French foundry. (D9q)

223-D. Control of Foundry Steelmaking. J. Blackburn. Foundry Trade Journal, v. 110, Feb. 23, 1961, p. 231-238.

Control of raw materials used in foundry steelmaking such as scrap, ferro-alloys and fluxes. Emphasis on items to control scrap quantity, composition, physical condition and segregation. Method of charging the furnace and working the melt. Composition of the bath and slag. Notes on the oxidizing and reducing periods. 5 ref. (D-general)

224-D. (German.) Manganese Distribution Between Iron Melts and Iron (11)-Oxide Slags in MnO Crucibles at 1520-1770° C. Wilhelm Anton Fischer and Hans Joachim Fleischer. Archiv fur das Eisenhuttenwesen, v. 32, Jan. 1961, p. 1-10.

Study of metal-slag equilibria and subsequent chemical, metallographic and X-ray investigation of reaction products to measure oxygen and Mn distribution. Thermodynamics of steel deoxidation by Mn. Measurement of melting point of MnO and liquidus line in the FeO-MnO system by thermal analysis. (D11)

225-D. Smelting Taconite in the Bureau of Mines Experimental Blast Furnace. Miles B. Royer, Norwood B. Melcher and W. O. Philbrook. U. S. Bureau of Mines, Report of Investigations 5724, 1961, 15 p.

Experimental refining of crude taconite to determine the extent to which blast furnaces can be used for smelting these siliceous iron ores. Tests indicate that coke consumption, slag rates, sulphur content and cost factors are significantly higher while metal quality is erratic as to Si content when compared to Mesabi iron ore. 7 ref. (D1b)

226-D. (German.) Use of a Lime-Iron-oxide-Sinter in the Basic Openhearth Process. Werner Fiedler. Freiberger Forschungshefte, no. B 43, 1960, 64 p.

Production of $CaO-Fe_2O_3$ sinter pellets (37.5% CaO, 62.5% Fe_2O_3) in a revolving kiln. Test melting in 40 ton basic openhearth furnaces with silica roof using $CaO-Fe_2O_3$ sinter as refining addition. Metallurgical effect of sinter on dephosphorization, desulphurization, carbon refining, Mn distribution and output. (D2, D11, 2-60)

227-D. (German.) Nonequilibria in Metal-Slag Reactions in the Basic Bessemer Converter. Theodor Kootz and Hans Joachim Ueberhorst. Stahl und Eisen, v. 81, Feb. 16, 1961, p. 239-248.

Influence of increasing amounts of SiO_2, Mn, Al_2O_3, TiO_2, MgO and CaF_2 on final composition of slag and metal in conventional basic Bessemer steel refining (40 ton converter). Influence of addition on decarburization, desulphurization and dephosphorization kinetics. (D11r, 2-60)

228-D. (French.) Back Pressure and Fuel Injection in Low Shaft Furnace Operation. E. Bonnaure. Revue de Metallurgie, v. 58, Jan. 1961, p. 13-24.

Increase of furnace efficiency by selection of optimum charge composition, size and CaO/SiO_2 ratio, providing for the phenomenon of back pressure injection of liquid and gaseous fuels and utilization of heated and oxygen enriched blast. 13 ref. (D8n)

229-D. (French.) Kaldo Process. R. Colmant, G. Decamps and P. Rocquet. Revue de Metallurgie, v. 58, Jan. 1961, p. 39-43.

Design and technical index for 110 metric ton Kaldo furnace producing extra-mild steel containing 0.045-0.077% C, 0.23-0.435% Mn, 0.009-0.016% P and 0.009-0.016% S. Data are given for hardness, elastic limit, tensile strength and elongation of deep drawing sheet manufactured from this steel. (D10b, Q-general; CN-g)

230-D. (Japanese.) Kinetic Studies of Steelmaking Reactions. Pt. 2. Rate of Carbon Oxidation in Liquid Iron by Oxygen Blowing. Kichizo Niwa, Mitsuo Shimoji, Tamiya Kishida and Yukiyoshi Itoh. Tetsu-to-Hagane (Iron & Steel Institute of Japan, Journal), v. 47, Feb. 1961, p. 111-115.

The velocity of the decarbonization reaction in liquid Fe as a function of oxygen pressure and velocity during oxygen blowing and time and temperature is considered theoretically in terms of the diffusion film theory and is observed in an experimental reactor at 1550° C. with oxygen pressure of 25-600 mm. Hg and flow velocity of 55 cc. per min. The rate determining factor for carbon oxidation is determined as the transfer of reactants (carbon) towards the surface where an equilibrium occurs. 5 ref. (D10, D11r)

231-D. (Japanese.) Continuous Casting of Steel. Pt. 4. Mechanism of Evaluation of Inner Cracks of Cast Billets. Kiyoto Ushijima. Tetsu-to-Hagane (Iron & Steel Institute of Japan, Journal), v. 47, Feb. 1961, p. 116-124.

Internal cracking as a function of internal stress caused by solidification phenomena in 0.62% carbon steel is investigated by macroscopy and microscopy methods and dye penetrant and magnetic inspection. Thermal stresses introduced by rapid spray cooling and mechanical stresses imposed by pinch rolling are shown to cause internal cracking with the extent of cracking being controlled by the solid-liquid metal interfaces and the temperature differences in the billet. 12 ref. (D9q, E25n, 2-61, 3-66, 9-72; ST)

232-D. Fuel and Energy Required for Steelmaking by the VLN Convertor Process. G. G. Fletcher and R. A. Pullen. Institute of Fuel, Journal, v. 34, Feb. 1961, p. 46-52.

Principles and application of the VLN oxygen-steam bottom blown basic convertor process used for producing deep drawing steels. Externally supplied fuel is not used in the process, the heats of oxidation of the hot metal impurities by the oxygen-steam blast and the heat of slag formation being sufficient. 9 ref. (D10c)

233-D. (Italian.) Application of Oxygen in Steel Production. Fonderia, v. 10, Jan. 1961, p. 23-26.

Use of oxygen blowing in the openhearth and in L-D, Kaldo and Rotor processes. (D10, D2g)

234-D. (Portuguese.) Modern Metallurgical Processes. Energy Requirements.

Ferrucio Fabriani. Engenharia, Mineracao e Metalurgia, v. 32, Dec. 1960, p. 339-345.

Calculations for the relation between enthalpy and mass to be reduced in metallurgical processes. Application to 21 modern furnace types. 8 ref. (D11, D-general, P12r, W17)

235-D. (Czech.) Manufacture of Stainless Steels in the Openhearth Furnace. Karel Protiva. Hutnicke Listy, v. 16, Jan. 1961, p. 7-12.

Openhearth production of Cr17Mn18 Ni4N2 and Cr18Ni9Ti alloy steel from charges containing scrap of these steels, carbon steel scrap, ferrochromium, silicochromium, metallic Ni and NiO with oxygen being blown through the melt. 5 ref. (D2g)

236-D. (Czech.) Remelting of Austenitic CrNiMnN Steel Scrap. Karel Lobl and Karel Hybek. Hutnicke Listy, v. 16, Jan. 1961, p. 13-19.

Processing of a charge containing 50-60% of the scrap and 0.25-0.30% carbon in an electric arc furnace with oxygen being blown through the melt. Formation of manganese silicate in the slag is avoided by adequate limestone addition. 14 ref. (D5a)

237-D. Agglomeration of Iron Ores Furthers Automation of the Blast Furnace. M. J. Greams. Iron and Steel Engineer, v. 38, Mar. 1961, p. 119-124.

Use of iron ore sinter and pellets as burden material with accompanying changes in blast furnace practice, such as beneficiation of raw materials, use of self-fluxing sinter, operation at higher top pressure maintaining higher blast temperatures while adding moisture, oxygen and natural gas. (D1a, B16; Fe)

238-D. Production of Stainless Slabs at the Continuous Casting Plant of Schoeller-Bleckmann Stahlwerke AG. B. Matuschka. Iron and Steel Institute, Journal, v. 197, Mar. 1961, p. 189-196.

Methods and equipment used in casting Ti stabilized stainless steel slabs. Effects of casting temperature, casting speed and degree of cooling on surface finish and quality of slab cross-section. (D9q, 1-52)

239-D. Notes on Gas-Flow Pattern Through the Regenerative Chambers of Open-Hearth Furnaces. Louis G. Septier. Iron and Steel Institute, Journal, v. 197, Mar. 1961, p. 215-222.

Theoretical consideration of gas-flow patterns through regenerative chambers of openhearth furnaces. Effects of pressure conditions above and under the checkers. Improvement of gas distribution in conventional regenerative chambers. Types of construction regularizing gas flows. 28 ref. (D2h)

240-D. Fluid Mold Aids Forging Finish. Iron Age, v. 187, Mar. 30, 1961, p. 111.

Molten slag is used to seal mold walls so that flaws can not occur on ingot surfaces during casting of high-temperature alloys and stainless and toolsteels. (D9k)

241-D. Fuel and Power Required for Making Steel in the LD Process. Kurt Rosner and Ferdinand Dobrowsky. Journal of the Institute of Fuel, v. 34, Jan. 1961, p. 3-7.

The amounts of heat available in L-D steelmaking, namely, the physical heat of the hot metal; the heat of oxidation of the accompanying elements including Fe going into the slag and into the dust; and the combustion of the process gases above the mouth of the crucible are compared with the utilized amounts of heat, these being composed of the heat contents of the liquid metal and slag; the heat required for the direct reduction of ore additions; and the heat content of the steam generated in the waste heat boiler. (D10a, D11k)

242-D. (Slovak.) Intensification of the Flame by the Addition of Oxygen in SM Furnaces. Alojz Presern. Nova Proizvodnja, v. 40, 1960, p. 368-380.

Direct addition of oxygen to the melt in the Siemens-Martin process shortens refining time, increases production and saves fuel, however, the reaction produces a thick brown smoke which contaminates the atmosphere. Intensification of the flame enables a much higher productivity, greater fuel economy and equally advantageous metallurgical conditions, while eliminating the contaminating fumes accompanying direct oxygen addition. (D2)

243-D. (Translation-Brutcher no. 5030.) Desulphurization of Pig Iron Outside the Blast Furnace Using Lime and Powdered Aluminum. S. K. Sobolev. Production

and Processing of Steel and Alloys. Metallurgizdat Press, 1960, p. 5-14.

Importance of having a simple and cheap method of external desulphurization of pig iron for subsequent refining operations. Laboratory experiments on desulphurization with lime injected into pig iron with the aid of an inert gas (nitrogen); factors determining the optimum conditions for sulphur removal. (D11n)

244-D. (Translation-Brutcher no. 4921.) Rate of Oxygen Removal in the Reduction of Iron Ores by a Mixture of Carbon Monoxide, Hydrogen and Nitrogen. E. Schurmann. Archiv Eisenhuttenwesen, v. 31, Sept. 1960, p. 509-519.

Study of rate of oxygen removal from a magnetite and a hematite ore during the reduction processes in the blast furnace stack. Theoretical analysis of the progress and rate of the reactions between a stream of carbon monoxide, hydrogen and nitrogen and solid iron ores. (D1)

245-D. (Translation-Brutcher no. 4940.) On the Refining of Basic Bessemer Irons by Oxygen Top Blowing L-D Process. Pt. 1. W. Plockinger. Stahl und Eisen, v. 80, no. 22, 1960, p. 1477-1481.

Development of a simple and dependable oxygen top-blowing process for basic pig irons with increased phosphorus contents. Theoretical and practical study of gas dynamics in free gas jets; general pattern; dynamic pressure distribution and oxygen content in a free jet in air. Optimum conditions for successful refining of basic Bessemer irons and how they can be realized. (D10a)

246-D. (Translation-Brutcher no. 5097.) Analysis of Some Factors in L-D Steelmaking (by Oxygen Top Blowing). M. Kishida. Tetsu-to-Hagane (Iron and Steel Institute of Japan, Journal), v. 46, Oct. 1960, p. 1182-1185.

Evaluation of three months' operating results (rimmed carbon steel for tubes) of an oxygen top-blown L-D furnace by multiple regression analysis. Factors in greatest need of control during operation: silicon content and temperature of hot metal; quantity of scrap and iron ore added. Effect of stage of furnace campaign on phosphorus in metal at end of blow; blowing time and metal yield. (D10a)

247-D. (Translation-Brutcher no. 5096.) Composition of the Hot Metal for the Oxygen Top-Blowing L-D Process. M. Oishi. Tetsu-to-Hagane (Iron and Steel Institute of Japan, Journal), v. 46, Oct. 1960, p. 1185-1187.

Plant-scale study of effect of hot metal composition on oxygen top-blown L-D furnace operations. Relations among slag weight, silicon and phosphorus contents of hot metal and slag basicity. (D10a)

248-D. (Translation-Brutcher no. 5095.) Sulphur Balance in a 50 Ton Oxygen Top-Blown L-D Furnace. S. Maehara. Tetsu-to-Hagane (Iron and Steel Institute of Japan, Journal), v. 46, Oct. 1960, p. 1187-1189.

Calculation of sulphur balance based on routine operating data from a 50 ton oxygen top-blowing L-D furnace producing low-carbon rimmed steel. Comparison of sulphur balance for L-D furnace with that for an openhearth furnace. Desulphurization by L-D furnace slag compared with openhearth slag. (D10a)

249-D. Russians Alter Blast Furnaces to Improve Oxygen Injection. Iron Age, v. 187, Apr. 13, 1961, p. 98-99.

Design of an oxygen feed system for use in blast furnaces producing no-silicon low-sulphur semifinished metal at 1450° C. Changes in ore beneficiation processes and pouring techniques are suggested as ways to increase production. (D1h)

250-D. Desulphurization of Cast Iron by Electrolyzing Slag. Foundry Trade Journal, v. 110, Mar. 23, 1961, p. 363-368.

Theory of desulphurization and technological parameters for electrolytic desulphurization of cast iron at 1500° C. Effect of slag basicity, current density, time of electrolysis, voltage and carbon and sulphur content on the percentage of desulphurization. 13 ref. (D11n)

251-D. Internal Defects in Steel Castings--Their Nature and How They Can Be Avoided. Foundry Trade Journal, v. 110, Mar. 23, 1961, p. 369-370.

Nature and incidence of internal defects occurring during steelmaking of large forging and casting ingots, including sand inclusions, gas porosity, contraction and shrinkage. (D9, 9-67, 9-68, 9-69)

252-D. (German.) Equilibrium of Sulphur Reaction Between Liquid Carbon Saturated Iron and Lime-Silica-Magnesium Oxide Slags. Hermann Schenck, Martin G. Frohberg and Tarek El Gammal. Archiv fur das Eisenhuttenwesen, v. 32, Feb. 1961, p. 63-65.

Measurement of sulphur distribution between carbon saturated iron and slags containing 21.15-55.61% CaO, 41.8-54.86% SiO_2 and 2.34-25.52% MgO at 1550° C. Influence of MgO on sulphur equilibrium. (D11n)

253-D. The Swing to All-Basic Furnaces. J. H. Chesters. Refractories Journal, Feb. 1961, p. 44-49.

Review of three main types of roof construction for the all-basic furnace; the continental, fully suspended and the rigid. Evaluation of the all-basic furnace for efficiency and economy in steelmaking as a result of faster driving--involving greater fuel input rates, with or without oxygen for combustion and lancing. Properties of silica and chrome-magnesite roof bricks. 16 ref. (D2, W18r, 1-65)

254-D. (Italian.) Ferrous Ingots. Raffaelo Zoja. Fonderia Italiana, v. 9, Dec. 1960, p. 484-489.

Furnace charging; reduction of oxides and influence of furnace operating conditions on casting composition. Standard composition of typical ingots. (D8)

255-D. Oxygen Converter Processes. H. F. Padbury. Refractories Journal, v. 36, May 1960, p. 118-120.

Technology of the bottom blown converter process using an oxygen-enriched air and oxygen-steam mixture and the top blown oxygen process as represented by LD and LD-AC (lime injection) processes. Consumption and wear pattern of refractories used in the process. (D10; RM-h, 17-57)

256-D. (French.) Processes for Reducing Iron From Minerals and Rumanian Research in This Field. P. Dumitrascu and M. Ispas. Revue Roumaine de Metallurgie, v. 5, Feb. 1960, p. 267-289.

Reduction of Fe in the liquid, viscous and solid state. Research on the application of mazut or methane in the blast furnace; review of direct reduction processes. 24 ref. (D8j)

257-D. Inductive Stirring in Arc Furnaces. Australian Mechanical Engineering, v. 48, Jan. 6, 1961, p. 34-36.

Installation of inductive stirring equipment in arc furnaces reduces operating time, improves quality and saves alloy elements. (D5f)

258-D. Fuel and Power Required for Making Steel in the Electric Arc Furnace. R. S. Howes and A. Jackson. Institute of Fuel, Journal, v. 34, Mar. 1961, p. 90-92.

The single slag process is used to manufacture rimming and solid carbon steels in an electric arc furnace consisting of a silica roof, dolomite bottom and magnesite lining. Electrical and thermal efficiency discussed. 5 ref. (D5)

259-D. Licensee Makes Nuclear Stock Gage. Steel, v. 148, Apr. 24, 1961, p. 142, 146.

Design of a nuclear device which permits more accurate determination of blast furnace burden level and closer control of the ironmaking process. Radiation sources send rays from one side of the furnace to detector units on the opposite side. When stock obstructs the beam, presence of burden at that level is sensed by the detecting unit. (D1a)

260-D. (English.) The Equilibria Between Sulphur in Molten Iron and Gaseous Sulphur and Sulphur Dioxide. Akira Adachi and Zen-ichiro Morita. Osaka University, Technology Reports, v. 10, Oct. 1960, p. 789-796.

The equilibrium relations between dissolved sulphur in molten Fe and gaseous sulphur and sulphur dioxide are established by thermodynamic calculations. The pressures of sulphur gases and sulphur dioxide in equilibrium with molten Fe and the heats of vaporization of sulphur from the bath are determined from these relations. 9 ref. (D11n, D11r, P12; Fe, S)

261-D. Fluid Mold Casting Cuts Ingot-to-Billet Costs. J. T. Evans. Western Metalworking, v. 19, Apr. 1961, p. 27-28.

Alloy and special steel forging ingots of improved forgeability, surface smoothness and low inclusion content are produced by teeming the melt into a mold containing molten slag, the slag

rising to coat the walls of the mold and fill in crevices. Longer mold life and less required preconditioning of the ingot for forging are attributed to the process. (D9k, D9p)

262-D. (German.) Production and Melting of Lime Sinter With Particular Reference to Desulphurization of Sinter and Pig Iron. Bernhard Weilandt and Fritz Kruse. Stahl und Eisen, v. 81, Mar. 2, 1961, p. 295-302.

Investigation of desulphurization in test sintering at a CaO/SiO_2 ratio of 0.8-1.4 and in test melting with a slag of 1.14-1.19 CaO/SiO_2 ratio. Production tests on a blast furnace using a 42% sinter (CaO-sinter and CaO-free sinter) containing burden. Influence of basicity on coke consumption and on desulphurization of pig iron. (D11n)

263-D. (German.) Reaction Mechanism in Oxygen Top-Blowing in Rotating Vessels. Pt. 2. Paul Ernst Hardt, Gunter Vocke and Hermann Schenck. Stahl und Eisen, v. 81, Mar. 2, 1961, p. 311-324.

Test refining of basic Bessemer steel by oxygen top-blowing in rotating vessels of round and oval cross section. Measurement of characteristic refining data such as decarburization rate, slag composition, steel analysis with particular reference to nitrogen content, oxygen consumption and waste gas composition as influenced by vessel geometry and rotating speed. (D10c)

264-D. (German.) Results Obtained in Automatic Openhearth Furnace Control. Friedhold Rabes. Neue Hutte, v. 6, Feb. 1961, p. 65-71.

Increase of output and efficiency and improvement of fuel consumption and gas chamber wear through semi-automatic and automatic hydraulic control of gas and air chambers, furnace pressure and gas-air ratio in openhearth refining. (D2h)

265-D. (German.) Economical Alloying in Steelmaking. Wolfgang Kuntscher. Neue Hutte, v. 6, Feb. 1961, p. 72-77.

Saving of alloying elements, with emphasis on Mn, in steelmaking by special melting and finishing operations such as predeoxidation by carbon powder, prevention of oxidation during tapping and casting and premelting of alloying elements under reducing slag and by special heat treatment such as hardening by quenching from rolling temperature and controlled cooling from rolling temperature. (D-general, J-general; ST)

266-D. (German.) Experiences in Deoxidation by Carbon Injection Into the Basic Bessemer Converter. Wolfgang Kuntscher and Gunther Richau. Neue Hutte, v. 6, Feb. 1961, p. 78-81.

Production tests on deoxidation by carbon powder injection into steel in a 7 ton basic Bessemer converter. Comparison of mechanical properties of carbon deoxidized steel with reference melts of conventional deoxidation and evaluation of Mn savings by carbon predeoxidation. (D3f, D11r, Q-general, 2-60; ST)

267-D. (Russian.) Developments in Computations of Zone Heat Balance and Thermal Parameter of Blast Furnaces. A. N. Chernyatin and B. I. Kitaev. Izvestiya Vuz Chernaya Metallurgiya, Oct. 1960, p. 20-30.

Method for derivation of zone heat balance and heat exchange efficiency for computation of thermal parameters in terms of the useful shaft height. Furnace productivity and degree of shaft height utilization are correlated as a function of gas and charge weight ratio, gas flow and charge size. 8 ref. (D1, D11k)

268-D. (Russian.) Method for Selection of Optimum Primary Slag Composition Based on Crystallization Data of $CaO-FeO-SiO_2$. A. A. Gimmel'farb. Izvestiya Vuz Chernaya Metallurgiya, Oct. 1960, p. 31-39.

Study of crystallization of $3CaO-2SiO_2$ slag component, which occurs first in melting, in various slags to determine the amount of the segregated crystals and the liquid phase in the system. Effect of slag basicity and FeO content on the blast furnace productivity. 9 ref. (D11r)

269-D. (Russian.) Optimum Conditions for Successful Dephosphorization in Processing Cast Iron. V. P. Grigor'ev and E. V. Abrosimov. Izvestiya Vuz Chernaya Metallurgiya, Oct. 1960, p. 46-57.

Dephosphorizing of high-phosphorous cast iron during the first stage of melting by oxygen blowing. Degree and rate of dephosphorization as dependent on the

content of Mn and Al_2O_3 in the starting material, the rate of heating and oxygen blowing. 7 ref. (D11n, 2-60)

270-D. An Improved Method of Desulphurizing Cast Iron With Sodium Carbonate. R. B. Coates and R. Williams. BCIRA (British Cast Iron Research Assoc.) Journal, v. 9, Mar. 1961, p. 263-278.

Molten metal is tapped onto a bed of sodium carbonate and agitated by compressed air introduced through a submerged lance. A 1% addition of $NaCO_3$ permits reduction of an initial sulphur content of 0.15-0.01%. 9 ref. (D11n)

271-D. The Effect of Nickel on the Chromium and Carbon Relationship in Stainless Steel Refining. A. Simkovich and C. W. McCoy. Metallurgical Society of AIME, Transactions, v. 221, Apr. 1961, p. 416-417.

The equilibrium concentration of Cr and C in the liquid metal at oxygen saturation and related bath temperatures are measured and calculated as a function of Ni content for stainless steel melts of 0.076-0.42% C, 7.58-9.50% Cr and 4.13-20% Ni composition held in an induction furnace at approximately 1580° C. with subsequent oxygen injection and temperature rise to approximately 1950° C. 4 ref. (D11r, P12d, 2-60, SS, Cr, C, Ni)

272-D. Analysis of Open Hearth Oxygen Injection. J. E. Hawkins, R. J. Fekete, G. A. Ferris and W. R. Kiessel. Journal of Metals, v. 13, Apr. 1961, p. 292-297.

Investigation of the effect of oxygen and its velocity and rate of flow, when used to enrich combustion air, on the composition and properties of steel produced by openhearth process. 6 ref. (D2g)

273-D. Oxy-Fuel Increases Open Hearth Potential. G. A. Ferris. Journal of Metals, v. 13, Apr. 1961, p. 298-299.

Experimentation to develop maximum production from openhearth steelmaking process. Results are reported on 400 ton heats with an output of 100 tons per hr. and a 200 ton furnace with a potential output of more than 65 tons per hr. (D2g)

274-D. Operating Experiences With Open Hearth Lances. D. F. Brion, R. F. Urban and T. B. Winkler. Journal of Metals, v. 13, Apr. 1961, p. 300-302.

Report on use of oxygen roof lances in openhearth steelmaking process. Guides are established for achievement of maximum production from individual furnaces. (D2g)

275-D. Future of the Open Hearth. A. K. Moore. Journal of Metals, v. 13, Apr. 1961, p. 303-304.

Evaluation of the future of the openhearth steelmaking process in terms of obsolescence and productivity as related to the new oxygen steelmaking technique. (D2)

276-D. Methods of Reducing Iron Ores. J. Astier. Journal of Metals, v. 13, Apr. 1961, p. 305-307.

Summary of techniques for iron ore reduction, including fluidized bed, kiln, gaseous reduction and electric furnace processes. 12 ref. (D-general)

277-D. Taconite Pellets in the Blast Furnace. W. E. Marshall. Journal of Metals, v. 13, Apr. 1961, p. 308-313.

Report on the use of taconite pellets in experimental and commercial blast furnace steelmaking. Data and results are presented from a 10 yr. testing program in selected mills. (D1b)

278-D. Pre-Reduced Iron-Ore Pellets. Their Experimental Preparation. J. P. Hansen, N. B. Melcher and M. M. Fine. Journal of Metals, v. 13, Apr. 1961, p. 314-315.

Research into the metallization of hard prereduced iron ore pellets, used as super blast furnace feed, to develop continuous pellet production methods. (D1a)

279-D. The Use of Natural Gas in the Blast Furnace. J. C. Moreland. Blast Furnace and Steel Plant, v. 49, Apr. 1961, p. 317-323.

Thermal equilibrium, degree of coke reduction and coke consumption as influenced by blast temperature and gas injection. Heat balance tests indicate changes in thermal requirements per ton hot metal and heat loss reduction. (D1)

280-D. The Potential and Limitations of High Blast Temperatures. Pt. 2. T. L. Joseph. Blast Furnace and Steel Plant, v. 49, Apr. 1961, p. 324-328.

Natural gas and moisture injections through insulated blowpipes make possible 2000° F. blast temperatures. Tonnages and coke rates as influenced by moisture and natural gas increases. Volume relationships between moisture grains per cubic foot of blast and natural gas as per cent of blast. (D1)

281-D. Ore Cooling in the Basic Oxygen Steelmaking Process. Jack Worsman. Blast Furnace and Steel Plant, v. 49, Apr. 1961, p. 338-340.

Effect of ore cooling process in which ore replaces scrap on yield, blowing time, oxygen consumption and slopping studied by data processing. (D10)

282-D. The Possibilities of the Basic Side-Blown Converter. G. Reginald Bashforth. British Steelmaker, v. 27, Apr. 1961, p. 115-119.

Design principles for the Tropenas side blown converter process and technical index for experimental basic-lined furnace production of carbon steel. The process is compared to the acid lined L-D and Kaldo converter processes with the best features of both plus added flexibility being attributed to the Tropenas process. (D10)

283-D. Continuous Casting in the Manufacture of Wire. F. Leitner and R. Rossegger. Wire World International, v. 3, Feb. 1961, p. 17-20.

General processing of carbon steel wire containing Si, Mn, P and S. Aspects covered include properties of cast strand, appearance of casting structure, density, condition of strand after rolling and structure, tensile strength and drawing properties of various grades of continuously cast materials. (D9q)

284-D. (Translation-Brutcher no. 5000.) On the Refining of Basic Bessemer Irons by Oxygen Top Blowing (LD Process). Pt. 2. W. Plockinger. Stahl und Eisen, v. 80, no. 22, 1960, p. 1481-1486.

Development of a new refining practice in a three ton pilot converter. Set-up for lance with guide and pneumatic feed of lime in lump or powder form at the 60 ton vessel. Data on hot metal composition, amount and nature of additions, metal composition in the first and second blowing stages, tapping temperature, total blowing time and oxygen consumption. (D10a)

285-D. (Translation-Brutcher no. 5035.) Influence of Blast Temperature, Intensifiers and Injection of Fuels Upon the Oxidizing Zone of a Blast Furnace. V. I. Loginov. Izvestiya Vuz-Chernaya Metallurgiya, Apr. 1960, p. 29-36.

Plant-scale study of changes in size of the oxidizing zone in blast furnaces producing basic iron, ferrosilicon and ferromanganese, as brought about by present-day smelting practices. Effect of blast temperature and blast humidity, also of oxygen enrichment of blast upon composition of hearth gases. (D1)

286-D. (Translation-Brutcher no. 5092.) Desulphurization of Liquid Steel by Slag Mixtures During Vacuum Treatment. Izvestiya Vuz-Chernaya Metallurgiya, Nov. 1960, p. 32-35.

Experimental study of effectiveness of desulphurization of steel by slag mixtures under vacuum. Treatment of liquid steel in a magnesite crucible of a vacuum induction furnace with slag mixture of 80% lime + 20% spar (dry, crushed) and mixture of 50% lime + 50% alumina (fused). (D11n)

287-D. (Translation-Brutcher no. 5082.) Effect of Way of Pouring the Metal Into Mold Upon Longitudinal Hot Cracking of Continuously Cast Slabs. E. A. Iodko. Izvestiya Vuz-Chernaya Metallurgiya, Dec. 1960, p. 31-38.

Laboratory and plant-scale studies of ways of minimizing longitudinal surface hot cracking on slab surfaces, particularly in the continuous casting of large tonnage killed carbon steel St. 3 with tensile strengths ranging from 55,000-67,000 psi. (D9q)

288-D. (Translation-Brutcher no. 5083.) Slag Control in Oxygen Top-Blowing Process of Steelmaking. Izvestiya Vuz-Chernaya Metallurgiya, Dec. 1960, p. 173-182.

Study of possibilities of cutting the consumption of slag-building materials and the losses of metal to the slag in the oxygen top-blowing process. (D10a)

289-D. (Translation-Brutcher no. 5102.) Relationship Between the Carbon Elimination Reaction and the Nitrogen Removal From Liquid Steel in Oxygen Steelmaking. Processes. S. Maekawa. Tetsu-to-Hagane (Iron and Steel Institute of Japan, Journal), v. 46, Oct. 1960, p. 1233-1234.

Relation between amount of carbon removed and the oxygen partial pressure rate-determining factor in carbon elimination; carbon drop rate as related to nitrogen elimination rate for various temperatures and oxygen pressures. (D10, D11)

290-D. (Translation-Brutcher no. 5072.) Properties of Cold Rolled Sheet From Oxygen Top-Blown (LD) Steel. B. Kawasaki. Tetsu-to-Hagane (Iron and Steel Institute of Japan, Journal), v. 46, Oct. 1960, p. 1275-1276.

Investigation of properties of cold rolled sheet made from 88 heats of low-carbon, rimmed LD process steel and from 66 heats of low-carbon, rimmed openhearth steel. (D10a)

291-D. (Italian.) Production of Stainless Steel Castings. Nickel, Dec. 1960, p. 1-7.

Melting of stainless steel in induction and electric arc furnaces. Composition of cast corrosion and heat resistant stainless steels. 4 ref. (D5, D6, D9, 2-60; SS)

292-D. Basic Oxygen Steelmaking. J. E. Tredennick. Industrial Heating, v. 28, Feb. 1961, p. 301-304, 306-308, 310.

Operating procedures and process for removing the elements C, Si, Mn and P. Method for determining the charge and control of these elements to meet a prescribed specification. (D10)

293-D. Oxygen Roof Lancing in Open Hearth Furnaces. Pt. 1. Industrial Heating, v. 28, Feb. 1961, p. 314, 315, 318.

Design and operation of oxygen roof lance which improves the production rate and the fuel consumption of the furnace. (D2g)

294-D. Oxygen Roof Lancing in Open Hearth Furnaces. Pt. 2. Industrial Heating, v. 28, Feb. 1961, p. 345-346, 348, 350, 352.

Effect of oxygen lanced practice on refractory requirements with respect to the roof and its height, back wall, bottom and bridge wall. Discusses improved furnace construction for this type of steelmaking. (D2g)

295-D. Use of Computers in Predicting Blast Furnace Operations and Heat Losses in Other Furnaces. A. L. Hodge, R. J. Leary, R. W. Smith and B. J. Mitchell. Industrial Heating, v. 28, Apr. 1961, p. 717-725.

Report on the application of large and small electronic computers to predict blast furnace operation with reference to temperature control, moisture content, oxygen enrichment, heat loss, coke rate, fuel consumption, metal and slag composition and curve fitting. (D1b)

296-D. Essentials of Steel Deoxidation. N. I. Shinokov. Indian Institute of Metals, Transactions, v. 13, Dec. 1960, p. 383-398.

Analysis of thermodynamic and thermochemical processes occurring during deoxidation of steel in the ladle and mold and in vacuum processes in relation to use of various deoxidants such as ferrosilicon, ferrochromium, silicocalcium and Al. Effect of deoxidation kinetics on slag metal reactions, nonmetallic inclusion content, steel composition, oxygen equilibrium concentration and gas metal reactions. 11 ref. (D11r; AD-r, 17-57)

297-D. Electronic Computer Facilitates End Point Temperature Control in Basic Oxygen Furnace Steelmaking. Industrial Heating, v. 28, Mar. 1961, p. 510, 512.

Computer calculates the proper proportions of hot metal, scrap and lime charge so that any desired steel may be tapped at the proper temperature. (D10)

298-D. (Italian.) Melting Tests in Electric and Openhearth Furnaces on Ferrous Materials Produced by Direct Reduction. O. Masi and P. Cannizzo. Metallurgia Italiana, v. 53, Jan. 1961, p. 1-16.

Effect of replacement of varying percentages of scrap by R-N briquettes on operating parameters, composition of melts and heat consumption. 14 ref. (D2a, D5a)

299-D. Silicomanganese Produces Cleaner Steel. Union Carbide Metals Review, v. 4, Winter-Spring, 1961, p. 6-9.

Silicomanganese deoxidation in the steelmaking furnace improves average cleanliness to better than that obtained with other furnace blocking practices. (D9r, D11r)

300-D. Ca-Mn-Si Boosts Casting Quality. Union Carbide Metals Review, v. 4, Winter-Spring, 1961, p. 23.

Use of Ca-Mn-Si in acid openhearth and acid electric furnaces to produce high-quality grade B steel castings. (D9r)

301-D. Mechanical and Induction Stirring in Arc Furnaces in Steel Mills. Journal du Four Electrique et des Industries Electrochimique, Feb. 1961, p. 63-66.

Comparison of the effect of mechanical and induction stirring on desulphurization and deoxidation reaction rates. (D11n, D11r, D5f)

302-D. Aluminum Capped Steel. W. P. Conner and D. J. Miller. Paper from "Open Hearth Proceedings". v. 43. American Institute of Mining, Metallurgical and Petroleum Engineers, 29 W. 39th St., New York 18, N. Y. 1961, p. 4-19.

Description of production processes for chemical capping of steels, a practice wherein the action of a poured rimming ingot is completely suppressed by the addition of a strong deoxidizer such as Al or Si. Results reported for the ingots include chemical inhomogeneity, ingot soundness, ingot-to-slab yield, sheet surface quality, sheet physical and chemical properties and sheet microstructure. (D9r, D11r)

303-D. A Practical Method for Statistical Evaluation of Open Hearth Problems. Raymond A. Hinnebusch and Jack A. McKinnon. Paper from "Open Hearth Proceedings". v. 43. American Institute of Mining, Metallurgical and Petroleum Engineers, 29 W. 39th St., New York 18, N. Y. 1961, p. 54-72.

A statistical method is used to evaluate the effect of rate of carbon elimination, amount of go-ahead carbon, length of finish slag, go-ahead temperature, time from addition of Mn to tap and size of heat on Mn recovery. (D2)

304-D. Use of Ultrasonics in Testing for Cleanliness. A. C. Mager. Paper from "Open Hearth Proceedings". v. 43. American Institute of Mining, Metallurgical and Petroleum Engineers, 29 W. 39th St., New York 18, N. Y. 1961, p. 72-85.

An ultrasonic reflectoscope is used to evaluate the effect of increased tapping temperature and ladle holding times, discontinuation of SiC ladle additions, adaptation of higher refractory ladle well tappings and discontinuation of pouring boxes on product cleanliness. (D9, 9, S13g)

305-D. Analysis of Plant, Operating Data Using Digital Computer. A. P. Woods. Paper from "Open Hearth Proceedings". v. 43. American Institute of Mining, Metallurgical and Petroleum Engineers, 29 W. 39th St., New York 18, N. Y. 1961, p. 86-137.

A data analysis procedure combining mathematical and graphical regression is used to determine optimized operating practice for an openhearth furnace with oxygen roof lance. (D2g)

306-D. Metallurgical Aspects of Oxygen Roof Lances. F. E. Gribble and N. F. Zepfel. Paper from "Open Hearth Proceedings". v. 43. American Institute of Mining, Metallurgical and Petroleum Engineers, 29 W. 39th St., New York 18, N. Y. 1961, p. 138-144.

Comparison of the mechanical properties of sheet products, killed carbon flange and firebox quality plates, killed forging blooms and Ni-Cr-Mo plates produced from oxygen lance and regular practice heats. (D2g)

307-D. Vacuum Treatment of Molten Steel. Fritz Harders, Helmut Knuppel and Karl Brotzmann. Paper from "Open Hearth Proceedings". v. 43. American Institute of Mining, Metallurgical and Petroleum Engineers, 29 W. 39th St., New York 18, N. Y. 1961, p. 145-161.

Description of the Dortmund-Horder Huttenunion process in which successive portions of heats of steel are degassed in a vacuum unit, then returned to the teeming ladle where they mix with the rest of the steel. Data are correlated to show the relation between oxygen content and recirculation factor, the latter being a measure of the number of times each particle of melt is exposed to the vacuum. (D9s)

308-D. Progress Report on the Carbon Subhearth. J. E. Smith. Paper from "Open Hearth Proceedings". v. 43. American Institute of Mining, Metallurgical and Petroleum Engineers, 29 W. 39th St., New York 18, N. Y. 1961, p. 186-195.

Comparison of bottom delay times on two openhearth furnaces, one having a conventional hearth and the other a carbon bottom. Evaluation of temperature changes above and below carbon blocks. (D2)

309-D. Experience With the Maerz-Boelens Open Hearth Furnace. Paper

from "Open Hearth Proceedings". v. 43. American Institute of Mining, Metallurgical and Petroleum Engineers, 29 W. 39th St., New York 18, N. Y. 1961, p. 195-214.

Design features of the Maerz-Boelens openhearth furnace which has front and back walls that slope inward over the hearth to the roof with the cross-sectional area of the furnace assuming a semi-elliptical time, tap-to-tap time, output and fuel consumption during several heats. (D2)

310-D. Production of Low-Carbon, Medium Carbon and High-Carbon Steels by the Basic Oxygen Process. C. C. Benton. Paper from "Open Hearth Proceedings". v. 43. American Institute of Mining, Metallurgical and Petroleum Engineers, 29 W. 39th St., New York 18, N. Y. 1961, p. 215-219.

Discussion of sources of metallics, charge and slag compositions, steelmaking methods and product composition in production of steels containing 0.03-1.05% carbon. (D10)

311-D. Basic Problems in Handling Materials and Products in the Basic Oxygen Furnace Process. J. N. Albaugh. Paper from "Open Hearth Proceedings". v. 43. American Institute of Mining, Metallurgical and Petroleum Engineers, 29 W. 39th St., New York 18, N. Y. 1961, p. 220-228.

Problems of scrap handling, mold requirements, ladle lining, skulling out and furnace relining in basic oxygen steelmaking. (D10)

312-D. Basic Oxygen Furnace With Cupola Iron. E. R. Richards. Paper from "Open Hearth Proceedings". v. 43. American Institute of Mining, Metallurgical and Petroleum Engineers, 29 W. 39th St., New York 18, N. Y. 1961, p. 229-232.

Discussion of equipment performance, flow of materials and Fe quality encountered during production of steel by the hot blast cupola basic oxygen furnace process. (D10c)

313-D. Changes Made After Start-Up to Increase Tonnage and Improve Quality. W. F. Bowers. Paper from "Open Hearth Proceedings". v. 43. American Institute of Mining, Metallurgical and Petroleum Engineers, 29 W. 39th St., New York 18, N. Y. 1961, p. 233-235.

Description of modifications to increase steel ladle capacity and improve brick relining technique during basic oxygen steelmaking. (D10)

314-D. Production Advantages From the Use of Oxygen Roof Lances. Orville O. Haniford. Paper from "Open Hearth Proceedings". v. 43. American Institute of Mining, Metallurgical and Petroleum Engineers, 29 W. 39th St., New York 18, N. Y. 1961, p. 236-240.

Typical charge compositions and data for furnace operation and performance are presented for 345 ton openhearth furnaces equipped with a single roof lance. (D2g)

315-D. Design Problems--Oxygen Roof Lances. E. J. Sobey. Paper from "Open Hearth Proceedings". v. 43. American Institute of Mining, Metallurgical and Petroleum Engineers, 29 W. 39th St., New York 18, N. Y. 1961, p. 251-257.

Illustration of various lance designs used by Jones and Laughlin Steel to increase openhearth furnace production. (D2g)

316-D. Fuels and Firing Practices With Oxygen Usage. Luis T. Sanchez. Paper from "Open Hearth Proceedings". v. 43. American Institute of Mining, Metallurgical and Petroleum Engineers, New York 18, N. Y. 1961, p. 258-266.

Illustration of standard practice firing profiles used with openhearths on regular nonoxygen heats, oxygen lance heats, oxygen combustion heats and oxygen lance combustion heats. Figures are given for oil, gas, tar and oxygen consumptions. (D2h)

317-D. Development of Low Alloy Steel Compositions Suitable for High-Strength Steel Castings. H. R. Larson. American Brake Shoe Co. (Wright Air Development Division). U. S. Office of Technical Services, PB 171065, July 1960, 75 p. $2.

Acceptable properties are developed in the modified 8735 and 4335 alloys in 2 and 3 in. sections, but the problem of poor ductility in heavy sections of 5% Cr steel is not solved. Spectrographic analyses and sulphur additions to high-purity heats failed to reveal the factors responsible for improved properties in high-purity heats. (D9)

318-D. Purification of Cast Iron by Oxidation Processes. R. H. T. Dixon. British Foundryman, v. 54, Apr. 1961, p. 162-170.

Effectiveness of oxygen blowing, oxygen lancing, vibration and slag addition as processes for the removal or reduction of impurities. (D10, D11n)

319-D. (German.) Recent Experiences in Steel Melting in Induction Furnaces. K. Schafer. Elektrowarme, v. 19, Jan. 1961, p. 14-20.

Alloying, deoxidation, degassing reactions between melt and furnace lining involved in melting alloyed steel in the induction furnace. Economic comparison with converter, openhearth furnace and arc furnace processes with particular reference to production of X10CrNiNb 18 9, CrAl 8 5, CrAl 20 5, CrAl 30 5, CrNi 20 20, NiCr 30 20, NiCr 60 15 and NiCr 80 20 steel. Selection of frequency range; static frequency transformation. (D6)

320-D. (Russian.) Effect of Modification on the Viscosity of Pig Iron. B. M. Turovskii and A. P. Liubimov. Izvestiya Vuz-Chernaya Metallurgiya, Sept. 1960, p. 5-7.

Investigation of viscosity changes in molten pig iron due to ferrosilicon (43.2% Si) additions in a He atmosphere at 1375° C. Viscosity related to length of time following addition of ferrosilicon. 10 ref. (D9r, P10f, 2-60, 3-67; CI-a)

321-D. (Russian.) Desulphurization of Pig Iron and Steel in Vacuum. G. N. Oiks, Han Yao-ven and A. I. Litvintsev. Izvestiya Vuz-Chernaya Metallurgiya, Sept. 1960, p. 18-28.

Vacuum induction melting of pig iron and ShKh15 steel using basic, acid, carbon and alundum crucibles with X-ray and spectroscopic study of desulphurization as affected by initial S and Mn content, temperature and vacuum practice. 4 ref. (D11n, D6, 1-73, 2-60, 2-61)

322-D. (Russian.) Behavior of Vanadium During Blowing Out in Relation to Oxidation Intensity and Metal Temperature. S. V. Mihailikov and V. P. Revebtsov. Izvestiya Vuz-Chernaya Metallurgiya, Sept. 1960, p. 29-34.

Investigation of conversion of pig iron containing vanadium using air or oxygen lancing with porcelain or quartz tubes. Relation of vanadium oxidation to gas, blowing rate, carbon content, furnace lining and temperature. Influence of initial pig composition and time. 6 ref. (D11r, D3b, 2-60, 2-61, 3-67; CI-a, V)

323-D. (Russian.) Role of Hearth Fettling in Oxidation Processes During Melting of Steel. V. I. Kozlov and V. I. Yavoiskii. Izvestiya Vuz-Chernaya Metallurgiya, Sept. 1960, p. 35-42.

Analysis of furnace lining and bath composition changes during acid openhearth operation. Composition is shown to vary with time of heat and location of sample in furnace. 13 ref. (D11r, D2, 3-67)

324-D. (Russian.) Peculiarities of the Process of Pressing Molten Steel Under High Pressures. P. N. Bidulya and K. N. Emirnova. Izvestiya Vuz-Chernaya Metallurgiya, Sept. 1960, p. 43-49.

Hydraulic pressing of molten steel in molds for mechanical property improvement. Effect of specific applied stress on strength and plasticity. Variation in density with test specimen location in pressed part. 3 ref. (D9, 3-74)

325-D. (Russian.) Quality of Steel Melted by the Duplex, Convertor-Electric Furnace Process. A. P. Potrusaev and A. M. Samarin. Izvestiya Vuz-Chernaya Metallurgiya, Sept. 1960, p. 50-56.

Use of basic convertor iron for producing ShKh15 and 45 steels in electric furnaces. Dependence of metal composition upon reduction time. Investigation of nonmetallic inclusions, mechanical properties and energy expanded. (D5a)

326-D. Consumable-Electrode Melting of Steels Present and Future. W. W. Dyrkacz. Metal Progress, v. 79, May 1961, p. 65-70.

Since its adaption to specialty steel and superalloys, consumable-electrode vacuum melting has proved to be a valuable technique for obtaining cleaner ingots which have lower gas content and better mechanical properties than comparable air-melted ingots. As a consequence, larger and larger remelting units are being built and 60,000 lb. ingots will soon be available. (D5, D8m, D9)

327-D. Pouring Degassed Steel in an Argon Atmosphere. William Wilson.

Metal Progress, v. 79, May 1961, p. 71-73.

Ingot molds can now be filled with Ar, an inert gas 38% heavier than air, to prevent ladle degassed steel from pickling by hydrogen, oxygen and nitrogen when it is teemed. The result: improved macroetches, fewer inclusions, higher ductilities and good ingot surfaces. (D9s)

328-D. Deoxidizing Steels by Vacuum. G. E. Danner and E. Dyble. Metal Progress, v. 79, May 1961, p. 74-78.

When unkilled steel is stream degassed in a vacuum, included oxygen will unite with the carbon in the steel and boil off as carbon monoxide. Extensive tests show that steel deoxidized in this manner will contain less gases and fewer inclusions. (D9s, 1-73, D8m)

329-D. Significance of Experimental Operations to Industrial Blast Furnace Practice. M. B. Royer and W. M. Mahan. U. S. Bureau of Mines, Report of Investigations 5766, 1961, 8 p.

Comparison of pressure, temperature, dust load, blast rate, coke consumption, slag volume and basicity and production rate parameters in blast furnaces using ores containing 57.9-68.4% Fe. (D1)

330-D. Argon Casting for Improving Steel Quality. M. F. Hoffman, P. G. Bailey and R. L. W. Holmes. Journal of Metals, v. 13, May 1961, p. 345-349.

Steel casting in complete Ar atmosphere results in 30-65% reduction of nonmetallic inclusions, preservation of vacuum treatment effects and a 3-24% decrease in conditioning losses. 7 ref. (D9)

331-D. Argon Teeming of Degassed Steel. William Wilson. Journal of Metals, v. 13, May 1961, p. 350-352.

Application of Ar teeming techniques to degassed steel results in increased strength, cleanliness, ductility and machinability. (D9s)

332-D. Tin as a Ladle Addition in the Casting of Iron. R. M. MacIntosh. Tin and Its Uses, no. 51, 1961, p. 1-3.

Effect of ladle additions of Sn to cast iron on the Brinell hardness and machinability of the castings. (D9m)

333-D. (German.) Behavior of Minette Ore Sinter in the Blast Furnace. Rudolf Sandhofer and Otto Becker. Stahl und Eisen, v. 81, Apr. 13, 1961, p. 501-503.

Melting of sinter having small lump size, low loose weight and a high degree of oxidation in a low blast furnace in production tests using burdens containing 80 and 100% sinter. Correlations between degree of oxidation, loose weight and calorific value and composition of waste gas. (D2a)

334-D. Argon Teeming: Extra Refinement to Vacuum Degassing of Steel. Iron Age, v. 187, May 18, 1961, p. 146-148.

Vacuum degassed steel is poured through a blanket of argon gas into ingot molds filled with argon to prevent gas pickup during teeming. Magnetic frequency, tensile and yield strength, elongation determined. (D9s, 1-73)

335-D. (German.) Control and Regulation of Material Flow in Iron Works by Means of Data Processing. Bruno Turk. Stahl und Eisen, v. 81, Apr. 27, 1961, p. 548-551.

Control of material flow in terms of data processing (balancing and accounting) of blast furnace operation including automatic burdening, blast and waste gas control. (D1, 18-74)

336-D. (German.) Investigation of Reducibility of Sinter. Jacob Willems and Gunter Quade. Stahl und Eisen, v. 81, Apr. 27, 1961, p. 552-558.

Reduction tests, using CO-CO_2 gas mixtures at 200-1000° C., on magnetic, hematitic ores and strand sinter with various amounts of fuel and lime addition. Reducibility and degree of oxidation as influenced by grain distribution, basicity and sinter addition. Significance of testing results for blast furnace smelting. (D-general, D1; RM-n)

337-D. The Continuous Steel Casting Process. Hans Hofmeister. Blast Furnace and Steel Plant, v. 49, May 1961, p. 403-406.

Operation of casting ladle, tundish, molds, cooling chambers, withdrawing rolls and flame cutting machine used in continuous casting of ingots. History of the process. (D9q)

338-D. Utilization of Fuel Gas by Injection Through Blast Furnace Tuyeres. Eugene R. Dean. Blast Furnace and Steel Plant, v. 49, May 1961, p. 417-423.

Coke oven gas and natural gas are substituted for furnace coke in production of pig iron and Spiegeleisen. Production statistics. (D1b)

339-D. Vacuum Melting of Low-Alloy Steel. Beverly W. Dunning, Jr. U. S. Bureau of Mines, Report of Investigations 5778, 1961, 14 p.

Effect of vacuum melting on nonmetallic inclusions in 1018, 1345, 2317, 4017, 5135 and 6120 alloy steels. 6 ref. (D8m)

340-D. Utilization of Nickeliferous Serpentine. Lloyd H. Banning and Wallace E. Anable. Paper from "Extractive Metallurgy of Copper, Nickel and Cobalt". Interscience Publishers, Inc., New York 1, 1961, p. 301-313.

Comparative smelting tests on various samples of nickeliferous serpentine. Utilization of Co-containing ferronickel in the production of stainless steel. 9 ref. (D1; RM-n, AD-n31, Fe-b, Ni, 17-57)

341-D. Oxygen Practice Gets Boost at Old, New Steel Plants. Steel, v. 148, May 22, 1961, p. 124, 126.

Use of oxygen at the Pueblo (Colorado) plant of Colorado Fuel and Iron Corp. and at the Portsmouth (Ohio) plant of Detroit Steel Corp. (D-general; O)

342-D. (French.) Use of Pure Oxygen as Fuel in Openhearth Furnace Fired by Low-Grade Gas. L. Septier, J. Sophron and P. Karinthy. Revue de Metallurgie, v. 58, Mar. 1961, p. 223-240.

Injection of oxygen during melting into the burners of an openhearth furnace burning producer gas is used together with additions of compressed water vapor to improve output. 16 ref. (D2g)

343-D. (French.) Hydrogen Content Below 2 Ml/100 g. for Steel Produced in the Electric Furnace. N. Chvorinov. Revue de Metallurgie, v. 58, Mar. 1961, p. 271-275.

Hydrogen content of the steel, produced in a duplex process and coming from an openhearth furnace, is reduced to below 2 ml/100 g. by utilizing an oxygen blast during the oxidation period. (D5g)

344-D. Theoretical and Practical Aspects of Vacuum Induction Melting of High Strength Steels. P. S. Schaffer. Watertown Arsenal. U. S. Office of Technical Services, PB 161928, Mar. 1960, 69 p. $2.

Hydrogen and nitrogen are reduced to low levels by the inductive stirring mechanism which exposes new molten metal surfaces to vacuum to facilitate mass transfer of these elements in solution to their gaseous states by desorption. Oxygen content is greatly reduced by the carbon boil, at which time atomic hydrogen and nitrogen diffuse into the carbon monoxide bubbles, causing further reduction of these gases. (D6, 1-73)

345-D. Vacuum Induction Melting Oxygen and Carbon in Iron. J. E. Srawley. U. S. Naval Research Laboratory. U. S. Office of Technical Services, PB 161764, Sept. 1960, 20 p. $.50.

Oxygen is removed from vacuum induction melts of electrolytic Fe to a limiting level of 20 ppm. carbon additions. The initial oxygen content is about 200-300 ppm.; a minimum of about 450 ppm. of carbon is required to lower the oxygen contents to 20 ppm. Excess carbon reacts with the crucible materials, which results in a loss of about 10% of the carbon added during heats of 4-5 hr. duration. (D6, 1-73)

346-D. (Portuguese.) Processing Iron With Nickel Content in a Small L.D. Converter. Egberto Franco and Luiz C. Correa da Silva. Boletim da Associacao Brasileira de Metais, v. 17, no. 61, 1961, p. 45-55.

Experimental refining of 20-200 kg. iron charges containing 1.80-2.63% C, 0.74-2.20% Si up to 0.20% Mn, 0.07-0.27% P, 0.02-0.04% S and 22.2-25.2% Ni under a slag composed of SiO_2, Al_2O_3, FeO, CaO, MgO and NiO. Oxygen blowing at 1-6.5 kg. per sq. cm. pressure against the surface. A steel melt with 23.3-30.7% Ni is obtained. 4 ref. (D10a)

347-D. (Pamphlet-English.) Theoretical Considerations on the Injection of Auxiliary Fuels Into the Blast Furnace. Alfred M. Decker. 7 p. 1961. Vaillant-Carmanne, S. A. 4, Place St-Michel, 4, Liege, Belgium.

Blast temperature, production and coke consumption as influenced by the injection of hydrocarbons (fuel oil, natural gas and coke oven gas) through tuyeres. (D1h)

348-D. (Pamphlet.) A Mathematical Method for Analyzing and Predicting Changes

in Blast Furnace Operation. A. L. Hodge and E. R. Wyczalek. 65 p. 1961. Linde Co., Division of Union Carbide Corp., Newark, N. J.

Calculation of heat and material balances, heat transfer, top gas temperature, driving rate and shaft gas velocity. Operational changes as influenced by blast temperature, moisture control, fuel injection, oxygen enrichment and wind rate. (D1b)

349-D. The Control of Oxygen Injection in Foundry Steelmaking. K. Knagg. Iron and Steel Institute, Journal, v. 198, May 1961, p. 14-20.

Injection of oxygen is utilized for the removal of carbon during steelmaking in electric furnaces. Specific data are given for the volume of oxygen required to remove a specific quantity of carbon from any particular initial carbon level. (D5g)

350-D. D-H Process: Vacuum Degassing Handles Openhearth Heats. Iron Age, v. 187, May 25, 1961, p. 104-105.

Vacuum degassing and alloying of openhearth and electric furnace steel by D-H process produces steel with consistently fine grain size and lower oxide inclusion content. (D9s)

351-D. The Pre-Refining of Blast-Furnace Iron and Development of the Brymbo Oxygen/Electric Steelmaking Process. Emrys Davies. Iron and Steel Institute, Journal, v. 197, Apr. 1961, p. 271-282.

Review of early experiences with pre-refining and design, development and operation of a pre-refining furnace with trials in desiliconization and dephosphorization of blast furnace metal by the injection of powdered lime and oxygen. Advantages of using pre-refined metal as 50% of the electric furnace charge in the production of carbon and low alloy steels by the oxygen-electric steelmaking process. (D5g, D11h)

352-D. (Russian.) Blast Furnace Operation on Sized Sinter. S. K. Trekalo, N. M. Yakubtsiner, V. N. Andronov, G. F. Grigor'evykh, V. D. Kailov and A. B. Shur. Stal', Dec. 1960, p. 1063-1070.

Use of two sinter classes of sizes from 3-32 mm. and from 3-150 mm., differing by the percentage of intermediate sizes. Effect of the charging sequence and the quantity of each class charged on consumption of blast, temperature, pressure drop between hearth and bosh mixture ratio of CO to CO_2 in the gas, coke consumption and slag formation. 8 ref. (D1b)

353-D. (Russian.) Behavior of Sulphur in the Operation of Openhearth Furnaces on Natural Gas With Self-Carburization. S. F. Karp, I. I. Kobeza, G. I. Mikhailov and I. A. Goncharov. Stal', Dec. 1960, p. p. 1075-1078.

Steelmaking by the scrap-ore process with 60-65% cast iron in the charge. Sulphur content, consumption of charging materials, limestone and ore, basicity and FeO content of slag and time consumed in the individual operation periods are recorded for the operation on coke oven gas-furnace gas firing and compared with the same parameters measured in the operation on natural gas. (D2h)

354-D. (Russian.) Openhearth Furnace Manufacture of Killed Steel With Oxygen Blowing. L. S. Rybakov, N. A. Khudyakov, V. S. Krivonosov and D. F. Nagovitsyn. Stal', Dec. 1960, p. 1078-1080.

Charging with 62-65% Fe, 35-38% steel scrap, approx. 5% limestone, 8-10% ore and approx. 0.5% bauxite. Blowing during the melting and finishing periods with oxygen at a rate of 1200-2400 cu.m. per hr. Rate of carbon oxidation as a function of oxygen pressure. Effect of blowing on slag composition. Influence of the slag basicity measured before the period of reduction on the phosphorus content. (D2g)

355-D. (Russian.) Technological Improvement in the Refining of Cast Iron Containing Vanadium. A. L. Klein, A. I. Pastukhov, A. H. Lekontsev, G. S. Kalganov and Yu. A. Kharitonov. Stal', Dec. 1960, p. 1081-1086.

Processing of an iron obtained from Kachkanar sinter-ore and containing 0.42-0.44% vanadium in a top-blown converter. Powdered scale and ore and water are added to the oxygen blast to control the melt temperature. A slag containing 13.12-16.40% V_2O_5 is obtained, serving as a starting material in the preparation of ferrovanadium. 3 ref. (D3f)

356-D. (Russian.) Effect of Alloying Elements on the Behavior of Oxygen and Nitrogen in Vacuum Melting. P. Ya. Ageev and B. G. Chernov. Stal', Dec. 1960, p. 1093-1096.

Experimental vacuum treatment of Fe melts containing 0-35% Cr, 0-5.50% Al, 0-6% Ti, 0-5.50% Si and 0-4.55% Cb and of Ni-base alloys containing 5-10% of Ti, Al, Cr, W, Mo or Co and 0.15-0.20%. Effect of alloying elements present on removal of oxygen and hydrogen. (D8m)

357-D. (Russian.) Casting of 1Kh18N9T Steel With Ingot Molds Lubricated With Petrolatum. Yu. G. Gurevich, B. B. Rozin, R. S. Geifman, G. A. Khasin and B. P. Okhrimovich. Stal', Dec. 1960, p. 1096-1098.

The optimum casting temperature measured in the ladle was found to be 1540° C. Time for which the melt was kept in the ladle prior to casting ranges from 5-12.9 min. Surface quality improvement by petrolatum lubrication. 4 ref. (D9, 18-73)

358-D. Fuel and Energy Required for Steelmaking in the Open-Hearth Furnace. R. Mayorcas and I. H. McGregor. Institute of Fuel, Journal, v. 34, Apr. 1961, p. 153-156.

Study of materials, oxygen and heat balance for openhearth furnaces when operating under different proportions of scrap and hot metal. Effect of waste heat and oxygen on fuel efficiency. (D2h)

359-D. Electric Smelting Titaniferous Magnetite Ore, Iron Mountain, Wyoming. H. C. Fuller and V. E. Edlund. U. S. Bureau of Mines, Report of Investigations 5776, 1961, 11 p.

Using limestone as a flux and coal as a reducing agent, a pig iron containing 95.1% Fe and 0.41% Ti is produced from an ore containing 45% Fe and 20% titanium dioxide. (D5)

360-D. Residual Elements and Their Effect on the Processing of Steel Products. G. G. Brown. Australian Institute of Metals, Journal, v. 6, Feb. 1961, p. 68-77.

Behavior of residual elements during steelmaking. Effect of elements on strength properties, transformation behavior, grain boundary phenomena, hot workability, surface behavior and weldability. 44 ref. (D-general, Q-general, 3-69)

361-D. (German.) Phase Separation of Slags During Normal Basic Bessemer Steel Refining. Hans vom Ende and Gustav Mahn. Stahl und Eisen, v. 81, May 11, 1961, p. 641-645.

Determination of the miscibility gap in liquid quasi-ternary P_2O_5-(FeO + MnO)-CaO system containing less than 3% Si (basic Bessemer slag) by chemical analysis and microscopic examination of samples taken during refining in a 30 ton converter. (D3)

362-D. Direct-Reduction Processes. J. Jackson. Iron & Steel, v. 34, May 1961, p. 192-193.

Review of several practical methods for the direct production of Fe from Fe ores. Comparison of yields and degree of reduction achieved with ores and iron sand concentrates. 21 ref. (D8j)

363-D. Oxygen Steelmaking in the Ajax Furnace of the Appleby-Frodingham Steel Co. Albert Jackson. Iron and Steel Engineer, v. 38, Apr. 1961, p. 67-76.

Openhearth furnaces are modified to allow intensive oxygen lancing with low-refractory and operation costs. High-quality steels are produced from high-phosphorus hot metal charges with increase in production of all-basic silica furnace and a decrease in operating costs attributed to the process. (D2g)

364-D. Orcarb Electric Furnace Process for the Direct Reduction of Iron Ore. W. R. Braddock. Iron and Steel Engineer, v. 38, Apr. 1961, p. 123-125.

Pilot plant production of sponge iron by a process incorporating pelletizing of ore fines with low-temperature coke and carburizing in an electric retort, pre-reduction of 80% in a rotary kiln and smelting in an electric furnace. (D8j)

365-D. (French.) Application of T.W.A. Desulphurization Process. Journal d'Informations des Industries de la Fonderie, no. 124, Mar. 1961, p. 6-9, 11.

Desulphurization of melts by lime powder blasts or mixtures of lime and bicarbonate of soda. (D11n)

366-D. Oxygen in Steelmaking--Today and Tomorrow. E. F. Kurzinski. Metal Progress, v. 79, June 1961, p. 97-102.

Since the importation of the basic oxygen converter from Austria a few years ago, the use of oxygen by this nation's steelmakers has nearly doubled. With the development of several promising processes such as the oxygen-natural gas lance, tomorrow may see production rates far greater than those of today. (D10, D-general; O)

367-D. Bethlehem Steel Expands Its Vacuum Cast Production. Iron and Steel Engineer, v. 38, May 1961, p. 163.

Discussion of Bethlehem Steel's pouring process used in producing vacuum cast ingots for press forging. Large press forgings can be produced from sounder, cleaner ingots with the possibility of flaking or microcracking practically eliminated. (D9p, 1-73)

368-D. (French.) Development of Nitrogen in the Basic Electric Arc Furnace. R. Ferry and R. Lescuyer. Revue de Metallurgie, v. 58, Feb. 1961, p. 137-149.

Nitrogen evolution determined during different stages of hard steel production, especially as a function of the carbon content of the slag. Techniques designed to eliminate or reduce nitrogen including control of carbonization. 11 ref. (D5, D11h)

369-D. (French.) Vacuum Casting of Steel. L. Colombier. Revue de Metallurgie, v. 58, Feb. 1961, p. 151-163.

Review of process parameters including treatment in ladle, operation of vacuum elevator and degassing by vacuum circulation. Data given for composition, properties and transition point of welded, thick Mn-Mo steel plate. Reduction of H_2, O_2 and N_2 in carbon or low-alloy steels. 25 ref. (D9, 1-73)

370-D. "Silex Coffeemaker" Degasses Steel. American Machinist/Metalworking Manufacturing, v. 105, May 29, 1961, p. 60.

A hydraulically mounted vacuum vessel moves up and down into a ladle to circulate steel for degassing and for small alloy additions. The vessel goes through 32 cycles treating 10% of the steel at each cycle. (D9r, D9s, 1-52)

371-D. G. K. I. & S. Ingot-Mould Foundry Traditional Site Retained for New Project at Dowlais. Foundry Trade Journal, v. 110, May 18, 1961, p. 625-631.

Foundry equipment and methods used in the production of ingot molds for steelmaking at Guest Keen Iron & Steel Co., Ltd. Topics include sand preparation, molding, cupola operation, melting, casting and cooling, sand blasting and trimming and destruction of scrap molds by detonation. (D9)

372-D. (French.) Behavior of Hydrogen in Cast Steel. Paul Bastien. Fonderie, no. 183, Apr. 1961, p. 131-138.

Hydrogen solubility as a function of pressure and temperature, ranging from 600-1800° C. Determination of hydrogen in steel by vacuum heating the solid sample. Absorption of hydrogen from humid air by a steel melt. Pipe, cracks, embrittlement of castings caused by hydrogen. Degassing by vacuum casting. 17 ref. (D11h; H)

373-D. (French.) Introduction of Various Elements to the Melt With Special Reference to Carbon. Nicolas Volianik. Fonderie, no. 183, Apr. 1961, p. 139-150.

Increase of C content in Fe melts by depositing powdered graphite on the surface and simultaneous blowing with nitrogen. Various cast irons containing 2.55-3.88% C, 0.55-2.12% Si, 0.33-0.60% Mn, 0.10-0.14 S and 0.26-1.11% P are obtained for tensile and impact strengths and hardness. 9 ref. (D11s)

374-D. Performance of Stora-Kaldo Oxygen Steelmaking Facility in France. Industrial Heating, v. 28, May 1961, p. 930-932, 934, 944.

Facility consists of two 110-ton Stora-Kaldo oxygen converter vessels which are tilted on their horizontal axis for charging, blowing and pouring and rotated on their longitudinal axis at varying speeds during refining. Advantages of process, metallurgical performance, refractory consumption, exhaust equipment, oxygen consumption and lance life; other Stora-Kaldo oxygen installations. (D10b)

375-D. Iron Ore Reduction--Kinetics and Thermodynamics. Pt. 3. Industrial Heating, v. 28, May 1961, p. 936, 940, 942, 944.

Kinetics of the reduction of hematite to magnetite and mechanisms controlling the rates of reduction at low and high temperatures. Results of experiments indicate that the thickness of the reduced layer is directly proportional to time and that the rate of reduction is proportional to the area of reacting interface. (To be continued.) (D11)

376-D. Gunned Graphite Governs Carbon Content in Steel. Steel, v. 148, June 5, 1961, p. 99.

Recarburization and deoxidation of soft heats of steel by pneumatic injection of graphitic carbon. (D11s)

377-D. (Spanish) Role of Slag in Iron Smelting. Guillermo Coll. Instituto del Hierro y del Acero, no. 70, Oct-Dec. 1960, p. 861-870.

Effect of slag composition and carbon content on oxide reduction in the blast furnace and Lubatti processes. (D1b)

378-D. (Russian.) Experience With a Blast Furnace of Large Capacity. M. Ya. Ostroukhov, V. I. Kholzakov and Yu. A. Popov. Metallurg, Dec. 1960, p. 5-9.

Technical-economic index given for one and a half year's experience with a blast furnace of large capacity using a charge consisting of agglomerate and coke of varying basicity. Effect of agglomerate preparation and loading methods on operating efficiency. (D1)

379-D. Development of Iron and Steel Industry in India. G. Pande. Institution of Engineers (India), Journal, v. 41, Jan. 1961, p. 215-224.

History and development. Pig iron and steel production and plant expansion goals. Materials and gas flow chart in an integrated iron and steel works. Composite structure of the new steel plants. (D-general)

380-D. Rapid Desulfurization to 0.002 Per Cent Sulfur. Edward J. Dunn, Jr. Modern Castings, v. 39, June 1961, p. 90-94.

Treating a 4340 steel with lime and CaMnSi before pouring produces castings with improved ductility, toughness and hardenability and reduces surface defects, red-shortness and welding porosities. Sulphur content may be reduced from 0.024-0.002%. 6 ref. (D11n)

381-D. (Spanish.) Porosity of Cast Steel. Otto Heide. Instituto del Hierro y del Acero, v. 14, Jan. 1961, p. 27-45.

Steel containing 0.11-0.51% C, 0.42-1.27% Si, 0.24-0.56% Mu, 0-0.008% O, 0-0.285% Al and 0.007-0.010% N is cast into test pieces at a pouring temperature of 1610-1710° C. Hydrogen absorption from the bentonite mold used and porosity as functions of casting temperature and Si and Al contents. 26 ref. (D9, 9-68)

382-D. (Swedish.) Thermochemical Calculations of the Blast Furnace Process. Rolf Linder. Jernkontorets Annaler, v. 144, Dec. 1960, p. 859-967.

Reactions and heat requirements for five temperature zones; influence of different variables on coke rate. 34 ref. (D1)

383-D. (German.) High Vacuum Melting of Steel in a 60 Kw. Electron-Ray Multiple-Chamber Furnace. M. von Ardeene, S. Schiller, W. Kuntscher, H. Thiel and L. Meyer. Neue Hutte, v. 6, Apr. 1961, p. 198-211.

Method and plant (60 kw. power and 20 kg. capacity) for vacuum melting of metals by bipole electron irradiation. Test melting of 4.5 kg. C 35 and X 22 CrMoV 12.1 steel and investigation of steel quality by chemical analysis and analysis of extraction residues such as oxidic inclusions. 30 ref. (D8m)

384-D. Metallurgical and Engineering Techniques in Japan. Tetsu-To-Hagane Abstracts (Abstracts from Iron and Steel Institute, Journal), no, 10, 1960, p. 5-16.

Review of improvement in steelmaking production techniques, industrial engineering and research operations. (D-general)

385-D. Trends and Present Situations of Converter Steelmaking in Japan Steel and Tube Corp. Tsuneo Kinoshita. Tetsu-To-Hagane Abstracts (Abstracts from Iron and Steel Institute, Journal), no. 10, 1960, p. 17-30.

Historical and technical review of steelmaking by Thomas converters and L-D converters in Japan. Changes in shop equipment, converter body and linings and blowing operation. Effect of chemical composition on the quality of steel. (D-general)

386-D. Co-operative Steel Research in France. J. Astier and L. Wahl. Journal of Metals, v. 13, June 1961, p. 411-416.

Research activity at IRSID with special reference to ore dressing and treatment of hot metal. Blast furnace, openhearth, basic bessemer operations and the OLP process. (D-general)

387-D. A New Approach to Ladle Degassing-Bottom Bubbling. J. Duflot, J. Verge and E. Spire. Journal of Metals, v. 13, June 1961, p. 417-418.

Vacuum degassing at IRSID of molten metal and steel using a bottom bubbling technique. Degree of vacuum, intensity of stirring and length of treatment determine efficiency of the process. Data are given for H, N, D and C content following treatment. (D9s)

388-D. OLP Steelmaking--Recent Studies and Industrial Progress. B. Trentini, P. Vayssiere and C. Roederer. Journal of Metals, v. 13, June 1961, p. 418-421.

Review of the OLP steelmaking process which uses powdered lime and oxygen to make steel from a hot metal containing Fe, 2.45% C, 2.65% Si and 1.35% P. Refined steel contains 0.060% C and 0.016% P. Changes in Fe, P, and C content of slag during OLP treatment. (D10)

389-D. Collecting Unburnt Gases From Oxygen Converters. M. Allard, P. Vayssiere and G. Namy. Journal of Metals, v. 13, June 1961, p. 421-424.

Refining gases consisting mostly of CO are collected without combustion during the refining of hot metal in top-blown oxygen converters using a pressure-control process which conducts the gases either to a dust-collecting system or directly to the atmosphere. Potential for recovery of gas of considerable calorific value. (D10, A8a)

390-D. America's First D-H Unit. Journal of Metals, v. 13, June 1961, p. 431.

Vacuum degassing of steel by the D-H process enables close control of temperature and favorable recovery of alloy additions such as of Si, Cr and Mn. Other advantages of the method include improvement in grain size and microcleanliness of the product and increase in tonnage process. (D9s, 1-73)

391-D. Fuel and Energy Required for the Manufacture of Steel by the Kaldo Process. Folke Johansson and Bo Kalling. Institute of Fuel, Journal, v. 34, May 1961, p. 172-176.

A heat balance for the Kaldo process with scrap cooling based on the figures of one month's operation of the 120-ton Kaldo furnace at the Sollac steel plant. This heat balance, when converted to 100% scrap cooling, shows a scrap melting capacity of 740 kg. of scrap per metric ton of hot metal corresponding to 623 kg. of hot metal per metric ton of steel. (D10b)

392-D. (German.) Deoxidation Problems in Modern Steel Production. E. Plockinger. Radex Rundschau, Jan. 1961, p. 485-491.

Relationships between refining processes and deoxidation (optional refining rate in melting special steels, vacuum melting and vacuum treating). Deoxidation and steel properties (crystallization microstructure, nonmetallic inclusions, workability, machinability, corrosion resistance, electric and magnetic properties). 9 ref. (D-general, N12, M27, P-general)

393-D. (German.) Improvement of Ingot Surface by Use of Corrugated Pastebord Lids in Casting. K. Krauskopf. Radex Rundschau, Apr. 1961, p. 543-545.

Sandy defect spots on ingot surfaces are avoided by using corrugated pasteboard lids during uphill casting of killed steel. Comparison of surface quality of ingots. (D9k)

394-D. The Electrochemical Theory of Smelting and Related Reactions. Xavier De Hemptinne, Henry Eyring and Taikyue Ree. Paper from "Physical Chemistry of Process Metallurgy". Pt. 1. v. 7. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1959, p. 65-93.

Development of a smelting theory based on the general theory of membrane diffusion of charged particles in an electric field. Results are applied to the desulphurization of Fe in which diffusion of ions is coupled with an irreversible chemical reaction. 11 ref. (D-general, D11n)

395-D. The Thermodynamics of Liquid Iron Silicates. John Lumsden. Paper from "Physical Chemistry of Process Metallurgy". Pt. 1. v. 7. Metallurgical Society of

AIME. Interscience Publishers, Inc., New York 1, 1959, p. 165-205.

Thermodynamic properties of the liquid system $FeO-Fe_2O_3-SiO_2$ and of non-stoichiometric magnetite can be well represented by a simple regular solution equation. In the model used the three cations Fe^{2+}, Fe^{3+} and Si^{4+} are distributed in a matrix of oxygen anions and the components can be formally regarded as FeO, $FeO_{1.5}$ and SiO_2. 15 ref. (D11n)

396-D. The Activity of Ferrous Oxide in the Stoichiometric $FeO-SiO_2$ System. C. Bodsworth and I. M. Davidson. Paper from "Physical Chemistry of Process Metallurgy". Pt. 1. v. 7. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1959, p. 233-244.

A statistical mechanical treatment is applied to the activity data for FeO in binary silicate melts to derive the thermodynamic behavior of the ferrous oxide. The activity shows a positive deviation from ideality at low-silica concentrations and changes to a negative deviation at higher silica contents. These effects can be attributed to the cation deficiency of the Fe-saturated phase. 8 ref. (D11n)

397-D. Statistico-Thermodynamical Studies on the Fe-O System in the Molten State. S. Takeuchi and K. J. Furukawa. Paper from "Physical Chemistry of Process Metallurgy". Pt. 1. v. 7. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1959, p. 245-262.

Equilibrium relations between slag composition and oxygen partial pressure are calculated based on a configurational model with few assumptions. Theoretical results are in good agreement with the measured values of Darken and Gurry from 1400-1600° C. over a wide range of composition and pressure. 8 ref. (D11n)

398-D. The Mixing of Silicates in Molten Slags. K. P. Abraham and F. D. Richardson. Paper from "Physical Chemistry of Process Metallurgy". Pt. 1. v. 7. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1959, p. 263-276.

Heats of formation of the solid solutions which can exist in the systems Ca SiO_3 + $FeSiO_3$ and Ca_2CiO_4 + Fe_2SiO_4 are measured by solution calorimetry. There are no structural changes over the range of solutions studied. The lattice parameter changes steadily as the larger ion of Ca replaces that of Fe. 13 ref. (D11n)

399-D. The Activities of Zinc Oxide and Ferrous Oxide in Liquid Silicate Slags. A. W. Richards and D. F. J. Thorne. Paper from "Physical Chemistry of Process Metallurgy". Pt. 1. v. 7. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1959, p. 277-291.

$FeO-CaO-SiO_2$ and $FeO-SiO_2$ melts containing 1-2% ZNO are equilibrated in Fe containers with a gas composed of Zn vapor, CO and CO_2 at 1200° C. Activity coefficients are determined at two FeO levels and various CaO/SiO_2 ratios. 10 ref. (D11n)

400-D. Activity of Carbon and Oxygen in Liquid Iron. Shiro Ban-Ya and Sachio Matoba. Paper from "Physical Chemistry of Process Metallurgy". Pt. 1. v. 7. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1959, p. 373-402.

The equilibrium of $CO-CO_2$ gas mixtures with carbon and oxygen dissolved in liquid Fe is studied in the range from dilute solution to 2.5% carbon from 1460-1760° C. Equations are derived for the relationship between the activity coefficient of carbon or oxygen and the concentration of carbon and for the free energy of solution of carbon. 26 ref. (D11h)

401-D. (Russian.) Process of Direct Reduction of Ferro-Oxides From the Molten Slag Electric Current. V. I. Orlow, O. A. Esin and P. M. Shurihin. Chernaya Metallurgiya, Nov. 1960, p. 12-19.

Experimental determination of the galvanic phenomenon in the furnace in the process of steel melting with slags containing various concentrations of FeO and gases. The electromotive force in the furnace is determined by the reduction of solid or liquid ferro-oxide. 20 ref. (D11n)

402-D. (Russian.) Desulphurization of Steel and Slag by Electric Current in an Arc Furnace. O. A. Esin, A. I. Pastukhov, S. I. Popel and S. K. Dzemian. Chernaya Metallurgiya, Nov. 1960, p. 20-26.

Influence of electric arc operating on a-c. or d-c. on the completeness and speed of steel desulphurization, intensification of desulphurization by addition of feldspar and by decreasing the thickness of the slag

layer and effect of C content and FeO on acceleration or inhibition of S reduction. 11 ref. (D5, D11n)

403-D. (Russian.) Desulphurization of Liquid Metal With the Aid of Slags in the Process of Vacuum Treatment. V. A. Chernyakov and A. M. Samarin. Chernaya Metallurgiya, Nov. 1960, p. 32-35.

Desulphurization of steel in a vacuum induction furnace by artificial slag powder made of lime (80%) and feldspar (20%). 5 ref. (D6, D11n, 1-73)

404-D. (Russian.) Segregation of Inclusions During Crystallization of Steel Ingots. L. B. Kosterev and H. N. Oiks. Chernaya Metallurgiya, Nov. 1960, p. 50-60.

Influence of atmospheric oxygen on the carbon and oxygen content in 08 and St. 3kp (rimming) steel ingots that are crystallized (cooled) in the open and in bottle-shaped molds. Determination of the carbon and oxygen concentration at the border of the liquidus and solidus phase and the distribution of oxidic and carbidic inclusions. 7 ref. (D9, 9-69)

405-D. (Czech.) Aluminium Loss During the Deoxidation of Carbon Steel. Premysl Fremunt and Karel Stransky. Slevarenstvi, v. 9, Apr. 1961, p. 126-131.

CSN 422652.1 steel containing 0.27-0.37% C, 0.30-0.50% Si, 0.60-0.91% Mn and 0.010-0.025% S is manufactured in an arc furnace with basic lining. Deoxidation by Al addition is carried out in the furnace or in the ladle before the casting of test bars to study the effect of the two different deoxidation methods on the Al loss. 23 ref. (D5c)

406-D. Oxygen in Openhearth Steelmaking. J. W. Kirkpatrick. American Iron and Steel Institute, New York, May 24, 1961, 35 p.

Development of process and oxygen roof lance practice. Data on openhearth capabilities using these practices. Economic considerations. 20 ref. (D2g)

407-D. (French.) Process Control in Iron and Steel Production. Andre Roos. Metallurgie, v. 93, Apr. 1961, p. 313-329.

Control of charging blast pressure and temperature and top gas pressure, composition and temperature during blast furnace operation. Temperature control in the basic Bessemer process by correct dosage of additions. Control of C, S, P and Mn contents in a openhearth melt. Radiographic testing of ingots. Temperature, combustion rate and pressure control during heating in a soaking pit. (D-general)

408-D. (Czech.) Manufacture of Semi-Killed Steel. Gellert Repasi. Hutnicke Listy, v. 16, Apr. 1961, p. 229-235.

Computation from the carbon content of the correct Al quantity needed for deoxidation performed in the ladle. Use of bottle-shaped ingot molds. Distribution of Al in the ingot. Mechanical properties of sheet rolled from the ingots. (D9)

409-D. (Czech.) Effect of the Sulphur Contained in the Fuel Oil on the Sulphur Content of Openhearth Steel. L. Georgiev and I. Kasik. Hutnicke Listy, v. 16, Apr. 1961, p. 236-240.

An openhearth furnace is fired with an oil containing 0.6% S or 1.7-2.6% S. Transition of S from the furnace atmosphere into the melt by radioactive tracing or statistic-mathematical methods. Effect of S in fuel oil on S content of steel. 15 ref. (D2)

410-D. (Czech.) Hydrogen Evolution After the Solidification of Steel. Jiti Vaclavinek. Hutnicke Listy, v. 16, Apr. 1961, p. 280-281.

CSN 422650 steel alloy steel with 11% Cr and 1.5% Mo, or containing 5% Mn, 18% Cr, 4% Ni and 0.2% N, and gray cast iron are cast into cylindric samples and tested for hydrogen evolution. Quantity of freed hydrogen as a function of time. Relationship between hydrogen evolved and total hydrogen contained in the metal. (D9s, D11h)

411-D. (Pamphlet.) Metallurgical Aspects of the Manufacture of Large Rimming Ingots. B. W. Bowen. 1961. 5 p. American Institute of Mining, Metallurgical and Petroleum Engineers, 29 W. 39th St., New York 18, N. Y.

Study of carbon and sulphur segregation during the processing of steel rimming ingots. A practical method of segregation control is capping with Al shots. (D9, 9-69)

412-D. The Dephosphorization of Pig Iron. G. Reginald Bashforth. Current Engineering Practice, v. 3, Mar. 1961, p. 27-30.

Pig iron is dephosphorized with minimum decarburization by holding the melt

in a cupola and introducing an oxygen lance. The melt is maintained at a temperature which will increase the exothermic dephosphorization rate while decreasing the endothermic decarburization rate. Desiliconization, also an exothermic reaction, occurs simultaneously with dephosphorization. (D11n)

413-D. High-Vacuum Induction Melting. I. S. Servi. Metals Engineering Quarterly, v. 1, May 1961, p. 103-111.

Melting, refining and alloying of steel in a vacuum induction furnace to produce up to 4500 lb. ingots of low-alloy bearing and stainless steels. Products have higher ductile to brittle transition temperatures, lower impurity content and higher fatigue strength. (D6)

414-D. Rates of Reduction of Some Iron Ores in a Fluidized Bed. H. H. Brant and W. E. Marshall. Paper from "Physical Chemistry of Process Metallurgy". Pt. 2. v. 8. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1959, p. 647-669.

Reaction rates of different Fe ores reduced by hydrogen rich gases in a small laboratory device simulating a fluidized bed. Effect of gas quantity and hydrogen content, caking and reduction characteristics of the ores on low temperature direct reduction processes. (D8j, D11, B15q)

415-D. Rate and Mechanism of the Hydrogen Reduction of Fine Hematite Ores. John B. Henderson. Paper from "Physical Chemistry of Process Metallurgy". Pt. 2. v. 8. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1959, p. 671-688.

Reduction of two high-grade Australian hematite ores by hydrogen by weighing the water evolved in the reaction and by analysis of reduction mechanisms and factors affecting the rate of reduction. Influence of temperature on reduction rate is explained by the difference in permeability to water of the reduced Fe above and below the rate maximum of 550° C. 32 ref. (D8j, D11)

416-D. Kinetics of the Carbon-Oxygen Reaction in Liquid Iron. Kichizo Niwa, Mitsuo Shimoji, Tamiya Kishida and Yukiyoshi Itoh. Paper from "Physical Chemistry of Process Metallurgy". Pt. 2. v. 8. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1959, p. 689-703.

Measurement of carbon oxidation in liquid Fe by oxygen blowing at 1550° C. Analysis of reaction mechanism and diffusion film theory. Mathematical expressions are devised for nucleation, growth and motion of carbon monoxide bubbles in liquid Fe and for reaction rates in the openhearth furnace. 13 ref. (D11r, D2g)

417-D. Analysis of Factors Affecting Temperature Drop Between Tapping and Teeming in Steelmaking. N. L. Samways, T. E. Daney, K. Li and J. Halapatz. Paper from "Physical Chemistry of Process Metallurgy". Pt. 2. v. 8. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1959, p. 1029-1063.

Bath and teeming stream temperatures measured with calibrated thermocouples on 73 openhearth and 25 basic oxygen heats covering a range of grades. Theoretical calculation of temperature drop for a range of ladle refractory temperatures and tapping, holding and teeming ties. Effects of ladle additions on temperature. Comparison of theoretical values with temperature coefficients derived from a least squares solution of linear equations relating the variables between tapping and teeming. 9 ref. (D9n, D9p, 2-61)

418-D. Vacuum Distillation of Minor Elements From Liquid Ferrous Alloys. Michel Olette. Paper from "Physical Chemistry of Process Metallurgy". Pt. 2. v. 8. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1959, p. 1065-1087.

Effect of vacuum melting on the As, Cu, Sn, Al, Si, Mn, S and P contents of Fe alloys and commercial steel. Tentative theory of distillation of minor elements out of Fe melts. Vapor pressures of several pure elements and of impurities above their dilute solution in Fe. 22 ref. (D8m)

419-D. Application of Physical Chemistry to the Basic Oxygen Steelmaking Process. A. Decker and P. Metz. Paper from "Physical Chemistry of Process Metallurgy". Pt. 2. v. 8. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1959, p. 1089-1109.

Operational procedure for basic oxygen steelmaking process with injection of powdered lime. Relationships between O

and C, O and Mn, and Fe and P_2O_5 contents of the slag and Fe content and basicity of the slag and desulphurization. 32 ref. (D2d, D2g)

420-D. Physical Chemistry of Titanium in the Blast Furnace. F. D. Delve, H. W. Meyer and H. N. Lander. Paper from "Physical Chemistry of Process Metallurgy". Pt. 2. v. 8. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1959, p. 1111-1139.

Solubility of Ti in carbon saturated Fe from 1500 and 1600° C. under neutral and nitrogen atmospheres. Characteristics of precipitated phases of TiC and Ti (C, N). Rate and manner of reduction of TiO_2 into carbon saturated Fe from silicate slag. Effects of TiO_2 on blast furnace operation. 20 ref. (D1, D11n, P12e; Fe, Ti)

421-D. Factors Affecting Dephosphorization and Desulfurization in Basic-Electric Steel Production. John Zotos. Paper from "Physical Chemistry of Process Metallurgy". Pt. 2. v. 8. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1959, p. 1229-1252.

Statistical analysis of equilibrium steelmaking data indicating that good correlation is obtained when dephosphorizing power is a logarithmic function of the product of the slag's basicity times, its oxidizing power and when the desulphurizing power is a logarithmic function of the quotient of the slag's basicity divided by its oxidizing power. Statistical analysis of slag and metal compositions obtained during the production of AISI 4140, 4325, 4330 and 1040 basic electric steels. Equations for estimating dynamic phosphorizing and desulphurizing powers of basic electric slags at any stage of a heat. 13 ref. (D5, D11n)

422-D. Some Mechanisms in the Refining of Steel. B. M. Larsen and L. O. Sordahl. Paper from "Physical Chemistry of Process Metallurgy". Pt. 2. v. 8. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1959, p. 1141-1179.

Review of experimental data and survey of thermochemical parameters for 100-lb. melts in laboratory indirect arc furnaces simulating processes in large scale furnaces including control of rate of low steady state boil in steel refining by the rate of diffusion in gas boundary film just above the top surface of the slag, influence of oxygen spray on boil rate and volatilization of sulphur, variation of nucleation and growth of carbon monoxide bubbles and slag-interface area with boil rate, and limitation on boil rate under heavy ore feeding due to rate of heat flow in slag boundary films. 10 ref. (D5, D11n, 1-54)

423-D. Sulfur Control in the Blast Furnace When Using Sinter Burdens. J. G. Sibakin, J. C. McKay and P. M. Audette. Paper from "Physical Chemistry of Process Metallurgy". Pt. 2. v. 8. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1959, p. 1183-1212.

Blast furnace operating data used to determine influence of slag composition and temperature on desulphurizing power of blast furnace slags with lime-silica ratio being judged the best approximate method for expressing slag basicity. Compositional limits are suggested for slag and for self-fluxing center. 13 ref. (D1a, D11n)

424-D. Effects of Applied Current on Desulfurization of Iron. M. Ohtani and N. A. Gokcen. Paper from "Physical Chemistry of Process Metallurgy". Pt. 2. v. 8. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1959, p. 1213-1227.

Influence of electric current on desulphurization in a system of liquid Fe and blast furnace type slag. Effects of current intensities, slag and metal composition and bubbling of carbon monoxide on the rate of desulphurization. 5 ref. (D11n, D1)

425-D. Mathematical Model for Sulfur Distribution in the Open Hearth. Gordon F. Lilly. Paper from "Physical Chemistry of Process Metallurgy". Pt. 2. v. 8. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1959, p. 1327-1355.

Mathematical model is derived relating sulphur content of low-carbon openhearth steels at tap to relevant operating variables such as slag volume, slag composition, metal weight and sulphur in the charge. Evaluation of changes in openhearth practice. 16 ref. (D2, D11n)

426-D. (Spanish.) Defects in Quality Steels and Special Steels. Pt. 2. Jeronimo Vazquez Lopez. Anales de Macanica y Electricdad, v. 37, Sept-Oct. 1960, p. 241-263.

Discussion of porosity and pipe caused by absorbed gases, pipe developing after cold rolling followed by descaling and bright annealing and inclusions caused by slags, refractories, mold sand or oxidation products. Effect of additions and composition, especially the Mn/Si ratio, on the formation of inclusions. 12 ref. (D9, 9, 2-60; ST)

427-D. New "Fluid Mold Casting" Process Improves Forging Ingots. Western Machinery and Steel World, v. 52, June 1961, p. 50-51.

Production of steel ingots using a fluid mold casting process in which floating molten slag coats the mold wall filling imperfections as the molten metal rises in the mold. Application to casting of stainless and toolsteels. (D9k)

428-D. Oxygen Roof Lancing in Open Hearth Furnaces. Pt. 3. Industrial Heating, v. 28, June 1961, p. 1140, 1142, 1148.

Lance design and cooling techniques to minimize lance failure. (To be continued.) (D2g)

429-D. Sulfur Equilibria Between Gases and Calcium Ferrite Melts. E. T. Turkdogan and L. S. Darken. Metallurgical Society of AIME, Transactions, v. 221, June 1961, p. 464-474.

Fe-Ca-O melts are equilibrated with sulphur and oxygen-bearing gases from 1290-1620° C. At oxygen partial pressures below 10^{-4} atm. the sulphide reaction occurs and at higher oxygen pressures the sulphur dissolves in the melt principally as sulphate ions. 31 ref. (D11h, D11n, P12d; Fe-b, Ca, 14-68, S)

430-D. A Thermochemical Model of the Blast Furnace. H. N. Lander, H. W. Meyer and F. D. Delve. Metallurgical Society of AIME, Transactions, v. 221, June 1961, p. 485-492.

Calculation of the changes in blast-furnace performance brought about by burden and/or blast modification using a method consisting of three simultaneous equations derived from material and heat balances. 17 ref. (D1)

431-D. Synthetic Inclusions in the FeO-MnO-MnS-SiO_2 System in Equilibrium With Resulfurized Steel. E. N. Silverman. Metallurgical Society of AIME, Transactions, v. 221, June 1961, p. 512-517.

Mixture of MnS, $2FeO.SiO_2$, $2MnO.SiO_2$, FeO and MnO are prepared synthetically and used to study the planes $2FeO.SiO_2$-$2MnO.SiO_2$-MnS, FeO-MnO-MnS, and FeO-MnO.SiO_2-MnS in the quaternary system by equilibration from 1900-2400° F. Equilibrium phase-temperature composition diagrams and solid-liquid relations are established to determine the nature of inclusions in steels and fluxing reactions and heat treatment parameters for their modification. 12 ref. (D11n, D11s, M24d, 9-69; Fe-b, 14-68)

432-D. Acid Bessemer Oxygen-Steam Process. G. M. Yocom. Metallurgical Society of AIME, Transactions, v. 221, June 1961, p. 536-539.

Blowing in acid Bessemer converters with a 50-50 mixture of oxygen-steam, combined with a dephosphorizing treatment in the steel ladle, resulting in low-carbon steels of low nitrogen (0.002%) and low phosphorous (under 0.035%) contents, which have physical properties equivalent to openhearth steels of similar analysis. (D3b)

433-D. (German.) Use of Oxygen in Openhearth Furnaces. Hans Kosmider, Herbert Neuhaus, Hans-Jurgen Langhammer and Herman Schenck. Stahl und Eisen, v. 81, May 25, 1961, p. 701-707.

Oxygen top-blowing by two lances during refining of 30-75% basic Bessemer pig iron and 70-25% scrap melts in a producer gas heated 60-ton basic openhearth furnace. Control of brown smoke formation by small lance-to-bath distance. Refining metallurgy. Efficiency. (D2g)

434-D. (German.) Heat Balance and Waste Gas Volumes of a Large Size Arc Furnace. Robert Gorgen. Stahl und Eisen, v. 81, May 25, 1961, p. 707-711.

Measurement of incoming and waste energies in establishing a heat balance during conventional melting and oxygen refining of 0.14 and 0.30% carbon steel in a 80-ton arc furnace. Waste gas volumes as influenced by oxygen. (D5b)

435-D. Modern Trends in Refractories Practice in Iron and Steel Works. H. R. Lahr. Refractories Journal, v. 37, May 1961, p. 134-144.

Review of steelmaking processes including history and design of open-hearth furnaces, oxygen procedures, use of magnesia brick and charging operations. Design and data on the Maerz-Boelens furnace, openhearth furnace substructure and blast furnaces. 5 ref. (D-general, W17g, W18r; RM-h)

436-D. Application of Oxygen to Openhearth Furnaces. A. Jackson. Refractories Journal, v. 37, May 1961, p. 146-156.

Application as an aid to combustion or directly to metal lancing. Furnace designs with emphasis on lancing in an Ajax furnace. Description of lance types. (D2g)

437-D. Blueprint for Integrated Flow Production of Steel. Engineering, v. 191, June 9, 1961, p. 805.

Layout of new Spencer Steelworks at Llanwern, England, showing relative positions of principal production and ancillary units. Description of production flow from receipt of raw materials to dispatch of finished goods. (D-general, A5)

438-D. Aspects of Predicting Blast Furnace Behavior. A. L. Hodge. Iron & Steel, v. 34, May 19, 1961, p. 232-238.

Mathematical model of blast furnace process developed from empirical and theoretical thermochemical data for programming in the electronic computer. Prediction of effects of changes in blast and burden and their relationship to heat transfer, temperature distribution, production rate and top gas composition and other variables. (D1, 17-56)

439-D. Pre-Refining of Blast-Furnace Iron and Development of the Brymbo Oxygen/Electric Steelmaking Process. Emrys Davies. Iron & Steel, v. 34, May 19, 1961, p. 253-257.

Desiliconizing and dephosphorizing hot metal for the blast furnace by injecting oxygen and lime through a water-cooled lance in a pre-refining operation. (D11h, D11n, 1-52)

440-D. Operation of the Oxygen/Steam Blown Converters at the VLN Steel Plant of the Steel Co. of Wales Ltd. M. C. Harrison and P. Truscott. Iron & Steel, v. 34, May 19, 1961, p. 258-264.

Preparation and installation of suitable tar and dolomite converter linings and bottoms. Influence of lime quality and oxygen/steam ratio on slag composition and the P, S and N content of the steel produced. Mechanical properties of the cold reduced and annealed steel. (D3, W18p; RM-h, 17-57)

441-D. (Russian.) Regulation of the Thermal System for Blast Furnaces. A. D. Gotlib. Izvestiya VUZ--Chernaya Metallurgiya, Feb. 1961, p. 10-21.

Instructions for substantial improvement in blast furnace thermal process regulation to increase output and reduce coke consumption. 9 ref. (D1)

442-D. (Russian.) Process of Hydrogen Removal From Liquid Steel When It Is Blown Through With Gases. B. A. Baum, K. T. Kurochkin and P. V. Umrikhin. Izvestiya VUZ--Chernaya Metallurgiya, Feb. 1961, p. 22-31.

The process of hydrogen transition from the liquid metal to the gas phase is described in three consecutive stages. The speed of this process is influenced by the molization speed of the hydrogen in the top layer of the metal, by the quantity of the used gas, the metal temperature and the depth to which the hydrogen gas delivery tube is inserted into the molten metal. 19 ref. (D9s)

443-D. (Russian.) The Influence of Compressed Air Blown Through the Bath on the Quality Characteristics of the Martin Scrap Process. M. Ya. Medzhibozhskii and A. K. Gurov. Izvestiya VUZ--Chernaya Metallurgiya, Feb. 1961, p. 32-38.

Melting time for a 30-ton charge, ingot quality, ferric oxide content of the slag, firebrick durability and rate of carbon removal as influenced by blowing compressed air for 15 min. through the melting bath. Data show compressed air expenditure, fuel consumption and furnace temperature distribution. 4 ref. (D-general)

444-D. (Russian.) How Much Hydrogen Does Alloyed Electric Steel Contain. E. S. Kalinnikov and I. P. Zabaluev. Izvestiya VUZ--Chernaya Metallurgiya, Feb. 1961, p. 45-50.

Effectiveness of hydrogen removal from a deoxidized electric steel which has been held in vacuum for 12 min. during pouring is compared with the same process carried out in a casting ladle. Effectiveness of vacuum treatment in the casting ladle can be

increased by more recent methods of steel deoxidation. The hydrogen content in the electric steel before the removal of the charge from the furnace is directly dependent on the air humidity, which remains practically the same during removal of the charge from the furnace to the casting ladle. Values found are for molten alloyed electric steels at approximately 1550° C. 9 ref. (D9s)

445-D. (German.) Preliminary Production Tests in Smelting of Iron Ore Pellets in the Blast Furnace. Paul Maertens and Arthur Poos. Stahl und Eisen, v. 81, June 8, 1961, p. 778-782.

Test smelting of 30-40 mm. diameter ore pellets in a blast furnace with 6.25 m. hearth diameter and of 20-25 mm. diameter pellets in a blast furnace with 8.75 m. hearth diameter, in the production of basic Bessemer pig iron. Data are given for material and heat balance. (D1a)

446-D. (German.) Material and Heat Consumption in Pig Iron Production in the Electric Furnace. Borut Marincek. Stahl und Eisen, v. 81, June 8, 1961, p. 782-787.

Material and heat balance in production of basic Bessemer, hematite and basic openhearth pig iron by the electric reduction furnace in relation to subdivision of burden into a theoretical ("pure") and a slag containing burden. Influence of scrap additions to burden on process parameters. (D5)

447-D. Vacuum-Cast Ingot--Biggest Ever Made. Iron Age, v. 187, June 29, 1961, p. 42.

Vacuum casting of a Ni-Mo-V alloy steel into a single-piece generator rotor for an 800,000 kw. steam turbine. A special mold 120 in. in diameter and 175 in. high is used for pouring. Forging into final shape is followed by heat treatment to achieve designated mechanical properties. (D9, 1-73, F22; SS, Ni, Mo, V)

448-D. (Japanese.) Gas Contents in Molten Slag. Pt. 1. Influence of Water Vapor Pressure in Air on Gas Contents in Molten Steel. Yoshihiko Abe. Tetsu-to-Hagane (Iron and Steel Institute of Japan, Journal), v. 47, May 1961, p. 693-698.

Variation of hydrogen content and total Fe oxide contents in molten basic electric furnace and openhearth slags as a function of water vapor pressure and temperature as determined by vacuum fusion analysis through heating from 1400-1500° C. 7 ref. (D11g, D11n, 2-60, 2-62)

449-D. (Japanese.) Study of Degassing From Iron-Base and Nickel-Base Alloys Containing Chromium by Vacuum-Induction Melting. Masao Kawahata and Tetsuya Watanabe. Tetsu-to-Hagane (Iron and Steel Institute of Japan, Journal), v. 47, May 1961, p. 715-720.

Investigation of the reduction of the oxygen content of melts by using hydrogen and carbon during vacuum melting. Experimental oxygen and nitrogen values are compared with predicted values for deoxidation of Fe and Ni alloys containing 0-20% Cr, including Inconel and 304 stainless, after addition of 0.30% C or impinging with dry hydrogen, with holding from 1570-1620° C. for various times. (D8m, D9s, D11r; Fe-b, Ni-b, Cr)

450-D. (Translation-Brutcher no. 5032.) Blast Furnace Control by Computers. V. Loskutov. Promyshlenaya Ekonomicheskaya Gazeta, v. 5, no. 42, 1960, p. 3.

Review of Soviet developments, general principles involved, advantages of breaking down the blast furnace process into zones using a series of computers. Automatic continuous computation of the direct-reduction coefficient. (D1, X14)

451-D. (Translation-Brutcher no. 5093.) Desulphurization of Steel and Slag in the Arc Furnace by Electric Current. O. A. Esin. Izvestiya VUZ--Chernaya Metallurgiya, Nov. 1960, p. 20-26.

Data based on 40 heats in a 1/2-ton arc furnace using direct as well as alternating current of industrial frequency. Initial and final compositions of metal and slag; variation of sulphur content in metal and slag of various heats with d-c. and a-c.; effect of slag volume; best slag composition for maximum sulphur removal into gas phase. (D5b)

452-D. (Russian.) Crystallization of Steel Under Pressure. B. B. Gulyaev, M. F. Makelski and V. O. Nazarenko. Liteinoe Proizvodstvo, Dec. 1960, p. 33-34.

Investigations of microstructure, and impact and tensile strength of 20L, 35L and IX 18N9TL steels crystallized under piston pressure of 2000-6000 kg. per. cm^2. Effect of casting pressure on mechanical and physical properties including density, plasticity, shrinkage and porosity. (D9, M27, P-general, Q-general, 3-74; ST)

453-D. (Translation-Brutcher no. 5025.) Dimensions of the High Voidage Zones in the Blast Furnace Stock Column. V. K. Gruzinov. Izvestiya VUZ--Chernaya Metallurgiya, Aug. 1958, p. 3-6.

Formation of ellipsoid zones with an increased volume of voids above the raceways in the blast furnace. Change of ellipsoid top to funnel shape under blast furnace conditions. Calculation of dimensions of high voidage ellipsoids; relation of latters' height to projection of raceways on the horizontal plane; advantage of large projections for high driving rates. (D1)

454-D. (Translation-Brutcher no. 4931.) Heat Extraction in the Secondary Cooling Zone During Continuous Casting of Steel. A. D. Akimenko and A. A. Skvortsov. Izvestiya VUZ--Chernaya Metallurgiya, July 1960, p. 54-59.

Method for calculating the quantity of steam formed from cooling water fed through sprays. Laboratory experiments giving data on nature and rate of cooling with rollers over which low pressure water is poured as against spray cooling. Data on effect of some variables on rate of heat extraction in secondary cooling, such as spacing of supporting rollers. (D9q)

455-D. (Translation-Brutcher no. 5179.) Natural Gas in the Reduction Reactions of Iron Ores in a Fluidized Bed. K. P. Lavrovskii, A. L. Rosental and A. Kh. Eglit. Izvestiya Akademii Nauk SSSR, OTN Metallurgiya i Topliva, Feb. 1961, p. 13-19.

Results of laboratory and pilot plant experiments on various ores with various Fe contents. Relation between reaction rate and time of reduction with 68% Fe hematite; catalytic and non-catalytic stages. Possibility of creating conditions precluding any sticking together of the solid particles in the bed without resort to inert additions. (D8j)

456-D. (Translation-Brutcher no. 5167.) Production of Steel Ingots Whose Pipe Welds Up in Subsequent Hot Working. G. N. Oiks and F. A. Sokolov. Izvestiya VUZ--Chernaya Metallurgiya, Mar. 1961, p. 37-39.

Proposed relatively simple and inexpensive setup for steel melted in an ordinary furnace with access of air and then run into an intermediate ladle under vacuum for deoxidation and alloying and finally poured into a mold, also under vacuum. (D9, 1-73)

457-D. (Translation-Brutcher no. 5086.) Determination of Humidity of Blast Furnace Wind. A. M. Chernyshev and A. A. Baikova. Trudy Institute Metallurgii Imeni, v. 4, 1960, p. 53-57.

Operation of blast furnaces on blast of constant humidity; fundamentals of psychrometry. Development of a new chart specifically for the determination of blast furnace humidity for blast furnaces. (D1b)

458-D. (Translation-Brutcher no. 5124.) Blast Furnace Operation on Natural Gas. M. A. Shapovalov. Metallurg, Aug. 1960, p. 4-6.

Previously abstracted from original. See item 543-D, 1960. (D1b)

459-D. (Translation-Brutcher no. 5067.) Desulphurization of Pig Iron and Steel in Vacuum. G. N. Oiks. Izvestiya VUZ--Chernaya Metallurgiya, Sept. 1960, p. 18-28.

Previously abstracted from original. See item 321-D, 1961. (D11n, 1-73)

460-D. (Translation-Brutcher no. 5081.) Oxidation of the Impurities Present in Steelmaking Baths. V. I. Yavoiskii and A. F. Vishkarev. Izvestiya VUZ--Chernaya Metallurgiya, May 1960, p. 39-48.

Previously abstracted from original. See item 459-D, 1960. (D11r)

461-D. (Translation-Brutcher no. 5121.) Increasing the Output of an Experimental Blast Furnace by Incorporating Oxygen and Carbon Monoxide Into Blast. K. Spolders and N. Wenzel. Stahl und Eisen, v. 81, Mar. 1961, p. 149-154.

Previously abstracted from original. See item 197-D, 1961. (D1h)

462-D. (Translation-Brutcher no. 5045.) Absorption and Elimination of Gases in the

Top Pouring of Heavy Forging Ingots. E. Schurmann, M. Hater and A. Fricke. Stahl und Eisen, v. 81, Mar. 1961, p. 172-183.

Previously abstracted from original. See item 200-D, 1961. (D9s, 1-73)

463-D. Quality Steel--From the Open Hearth. Machine and Tool Bluebook, v. 56, July 1961, p. 127-129.

Ladles of molten steel are degassed by repeated raising and lowering of the level of a "snorkel" extending down from a vessel overhead. Vessel pressure is reduced causing the molten metal to be pushed up the snorkel into the vessel. Steel produced is free of inclusions and voids in tonnage quantities. (D9s, 1-52)

464-D. (German.) Influence of Alloying Elements in Steel. Christian Gg. Enke. Metall-Reinigung + Vorbehandlung, v. 10, May 1961, p. 69-70.

Review of alloying elements effect in refining of steel and as factors influencing steel properties including mechanical, corrosion and working properties for additions of C, Si, P, O, N, S, Cr, Al, Mn. Role of Al, Mn and Si in deoxidation of steel. (D11, Q-general, R-general, 2-60; ST)

465-D. West of Scotland Iron and Steel Institute, Journal, v. 67, 1959-1960, 257 p.

A collection of papers and discussions on pressure vessels and brittle fracture, slag composition and influence on blast furnace practice, spectrometric instrument for steel analysis, crack propagation on mild steel, self-fluxing sinter, installation of an 80-ton electric arc melting furnace, engineering aspects of an openhearth steel plant and the production of Fe by methods other than the blast furnace. (D-general, Q26, S11a, T26q, W18s; CN, ST)

466-D. Slag Composition and Influence on Blast Furnace Practice. K. C. Sharp. Paper from "West of Scotland Iron and Steel Institute, Journal", v. 67, 1959-1960, p. 15-44.

Review of published data on composition of blast furnace slags. Burdening policy with particular reference to British practice. Influence of blast temperature, MgO content in blast furnace slag and high slag basicity on blast furnace operation. 11 ref. (D1)

467-D. (German.) Study on Kinetics of Reactions in Ferrous Extraction Metallurgy. Pt. 1. Sintering, Degassing and Reducing. Ludwig von Bogdandy. Archiv fur das Eisenhuttenwesen, v. 32, May 1961, p. 275-286.

Application of the theory of kinetics to technical processes including reactions between solids (in a heap) and gas and between liquid Fe and gas; phase boundary reactions, reduction of iron oxide by gas and of small oxide particles in a fluidized bed. Application of process parameter to blast furnace operation and modern reduction techniques without solid reducing agent. (D11, D1)

468-D. (German.) Kinetics of Reactions in Ferrous Extraction Metallurgy. Pt. 2. Evaporation and Refining. Ludwig von Bogdandy. Archiv fur das Eisenhuttenwesen, v. 32, May 1961, p. 287-296.

Kinetics of carbon refining of pig iron in Bessemer converter, openhearth furnace, L-D converter and rotor processes are discussed in terms of theories and hypotheses including drop-nucleus formation, diffusion in two-phase (liquid-to-gas bubble) material transport and formation of gas bubbles in liquids. (D-general, D11)

469-D. (German.) Investigation of Equilibria in Magnesiowustites and Magnesioferrites. Norbert G. Schmahl, Bertram Frisch and Gunter Stock. Archiv fur das Eisenhuttenwesen, v. 32, May 1961, p. 297-302.

Measurement of the isothermic decomposition equilibria of Fe_2O_3-MgO mixtures under CO/CO_2 gas from 800-1000° C. Data are given for phase equilibria in the Fe-Mg-O system and thermodynamic activities of FeO in the FeO-MgO system. (D11n, M24c, P12d; Fe-b, Mg, O)

470-D. (German.) Reactions of Manganese Containing Iron With Its Oxides in Lime Crucibles From 1600-1800° C. Wilhelm Anton Fischer and Hans-Joachim Fleischer. Archiv fur das Eisenhuttenwesen, v. 32, May 1961, p. 305-313.

Measurement of equilibrium concentrations of liquid metal (Fe-O-Mn) and liquid slag phase (FeO-MnO-CaO) in equilibrium with solid lime from 1600-1800° C. Study of phase equilibria in FeO-MnO-CaO system. Influence of CaO on deoxidation of steel by Mn. (D11n, D11r, P12d; Fe-b, Mn, O)

471-D. (Czech.) Recarburization of Gray Cast Iron in an Arc Furnace. Milan Brhel and Jan Suchanek. Slevarenstvi, v. 9, May 1961, p. 188-190.

Use of crushed graphite electrodes, petroleum coke, pitch coke or foundry coke as a carburizing agent. Manufacture of synthetic cast iron by melting and recarburizing steel scrap. Dependence of the recarburization rate on the density of the carburizing agent. (D5, 2-60; CI-n, AD-n34, 17-57)

472-D. Oxygen in Open Hearth Steelmaking. J. W. Kirkpatrik. Blast Furnace and Steel Plant, v. 49, July 1961, p. 621-632.

History and development of oxygen steelmaking. Oxygen for flame enrichment; oxygen roof lancing. Heat efficiency in roof lancing is compared to conventional practice. Economic and statistical considerations. 20 ref. (D2g)

473-D. (German.) Mathematical-Statistical Investigation of Factors Influencing Characteristic Operation Data on the Low-Shaft Furnaces at Calbe (Saale). Dieter Reimann and Hans Burger. Neue Hutte, v. 6, May 1961, p. 276-283.

Statistical evaluation of data, obtained in long-time (2 1/2 yr.) production tests, in the production of pig iron from domestic ores using low-grade coke. Correlations between coke consumption, burden recovery, blast temperature, blast humidity and coke composition. 17 ref. (D8n)

474-D. Vacuum Casting of Steel. J. Levaux and L. Hannon. Vacuum, v. 10, Dec. 1960, p. 435-443.

Evaluation of degassing effects on the hydrogen content and the number of oxidized inclusions, elongation, reduction in area crack susceptibility and impact strength of vacuum cast forging ingots. (D9s, 1-73, Q-general, 2-60; ST)

475-D. Improving Steel Quality by Casting of Ingots Under Argon. M. F. Hoffman, P. G. Bailey and R. L. W. Holmes. Industrial Heating, v. 28, July 1961, p. 1321-1324, 1326.

Technique and equipment used in mold purging and teem stream protection by argon during casting. Inclusion ratings, gas analysis and conditioning requirements of argon cast ingots. (D9, 2-66; ST, 9-69)

476-D. Some Features of Basic Oxygen Steelmaking With Basic Hot Blast Cupolas. E. R. Richards. Industrial Heating, v. 28, July 1961, p. 1328, 1330, 1334, 1336, 1396.

Method of producing low-sulphur steel from Fe and steel scrap and pig iron with a reducing basic slag in the cupola and an oxidizing basic slag in the oxygen furnace. Design and operation of the cupolas and furnace. Composition analysis of the hot metal and cupola slag. (D10, 1-65)

477-D. (Russian.) Diagram of Elements Affinity to Oxygen and Its Application for Thermodynamic Investigations of Reducing Processes in a Blast Furnace. A. A. Sigov and V. A. Shurkhal. Izvestiya VUZ--Chernaya Metallurgiya, Apr. 1961, p. 15-25.

Formulas and diagrams for metallurgical reactions during blast furnace operations including affinity to oxygen of the involved elements, their chemical composition, interaction and stability, their thermodynamic reactions during the reducing process and their influence on the chemical composition of the slag. 5 ref. (D1b)

478-D. (Russian.) Experiments on Direct Production of Iron From Ores in a Boiling Layer. N. N. Dobrokhotov, K. E. Makhorin and O. S. Nichiporenko. Izvestiya VUZ--Chernaya Metallurgiya, Apr. 1961, p. 26-30.

Fe ores are heated to the boiling point in a reducing preheated steam or methane atmosphere. Effect of temperature, quality and size of the ores and quantity and quality of the gas. (D8j)

479-D. (Russian.) Thermal Experiment for Regulating Conditions in a Blast Furnace on the Basis of Gas Analysis. A. D. Gotlib, P. G. Goncharov, V. E. Levchenko, A. A. Himmelfarb, V. P. Pevtsov and A. M. Lapa. Izvestiya VUZ--Chernaya Metallurgiya, Apr. 1961, p. 31-37.

Determination of whether the CO_2, CO and H content in a blast furnace gas reflects a true picture of the Fe reduction process inside the furnace. Quantity and quality of ore and coke in the furnace, nature and content of the added Fe scrap, additional oxygen and

natural gas added to the compressed air and moisture content of the limestone and air are considered in terms of effects on thermal balance. (D1)

480-D. (Russian.) Influence of Manganese on the Speed of Desulphurization of Low-Carbon Iron. A. S. Tumarev and A. Kh. Urazgil'deev. Izvestiya VUZ--Chernaya Metallurgiya, Apr. 1961, p. 38-45.

Alloy containing Fe and Mn in various proportions is desulphurized in basic Martin slags of different compositions. 10 ref. (D11n, 2-60; Fe-b, Mn)

481-D. (Russian.) Changing Hydrogen Content in the Molten Metal During Melting in a Martin Furnace. D. Ya. Povolotskii. Izvestiya VUZ--Chernaya Metallurgiya, Apr. 1961, p. 46-52.

Investigation of the process of hydrogen removal from the molten metal bath of a basic Martin furnace into the furnace atmosphere together with CO bubbles and of the hydrogen re-entry into the molten metal through the slag as dependent on the original hydrogen content of the ore, scrap Fe, heating material and air. 16 ref. (D2a)

482-D. (Russian.) Study of the Viscosity of Sour Slags for Melting Electric Steels. A. I. Kholodov and V. S. Ignat'ev. Izvestiya VUZ--Chernaya Metallurgiya, Apr. 1961, p. 53-58.

Influence of SiO_2 and CaO on the viscosity of a slag at different temperatures during melting of electric steel in an arc furnace with acid refractory. Influence of SiO_2 on viscosity at 1515, 1550 and 1580° C.; influence of CaO at 1530, 1550 and 1570° C. (D5a, P10f, 2-60, 2-61; RM-q)

483-D. (Russian.) Influence of Discharge Slag on the Contamination of Steel With Nonmetallic Inclusions. P. M. Danilov and L. N. Karachentseva. Izvestiya VUZ--Chernaya Metallurgiya, Apr. 1961, p. 59-66.

Investigation of cast, forged and rolled ball bearing steel. Slag is made radioactive by an oxide of Ca^{45} to study the quantity and nature of the inclusions. 8 ref. (D11n; ST, SGA-c, 9-69)

484-D. (Russian.) Influence of Charge Weight on the Productivity of Martin Furnaces. V. K. Gorin. Izvestiya VUZ--Chernaya Metallurgiya, Apr. 1961, p. 162-166.

Investigation of the possibility of increasing the productivity of Martin furnaces 33-77% by doubling the weight of the charge and creating the right proportion between length, width and depth of the melting bath. 7 ref. (D2a)

485-D. (Russian.) Technical-Economical Considerations of Martin Furnace Operation When Different Intensifiers Are Used in the Melting Process. I. A. Medvedev, I. I. Kobilyakov, N. A. Nareiko and Yu. G. Dubina. Izvestiya VUZ--Chernaya Metallurgiya, Apr. 1961, p. 192-198.

Advisability of using oxygen and superheated steam (330-350° C.) for melting in the Martin furnaces taking in consideration the increase in output, economy in fuel, metal and overhead, reduction in initial cost of new furnaces and utilization of the byproducts of the oxygen producing plants. (D2a, D2g)

486-D. Electric Furnace or Cupola Basic Oxygen Converter for the Nonintegrated Steel Plant. D. A. Sutch and H. C. Manley. Iron and Steel Engineer, v. 38, July 1961, p. 101-107.

Comparison of the two processes in terms of rate of operations, flexibility, operational cost, quality of raw materials, product range and the ability to integrate existing facilities. (D5, D10c)

487-D. Cupola Metal Increases Open Hearth Production. Wilt H. Steinheider. Iron and Steel Engineer, v. 38, July 1961, p. 108-111.

Improvement of cold charge shop operation by addition of hot cupola metal. Metal is tapped from the cupola at 2750° F. and delivered to the furnaces at 2500° F. Details of cupola construction and desulphurization. (D2a)

488-D. (Pamphlet.) The British Steel Castings Research Assoc. Eighth Annual Report. 1961. 37 p. British Steel Castings Research Assoc., 5 East Bank Rd., Sheffield 2, England.

A review of research during the year covering steelmaking, deoxidation, desulphurization, molding and coremaking and heat treating, cleaning and

testing of castings. (D-general, D9, E-general, 10-54; ST)

489-D. Vacuum Steelmaking. A. M. Samarin. Iron and Steel Institute, Journal, v. 198, June 1961, p. 131-141.

Conditions for melting and pouring steel under vacuum pressures are discussed with the kinetics of the process. The deoxidizing power of carbon in vacuum is determined by holding liquid Fe with different carbon content at 1590° C. Decarbonization and desulphurization of stainless steel scrap is accomplished by remelting in a vacuum induction furnace. 17 ref. (D8m, D6, D11, 1-73)

490-D. Vacuum Casting of Steel at Steel, Peech & Tozer. Metal Treatment and Drop Forging, v. 28, July 1961, p. 296.

Vacuum casting of steel in commercial quantities. Process facilitates hydrogen removal and lowers carbon, sulphur and oxygen content. Transverse and impact properties and ductility. Equipment and sequence of operations. (D9, 1-73, 1-52, Q7, Q23; ST)

491-D. (French.) Steelmaking by the OLP Process. B. Trentini. Technique Moderne, v. 53, May 1961, p. 177-182.

Cast iron containing 0.1-2.1% phosphorus is refined in a converter with basic lining by top blowing with an oxygen/powdered-lime mixture. A steel containing approximately 0.06% C, 0.32% Mn, 0.02% P, 0.01% S and 0.0015% N is obtained after ferromanganese addition. Data are given for elastic limit, tensile strength, elongation and hardness in the cold rolled state. (D10c, Q-general, 2-60; ST)

492-D. (German.) Operation of Electric Furnaces for Steel Melting From the Viewpoint of Electrotechniques. W. Bettzieche. VDE-Fachberichte, v. 21, 1960, p. 46-50.

Power requirements and characteristic electrical data for melting of steel charges in electric furnaces as influenced by line current and disturbances in power line. (D5)

493-D. (German.) Several Research Results in Deoxidation of Metal Melts. A. M. Samarin. Monatsberichte der Deutschen Akademie der Wissenschaften zu Berlin, v. 2, June 1960, p. 375-385.

Thermodynamics of oxygen solutions in liquid metals, especially Fe. Influence of alloying elements on solubility of oxygen. Application to deoxidation of liquid metal melts. (D11r, 2-60, P12e; Fe, 14-60, O)

494-D. H-Iron Passes the "Acid Test". Iron Age, v. 188, Aug. 3, 1961, p. 78-79

Description of pilot plant operations during production of metallic Fe by reducing Fe ore with hydrogen gas. The H and Fe ore react in a series of four fluid beds at 850° F. and a pressure of 440 psi. (D8j)

495-D. (Italian.) Electrical Furnace Pig Iron in Italy. P. Nigri and G. Moga. Fonderia Italiana, v. 10, May 1961, p. 153-160.

Electric and blast furnace operations are compared in terms of tonnage requirements, capital investment and flexibility, both in starting and stopping the process and in production of various grades of pig iron and ferroalloys. (D5, D1, W-general)

496-D. (German.) The Metallurgy of Free Cutting Steel. Technica, v. 10, June 23, 1961, p. 865-866.

Review of technological parameters in production and processing of rolled, forged, drawn and heat treated free cutting steel (9 S 20, 9 SPb 23, 10 S 20, 9 SMn 23, 9 MnPb 23, 15 S 20, 22 S 20, 35 S 20, 45 S 20 and 60 S 20 steels) such as control of converter temperature, casting rate, deoxidation, composition and heat treatment. Data are given for mechanical properties and microstructure. (D-general, F-general, J-general, P-general, Q-general; SGA-k, AY)

497-D. (Russian.) Effect of Method for Hot Metal Delivery on Disintegration of Continuous Ingots by Hot Cracks. E. A. Iodko. Izvestiya VUZ--Chernaya Metallurgiya, Dec. 1960, p. 31-38.

Supply of metal for continuous casting of steel ingots is studied. Location and number of pouring spouts, entrance angle of metal, carbon content and pouring temperature are observed to affect the number and length of cracks. Skin formation and skin erosion are also investigated. (D9q, 1-52, 9-72)

498-D. (Russian.) Continuous Oxidation of Pig Iron Elements. V. V. Revenko and K. V. Demykin. Izvestiya VUZ--Chernaya Metallurgiya, Dec. 1960, p. 39-45.

Directing a jet of oxygen to hit a falling stream of molten Fe in a converter designer so that top and bottom blowing can be effected separately and/or together. The method of blowing and the height of the metal stream are observed to affect the composition of the metal. (D11r, D3b)

499-D. (Russian.) Manufacture of Manganese Alloys From Usinsk Manganese Ores. A. D. Kramarov, N. V. Tolstoguzov, E. Ya. Zarvin, V. P. Timmerman, A. M. Levin and A. K. Gurov. Izvestiya VUZ--Chernaya Metallurgiya, Dec. 1960, p. 46-54.

Laboratory electric furnace smelting of Mn ores containing 19.9-42.5% Mn. Composition of metal and slag, distribution of Mn between metal and slag and basicity depend upon ore composition and flux. Parameter governing design and operation of a production furnace. (D5, 1-53, 17-55; Mn-b)

500-D. (Russian.) Utilization of Silicon-Manganese From Usinsk Ores for Reduction of Steel. E. Ya. Zarvin, A. D, Kramarov, N. V. Tolstoguzov, G. K. Gurov, A. M. Levin and V. P. Timmerman. Izvestiya VUZ-Chernaya Metallurgiya, Dec. 1960, p. 55-62.

Openhearth refining using Si-Mn (62.1% Mn, 15.4% Si, 0.51% P) as reducing agent, indicating P content and loss of reducing agent as functions of reducing time and methods. The same factors are indicated as affecting O, N and H content. (D2a, D11; AD, Mn-b, Si, 17-57)

501-D. (Russian.) Technical Production Indicators for Openhearth Furnaces. M. A. Glinkov. Izvestiya VUZ--Chernaya Metallurgiya, Dec. 1960, p. 135-138.

Parameters are established for the evaluation of openhearth furnace efficiency. Tonnage capacity, hearth area and various other factors are considered. 4 ref. (D2)

502-D. (Russian.) Technical Production Indicators of Openhearth Furnaces. I. D. Semikin. Izvestiya VUZ--Chernaya Metallurgiya, Dec. 1960, p. 139-145.

Discussion of technical factors affecting openhearth furnace operations including heat utilization, heat losses, thermal smelting requirements and the thermal power of the furnace. Heat dissipation per ton of steel and furnace construction are also examined. 4 ref. (D2)

503-D. (Russian.) Automation of Hot Handling in an Openhearth Furnace. V. G. Antipin. Izvestiya VUZ--Chernaya Metallurgiya, Dec. 1960, p. 146-150.

Automation of openhearth furnace operations is analyzed in reference to heat and nature of charge. Temperature control depends on heat of additions, losses and charge composition, namely the relative amount of scrap, ore or pig iron. (D2, S16, 18-74)

504-D. (Russian.) Effect of Hydrogen in Steels on the Economics of Metallurgical Production. N. A. Shriro. Izvestiya VUZ--Chernaya Metallurgiya, Dec. 1960, p. 166-172.

Effect of hydrogen in steel and moisture content in air during smelting on plasticity and flaking tendency of steels. Methods of reducing hydrogen in liquid steels. Dependence of hydrogen content on temperature control, ingot and ladle cleanliness and pouring practice. 18 ref. (D9s, N15e, Q23, 3-69)

505-D. (Russian.) Slag Practice in the Refining of Steel in Top Blown Oxygen Converters. S. D. Gagin. Izvestiya VUZ--Chernaya Metallurgiya, Dec. 1960, p. 173-182.

Converting of Fe containing 0.6-0.9% Si, 1.4-1.7% Mn, 0.1% P, and 0.05-0.07% S. Slag and metal composition depends on time. P content determined by temperature, amount CaO used, slag basicity and FeO concentration in slag. Effect of lance height above slag on slag oxidation and on amount of FeO. 5 ref. (D3b, D11)

506-D. Degassing Unit Processes Steel in Vacuum. Tool and Manufacturing Engineer, v. 47, Aug. 1961, p. 54-56.

Ladles of molten steel are degassed by drawing molten metal through a suction nozzle into an evacuated vessel, releasing the degassed metal back into the ladle and repeating the operation until the desired degree of gas removal is achieved. The process also permits the addition of alloying elements under vacuum. (D9s, D9r, 1-73)

507-D. (Italian.) Free Way to the Molten Cast Iron by an Air Drill. Giacomo Storace. Fonderia, v. 10, June 1961, p. 250.

Blast furnace charging and air drilling of a taphole in the crucible to give a free way to the molten metal. (D1a)

508-D. (Czech.) Semi-Killed Steel. J. Uricar. Hutnicke Listy, v. 16, Feb. 1961, p. 88-94.

Openhearth steelmaking including deoxidation by FeMn additions in the furnace and FeSi additions in the ladle. Tapping temperature is 1620-1680° C. and casting temperature is 1450-1490° C. Macrostructure and sulphur segregation. 15 ref. (D2, M27; ST-k, 9-69)

509-D. (Czech.) Effect of the Cleanness of Ceramic Pouring Systems on the Micropurity of Railroad Wheel Tire Steel. Pt. 2. Theodor Myslivec, Josef Cadek, Miroslav Mandl, Jaroslav Vrsek, I. Brodsky and M. Lubovsky. Hutnicke Listy, v. 16, Feb. 1961, p. 94-102.

Influence of pouring system cleanness and material used on quantity of FeO, MnO, SiO_2, Al_2O_3 and CaO inclusions in the steel. The inclusions are traced by Ca^{45} isotope. 20 ref. (D9p, T23; ST, 9-69)

510-D. (Czech.) Tin Plate Steel Manufactured in an Experimental Oxygen Blown Converter. Josef Teindl, Augustin Havlik and Zdenko Zdenek. Hutnicke Listy, v. 16, Feb. 1961, p. 103-107.

A charge of 7000 kg. openhearth Fe, 200 kg. scrap, 7.65% lime 1.65% scale and 0.07% bauxite is refined with an oxygen consumption of 75 cu. in. per ton of raw Fe. The steel, which contains 0.04% C, 0.020-0.021% Mn, 0.03-0.04% Si, 0.038-0.039% P, 0.03% S, 0.015% Cu and 0.006-0.007% N, is rolled and Sn plated. Ingot, rolling and tinning defects. 16 ref. (D3, F23, L17; ST, 9)

511-D. (Russian.) Production of Ingots With Self-Sealing Pipe. G. N. Oiks and G. A. Sokolov. Izvestiya VUZ--Chernaya Metallurgiya, Mar. 1961, p. 37-39.

A method of using special molds for casting ingots without double degassing, either in vacuum or in a neutral atmosphere. The process decreases nonmetallic inclusions and avoids the necessity to cut off a part of the ingot on account of defective shrinkage. The expenditure for all materials is reduced. (D9k, D9s, 1-73, 9-67)

512-D. (Russian.) Regulation of the Combustion in Martin Furnaces Judging by the Oxygen Content. Yu. N. Tuluevskii, A. A. Dobrokhotov, S. I. Akhmanaev and E. P. Chistova. Izvestiya VUZ--Chernaya Metallurgiya, Mar. 1961, p. 184-191.

Regulating 340 ton openhearth furnace in order to obtain optimum efficiency by controlling the composition of the heating material and combustion. Air-gas mixtures, gas evolution from the melt. 10 ref. (D2, D11j)

513-D. Iron Production in Current Development. W. H. Dennis. Mining Magazine, v. 105, July 1961, p. 13-18.

Review of nonblast furnace methods of direct reduction of Fe ore. Design, operation, size and conversion efficiency of the Krupp-Renn, R-N, Strategic-Udy, Wiberg-Soderfors, Electrometall and fluidized and fixed bed reactor furnace systems. Grade and composition of the ore and of the metal or sponge iron produced. (D8j)

514-D. Thermal Analysis of the Iron Blast Furnace Process. H. N. Lander. News in Engineering, v. 33, July 1961, p. 21-27.

A thermochemical model and graphical heat balance methods are described with applications for the prediction of steady-state performance under various operating conditions and for the development of procedures for analyzing the kinetic behavior of the process. 11 ref. (D11k, 17-56)

515-D. Pressure Pouring Tested in Full Scale Slab Molds. Steel, v. 149, Aug. 7, 1961, p. 74, 76.

Production of carbon and stainless steel slabs 14 ft. long, 3 1/2 ft. wide and 5 in. thick using a direct casting technique in which air pressure forces the molten steel upward through a ceramic tube and into a semipermanent

graphite mold. (D9p, 3-74; CN, SS, 4-52)

516-D. (Ukranian) Modification of Magnesium Cast Iron. A. V. Chornoval. Dopovidi Akademii Nauk Ukrainskoi RSR, Feb. 1961, p. 183-186.

Addition of FeSi or CaSi to prevent chilling during solidification of castings. Effect on overcooling, graphite inclusions and free cementite content. 8 ref. (D9r, N12, 2-60; CI, Mg)

517-D. Open Hearth Furnace Research. Australian Mechanical Engineering, v. 48, July 5, 1961, p. 33-37.

Use of small-scale clear plastic models which reproduce gas flow features of full-scale unit at room temperature to provide data for modifications of design of regeneration. (D2, 1-53, 17-51, 17-56)

518-D. Experimental Smelting of Utah and Wyoming Iron Ores. Nick Derick and J. P. Riott. U. S. Bureau of Mines, Report of Investigations 5817, 1961.

Replacing part of a burden of Utah iron ore with pellets produced from Atlantic City Wyoming concentrates and substituting a high quality Eastern coke (Fairless) for Utah coke in order to increase maximum wind rate in the blast furnace. (D1a; Fe, RM-n, RM-j43)

519-D. (Spanish.) Use of Oxygen and Powdered Lime in Steelmaking. E. Trentini, P. Vayssiere, J. Francais and M. Allard. Instituto del Hierro y del Acero, v. 14, Jan.-Mar. 1961, p. 263-274.

Refining by top blowing oxygen containing powdered lime in a converter or an openhearth furnace, or by lancing the oxygen-lime suspension into the openhearth bath. Desiliconization, dephosphorization and decarbonization. 12 ref. (D10, D11n)

520-D. (Spanish.) Use of Low Frequency Induction Furnaces in the Manufacture of Highly Homogeneous and Pure Metals. Luis Maria Ojeda Segur. Instituto del Hierro y del Acero, v. 14, Jan.-Mar. 1961, p. 275-280.

Elimination of micro-impurities by induction heating during the melting or alloying process carried out in the induction furnace. Theories of the heating process. (D6)

521-D. A Survey of Oxygen Steelmaking. Donald Garmonsway. New Scientist, v. 11, July 20, 1961, p. 153-155.

Various techniques are based on the principle of the Bessemer converter in which oxygen enters the molten iron either through nozzles inserted in the base of the vessel or through a water cooled pipe or lance from above. Oxygen is also used in the conventional openhearth process. (D10)

522-D. Sulphur Is Captured in Slag. Demag Courier, v. 3, June 30, 1961, p. 3.

Design and operation of a shaker ladle used to desulphurize molten pig iron by shaking and thoroughly mixing quicklime powder or calcium carbide with the molten metal to produce pig iron in a quality previously unachievable. (D11n, 1-52; AD-a)

523-D. Vacuum Melting Makes More Perfect Metals. Union Carbide Metals Review, v. 4, Summer 1961, p. 2-5.

Use of vacuum in an induction furnace during melting and pouring in arc melting of an electrode formed in pure air or in a vacuum induction furnace and in pouring air-melted metal into a mold (vacuum degassing) improves ductility, impact strength, fatigue strength and tensile, rupture and magnetic properties of various steels, superalloys and refractory metals. (D8m, D9s, C5m, C25, P16, Q-general; ST, SGA-h, EG-d37)

524-D. Alloy Quality Versus Steel Quality. E. R. Saunders, W. D. Forgeng and J. W. Farrell. Union Carbide Metals Review, v. 4, Summer 1961, p. 22-24.

Effects of inclusions in alloy additives on inclusions in steel. Cleanliness of the ferroalloys has no measurable effect on quality of steels because inclusions in the additives separate rapidly from the bath. Alloy additives influence inclusion formation by changing the solubility relationships of oxygen and sulphur. (D-general, 3-69; ST, 9-69)

525-D. (German.) Summarizing Presentation of Equilibria Between Iron and Lime-Containing Phosphate Slags. Gerhard Tromel, Wolfdietrich Fix and Hans Werner Fritze. Archiv fur das Eisenhuttenwesen, v. 32, June 1961, p. 353-359.

Establishment of phase equilibria in the quaternary system Fe-FeO-CaO-P_2O_5 by measuring metal-slag equilibria in P_2O_5-containing lime crucibles at temperatures from 1550-1675° C. Microstructure investigation and chemical analysis of equilibrated phases. (D11n, M27, S11; RM-q)

526-D. (Translation-Brutcher no. 4926.) Continuous Blowing of Hot Metal in Runner With Oxygen. V. A. Fuklev. Izvestiya VUZ--Chernaya Metallurgiya, July 1960, p. 60-67.

Promise of continuous oxygen blowing of liquid pig irons in runners, a practice in line with other continuous metallurgical processes and a more complete suppression of brown fumes. Development of a special runner design to eliminate many of the current shortcomings. Optimum depth of penetration of oxygen jets, enabling calculation of the number of lances required and the quantity of oxygen needed. (D8n)

527-D. (Translation-Brutcher no. 5105.) Rate of Flow Granular Materials From an Opening and the Shape of the High-Permeability Zone. B. S. Fialkov and V. K. Gruzinov. Izvestiya VUZ--Chernaya Metallurgiya, Dec. 1960, p. 17-22.

Similarity of laws obeyed by the movement of the blast furnace stock column with special reference to the fusion zone and the coke combustion zone at the tuyeres and the movement of granular materials when they are let out through the opening. Change in pressure at tuyere level as function of charge-column height; stages in the formation and collapse of arches as recorded by cinematography. (D1)

528-D. (Translation-Brutcher no. 5177.) Equipment for Vacuum Degassing of Steel. I. Mydlarz. Problemy Projektowe, Feb. 1960, p. 53-59.

Two vacuum degassing plants designed according to the Bochumer-Verein principle. Data on volumes of gas to be drawn off at various pouring rates and vacua design details of vacuum tank seals. (D9s, 1-52, 1-73)

529-D. (Translation-Brutcher no. 5108.) Mechanism of Longitudinal Cracking on Surface of Continuous Cast Billets. Y. Aketa and K. Ushijima. Tetsu-to-Hagane (Iron and Steel Institute of Japan, Journal), v. 46, 1960, p. 1733-1740.

Process of solidification and stress development in square-section continuous cast billets in mold. Relation between mold wall and billet shell; stress state in this connection; equation for stresses. Effect of shape of mold corners, uniformity of cooling, especially of billet sides, casting temperature and casting speed upon longitudinal surface cracking. (D9q; ST, 9-72)

530-D. (Translation-Brutcher no. 5154.) Effect of Deoxidation With a Mn-Si-Al Alloy on Quantity and Composition of Oxide Inclusions in Steel. Yu. T. Foryst, V. A. Mchedlishvili and A. M. Samarin. Trudy Institute Metallurgii, v v. 5, 1960, p. 22-35.

Quantities of oxide inclusions as related to the different deoxidizer alloys and the size of the inclusions. Al/Si ratio in Mn-Si-Al deoxidizer alloy raised from 0.01 to 0.025, with constant Mn-Si ratio, in presence of large amounts of oxygen and effect on inclusion content; significance of Mn/Si ratio. Data on effect of increased Mn/Si ratios on oxide inclusion content. Explanation of harmful effect of deoxidation of steel bath with Al alone, additionally to use of complex deoxidizers. (D11r; AD-r31, 9-69)

531-D. (Translation-Brutcher no. 5134.) Kinetics of Direct Oxidation of Impurities in Liquid Iron. S. I. Filippov and S. Z. Martynov. Izvestiya VUZ--Chernaya Metallurgiya, Jan. 1961, p. 5-11.

Laboratory study of rates of oxidation of various elements dissolved in liquid iron at different rates of feed of gaseous oxidizing agents. Gaseous oxidizing agents include argon + oxygen; carbon dioxide data on their utilization coefficient under various conditions. (D11r)

532-D. (Translation-Brutcher no. 5088.) Reactions in Rotary Steelmaking Vessels With Oxygen Top Blowing. P. E. Hardt, G. Vocke and H. Schenck. Stahl und Eisen, v. 81, Mar. 1961, p. 155-163.

Previously abstracted. See item 198-D, 1961. (D2g)

533-D. (Translation-Brutcher no. 5089.) On the Metallurgy of the "Phoenix Lancing" Process. E. Schurmann, K. K. Aschendorff, H. Hofges and E. Kohler. Stahl und Eisen, v. 81, Mar. 1961, p. 163-172.

Previously abstracted. See item 199-D, 1961. (D3)

534-D. (Translation-Brutcher no. 5110.) Production of Lime-Containing Sinter and Its Smelting, With Special Reference to Sulphur Removal From Sinter and Pig Iron. B. Weilandt and F. Kruse. Stahl und Eisen, v. 81, May 1961, p. 295-302.

Previously abstracted. See item 262-D, 1961. (D11n)

535-D. (English.) Research on the Activity of Components in Iron Blast Furnace Slag. Pt. 3. Measurement of the Activity of Silica and Alumina in the $CaO-MgO-SiO_2-Al_2O_3$ System. Koji Sanbongi and Yasuo Omori. Tohoku University, Science Reports of the Research Institutes, v. 13, June 1961, p. 174-182.

Effect of MgO on the activity of SiO_2 and Al_2O_2 in the slag of $CaO-SiO_2-Al_2O_3$ is measured by the emf. method of double cell. 6 ref. (D11n, P12b; RM-q)

536-D. Hydrogen Reduction Advantages Shown. Steel, v. 149, Aug. 14, 1961, p. 158-159.

Pulverized Fe ore is reduced by hydrogen in a series of four fluid beds at 850° F. and a pressure of 440 psi. The briquettes obtained after passivation are suitable for use in electric furnaces. (D8, 2-61, 3-74, H14, R10c; Fe, 17-57)

537-D. Steelmaking Processes. Frederick C. Langenberg. Metals Review, v. 34, Aug. 1961, p. 17-18.

Review of steelmaking techniques and equipment. Design and operation of the Kaldo converter, L-D converter, Rotor furnace and openhearth furnace. Vacuum degassing and continuous casting of steel. (D-general, 1-52)

538-D. Vacuum Melting--Bigger Ingots for Bigger Markets. C. L. Kobrin. Iron Age, v. 188, Aug. 17, 1961, p. 93-94.

Increased production of vacuum melted ingots composed of low and high alloy steels by a consumable electrode furnace for ingots up to 60 in. in diameter with a weight of 80,000 lbs. (D8m)

539-D. (Japanese) Gas Content of Molten Steel Just Before Tapping. Pt. 2. Influence of Water-Vapor Pressure in Air on Gas Contents in Molten Steel. Yoshishiko Abe. Tetsu-to-Hagane (Iron and Steel Institute of Japan, Journal), v. 47, July, 1961, p. 902-907.

Distribution and equilibrium relations of oxygen and hydrogen in the molten steel and the $CaO-SiO_2$ slag of baths in basic electric are furnaces during melting in air from 1560-1624° C. 16 ref. (D11h, D5)

540-D. (Russian.) Reactions of Carbon and Oxygen in Liquid Iron. A. Yu. Polyakov, A. M. Samarin and Syui Tszen-Tszi. Izvestiya Akademii Nauk SSSR, Otdelenie Tekhnicheskikh Nauk, Metallurgiya i Toplivo, Jan. 1961, p. 3-9.

Temperature dependence of carbon and oxygen activity for various concentrations. Oxygen solubility as a function of carbon concentration, pressure and temperature. 15 ref. (D11g, 2-60, 2-61, 3-74; C, O)

541-D. (Russian.) Distribution of Dissolved Admixtures in Rimming Steel, Over the Ingot Volume. D. E. Temkin. Izvestiya Akademii Nauk SSSR, Otdelenie Tekhnicheskikh Nauk, Metallurgiya i Toplivo, Jan. 1961, p. 10-14.

Computation of the concentration of carbon and other elements based on their diffusion coefficient, ingot diameter and distances from the ingot surface and the crystallization front. Solidified-shell thickness and crystallization speed as functions of time. (D11s, N12, 3-67; ST-d)

542-D. (Russian.) Effect of Preparation and Composition of Slag Forming Substances on Dephosphorization of Steel. S. I. Lebedev and A. E. Khlebnikov. Izvestiya Akademii Nauk SSSR, Otdelenie Tekhnicheskikh Nauk, Metallurgiya i Toplivo, Jan. 1961, p. 20-23.

Electrolytic Fe containing 1.9% P is melted in a laboratory furnace and treated at 1600° C. by addition of Fe ore,

lime, scale and bauxite in the granulated, compacted or sintered state. Temperature of additions and dephosphorizing power. 6 ref. (D11n, 2-60)

543-D. (Russian.) Generation of Vibrations in Molten Metals. I. I. Teumin. Izvestiya Akademii Nauk SSSR, Otdelenie Tekhnicheskikh Nau, Metallurgiya i Toplivo, Jan. 1961, p. 24-30.

Vibrations at frequencies of 1000-10,000 cps. are introduced to the top or bottom of the solidifying ingot or to the melt in a special ladle prior to casting to influence crystallization and thus mechanical and technological properties. (D9k, D9m, N12, Q-general; 14-60)

544-D. (Russian.) Reduction of Roasted Pellets Manufactured From Concentrates, by Gases. G. V. Gubin, V. I. Karmazin and G. D. Shkovyra. Izvestiya Akademii Nauk SSSR, Otdelenie Tekhnicheskikh Nauk, Metallurgiya i Toplivo, Jan. 1961, p. 147-149.

Reduction of Fe concentrates at 600-1000° C. in a stream of CO, H, humid or dry natural gas. Reducibility and reduction velocity as functions of temperature and time. It is found that the reduction power of natural gas at 1000° C. is comparable with that of CO gas. (D-general)

545-D. (Russian.) Reduction of Iron Ores Containing Organic Substances. N. A. Vasyutinskii and S. K. Gregnev. Izvestiya Akademii Nauk SSSR, Otdelenie Tekhnicheskikh Nauk, Metallurgiya i Toplivo, Jan. 1961, p. 149-151.

Ores containing organic carbon or carbon + siderite are heated in closed 1Kh18N9T steel tubes and held at 600-900° C. for 1 hr. Partial reduction to magnetite by the natural carbon and siderite admixtures acting as reducing agents is achieved. Effect of temperature. 4 ref. (D-general)

546-D. Melting in the Electron Beam Furnace. G. Ogiermann. Vacuum, v. 10, Dec. 1960, p. 454-465.

Description of the furnace unit, melting technique and practice and metallurgical aspects of the process. Block diagram of electronic control. Capacity of the furnaces with ring cathode arrangement as a function of melting temperature and mold diameter. (D8p, C5k, W18)

547-D. Operation of the Oxygen/Steam Blown Converters at the VLN Steel Plant of the Steel Company of Wales Ltd. M. C. Harrison and P. Truscott. Iron and Steel Institute, Journal, v. 198, Aug. 1961, p. 341-352.

Application of a double slag process using bottom-blown converters for making low-carbon, deep drawing steel from a high phosphorus iron. Lining and bottom making practice are reviewed with plant design and operation. (D3f)

548-D. Desulphurization of Induction Melted Plain Carbon and Low Alloy Steels. Charles H. Lumpp, Jr. American Institute of Mining Metallurgical and Petroleum Engineers, Preprint, Nov. 30-Dec. 2, 1960, 5 p.

Method for sulphur removal and maintenance of specific sulphur levels in induction melted steel using a burnt lime and fluorspar basic slag. Description of the induction furnaces and furnace lining practice. 4 ref. (D11n, D6)

549-D. Casting Procedures for Ferroalloys. H. W. Rathmann. American Institute of Mining, Metallurgical and Petroleum Engineers, Preprint, Nov. 30-Dec. 2, 1960, 6 p.

Technological parameters and application of casting methods for ferroalloys including solidification-in-place; bare metal casting in sand beds, in graphite molds and in cast iron molds; pig machine casting and casting through slag. (D9)

550-D. Effect of Vacuum Degassing on Steel Quality. A. L. Lehman. American Institute of Mining, Metallurgical and Petroleum Engineers, Preprint, Nov. 30-Dec. 2, 1960, 10 p.

Review of the metallurgical advantages of vacuum degassing such as average removal of 63% of the hydrogen, uniform cross sectional distribution of hydrogen and improved ductility in aged and unaged Ni-V-Mo forgings. Design and operation of the vacuum degassing equipment. (D9s, 1-52, 1-73, Q-general, 2-60; AY)

551-D. Optimum Desulphurization and Dephosphorization of Steels in Air Induction Furnaces. John Zotos and David A. Colling. American Institute of Mining, Metallurgical, and Petroleum Engineers, Preprint, Nov. 30-Dec. 2, 1960, 6 p.

Desulphurization of steel by refining a highly deoxidized steel bath under a basic, fluid slag and by inoculation with Co-base alloys and dephosphorization by processing a highly oxidized steel bath under a highly basic, oxidizing slag. Two expressions are derived for the dynamic dephosphorizing and desulphurization powers existing during the production of steel as a function of the slag parameters. 7 ref. (D11n, D11s D6)

552-D. More Pig Iron for Less Coke--Coal Injection and Oil Firing. British Steelmaker, v. 27, Aug. 1961, p. 261.

Production of pig iron by techniques which replace up to 30% coke with milled coal for auotmatic injection into blast furnaces through lances a placed usually in tuyeres. An alternative and competitive technique is an oil firing system intended to reduce coke consumption. (D1; SI-a, RM-k, RM-j)

553-D. (German.) Blast Furnace Smelting Tests With Lime Coke. Paul Huttemann and Robert Mintrop. Stahl und Eisen, v. 81, Aug. 3, 1961, p. 1041-1047.

Test melting of lime coke (8% lime) in a blast furnace of 800 tons per day (basic Bessemer pig iron) capacity. Investigation of smelting metallurgy with emphasis on metal slag composition and desulphurization reaction. (D1, D11)

554-D. (German.) Increase of Production of Openhearth Furnaces by Investigation of Gas Flow. Hans-Jurgen Darmann, Alfred Esch and Heinz Moller. Stahl und Eisen, v. 81, Aug. 3, 1961, p. 1057-1062.

Investigation of gas-flow pattern by pressure measurement and computation. Increase of heat efficiency and production and improvement of refractory wear by structural changes which improve gas flow. (D2h)

555-D. Vacuum Degassing of 500 Lb. Melts for Carbon Steel Castings. D. E. Parsons. American Institute of Mining, Metallurgical and Petroleum Engineers, Preprint, Nov. 30-Dec. 2, 1960. 34 p.

The effect of vacuum spray casting and of vacuum ladle degassing of melts of 0.30% carbon steel is studied by comparison of 12 x 12 x 4 in. slab castings, made from degassed and nondegassed metal, after sectioning and heat treatment of 6 x 6 x 4 in. samples. Data are tabulated for reduction in gas content, change in macrostructure, gas porosity, tensile ductility, impact strength and fatigue notch sensitivity. (D8s, 1-73, Q-general, 2-60; CN-g)

556-D. Refractories for the New Steelmaking Processes. Pt. 2. J. H. Chesters. Refractories Journal, v. 37, July 1961, p. 200-204.

Evaluation of refractories in oxygen-blown openhearth, Ajax furnaces, large arc furnaces, stram-oxygen converters and oxygen-converter processes. Factor influencing life and performance of refractories are reviewed in terms of the changing pattern of steelmaking (i. e., the increased use of oxygen) 14 ref. (D-general, W18, W17; RM-h, 17-57)

557-D. Fuel and Energy Requirements for Some Possible Future Steelmelting Processes. M. W. Thring. Institute of Fuel, Journal, v. 34, July 1961, p. 272-274.

Processes discussed in terms of fuel consumption include counterflow steelmelting, with details of a German application; pneumatic steelmaking, in which waste gases are utilized for the preheating of the next charge; flexible hot metal, cold scrap processes, using both oxygen blowing and fuel firing; and electric arc furnace steelmaking. (D-general, 10-51, 10-53)

558-D. (German.) Temperature Profile and Reaction Kinetics in the Blast Furnace. Gerhard Hegnert and Kurt Hedden. Chemie-Ingenieur-Technik, v. 33, July 1961, p. 469-478.

Measurement of temperature distribution and gas composition in a basic Bessemer pig iron blast furnace by probe tests and analysis of reaction pattern and reaction kinetics. Investigation of coke consumption as influenced by coke reactivity. (D1, D11j, D11k)

559-D. (German.) Continuous Casting of Alloy Steels. B. Tarmann. Radex Rundschau, Mar. 1961, p. 579-589.

Review of technology for continuous casting of tool, stainless and wear resistant Mn steels in terms of casting plant design; properties and defects of continuous castings such as microstructure, mechanical properties, shrink holes and longitudinal and vertical cracks; and cost analysis and technical index. (D9q, 10-54)

560-D. The D-H (Degassing and Alloying) Process. Walter L. Finlay and Charles D. Preusch. Blast Furnace and Steel Plant, v. 49, Sept. 1961, p. 867-877.

Intermediate between the conventional steel vacuum depassing process and vacuum induction melting process, it controls the interstitial compound-forming elements C, H_2, O_2 and N_2 by vacuum removal as gases without oxidation or slag interaction. (D9s, 1-52, 1-73)

561-D. New Trends and Ideas in Operation and Design of Open Hearth Furnaces. Stephen Wortman. Blast Furnace and Steel Plant, v. 49, Sept. 1961, 878-889, 893.

Firing rates are increased by atomizing liquid fuels with natural gas using combustion oxygen, oxygen lancing and adding carbon. Production is alternatively increased by using oxygen-gas roof burners, all basic openhearth furnaces and newly designed roofs, slag pockets, downtakes and checker chambers. (D2, 1-52, 10-54, 17-51, 17-57)

562-D. (German.) Gas Passage Through Burden in the Upper Part of the Blast Furnace. Eugen Peetz and Gerhard Winzer. Stahl und Eisen, v. 81, Aug. 17, 1961, p. 1101-1107.

Test charging of sintered blast furnace burden and measurement of gas flow rate on a model representing the upper part of a blast furnace shaft (natural size). Establishment of gas passage profiles as influenced by burdening technique, (i. e. distance between bell and wall of furnace shaft and pouring height). (D1a)

563-D. (German.) Means of Increasing Refining Rate in Oxygen Top Blowing (Rapid Refining). Hans Kosmider, Herbert Neuhaus, Max Wirth and Hermann Schenck. Stahl und Eisen, v. 81, Aug. 17, 1961, p. 1107-1116.

Test refining by oxygen top blowing of acid and basic Bessemer pig iron in a 2-ton pilot converter with and without additional stirring using rock lime for slag formation and scrap and ore for cooling. Investigation of refining kinetics. (D3f)

564-D. Argon Atmosphere Teeming Upgrades Premium Steels. Steel, v. 149, Sept. 11, 1961, p. 110, 112.

Die steels, alloy steels and superalloys teemed in argon atmospheres possess improved mechanical properties and cleanliness as compared with those teemed in air. (D9p, Q-general, 2-60; ST, SGA-h)

565-D. Influence of Cold-Reduction and Heat-Treatment Combinations on Hydrogen Solubility and Permeability in Steel. R. M. Hudson, K. J. Riedy and G. L. Stragand. Corrosion, v. 17, July 1961, p. 86-88.

The direct relation of cold reduction on hydrogen solubility is shown to persist through subsequent heat treatment and later cold reductions. Hydrogen permeability increases with cold reduction to a limit (below 30% reduction for initial hot rolled steel), after which the permeability is inversely related. Tests also confirm that the maximum value of hydrogen desorption rate in water and in dry nitrogen at 38° C. occurs below 30% reduction. (D11h, J2, 1-64; ST)

566-D. Vacuum Casting of Steel. Metallurgia, v. 64, July 1961, p. 26.

Equipment, sequence of operations and properties of the produced steel with particular reference to hydrogen, oxygen, carbon and sulphur contents, ductility, transverse properties, impact properties and transition temperature. (D9, 1-52, 1-73, Q-general; ST)

567-D. Making, Working and Testing of Steel. Metallurgia, v. 64, July 1961, p. 31-36.

Review of pilot projects carried out at the Sheffield Station of the British Iron and Steel Research Assoc. including spray refining of blast furnace metal, degassing of molten steel, electric steelmaking, continuous casting, forging production, wire drawing, manufacture of sheet and strip, manufacture of rounds and sections, mechanical and physical properties and analytical techniques. (D-general, A9j, F-general, P-general, Q-general, S11; ST)

568-D. (Japanese.) Teeming in Protective Atmosphere. Pt. 2. Studies on Nonmetallic Inclusions, Especially Sand Marks in Steel. Zenichiro Takao, Kiichi Narita, Kazuo Kanda and Atusi Miyamoto. Tetsu-To-Hagane (Iron and Steel Institute of Japan, Journal), v. 47, Aug. 1961, p. 1156-1162.

Effects of teeming 1030, 1040 and SCM21 steel melts in air, nitrogen and argon on nature and amount of oxide inclusions, oxidation rates, occurrence of sand marks during deformation and recovery of Al acting as

the deoxidizer and austenite grain refining agent. (D9p)

569-D. Metalworking's Technological Explosion--Steelmaking. Pt. 3. C. L. Kobrin. Iron Age, v. 188, Sept. 14, 1961, p. 169-176.

Survey of direct reduction, oxygen blowing, vacuum arc melting, continuous casting, sinter and fuel injection and vacuum degassing methods in steelmaking. (D-general, 10-54)

570-D. (German.) Ingot Top Heating (Hot Top Techniques). Pt. 1. Survey on Techniques and Theoretical Basis. Karl-Ludwig Kiesel and Peter Schulz. Neue Hutte, v. 6, July 1961, p. 391-399.

Techniques include heating by gas-oxygen mixture. Use of exothermic reactants added after casting or applied as a lining in ingot top; and electrical heating including the Kellogg Hot Top Technique. Theoretic investigation of heat flow. (D9, D11k, 10-54; ST)

571-D. Pneumatic Steel Processes Replace Old Open Hearths. Steel, v. 149, Sept. 25, 1961, p. 150, 153.

Comparison of L-D, Demag, Rotor, Kaldo and oxygen processes with openhearth furnaces with regard to amount and quality of output. (D10, D2, 1-52)

572-D. (German.) Reducibility of Several Egyptian Iron Ores. Hermann Schenck, Hans-Peter Schulz and Raouf Radwan. Archiv fur das Eisenhuttenwesen, v. 32, July 1961, p. 431-436.

Isothermal reduction tests of Fe ore specimens (cubes) of varying Fe and gangue content, using Co and CO/CO_2 mixtures as reducing agents, at 800-1100° C. Investigation of hydrate and carbonate decomposition by differential thermal analysis. (D-general)

573-D. (German.) Equilibria Between Carbon, Oxygen and the Metals Chromium and Manganese in Oxygen Refining in the Basic Arc Furnace as Influenced by Temperatures. Pt. 1. Chromium. Kurt Tesche. Archiv fur das Eisenhuttenwesen, v. 32, July 1961, p. 437-450.

Oxygen test refining of steel (1.25-12.5% Cr, 2.5-12.5% Mn) in a 300 kg. arc furnace under a lime-fluorspar slag. Investigation of Cr distribution as influenced by temperature, FeO and slag basicity. (D5, D11, 2-60, 2-61)

574-D. (German.) Kinetics of Deoxidation of Liquid Iron. Ludwig von Bogandy, Wolfgang Meyer and Iwan N. Stranski. Archiv fur des Eisenhuttenwesen, v. 32, July 1961, p. 451-460.

Measurement of nucleus formation and growth in deoxidation of laboratory melts by Zr and Fe-Zr alloys in a carbon-tube resistance furnace under Ar protective atmosphere. Study of dissolution rate of deoxidants. (D11r, D5)

575-D. Developments in Iron and Steelmaking. Australian Mechanical Engineering, v. 49, Aug. 5, 1961, p. 38-44.

Topics include the use of pellets or sinter as blast furnace charge; factors influencing blast furnace productivity; and description of the direct reduction process and of various oxygen processes. (D-general, 10-54)

576-D. (German.) Influence of Ionization on Degassing in Electron Beam Melting. Paul Muller. Zeitschrift fur Metallkunde, v. 52, July 1961, p. 488-491.

Estimation of the effect of ionization of gases in electron beam melting on the tendency of electric breakdown and on the degassing effect on the melted metal. (D8, D9s, D11g)

577-D. (Translation-Brutcher no. 4943.) On the Lining of Basic Oxygen Furnaces. S. Maehara and T. Kohtani. Tetsu-To-Hagane (Iron and Steel Institute of Japan), v. 45, Sept. 1959, p. 957-959.

Improvements in the lining of 50-ton basic oxygen furnaces in Japan, principally based on use of burnt and of tar-bonded dolomite bricks; as against imported magnesite brick. Physical properties and chemistry of refractories; details on three lining practices (D10a; RM-h)

578-D. (Translation-Brutcher no. 4947.) Basic Oxygen L-D Furnace Operated on High Hot Metal Charges. S. Maehara, T. Kohtani and K. Tagiri. Tetsu-To-Hagane (Iron and Steel Institute of Japan), v. 45, Sept. 1959, p. 959-961.

Possibility of adjusting the additions of lime, millscale, limestone and ore without inviting slopping as the holding capacity of the L-D oxygen furnace goes up in the course of the campaign. Cooling efficiencies of millscale, linestone

and Fe ore compared with that of steel scrap. (D10a)

579-D. (Translation-Brutcher no. 5117.) Behavior of Hydrogen in Basic Arc Furnace Steel Bath During Oxidizing Stage. S. Nagata Tetsu-To-Hagane (Iron and Steel Institute of Japan), v. 45, Sept. 1959, p. 966-967.

Study of hydrogen content in oxygen-blown basic arc furnace steel heats as affected by limestone or burnt lime added during blowing or between blowing and slag-off. (D5)

580-D. (Translation-Brutcher no. 5069.) Krupp-Renn Process Granules and Sponge Iron as Coolants in the Basic Oxygen L-D Process. E. Plockinger and K. Borowski. Technische Mitteilungen Krupp, v. 18, Jan. 1960, p. 1-8.

Previously abstracted. See item 177-D, 1961. (D10a)

581-D. (Translation-Brutcher no. 5074.) Special Features of High Pressure Treatment of Liquid Steel. P. N. Bidulya and K. N. Smirnova. Izvestiya VUZ-Chernaya Metallurgiya, Sept. 1960, p. 43-49.

Previously abstracted. See item 324-D, 1961. (D9, 3-74)

582-D. (Translation-Brutcher no. 5051.) New Developments Concerning the L-D (Basic Oxygen) Process. R. Rinesch. Berg und Huttenmannische Monatshefte, v. 105, Nov. 1960, p. 302-313.

Previously abstracted. See item 126-D, 1961. (D10a)

583-D. (Translation-Brutcher no. 5247.) Operating Results of the New Tobata Basic Oxygen. Y. Mitarashi and S. Morita. Tetsu-To-Hagane (Iron and Steel Institute of Japan), v. 46, Oct. 1960, p. 1180-1182.

Report on a new Japanese L-D basic oxygen plant put into operation in Sept. 1959. Data on ladle life, hot metal ratio and composition; charge to tap time; lining life; mold consumption; breakdown of heat time; temperature control; refractories consumption; breakdown on repair times, hourly furnace production, downtimes and ingot production for the first seven months of operation. (D10a)

584-D. (Translation-Brutcher no. 5149.) Hydrogen Problem in Alloy Steels From the Electric Furnace. E. S. Kalinnikov and I. P. Zavaluev. Izvestiya VUZ--Chernaya Metallurgiya, Feb. 1961, p. 45-50.

Previously abstracted. See item 444-D, 1961. (D9s)

585-D. (Translation-Brutcher no. 5109.) Reactions in Rotary Steelmaking Vessels With Oxygen Top Blowing. Pt. 2. P. E. Hardt, G. Vocke and H. Schenck. Stahl und Eisen, v. 81, no. 5, 1961, p. 311-320.

Previously abstracted. See item 263-D, 1961. (D10c)

586-D. (Translation-Brutcher no. 5193.) Preliminary Smelting Trials of Iron Ore Pellets in the Blast Furnace. P. Maertens and A. Poos. Stahl und Eisen, v. 81, no. 12, 1961, p. 778-782.

Previously abstracted. See item 445-D, 1961. (D1a)

587-D. (French.) Application of Vacuum Bubbling to Degassing of Metals in Ladle. J. Verge, J. Duflot, E. Spire and M. Michaud. Revue de Metallurgie, v.58, June 1961, p. 465-482.

Fe or steel held in a ladle in a low vacuum is treated with a current of inert gas bubbles, substantially dehydrogenating the metal with a 50% reduction of C and O content and an absence of renitriding even in the case of N bubbling. 15 ref. (D9s, 1-73)

588-D. (French.) Continuous Casting of Steel at the British Iron and Steel Research Assoc. and the Centre National de Recherches Metallurgiques. G. Fenton, G. Littlewood and J. Zaeytydt. Revue de Metallurgie, v. 58, June 1961, p. 483-487.

Parameters governing choice of molds for continuous casting of low-carbon, killed and rimming steel. Influence of cooling methods on quality and surface properties of ingots. 14 ref. (D9q, J2; ST, 5-59)

589-D. Vacuum Deoxidation of Steel for Large Ingots. George E. Danner and G. Taylor. Paper from "Vacuum Metallurgy Conference, Transactions, 1960". Interscience Publishers, Inc., New York 1, 1961, p. 225-233.

Deoxidation of electric furnace steel for large forging ingots, using vacuum stream degassing facilities, resulting in reduction of inclusion content and distribution, improved ingotism and

greater soundness and cleanness of castings. Comparison with vacuum stream degassed and air cast steels by ultrasonic testing and metallographic methods. (D9s, 1-73, M-general, Q-general, 9-69; ST-f)

590-D. Argon Teeming of Degassed Steel. William Wilson. Paper from "Vacuum Metallurgy Conference, Transactions, 1960". Interscience Publishers, Inc. New York 1, 1961, p. 235-241.

Forging ingots of 4340 steel and Cr-Ni-Mo die steel are teemed in argon atmospheres from vacuum degassed electric furnace melts with subsequent heat treatment, forging, surface finishing, ultrasonic and mechanical testing, magnetic particle inspection and macrostructure examination. Gas pickup and cleanliness are evaluated and structure surface and mechanical properties including ductility and forgeability are compared to air cast specimens. (D9p, D9s, M28, Q-general, 9-69; ST)

591-D. The D-H Vacuum Process for Molten Steel. P. J. Wooding and W. Sieckmann. Paper from "Vacuum Metallurgy Conference, Transactions, 1960". Interscience Publishers Inc., New York 1, 1961, p. 243-252.

Thermochemical parameters and operating principles for vacuum degassing of steel by the D-H process in which atmospheric pressure is used to force successive portions of the molten metal up through a refractory-line nozzle into the treatment vessel. Application to low and medium carbon, killed and semikilled and stainless steel. Effect of cyclic variation of the nozzle immersion depth, time and temperature of treatment and vacuum surface area of the melt on gaseous H, O and N removal, impurity reduction and CO evolution. 8 ref. (D9s, D11, 2-60, 3-69)

592-D. Specify Vacuum-Processed Steel for Forgings That Will Not Fail. H. R. Daniels. Metalworking, v. 17, Oct. 1961, p. 69-71.

Steels and alloys for forgings and die block produced by vacuum metallurgy techniques including consumable electrode arc melting, induction melting, castings, teeming and degassing (with particular reference to the D-H process). Effect of vacuum refining and alloying on composition and mechanical properties, particularly fatigue. Examples for application to H-11 tool, 52100, 8620, 4340 and carbon steels. (D8m, D9, 1-73, F22, 17-52; ST)

593-D. Oxygen Teams Up With Fuel to Hike Iron Output. C. L. Kobrin. Iron Age, v. 188, Oct. 5, 1961, p. 69-71.

Oxygen is added to natural gas and oil for injection through tuyeres in blast furnace operations. Coke replacement and production are influenced. (D1h, 1-52; RM-m)

594-D. The Burning Question in Blast Furnaces. Steelways, v. 17, Sept. 1961, p. 21-24.

Utilization of natural gas or fuel oil to supplement coke in steelmaking processes in terms of economic factors including equipment maintenance and operational factors including blast furnace temperatures. (D1b; RM-j43, RM-k30, RM-m35)

595-D. Recent Developments in Pig Iron Blast Furnace Construction--Raw Materials and Practice. Donal M. Morrison. Mines Magazine, v. 51, Sept. 1961, p. 25-26, 34.

Developments in blast furnace design and operation including use of moisture in the blast, of blast temperatures up to 2000° F., of supplementary hydrocarbon fuels injected at the tuyeres and of pelletizing as a means of upgrading low-grade ores. (D1, B16b; RM-k, RM-n, NM-b)

596-D. Ore Cooling in the Basic Oxygen Steelmaking Process. Jack Worsman. Paper from "Regional Technical Meetings, 1960". American Iron and Steel Institute, New York, 17, 1961, p. 271-278.

Use of a magnetite ore as a scrap replacement during steelmaking is evaluated as to yield, blow and bath temperature, blowing time, oxygen consumption and slopping. (D10, 1-65)

597-D. Practical Applications of a Thermochemical Model of a Blast Furnace. H. S. Turner. Paper from "Regional Technical Meetings, 1960". American Iron and Steel Institute, New York 17, 1961, p. 371-391.

Analysis of thermal balance and combustion and slag-metal reactions

using a thermochemical model. Effects of burden and blast modifications. 9 ref. (D11, D1, 17-56)

598-D. New Steelmaking Processes. Australasian Manufacturer, v. 46, Aug. 12, 1961, p. 48-50.

Oxygen enrichment techniques including L-D (Linz-Donawitz), P-R (Phoenix-Rheinrohr), lime additive and rotor processes are studied as they affect composition and dephosphorization. The production of oxygen-blown and basic Bessemer steel is compared in terms of European practice. (D10, D11, 10-54)

599-D. (French.) Metallothermic Steelmaking Process. Journal du Four Electrique, v. 66, May 1961, p. 151-152.

Use of a metallic reducing reagent instead of coke. Fe ore is mixed with a fuel obtained by the reduction of waste products, containing 40-50% Si, approx. 25% Al, 15-20% Fe and some Ti and C and charged to a furnace after limestone addition. A steel containing 0.01-0.04% C and less than 0.01% Si is obtained. (D8)

600-D. (French.) Continuous Casting of Steel. Journal du Four Electrique, v. 66, 1961, p. 171-172.

Casting of 1 ton of steel per min. into four billets. After leaving the mold, surface solidification has taken place and the cast billet is guided by rollers into water cooled chambers where it is cooled by a mist of water sprayed on the surface. The casting speed varies between 0.5 and 2.5 m. per min. Billets of 115-200 mm. square section and 2.40-4 m. length are obtained. (D9q, 1-52)

601-D. Process Kinetics of Oxygen Steelmaking. W. O. Philbrook. Journal of Metals, v. 13, Sept. 1961, p. 613-620.

Chemical principles, jet and lance mechanisms and process reactions including oxygen absorption, carbon boil, slag-metal mixing, phosphorus elimination, sulphur reduction and process control. 19 ref. (D10, D11)

602-D. Basic Oxygen Steelmaking in Colorado. George Grosvenor. Journal of Metals, v. 13, Sept. 1961, p. 621-624.

Plant layout and operations and equipment including charging, teeming and storage facilities. Technical indexes given for heats, timing, output, charges and chemical analysis of steel and Fe. (D10, 1-52, 1-65, 18-67)

603-D. Cleveland Receives Basic Oxygen Steelmaking. J. A. Glasgow. Journal of Metals, v. 13, Sept. 1961, p. 625-627.

Installation, design data and operating procedures including hot charging, teeming and ingot handling and use of precipitators, computers and water cooling system for a two-furnace 200-ton per hr. facility. (D10, 1-52, 1-65, 18-57)

604-D. Great Lakes' Basic Oxygen Furnaces. R. B. Morgan. Journal of Metals, v. 13, Sept. 1961, p. 628-630.

Plant layout, functions and facilities including scrap handling and charging, teeming and ingot handling and gas and fume control. (D10, 1-52, 1-65, 18-67)

605-D. Sharon Steel's Kaldo Furnaces. R. N. Merk and D. R. Berg. Journal of Metals, v. 13, Sept. 1961, p. 635-637.

Installation, design data, operating procedures and plant layout for a Kaldo basic oxygen steelmaking two-furnace facility. Comparative technical indexes are given for this and other Kaldo units using hot metals of high and low phosphorous content. (D10b, 1-52, 1-65, 18-67)

606-D. Sweden's Second Kaldo Plant. Carl Sebardt. Journal of Metals, v. 13, Sept. 1961, p. 638-640.

Review of development of the Kaldo oxygen furnace process with attention to design and installation of an integrated plant at Oxelosund for producing low-phosphorus steel. Survey of changing and operational procedures with data for technical index. (D10b, 1-52, 1-65, 10-54, 18-67)

607-D. (German.) Equilibria Between Carbon, Oxygen and the Metals Chromium and Manganese as Influenced by Oxygen Refining in the Basic Arc Furnace. Pt. 2. Manganese. Kurt Tesche. Archiv fur das Eisenhuttenwesen, v. 32, Aug. 1961, p. 503-508.

Equilibria in steel and slag obtained during oxygen refining of production melts are given in terms of "apparent equilibrium constants" and discussed as functions of temperature (1550-1750° C.), basicity of slag and concentration of steel. (D11n, 2-60, 2-61; Cr, Mn)

608-D. (German.) Determination of Activity of Manganous Oxide in Liquid Manganous Oxide-Silica Slags at 1550° C. Hermann Schenck, Martin G. Frohberg and Tarek El Gammal. Archiv fur das Eisenhuttenwesen, v. 32, Aug. 1961, p. 509-511.

Measurement of Mn distribution between liquid MnO-SiO_2 slags and carbon-saturated iron at 1550° C. Evaluation of interaction parameter of C on Mn and computation of activity of MnO in slag. (D11n; Mn)

609-D. Silicomanganese Helps Produce Cleaner Steels. Steel, v. 149, Oct. 9, 1961, p. 126, 129.

Blocking the heat in furnace before tapping using silicomanganese which penetrates the slag and dissolves at the slag-metal interface, yielding Si and Mn for effective deoxidation and reduction of slag to metal transfer. (D11n, D11r; ST, Si, Mn)

610-D. Better Steel Ingots by New Casting Process. Machinery Lloyd (Overseas Edition), v. 33, Sept. 16, 1961, p. 45-46.

High-speed steel is cast into molds which have inner exothermic linings, making a homogeneous ingot having a structure free from heavy central carbide segregation. (D9k, 1-52; TS-m)

611-D. (Russian.) Reduction of Oxygen in Arc Vacuum Melting of Special Steels. H. N. Okorokov, A. Y. Koliakov and A. M. Samarin. Izvestia Akademii Nauk SSSR--Metallurgiya i Toplivo, Mar. 1961, p. 3-9.

Deoxidation and purification from nonmetallic inclusions by surface concentration, by elimination of O in the form of CO and by flotation with the aid of ascending gas bubbles. Effect of physical characteristics of inclusions and of boiling intensity on oxygen reduction. 8 ref. (D8m, D11r, 1-52; ST)

612-D. (Russian.) Phase Composition of Openhearth and Synthetic Phosphate Slags. A. V. Rudneva and I. Y. Kozhevnikov. Izvestiya Akademmi Nauk SSSR--Metallurgiya i Toplivo, Mar. 1961, p. 10-16.

Synthetic phosphate slag is obtained by melting constituents in an induction furnace to determine its crystal structure. Data are given for saturation of phosphate slags with P_2O_2 to dephosphorize Fe. 5 ref. (D11n, M26)

613-D. (Russian.) Investigation of Viscosity of Synthetic and Natural Slags of Silico-Chromium Nature. N. L. Zhilo. Izvestiya Akademii Nauk SSSR--Metallurgiya i Toplivo, Mar. 1961, p. 17-24.

Synthesis of $MgO-Al_2O_3-SiO_2$ slag in proportions resembling the ratio of Si-Cr slag and study of its viscosity from 1450-1675° C. to determine the effect of temperature and of silicon-carbide inclusions. 8 ref. (D11n)

614-D. (Russian.) Viscosity of $CaO-SiO_2$-CaS Slags. A. S. Panov, I. S. Kulikov and L. M. Zylev. Izvestiya Akademii Nauk SSSR--Metallurgiya i Toplivo, Mar. 1961, p. 25-30.

Petrographic and viscosimetric analysis of $CaO-SiO_2$-CaS slag with $CaO-SiO_2$ ratio constant and CaS content variable. Solidus and liquidus temperatures are determined. 14 ref. (D11n, N12)

615-D. The Ajax Furnace and Process. A. Jackson. NML (National Metallurgical Laboratory) Technical Journal, v. 3, May 1961, p. 7-12.

Technological parameters for equipment and operation of oxygen lance process for the production of steel from phosphoric pig iron. (D10, 1-52)

616-D. (French.) Vacuum Techniques. Leon Moreau. Industrie Nationale, Feb. 1961, p. 35-47.

Vacuum treatment of steel and resultant carbon and oxygen contents as functions of the partial pressure of CO contained in the gas phase above the melt surface with hydrogren and nitrogen contents varying with the temperature and partial pressures. Vacuum arc melting of Ti and Zr sponges. (D8m, C5h, 1-73; ST, Ti, Zr)

617-D. (German.) Conversion of 30-Ton Openhearth Furnaces From Producer Gas to Natural Gas-Oil Heating. E. Pink, O. Krifka and A. Schoberl. Radex Rundschau, no. 4, Aug. 1961, p. 647-656.

Production tests in melting of unalloyed and alloyed steels with 0.02-1.5% C, 0-1.8% Cr and 0-4% Ni from solid metal (70% scrap, 30% pig iron) using various burner and furnace designs. Output and refining rate are measured as influenced by flow rate of fuel jet. Improved heat transfer by installation of burner in furnace roof. (D2h, 1-53; ST, RM-k30, RM-m35, RM-m36)

618-D. Future Trends in Iron and Steel-Making. A. K. Gupta. Tisco (Tata Iron & Steel Co., Journal), v. 8, Oct. 1961, p. 220-229.

Technological developments in blast, low shaft and electric furnaces, cupola, converter, open-hearth and oxygen steelmaking processes to overcome difficulty of inferior raw materials and higher production costs. 25 ref. (D-general, 10-54)

619-D. (German.) Trends of Development in Ferrous Extraction Metallurgy. Bernhard Knapp. Gluckauf, v. 97, July 19, 1961, p. 886-888.

Review of the use of pure O, H and CO and of vacuum processes in refining, smelting, continuous casting and rolling of steel. (D-general, 10-54)

620-D. (German.) Injection of Reducing Agents Through the Tuyeres of a Blast Furnace. Alfred Decker. Stahl und Eisen, v. 81, Sept. 14, 1961, p. 1264-1270.

Methods derived from experimentation to increase efficiency and blast temperature of blast and low-shaft furnaces by injection of water vapor and hydrocarbons (light oil or methane) into tuyeres and by oxygen enrichment of blast. (D1h, 1-52; EG-q, NM-b, 17-57)

621-D. (German.) Hot Blowing of Basic Bessemer Converters After Relining and Bottom Change Using the Bottom Burner Technique. Alfred Latour and Leo Heinen. Stahl und Eisen, v. 81, Sept. 14, 1961, p. 1270-1274.

Conventional converter drying by wood coke firing or gas or oil heating. Development of a technique in which a gas-air-oxygen mixture is fed through the converter bottom using the bottom as burner. (D3f, 1-65)

622-D. (German.) Investigation of Material Properties of Foamed Slag. Walther Kayser. Stahl und Eisen, v. 81, Sept. 14, 1961, p. 1288-1292.

Measurement of grain strength of foamed slag of varying chemical composition by crushing tests of the Hummel type and by wear testing by the Los Angeles method. Development of a significant measure to assess the quality of foamed slag. (D11n, 1-53; RM-q)

623-D. (German.) Study of Reactions of Phosphorus in Iron Alloys. Pt. 2. Siegfried Bohmer. Bergakademie, v. 13, June 1961, p. 399-406.

Review of literature on reactions of phosphorus with slag and metal in refining of pig iron in the puddle furnace, basic openhearth furnace and in the Bessemer process. Decarburization and dephosphorization curves in conventional and oxygen refining. (D11, 10-54; Fe-b, P)

624-D. The Design of Electric Reduction Furnaces for Ferro-Alloy Production. J. J. Coetzee. South African Institute of Mining and Metallurgy, Journal, v. 61, July 1961, p. 541-559.

Application of continuous self-baking electrode to ferroalloy furnaces with special reference to the baking process and the conduction of large electric currents to the electrode. (D5, T1f)

625-D. The Kaldo Process. P. A. Young. Iron & Steel, v. 34, Oct. 1, 1961, p. 455-462.

Review of oxygen steelmaking process using a vessel with a high rotational speed and a low pressure lance. Included are graphical analyses of changes in operating conditions during the production of low, medium and high-carbon steel and a comparison of oxygen steelmaking processes. 12 ref. (D10b, 1-52, 10-54)

626-D. As-Cast Cast Iron Compact Graphite. R. W. Heine and T. W. Mueller. Modern Castings, v. 40, Oct. 1961, p. 103-109.

Effect of additions to the melt and variations in base composition of the Fe on the production of compact graphite in the as-cast structure of cast irons. (D11, N8s, 2-60; CI)

627-D. Induction Melting and Degassing Installation. O. E. Erickson. Modern Castings, v. 40, Oct. 1961, p. 127-128.

Production of stainless steel with a low gas threshold level and improved ductility by using an installation consisting of a 300 kw. induction melting unit with two one-ton furnaces arranged so that a vacuum degassing chamber may be placed over either one. (D6, D9s, 1-52, 1-73, Q23p; SS)

628-D. Chemicals Consumed in the Manufacture of Steel. J. S. Doerr. U. S. Steel Corp. Technical Paper, Science and Technology, v. 8, no. 1, 1961, 5 p.

Survey of applications of chemicals in steel refining, hot forming, finishing and inorganic coating including oxygen, acids, lime, alkalis, oils, coke, aluminum oxide and fluoride, magnesium chloride, titanium and uranium tetrafluoride, artificial cryolite, zirconium chloride and sodium sulphate. Production and consumption data are given for use of electrolytic Mn and minor metals in steelmaking. 5 ref. (D-general, 10-54)

629-D. Effect of Burden Materials and Practices on Blast Furnace Coke Rate. R. V. Flint. Reprint from "Chicago Regional Technical Meeting of AISI", Sept. 27, 1961, 36 p.

Coke rate relationships are established in the development of formulas to aid in operations analysis and planning cost control, raw material and facility planning and product costing. Discussion of variables and examples of applications. 13 ref. (D1a, 1-52, 17-53; RM-j43)

630-D. Energy Requirements for Iron Ore Reduction. R. Wild. Institute of Fuel, Journal, v. 34, Sept. 1961, p. 381-392.

Various processes for the reduction of Fe ore to Fe metal are classified according to the fuel used. Smelting efficiency and thermal efficiency are compared on the basis of the energy required. 32 ref. (D-general; RM-j, RM-k, RM-m, 16-61)

631-D. Vacuum Casting--Faster Steel Production. Machinery Lloyd (Overseas Edition), v. 33, Sept. 30, 1961, p. 39.

Removal of oxygen and hydrogen to improve ductility, transverse properties and impact strength. (D9s, 1-73, Q-general; ST)

632-D. Revolutions in Iron and Steelmaking. Howard K. Worner. Mining & Chemical Engineering Review, v. 53, Aug. 15, 1961, p. 60-66.

Review of new and conventional processes along with recent advancements which improve productivity. Oxygen and openhearth processes and electric steelmaking are included. (D-general, 10-54)

633-D. (German.) Application of the Ionic Theory to Metallurgical Slags With Particular Emphasis on Oxygen and Sulphur Distribution. Martin G. Frohberg. Archiv fur das Eisenhuttenwesen, v. 32, Sept. 1961, p. 597-606.

Thermodynamic treatment of ionically dissociated acid and basic slags and interpretation of oxygen and sulphur distribution between liquid Fe alloys and liquid slags in terms of ionic theory. (D11n, 1-54, 2-60; Fe)

634-D. Blast Furnace Tapping Goes Automatic. Iron Age, v. 188, Oct. 26, 1961, p. 96.

Remote-controlled tapping jack cuts tapping time to 1 min. or less, increases steel production and reduces safety hazards. (D1f, 1-52, 18-74)

635-D. Blast Furnace Fuel Oil Injection. W. R. Rombough. Journal of Metals, v. 13, Oct. 1961, p. 743-745.

Equipment, instrumentation, test results and process control factors for the substitution of oil for coke in furnace operation. (D1, 1-52; RM-k30)

636-D. (English.) Study on Continuous Casting of Steel. Yoshio Aketa, Kantaro Sasaki and Kiyoto Ushijima. Tetsu-To-Hagane (Overseas), v. 1, June 1961, p. 31-37.

Experimental study of the effect of primary cooling including mold shape, evenness of cooling, casting temperature and casting speed; and of the effect of secondary cooling including evenness of cooling, intensity of cooling and casting temperature, on the surface cracking and inner cracking of continuous cast silicon-magnanese steel billets. 6 ref. (D9q, 1-53, 2-61, 9-72)

637-D. New Oxygen Process for Australia. Castings, v. 7, Aug. 1961, p. 44-45.

Process and equipment parameters for L-D process requiring the establishment of tonnage oxygen plants to deliver the liquid and gaseous oxygen required. (D10a, 1-52; EG-q)

638-D. Some Aspects of Predicting Blast-Furnace Behavior. A. L. Hodge. Iron and Steel Institute, Journal, v. 199, Sept. 1961, p. 6-15.

A mathematical method for analyzing and predicting blast-furnace performance using a computer is derived, with

special attention to rate processes including heat transfer in the shaft, temperature gradients, carbon for direct reduction, hydrogen reduction and shaft gas velocity. Principal equations are derived for technological effects of variations in relative quantities of bosh gas and charged solids, production rate, burden ratio and fuel injection. 12 ref. (D1, D11)

639-D. The Influence of Three Foreign Cations on the Reduction of Magnetite. V. J. Moran and A. E. Jenkins. Iron and Steel Institute, Journal, v. 199, Sept. 1961, p. 26-33.

Microscopy is used to study the influence of small concentrations of B, Cr and Al during the solid state reaction between Fe and magnetite to study the controlling processes in the hydrogen reduction of magnetite. 9 ref. (D11h, 3-69)

640-D. Natural Gas Injection Into the Blast Furnace at Lone Star Steel Co. F. W. Farmer. Iron and Steel Engineer, v. 38, Oct. 1961, p. 88-95.

The gas injection process is described in terms of cost, coke consumption rates, gas analysis and ore content. (D1; RM-m35)

641-D. Solutions to Basic L-D Plant Layout Problems. J. W. Irvin. Iron and Steel Engineer, v. 38, Oct. 1961, p. 165-173.

Basic oxygen steelmaking with emphasis on factors involved in vessel size selection and layout of the furnace shop and auxiliary equipment. Methods of scrap and hot metal handling, raw materials, slag control, flux materials and gas cleaning. (D10a, 1-52, 18-67)

642-D. Blast Furnace Coal Injection Offers Promise. Iron and Steel Engineer, v. 38, Oct. 1961, p. 175.

The use of coal injection with oxygen enrichment is discussed in terms of fuel requirements and costs. (D1a; RM-j42, 17-57)

643-D. Vacuum Process Upgrades Forging Steels. Steel, v. 149, Oct. 23, 1961, p. 76, 78.

Purification of molten steel with additions of Si or Al using the Dortmund Horder cyclic vacuum process. Alloy content homogeneity and reduced heating time are obtained by H, O, C and P degassing and cyclic processing of metal prior to alloy addition. (D8m, D9s, 1-63, 1-73)

644-D. (Italian.) Fabrication and Application of Charcoal Iron in Foundry and Iron Metallurgy. Joachim von Elpons. Fonderia Italiana, v. 10, Sept. 1961, p. 349-367.

Production of charcoal iron in Europe and Australia as compared with the fabrication of cast iron. Application of charcoal iron for making malleable cast iron, nodular cast iron, ingots, plates, molds and crucibles. Comparison of physical and mechanical properties. (D-general, E-general, Q-general; Fe-m, CI)

645-D. (German.) Kinetics of Precipitation Reactions in Liquid Metals. L. V. Bogdandy, W. Meyer and I. N. Stranski. Zeitschrift fur Elektrochemie, v. 65, Aug. 1961, p. 560-565.

Deoxidation of steel melts with various oxygen contents by Zr in a Tammann furnace with investigation of precipitation of ZrO_2 by microscopic examination. Study of reaction mechanism and kinetics of Zr deoxidation. (D11r)

SECTION E

FOUNDRY

1-E. Grey and White Solidification of Cast Iron. Mats Hillert. American Society for Metals, Transactions, Preprint no. 216, v. 53, 1961, p. 555-567.

The unusual solidification sequence in cast irons showing inverse grayness or inverse chill was recently explained in terms of variations in cooling rate. New experiments are presented which emphasize the importance of the high rate of formation of ledeburite once cementite has been nucleated. 14 ref. (E25n; CI)

2-E. (French.) Casting of Iron Flywheels. Journal des Informations Techniques des Industries de la Fonderie, Sept. 1960, p. 1-2.

Pouring and molding of a 150 lb. pipe-free flywheel composed of low carbon cast iron. (E19, E23; CI)

3-E. (French.) Construction of Turn Over Matchplates. Journal des Informations Techniques des Industries de la Fonderie, Sept. 1960, p. 3-5.

Foundry patternmaking and molding processes. (E17, E19)

4-E. (French.) Molding of a Compressor Body. Journal des Informations Techniques des Industries de la Fonderie, Sept. 1960, p. 11.

Pouring and molding of a 17-ton pearlitic iron compressor body cast in two parts in sand molds. (E23, E19; CI)

5-E. (French.) Steel Foundry Practice. Metallurgie et la Construction Mecanique, v. 92, Sept. 1960, p. 655-661.

Effect of pouring, feeding and molding directions on casting design. (E-general; ST)

6-E. Small Foundries and Laboratory Service. Foundry Trade Journal, v. 109, Nov. 3, 1960, p. 557-558.

Control of casting quality by making wedge-shaped samples from the melt. Ladle and cupola practice. (E25, E10a)

7-E. British Cast Iron Research Association. Foundry Trade Journal, v. 109, p. 559-564, 566.

Casting of malleable white and chilled iron; use of sands and refractories. Casting defects and corrosion of castings. (E-general; CI)

8-E. Operating Experience With a Lining-Less Water-Cooled Cupola. M. E. Rollman and D. J. Pusack. Foundry Trade Journal, v. 109, Nov. 3, 1960, p. 565-566.

Production of high-strength gray iron for machine tool castings using a water-cooled cupola. Melting practice permits close control of carbon and Si content. (E10a; CI-n)

9-E. Methods of Overcoming Faults and Defects in the Die Casting Shop. T. P. Barbicane. Machinery (London), v. 97, Oct. 26, 1960, p. 965-973.

Hand finishing of cavities in die casting tools; use of lubricants and release agents in dies; design of overflow wells; and metal handling practice. (E13)

10-E. (German.) Cold Blast Siegerland Special Pig Iron. K. Schwindt. Technica, v. 9, Sept. 23, 1960, p. 1219-1224.

Production of special pig iron by melting in a cold blast cupola and finishing in controllable rotating ladle and mixer. Chemical composition, mechanical properties and microstructure. Applications in pressure cells for diesel motors. (E10a, Q-general, M27; CI-a)

11-E. Present-Day Foundry Practice L. C. Barton. Machinery Lloyd (Overseas Edition), v. 32, Oct. 8, 1960, p. 45-48.

Methods of oddside molding and use of pattern plates, cores and corewashes in sand casting. Use of cupolas and crucibles in metal melting practice. (E11, E10)

12-E. Production and Properties of Cast-Iron Bar. J. Cumberland. Foundry Trade Journal, v. 109, Oct. 27, 1960, p. 523-533.

Production of cast iron alloy bars by static and continuous die casting processes. Data are given for microstructure and mechanical properties of the bars. (E13; CI, 4-55)

13-E. Investment Casting in Vacuum. Australasian Manufacturer, v. 45, Oct. 22, 1960, p. 44-46, 48-51.

Induction melting and casting of Ni-base alloys to produce ingots of low gas content using a vacuum indirect arc furnace and vacuum induction furnace. (E15, C5, 1-73; Ni-b)

14-E. (German.) Application of Lost-Wax Process for Automobile Parts. Fritz Woydich. Fertigungstechnik und Betrieb, v. 10, Oct. 1960, p. 588-591.

Lost wax casting of stainless and toolsteels. Microstructure and properties of castings composed of Cr-V steel. (E15, M27; SS, TS)

15-E. Switch to Electric Melting Boosts Foundry Flexibility. Steel, v. 147, Nov. 28, 1960, p. 122, 124.

Production of alloy and carbon steels at high melting rates using electric arc furnaces which permit the production of large or small heats and the manufacture of castings in several sizes. (E10r, W18s; AY, CN)

16-E. Two Casting Processes Team Up to Improve Foundry Efficiency. Iron Age, v. 186, Dec. 1, 1960, p. 130-131.

Casting of alloy steels by a process combining ceramic-shell and investment molding to obtain high precision aircraft components. (E15, E16c, T24; AY, SS)

17-E. Low Pressure Die-Casting. H. K. Barton. Metal Industry, v. 97, Nov. 4, 1960, p. 375-379.

Die castings of Al crankcase halves and crankcase heads. Production, pressure testing and assembly. (E13, T21c; Al, 17-57)

18-E. (German.) Importance of Controlled Solidification for Proper Design. H. Hafner. Schweizerische Technische Zeitschrift, v. 57, Oct. 20, 1960, p. 841-845.

Theoretical investigation of influence of sand edges on solidification rate for metal melts, with emphasis on steel, malleable and gray cast iron. Results demonstrated. 7 ref. (E25n; ST, CI)

19-E. (French.) 11% Mg Aluminum Alloy for Castings. Louis Grand. Revue de l'Aluminium, v. 37, July-Aug. 1960, p. 847-855.

Molding practices and properties of molds. Influence of Fe and Si impurities, Be, Mn, Zr, Ti, Zn and Cu additions and heat treatment on mechanical properties of castings. 9 ref. (E-general, Q-general, 2-60; Al-b, Mg, AD-q40)

20-E. Magnesium Die Castings for Automobiles. A. R. Tinetti. Metal Progress, v. 78, Dec. 1960, p. 82-85.

Seven types of parts weighing up to 1/2 lb. are being cast of AZ 91 B Mg alloy in cold chamber die-casting machines. Larger parts are being considered for the future. (E13, T21; Mg)

21-E. A Century-Old Test of Metal. Harold J. Roast. Metal Progress, v. 78, Dec. 1960, p. 99-100.

Historical note on the casting of "Big Ben" 102 years ago at the Whitechapel Bell Foundry in London. (E-general, A2)

22-E. Mechanized Work-Unloading Device Makes Die Casting Fully Automatic. Clayton C. Batt, Jr. Machinery, v. 67, Dec. 1960, p. 126-129.

Hot, tedious manual removal of die castings is replaced by a novel unloader built into the tools. Used as parts of an ingenious handling device are the integral runners which support the ejected castings during the transfer to the automatic degating station. The operation cycle is now much shorter and efficiency improved. (E13)

23-E. GM's Compact V-8 Uses Permanent Molded Block and Heads. Foundry, v. 88, Dec. 1960, p. 66-67.

Casting of Al cylinder blocks in hydraulically-operated permanent molds having retractable mandrels to hold the centrifugally cast gray iron cylinder linings in position during pouring of the block. (E12, T21b, W19g; Al, 17-57)

24-E. Gating Malleable Iron Castings. Hans J. Heine. Foundry, v. 88, Dec. 1960, p. 68-73.

Effect of pouring rate and sprue height on the rate and direction of molten metal slow. Techniques for removing entrapped slag and avoiding turbulent flow in a gating system for malleable Fe castings. 4 ref. (E22p; CI-s)

25-E. New Patternmaking Materials. Robert LeMaster. Modern Castings, v. 38, Dec. 1960, p. 53-55.

New techniques in wood patternmaking appear likely through a carvable epoxy available in plank or paste form. Advantages claimed are elimination of grain or knots; uniform swelling; less shrinkage; higher heat distortion point; flame resistance and elimination of aging and drying. Epoxy can be worked with standard woodworking equipment. (E17)

26-E. Centrifugally Cast Steel Tubing. E. D. McCauley. Modern Castings, v. 38, Dec. 1960, p. 56-65.

Certain advantages in centrifugally casting steel tubing can be realized using considerably higher speeds with the elimination of the usual hot tearing and cracking problems. In production, 20-ft. flasks are lined with a flowable ceramic type refractory and compacted by spinning. The tube diameter can be produced to any given size depending only on the volume of the lining mix. 7 ref. (E14; CN)

27-E. Solidification of Aluminum Castings. M. C. Flemings, S. Z. Uram and H. F. Taylor. Modern Castings, v. 38, Dec. 1960, p. 66-80.

Influence of solidification behavior on foundry characteristics, including shrinkage and feed metal requirements, hot tearing and fluidity. Interrelationships between solidification behavior, soundness, structure and mechanical properties of cast Al. 36 ref. (E25n; Al)

28-E. Solidification of Copper Alloys. R. W. Ruddle. Modern Castings, v. 38, Dec. 1960, p. 81-86.

Commonly cast Cu alloys may be divided into two groups according to their method of solidification. One freezes by the mechanism of skin or shell formation, the other by a pasty or mushy manner. Data on rates of feeding, alloy feeding mechanism, grain refinement and segregation effects. 5 ref. (E25n; Cu)

29-E. Solidification of Metals. W. K. Bock. Modern Castings, v. 38, Dec. 1960, p. 87-91.

Summary of several papers on the solidification of Al and Cu alloys obtaining a desirable grain structure involves a careful selection of mold material, mold density, pouring temperature, selection and location of exothermic compounds and use of foreign body nuclei. 4 ref. (E25n)

30-E. Magnesium Foundry Practice Development. J. House. Modern Castings, v. 38, Dec. 1960, p. 92-96.

New alloys allow higher temperature applications and higher strength applications at both room and elevated temperatures. Increasingly more intricate, high quality castings are being produced with more versatile physical properties. (E-general; Mg)

31-E. (Swedish.) Coremaking in Hot Core Boxes. Gjuteriet, v. 50, Oct. 1960, p. 142-144.

A sand mixture containing a thermosetting binder is rammed by hand, blown, jolted or pressed into a core box held at 200-230° C. where hardening occurs. Bending strength of cores as a function of baking time. (E21)

32-E. (Czech.) Manufacture of SG-Cast Iron. Josef Vincenc. Slevarenstvi, v. 8, Oct. 1960, p. 351-353.

Cast iron is preheated to 800° C., inoculated with Mg in a ladle closed by an air-tight lid, then cast from an open ladle. (E25q; CI, Mg)

33-E. (Czech.) Sand Molds Rammed at Higher Compressions. Josef Dlezek. Slevarenstvi, v. 8, Oct. 1960, p. 341-347.

Molding of mixtures containing 15% clay, 7% bentonite and 3-5% waterglass or coal powder. Data for compressibility as a function of loading velocity and effect of ramming on compressive strength, porosity and density. 9 ref. (E19)

34-E. (Czech.) Thermal Expansion of Cores During Drying. Miroslav Prihoda. Slevarenstvi, v. 8, Oct. 1960, p. 360-362.

Cores made from a mixture of 30% new sand and 70% old sand with a moisture content of 7% are dried for 11 hr. at 300° C. Data for thermal expansion and contraction as functions of temperature and core temperature as a function of cooling time. (E21)

35-E. (Czech.) Casting in a Slant Position. Ladislav Steffek. Slevarenstvi, v. 8, Oct. 1960, p. 363-365.

Steel machine parts and gears are sand cast with the mold at an angle of 10-15° with the horizontal. Effect of this method on precision, metal consumption and casting surfaces. (E11, T7a; ST)

36-E. Large, Intricate Parts of All Metal Types Precision Cast by Ceramic Mold Technique. Industrial Heating, v. 27, Nov. 1960, p. 2450-2451, 2458.

Casting of brass, bronze, stainless steel, tool and die steel and high temperature alloys to close tolerances using a ceramic mold with a microcrazed structure developed during mold production. The small fissures prevent molten metal from entering into them but are large enough to accommodate the expansion of the ceramic particles when heated by the metal. (E16b, W19g; Cu-n, Cu-s, SS, TS, SGA-h)

37-E. Shrinkage Defects in Iron Castings. J. H. Gittus. Iron & Steel, v. 33, Nov. 1960, p. 552-555.

Effect of metal composition, melting and pouring temperatures and inoculation on the incidences of shrinkage characteristics such as draws, sinks, internal porosity and hot tears in test castings of gray iron. (To be continued.) (E25, 2-60, 2-61)

38-E. The Use of Oil-Petro Bond Sand for Higher Finish in Brass and Bronze Castings. O. E. Johnson. Castings, v. 6, Sept. 1960, p. 31, 33, 35, 37.

Comparative study of bentonite-water bonded sand and oil bonded sand containing Petro Bond (an organic ammonium montmorillonite) for use in molds in a nonferrous foundry. Data for hardness, green strength, permeability and oil and Petro-Bond percentages of molds cast from the Petro-Bond sand. (E18, E11; Cu-n, Cu-s)

39-E. (French.) Use of the Vallak Sinkhead Box. Mines et Metallurgie, Sept. 1960, p. 481-482.

Use of a light-weight box made of bricks or other shaped pieces in a mixture of coke powder, sawdust and a binder and coated on inside with thin layer of refractory material to reduce shrinkage of ingots in the mold during casting of steel. (E-general, E25q, W19C; ST)

40-E. (German.) Steel Scrap Content of Burden in Melting Cast Iron in the Cupola Furnace. H. Siepmann, H. Pacyna and H. W. Hauptvogel. Giesserei, v. 47, Nov. 3, 1960, p. 608-614.

Statistical analysis of use of steel scrap in melting cast iron in acid and basic hot and cold blast cupola furnaces between 1950 and 1960. Correlations between use of steel scrap and iron quality with emphasis on carbon content. (E10a, 10-54, CI)

41-E. (German.) Automation of Die Casting. Ernst Brunhuber. Giesserei, v. 47, Nov. 3, 1960, p. 634-693.

Design and mode of operation of automatic pneumatic and hydraulic die casting machines for light metals (Al and Mg alloys), gray and malleable cast iron. Special problems such as proper heat transfer in die during operation; mechanical locking and opening of dies. (E13, 1-52; Al-b, Mg-b)

42-E. (German.) Reconditioning and Re-Use of Zinc Die-Casting Scrap. Wolfgang Wolf. Giesserei, v. 47, Nov. 3, 1960, p. 640-644.

Storing and remelting of scrap in gas or oil heated cast iron containers with large surfaces at temperatures under 480° C. Purification of melts by salts or filters (NH_4Cl, $ZnCl_2$ and others) from oxides, gases and metallic and nonmetallic impurities. Remelting of electroplated Zn scrap. (E26; Zn, 5-61)

43-E. (French.) Manufacture of High Strength Cast Irons by Introduction of

Nitrogen With Calcium Cyanide. Nicolas Volianik. Fonderie, Aug. 1960, p. 307-324.

Effect of nitrogen formed by dissociation of calcium cyanide in bath on mechanical properties and structure of cast irons. Improvement of properties as a result of increase in number of eutectic cells and modification of form of graphite. Treatment is applicable to all grades of hypo and hypereutectic irons, optimum proportion of cyanide to be injected being governed by equivalent carbon of alloy. 15 ref. (E25q, Q-general; CI, N)

44-E. (French.) Study of a Hot-Blast Cupola (Philipon Type). Blast Temperature and Condition of Metal Charge. J. C. Margerie and E. Tallec. Fonderie, Aug. 1960, p. 325-342.

Experimental melts with blast temperatures between 300-650° C. and metallic charge composed of steel scrap and ferrosilicon and silocomanganese briquettes. Influence of blast temperature and thickness (0.2-20 mm.) of scrap on bath temperature, hourly production, Si and Mn melting losses, carburization and desulphurization of bath, basicity and degree of oxidation of slag, composition and temperature of charging hold gases, structure and mechanical properties of cast product. 5 ref. (E10a)

45-E. (Italian.) The Use of High-Capacity Induction Furnaces in Iron Foundries. A. Tagliaferri. Fonderia, v. 9, Sept. 1960, p. 411-415.

Evaluation of induction furnaces in production of ordinary and special analysis iron castings with attention to control of bath temperatures, low melting loss, relatively low power requirements. (E10r, W18a)

46-E. (German.) Melting in the Water-Cooled Cold Blast Cupola Furnace. Harald Thalmeier. Giesserei-Technik, v. 6, Sept. 1960, p. 266-269.

Melting of GG-18 cast iron in a pilot furnace (600 mm. inside diameter) and production furnace (700 mm. inside diameter). Design, efficiency, heat balance and coke consumption of furnace. Use of furnace with basic lining. (E10a)

47-E. (German.) Size of Shell Mold, an Important Factor in Lowering Molding Costs in Shell Molding. Hans Bohme. Giesserei-Technik, v. 6, Sept. 1960, p. 275-277.

Evaluation of most economical mold size for molding with resin-coated quartz sand during production of cast iron bushings. (E16, T7d; CI)

48-E. (German.) Experiments With a Basic Cupola Furnace. Otto Gerstmann. Giesserei-Technik, v. 6, Sept. 1960, p. 279-280.

Melting of cast iron (3.1-3.5% C, 0.058-0.083% S) in an 800 mm. ID cupola furnace with magnesite lining. Dependence of carbon and sulphur content in Fe on temperature. (E10a, 2-61)

49-E. (German.) Fast-Hardening Molding Mixtures With Dextrin, Sulphite-Lye-Dextrin and Soda Waterglass-Dextrin Bases. Alfred Gebauer. Giesserei-Technik, v. 6, Sept. 1960, p. 280-281.

Mixing, baking (160-180° C.) and coating of cores and molds composed of sand containing 1-2% dextrin, 2% sulphite lye and 4% soda waterglass. Data for composition and mechanical properties of the dextrin mixtures. (E21)

50-E. (Pamphlet.) The Federated PT (Pressure-Tight) Process. Bulletin No. 200, 1960, 2 p. American Smelting and Refining Co., 120 Broadway, New York 5, N. Y.

Use of a new refining treatment to control the distribution and form of solidification shrinkage and obtain pressure tightness in Al sand and permanent mold castings. (E11, E12, E25n; Al)

51-E. (Book.) Patternmaker's Manual. 1960. 406 p. American Foundrymen's Society, Inc., Des Plaines, Ill.

Selection of lumber for wood patterns; patternmaking from wood, plastic, plaster and gypsum cement; and storage of patterns. (E17)

52-E. (Translation-Brutcher no. 4939.) Fluidity Characteristics of Liquid Cast Iron Flushed With Methane Gas. L. Sofroni, C. Cosneanu and E. Nicoloiu. Studii si Cercetari de Metalurgie, v. 4, Apr. 1959, p. 525-535.

Effect of flushing with methane gas upon castability and the ensuing changes in structure. Action of methane compared with that of Mg and other inoculants. Effect on initial expansion and

contraction, shrinkhole formation and density, hot tearing, graphite structure, mechanical properties and gas evolution during solidification. (E25n, E25p; CI)

53-E. (Translation-Brutcher no. 4885.) Spheroidal Cast Iron Production by Inoculating Gray Cast Iron With Salts. Cestmir Hlousek. Slevarenstvi, v. 7, Oct. 1959, p. 425-432.

See item 37-E, 1960. (E10, E25q, 2-61, 3-67; CI-r, AD-p36)

54-E. (German.) Material Problems for Thin-Walled Gray Iron Castings. Josef Gerold. Freiberger Forschungshefte, B 45, 1960, p. 53-79.

Melting of 1.11-4.66% Si containing cast iron in a cupola furnace with and without subsequent inoculation with FeSi to establish a cast iron diagram of microstructure at saturation versus test bar diameter. Use of information in diagram to eliminate material faults caused by nonuniform microstructure in castings with less than 10 mm. wall thickness. Faults caused by gas holes and separation of free carbon during cooling. (E10a, E25q, M27; CI, Si)

55-E. (German.) Assessment of Coke for Melting in Cupola Furnace. Wolf Friedel. Freiberger Forschungshefte, B 45, 1960, p. 86-116.

Derivation of empirical conversion factors to determine equivalent coke amounts for different coke qualities during melting in water cooled cold blast cupola furnaces. Test melting of pig iron with coke of varying qualities in a pilot cupola furnace to determine influence of coke quality on Fe temperature. (E10a; CI-a)

56-E. (German.) Experiences and Results Gained During Reorganization of a Foundry for Large Scale Production of Light and Thin-Walled Steel Castings by Automated Flaskless Soda-Waterglass-CO_2 Moulding. Karl Haake and Willi Kleinfeld. Freiberger Forschungshefte, B 45, 1960, p. 117-142.

Reorganization of a steel foundry with two Bessemer converters and three cupola furnaces is discussed in terms of transportation of sand and preparation of return sand, molding and core production and supply and storing of CO_2 and soda water glass. (E-general, 18-67)

57-E. (German.) Results of Recent Investigations on Pin Holes in Cast Steel. Joseph Czikel. Freiberger Forschungshefte, B 45, 1960, p. 7-20.

Test melting of GS 45.1, GS 52.1 and GS 60.1 cast steel of varying solidification temperature ranges in 5 and 10 ton arc furnaces to prove a theory explaining the formation of pin holes in terms of interdendritic surface shrink holes. Influence of shape of casting, solidification range of steel and mold coating on formation of pin holes. (E25n, D5a; ST)

58-E. Big Investment Castings. Pt. 2. Henry Lefer. Precision Metal Molding, v. 18, Dec. 1960, p. 34-35.

Wax patternmaking, slip casting and firing processes for production of ceramic shells. Application in the casting of large stainless steel parts (up to 3 1/2 ft. long, weighing over 45 lb.) with ultimate tensile strengths of 200,000 psi. (E15; SS)

59-E. Vacuum Die Casting. Precision Metal Molding, v. 18, Dec. 1960, p. 29-30.

Metallurgical and physical properties of Zn and Sn alloy die castings produced in a closed system maintained at a vacuum of 29 1/2 -30 in. Hg. Data are given for density, elongation, yield point, melting point, Rockwell T hardness and shrinkage. (E13, 1-73, P-general, Q-general; Sn-b, Zn-b)

60-E. Some Aspects of the Production of Cast Steel Axleboxes for the Locomotive Industry. J. McConnell. British Foundryman, v. 53, pt. 2, Nov. 1960, p. 469-476.

Molding sand technique; core sand technique; green sand cores; gating; chills and denseners; use of knock-off risers. (E11, E19; ST)

61-E. Anomalous Expansion During the Cooling of Clay-Bonded Silica Sand. J. Goodison and J. White. British Foundryman, v. 53, pt. 2, Nov. 1960, p. 477-479.

When bentonite-bonded sand test-pieces are cooled from temperatures above that of the hot strength peak, the contraction due to the beta to alpha quartz conversion is followed by a marked expansion. This is also observed when ball-clay bonded sand test-pieces are cooled from above their hot strength peak. No expansion is observed, however, with either material when it is cooled from temperatures below the peak. (E18r)

62-E. Toward a Science of Gating Castings. John G. Kura. Battelle Technical Review, v. 9, Dec. 1960, p. 3-7.

Definition of a gating system; the significance of the Reynolds number; some principles of gating; calculating the gating system. (E22p)

63-E. (German.) Core Drying in High-Frequency Furnaces. H. C. Grassmann. Elektro Warme, v. 18, Oct. 1960, p. 323-328.

Baking of cores with organic binders at temperatures up to 220° C. by 30 kV, 15 MHz, 5-60 kW high-frequency furnaces. Construction details; economics. (E21h, W19k)

64-E. Automatic Pouring of Aluminum Sand Castings. Jack C. Miske. Foundry, v. 89, Jan. 1961, p. 71-81.

Conversion from gray iron to Al casting production at Pontiac Motor Division in the manufacture of timing chain covers. The new facilities can produce from 4-5 tons of Al per hr. on a continuous basis, while this amount of Al can be melted and poured by one man. (E23; Al)

65-E. Risering of Malleable Iron. Hans J. Heine and Robert A. Peacock. Foundry, v. 89, Jan. 1961, p. 82-89.

Function of risers for malleable iron castings; riser shapes, sizes and locations; effect of riser tops on feeding efficiency; effect of taper on riser efficiency; proper riser neck areas for castings of various shapes and ratios. 10 ref. (E22q; CI-s)

66-E. Technical Reports at the Die Casting Exposition and Congress. Foundry, v. 89, Jan. 1961, p. 171-181.

Resumes of papers presented at the First National Die Casting Exposition and Congress, Detroit, Nov. 8-11, 1960. Topics covered include die design; die building; use of Al die castings in automobile engines; application of sound waves in die casting; quality control; automation in die casting; vacuum die-casting. (E13)

67-E. (English.) Aspects of Olivine Sand as Molding Material in Steel Foundries. K. Beckius and A. Huldt. Jernkontorets Annaler, v. 144, Sept. 1960, p. 708-736.

Typical properties and compositions; crushing behavior; resulting changes on heating and cooling. Behavior of sand grains when heated by cast steel. (E18r, E19)

68-E. Aluminum Engine Block Die Cast for the Rambler. Materials in Design Engineering, v. 51, Dec. 1960, p. 9.

Six-cylinder, in-line block weighs 67 lb. --53 lb. of Al and 14 lb. of cast iron cylinder liners. The blocks are produced on special 2000 ton die casting machines. Liners and camshaft bores are incorporated in the single operation. (E13, T21b; Al)

69-E. Flow of Metal Through Screens. Y. J. Birch and G. Llewelyn. Foundry Trade Journal, v. 109, Nov. 24, 1960, p. 659-666.

Use of screens to exclude oxide from the mold when casting Mg-base and other light alloys. Uniform flow and minimum amount of turbulence and exposed metal are achieved by placing the screens far from the sprue base or by using a wire-wool ball in the sprue side of the well. 7 ref. (E-general; Mg-b)

70-E. False Joints in Molding Practice. Foundry Trade Journal, v. 109, Nov. 24, 1960, p. 667-671.

Use of false joints, which part a mold section independent of the main mold parts during hand-molding of certain types of castings such as grooved pulleys. The free section formed by the false joint rests on a suitable seating and is secured against misplacement by the molten metal during pouring. (E19)

71-E. Factors Affecting the Surface Quality of Steel Castings. Castings, v. 6, Oct. 1960, p. 29, 31, 33.

Extracts from the annual report of the British Steel Castings Research Assoc. on mold paints and washes, factors affecting the erosion of molds by molten steel, friability of green sand molding mixes on air drying and the collapsibility of CO_2-sodium silicate mixes. (E25q; ST)

72-E. (French.) The Manufacture of Solid and Hollow Copper Alloy Blanks. Paul Balanche. Fonderie, June 1960, p. 223-238.

Sand, static chill, centrifugal and continuous casting: technology, metallurgy and tooling. (E-general; Cu-b)

73-E. The Relation of Blast Quantity and Combustion Ratio in Cupola Operation. Kiyashi Ishikawa, Ichiro Saeda and Toshio Suzuki. Imono (Japan Foundrymen's Society, Journal), v. 32, Sept. 1960, p. 619-624.

Effect of blast input on melt temperature and combustion ratio. 8 ref. (E10a)

74-E. (Japanese.) Contribution of Padding to the Sound Area of Castings. Masataka Sugujama and Tatsuichi Fukusako. Imono (Japan Foundrymen's Society, Journal), v. 32, Sept. 1960, p. 642-648.

Effect of increased thickness and characteristic freezing made on the soundness and mechanical properties of castings of yellow brass, Sn bronze, pure Al and steel. 9 ref. (E25n, Q-general, 3-73; Al, Cu-b, ST)

75-E. Unusual Stainless-Steel Casting. Foundry Trade Journal, v. 109, Dec. 1, 1960, p. 689-692.

Molding of an 8 1/2 lb. candelabra pedestal cast in 18-8 stainless steel using a CO_2 mix to facilitate hand ramming and gassing. Green facing sand is used for the mold parts. (E11; SS)

76-E. Hollow Sprue: Radical Design Proves Out in Production. Iron Age, v. 186, Dec. 29, 1960, p. 50-51.

Precision investment castings composed of 4140 steel, Be, Al alloys and 17.4 PH alloy produced using a hollow ceramic sprue to reduce segregation and decarburization. Metal is poured into the sprue while the ceramic-shell mold is under the influence of a vacuum assist. (E15; Al-b, Be, SS, ST)

77-E. The Measurement of Relative Density of Sand. Shigeru Kitago and Fumiwo Kozaki. ASTM Bulletin, Sept. 1960, p. 36-40.

Maximum and minimum densities are determined for fine, medium and coarse sand after compacting by a vibration method. The one-layer, one-point method of vibration is used for measuring maximum density and the spout or dish method for minimum density. 5 ref. (E18r)

78-E. Vacuum Die Casting--the Present Position. H. K. Barton. Machinery (London), v. 97, Nov. 30, 1960, p. 1251-1259.

Effect of vacuum casting on the mechanical characteristics and internal porosity of large thin castings. Methods of improving heat transfer and control of metal flow and reducing back pressure during casting. (E13, 1-73)

79-E. Methods of Overcoming Faults and Defects in the Die Casting Shop. T. P. Barbicane. Machinery (London), v. 97, Nov. 30, 1960, p. 1259-1261.

Use of infrared heating to preheat dies at even working temperatures. Relationship of die defects to faults in casting procedure. (E13, E25q)

80-E. Shrinkage Defects in Iron Castings. J. H. Gittus. Iron & Steel, v. 33, Dec. 1960, p. 584-586.

Molds of rigidity comparable to that of dry sand are produced by milling sodium silicate with the sand and blowing CO_2 through the completed mold. Fe castings produced in the molds are tested for porosity and shrinkage defects; melts of malleable iron are tested to show the effect of oxygen on porosity. (E19, E25q; Fe)

81-E. New Furfurol Binders Reduce Core Cost. Modern Castings, v. 39, Jan. 1961, p. 31-33.

Furfuryl alcohol, urea formaldehyde resin and an acid catalyst are mixed with silica sand. Mix is blown into metal core box heated to 400-600° F. and cures in 12-30 sec. Process eliminates driers, ovens, rods and wires and reduces time and cost in coremaking. (E21; NM-f45)

82-E. How to Grain Refine High Silicon-Aluminum Alloys. J. Sulzer. Modern Castings, v. 39, Jan. 1961, p. 38-43.

Use of 0.10-0.16% P to eliminate coarse grain structure and improve machinability of hypereutectic Al-20% Si alloys. Use of alloys in automobile parts. 7 ref. (E25q, T21; Al-b, Si, 17-57)

83-E. Aluminum-Uranium Alloy Centrifugal Casting. N. E. Daniel, E. L. Foster and R. F. Dickerson. Modern Castings, v. 39, Jan. 1961, p. 53-59.

Casting of hollow Al-35 w.% uranium cylindrical extrusion billets. Melt temperature, mold and pouring spout configuration, mold speed and method of pouring. 6 ref. (E14; Al-b, U)

84-E. Chilling Behavior of a Roll-Type Cast Iron. K. E. Pinnow and R. W. Lindsay. Modern Castings, v. 39, Jan. 1961, p. 75-84.

Superheating temperature, pouring temperature and charge materials effects on chill characteristics are evaluated by making chill castings from melts of constant chemical composition. Superheating and pouring temperatures are precisely measured by immersion thermocouples. 10 ref. (E22r, 17-52, 2-61)

85-E. Systematic Approach to Sand Design and Control. Progress Report 2. Clay Bonded Sand Dry Properties. A. H. Zrimsek and G. J. Vingas. Modern Castings, v. 39, Jan. 1961, p. 85-92.

Dry properties of clay-sand-water combinations. Data presented complement that given in the previous progress report. Systems covered are those of western and soutnern bentonite and fireclay. (E18r)

86-E. (Japanese.) Compression Rate in High Temperature Tests on Molding Sand. Mototaka Mut Aguchi. Imono (Japan Foundrymen's Society, Journal), v. 32, Oct. 1960, p. 685-689.

Correlation between compressive stress and compression rate of foundry sand bonded with bentonite during casting of steel or cast iron. (E18p, E11; CI, ST)

87-E. (Japanese.) Design of Shower Gates for Molds. Nobutaro Kayama and Hiroshi Okita. Imono (Japan Foundrymen's Society, Journal), v. 32, Oct. 1960, p. 690-695.

Effect of the shape of the shower gate on the length of continuous flow during the casting of gray cast iron and Wood's metal. (E22p, D9, C5; CI-n, Bi-b)

88-E. (Japanese.) Construction and Operation of a Water Cooled Cupola. Ryozo Sato and Kanju Sato. Imono (Japan Foundrymen's Society, Journal), v. 32, Oct. 1960, p. 722-728.

Use of a water cupola to improve the uniformity of melting and efficiency during casting. 4 ref. (E10a)

89-E. (Czech.) Improvement of Quality in Ball Bearing Steel by Electroslag Remelting. Ivo Petrman and Ivan Kasik. Hutnicke Listy, v. 15, Nov. 1960, p. 839-851.

Rolled or cast rods are remelted into a water cooled ingot mold by a method resembling the electroslag welding process. Effect of remelting on surface quality, grain size, homogeneity, density, S, H and N contents and the quantity and shape of inclusions. 10 ref. (E10, E25; ST, SGA-c, 4-55, 5)

90-E. The Application of Ultrasonic Energy to Ingot Solidification. Pt. 1. D. H. Lane, J. W. Cunningham and W. A. Tiller. Metallurgical Society of AIME, Transactions, v. 218, Dec. 1960, p. 985-990.

The effect of ultrasonic vibrations on ingot solidification and the mechanisms involved in refining the grain structure are considered theoretically and experimentally. A technique for introducing the ultrasonic vibrations to the freezing interface is applied to the consumable electrode arc melting of 304 and 316 stainless steel, an austenitic Fe-Cr-Mn alloy and Ni-Al alloy. Effect on equiaxed grain growth and nucleation frequency. 15 ref. (E25n, E25q, 1-74, M-general, N-general; Fe-b, Ni-b, SS-e)

91-E. The Application of Ultrasonic Energy to Ingot Solidification. Pt. 2. D. H. Lane and W. A. Tiller. Metallurgical Society of AIME, Transactions, v. 218, Dec. 1960, p. 991-994.

Application of a zone melting technique for investigating the effect of ultrasonic irradiation upon ingot solidification. Effect of ultrasonic power level, freezing velocity, constant or variable frequency, direction of irradiation and transducer-coupling bar joint upon the grain size and the nucleation probability in the layer of liquid adjacent to the freezing interface of 316 stainless steel. (E25q, 1-74, C28k; SS-e)

92-E. (French.) Precision in Coring With Standard Tools Using New Synthetic Resins. M. Jacques Roth. Fonderie, Oct. 1960, p. 409-418.

A new coring process using a synthetic resin agglomerate binder to insure precision of cores and elimination of most finishing operations and corrections on castings. Advantages given include ease of sand preparation, reduction of baking time and unlimited storage possibilities. (E21)

93-E. Shell Coremaking. Metal Industry, v. 97, Dec. 1960, p. 460.

Design of an integrated coremaking apparatus composed of five basic units including core blower, oven feed, oven, knockout (ejection) table and corebox return grid. (E21, W19)

94-E. Technical Control of Steelfoundry Processes. Foundry Trade Journal, v. 109, Dec. 8, 1960, p. 723-729.

Summaries of papers presented at the annual conference of the British Steel Castings Research Assoc. on ladle practice, pouring of molds, inspection of molds, welding in the foundry, factors affecting control of heat treatment of steel castings and ultrasonic detection of defects in cast steel. (E-general; ST)

95-E. Tricks of the Trade. "Jacques". Foundry Trade Journal, v. 109, Dec. 8, 1960, p. 731-734.

Pattern for casting a grinder head is reconstructed for vertical molding by using a stripper-block and cover-core. (E17)

96-E. (German.) Experiments in Melting With Carbide Additions in the Cupola Furnace. Werner Hass. Giesserei-Technik, v. 6, Oct. 1960, p. 293-295.

Melting of cast iron in a 900-1000 mm. ID cupola furnace with 0.6-1.2% carbide additions to coke burden. Measurement of waste gas composition and temperature, iron temperature, amount and pressure of blast and melting efficiency, to evaluate influence of carbide addition on melting. (E10a; CI, NM-a35)

97-E. (German.) Use of Radioactive Isotopes in Foundry Industry. Siegbert Wadewitz. Giesserei-Technik, v. 6, Oct. 1960, p. 311-312.

Use of radioactive tracers in thickness measurements and analysis of transformation mechanisms and structures. Equilibrium reactions and composition of castings. Application to study of wear in foundry equipment. (E-general, 1-59)

98-E. (French.) Combined Effect of Shrinkage and Atmospheric Pressure on the Formation of Foundry Defects. Francois Boussard. Fonderie Belge, v. 30, Nov. 1960, p. 285-292.

Deflection, cavities and spongy porosity are observed in angle irons and grooved plates cast in iron containing 0.2-1.4% phosphorus due to contraction of metal before and during solidification, their shape and appearance depending on massiveness of castings and hot spots formed during solidification. Principles for prevention of these defects, including use of atmospheric feeder head. (E25n, 9-68; CI)

99-E. (Book-French.) Guide to the Design of Light Alloy Castings. 58 p. 1960. Editions Techniques des Industries de la Fonderie, 12 Ave. Raphael, Paris, France.

Composition, physical, mechanical and technological properties of standard French Al casting alloys. Selection of alloy, casting method (sand or chill) and design and layout of simple and complex shapes. 14 ref. (E-general; Al-b)

100-E. Hollow Tree Castings Have Big Potential. Steel, v. 147, Dec. 26, 1960, p. 58-60.

Use of hollow wax or plastic sprues in ceramic shell molding with vacuum casting to reduce cost and produce castings of uniform hardness. A high temperature burnout operation is used to remove patterns and partially set the ceramic. (E19c, E16c, 1-73)

101-E. (German.) Progress in Technology of Magnesium Cast Alloys. E. F. Emley. Giesserei, v. 47, Dec. 1, 1960, p. 703-713.

Review of casting and molding methods including shell casting, CO_2 molding and plastic molding. Determination of susceptibility to casting defects. Corrosion prevention by pickling, anodic oxidation and plastic coating. Applications in aircraft components. (E16c, E19, R10, T24; Mg-b)

102-E. Silicone Rubber Molds for Short-Run Castings. H. A. Smith. Product Engineering, v. 31, Dec. 26, 1960, p. 50-51.

Use of fluid silicone rubber in flexible molds and patterns for casting metal or plastic parts. These are room-temperature vulcanizing silicone compounds that, when catalyzed, cure into firm, rubbery solids without external heating. (E17, E19)

103-E. Iron Foundry Scrap Reduction. Mass Production, v. 36, Nov. 1960, p. 94-96.

Reduction of scrap loss from 24 to 8% by modifying baking procedures, eliminating breakage by handling castings cold and pouring at higher temperatures. (E-general)

104-E. (Czech.) Changes Increasing the Efficiency of Cupolas. Milan Brhel. Slevarenstvi, v. 8, Nov. 1960, p. 383-384.

Increase of furnace efficiency and reduction of lining wear by a special design and arrangement of tuyeres and blast system. (E10a)

105-E. (Czech.) New Casting Method for the Manufacture of Cylinder Inserts. Cestmir Pazourek and Jiri Ptacnik. Slevarenstvi, v. 8, Nov. 1960, p. 384-386.

Centrifugal casting of cylinder inserts for combusion engines in rotating sand molds. Fe composition: 3.1% C, 1.85% Si, 0.75 Mn, 0.20% P and 0.06% S. (E14, T21b; Fe)

106-E. (Czech.) Defect Shell Castings. Vladislav Svab. Slevarenstvi, v. 8, Nov. 1960, p. 386-387.

Defects observed in cast engine cylinders with cooling fins are thought to be caused by excessive porosity of molds and cores or chemical reactions occurring between mold and metal and can be avoided by correct choice of binders, quantity of the binder used, sufficient removal of gases in casting, correct casting velocity and temperature, shape of castings, solidification velocity and melt composition. (E16c, E25q, T21b; CI)

107-E. (Czech.) Centrifugal Casting of Heavy Bronze Bushings. Rudolf Koula. Slevarenstvi, v. 8, Nov. 1960, p. 388-391.

The correct number of mold rotations is determined from the desired inner and outer diameters of the bushing and the specific properties of metal compositions. The permanent mold is lined with 1-1.5 mm. thick Cu sheet and casting takes place at a mold temperature of 150° C. and a melt temperature of 1120-1140° C. 4 ref. (E14, T7d; Cu-s)

108-E. (Czech.) Permanent Mold Casting of a Large Aluminum Plate. Jiri Kadlec. Slevarenstvi, v. 8, Nov. 1960, p. 394-396.

Casting into an Fe mold with a special pouring system in which a tilting apparatus brings the mold into various positions during pouring and solidification. Castings produced by this method require little machining. (E12; Al)

109-E. (Czech.) Use of CT Molding Mixtures in the Manufacture of Boiler Fittings. Jan Rous. Slevarenstvi, v. 8, Nov. 1960, p. 396-399.

Casting of large cast iron fittings using economy molding mixtures containing 84.8-88.2% sand, 4-7% clay, 7% waterglass of 36-38° Be, 0.5-1% graphite and 0.2% soda lye. (E11, T6a; CI)

110-E. (Czech.) Manufacture of Shell Molds. Vladimir Vafek. Slevarenstvi, v. 8, Nov. 1960, p. 399-400.

Special blowing equipment is used in a mold making process in which the molding mixture is blown through openings in a plate which follows the outlines of a heated mold. 3 ref. (E19c)

111-E. (Czech.) Further Experiences in the Melting of Cast Iron With CaO_2 Added to the Charge. Josef Simek and Viktor Prachai. Slevarenstvi, v. 8, Nov. 1960, p. 401-402.

Coke, limestone and 0-0.6 kg. CaO_2 are added to the charge of an experimental cupola furnace containing 20 kg. metal to determine the effect of CaO_2 on coke consumption and temperature of melt. (E10a; CI)

112-E. Cast-to-Size Steel Molds Cut Compact Car Costs. Tool and Manufacturing Engineer, v. 46, Jan. 1961, p. 94-95.

Major mold components are produced in cast-to-size form with tensile strength of 100,000 psi. and 15% elongation and used with a new low-pressure Al casting process to produce compact car engine components. (E12, T21; Al)

113-E. Shell Molding. Otto W. Winter. Tool and Manufacturing Engineer, v. 46, Jan. 1961, p. 109-116.

Advantages of shell molding as compared with other precision processes, including investment, permanent mold and die casting and precision forging. Cost factors including tooling, casting size and accuracy are related to quantity of castings produced. 8 ref. (E19c)

114-E. Large Steel Castings for Heavy Duty. Heinz W. Balster. Metal Progress, v. 79, Jan. 1961, p. 89-93.

Basic electric furnaces with capacity over 25 tons and with induction stirring are used for alloy steels. A Cr-Mo-V analysis similar to Type 316 has been widely used for high-temperature service and 13% Cr steel is favored for corrosion resistance. Welding of simple shapes into complex assemblies is common practice. (E-general; ST, AY, SS)

115-E. (Japanese.) Effect of Ca on Al-Mg Alloys. Shigeo Muromachi and Tomoya Minegishi. Light Metals, v. 10, Nov. 1960, p. 394-396.

Oxidation of Mg in molten Al-Mg alloys containing 2.5-10% Mg and gas content and cast structure of the alloy as influenced by the addition of 0.05-0.5% Ca and 0.004% Be. (E25; Al-b, Mg, Ca, Be)

116-E. Die Casting Congress. Metal Industry, v. 97, Dec. 9, 1960, p. 483-484.

Summary of papers on die design, temperature control, solidification and the applications of die castings in automobile manufacture. (E13, T21)

117-E. Designing Castings for Quality and Economy in Production. Commonwealth Engineer, v. 48, Oct. 5, 1960, p. 43-45.

Design of castings taking into account soundness, surface finish and machinability requirements of castings and ease of mold production. (E25, 17-51)

118-E. Production, Application and Economics of S.-g Iron. R. Burleigh and H. Turner. Foundry Trade Journal, v. 109, Dec. 15, 1960, p. 755-762.

Production of spheroidal-graphite cast iron by melting in an electric furnace, treating with Mg, casting and heat treating. The s.-g iron replaces gray iron, steel and malleable iron castings and forgings in iron foundry machinery. (E10r, E25, W19; CI-r, 17-57)

119-E. Where to Use Shell Mold Castings. Materials in Design Engineering, v. 53, Jan. 1961, p. 76-80.

Shell casting of Al, Cu, Mg, gray iron, malleable iron and steel is compared with investment casting and green sand mold casting processes as to cost, tolerances, surface finish, uniformity and post-machining requirements. (E16c; Al, CI, Cu, Mg, ST)

120-E. (Spanish.) Aluminum Castings. Pt. 3. D. Iturrioz. Metalurgia y Electricidad, v. 24, Dec. 1960, p. 67-76.

Solubility of hydrogen in Al and Mg at 660-850° C. as affected by alloying. Effect of water content in air, tools, refractories and molds on hydrogen absorption. Removal of hydrogen by passing Cl_2 and BF_2 through the melt, remelting and stirring. (E25, N16m; Al, Mg, H)

121-E. New Ashworth Die Casting Plant. Machinery, v. 97, Dec. 21, 1960, p. 1436-1437.

Design of a foundry producing Zn and Al pressure and gravity die castings on machines which thermostatically control metal temperatures. (E13, 18-67; Al, Zn)

122-E. (Italian.) Mechanical Strength of Shell Molds at Casting Temperatures. J. Szekeres. La Fonderia Italiana, Oct. 1960, p. 403-406.

Manufacture of shell molds from a sand containing 96.5% Si, 0.5% Fe_2O_3 and 2% Al_2O_3, 2-9% resin and 1-5% graphite. Cold and hot bend strength are measured at 1300° C. and cold and hot compression strength as functions of resin and graphite contents, density and baking time and temperature. (E19c, Q5, Q28, W19g)

123-E. (Russian.) Effect of Hot Blasting on the Burning Process in a Cupola. M. K. Sin. Liteinoe Proizvodstvo, Oct. 1960, p. 4-6.

Effect of hot blasting on the temperature during thermal and metallurgical processes, firing loss of Fe, Si, Mn, pickup of sulphur and efficiency of the cupola. 6 ref. (E10a; CI)

124-E. (Russian.) On the Zone of Burning in Large Cupolas. V. P. Chernobrovkin and A. A. Ananyin. Liteinoe Proizvodstvo, Oct. 1960, p. 8-9.

Experimental measurements of gas components and temperature show that maximum temperature and CO_2 content are found in the peripheral area of the cupola. Most intensive burning and

melting proceeds in this circular area (500 mm. wide) near the tuyeres. 4 ref. (E10a)

125-E. (Russian.) Casting of Large Crankshafts for Diesel Engines. M. G. Kvasman, A. A. Tunik and B. E. Begun. Liteinoe Proizvodstvo, Oct. 1960, p. 13-15.

Defects such as black spots on the casting surface are prevented by adding cryolite in addition to Mg during modification of the cast iron. This method improves mechanical properties and provides high durability in the crankshafts. 6 ref. (E25, W11j; CI)

126-E. (Russian.) Casting Crankshafts for the DB-30 Engine at the Vladimir Tractor Works. N. V. Galperin, V. V. Zvolinskaya, V. S. Parfenov and A. D. Sherman. Liteinoe Proizvodstvo, Oct. 1960, p. 16-17.

Higher quality crankshaft castings are produced when Ce instead of Mg is used for modification of the cast iron. Since the specific gravity of cerium sulphide is much greater than that of magnesium sulphide, distribution of the Ce compound in castings is uniform and black spots on the surface of the crankshafts are eliminated. (E25, T3n; CI)

127-E. (Russian.) New Semiautomatic Coreblowing Maching "ZIL". N. I. Rastimeshin, A. A. Agafonov and A. A. Zamasov. Liteinoe Proizvodstvo, Oct. 1960, p. 26-28.

Advantages of a coreblowing machine with ability to produce 25 kg. complicated cores with high durability in the green state. (E21g)

128-E. (Russian.) Metal Molds With Sand Coating. P. P. Berg and B. Yu. Feigelson. Liteinoe Proizvodstvo, Oct. 1960, p. 32-33.

Production of very precise castings using permanent metal molds coated with sand. (E12)

129-E. (Russian.) Study of Aluminum Crystallization During Continuous Casting With Radioactive Isotopes. V. O. Dobatkin and B. I. Simakovsky. Liteinoe Proizvodstvo, Oct. 1960, p. 34-36.

Effect of movement of the liquid metal during crystallization on the casting structure by introducing Ca^{45} radioactive isotope to the melt during casting of Al ingots 280 mm. diameter. (E25n, C5q, 1-59; Al)

130-E. (Russian.) Sulphur in Surface Layers of Steel Castings. M. I. Balashov. Liteinoe Proizvodstvo, Oct. 1960, p. 36-38.

Concentration of sulphur in the surface area of metal is a result of its contact with the gas phase of the sand mold. Experimental results show that sulphur content and external cracking are a function of SO_2 content in the gas phase. By decreasing sulphur content in the sand-mold mixture, cracks could be eliminated. (E25, E11; ST)

131-E. Production of Large 13% Chromium Steel Castings. F. Maran. Iron & Steel, v. 34, Jan. 1961, p. 7-10.

Castings of 13% Cr steel for H_2O turbines are produced by pouring, heating, annealing and cooling techniques which avoid tears and inclusions. (E-general, W11k; ST, Cr)

132-E. Casting Technology for Titanium, Zirconium and Hafnium. S. S. Ausmus, F. W. Wood and R. A. Beall. U. S. Bureau of Mines, Report of Investigations 5686, 1960, p. 1-31.

Application of centrifugal or spin casting and the skull melting method to casting reactive metals. Evaluation of mold materials, including machined graphite and rammed mold materials. Effects of current and furnace atmosphere on parameters of the casting technique. 11 ref. (E14, C5; Hf-b, Ti-b, Zr-b)

133-E. (German.) The Problem of Cast Iron Assessment and Role of Microstructure in Matrix. Albert Collaud. Giesserei, v. 47, Dec. 15, 1960, p. 719-732.

Correlations between tensile strength, degree of carbon saturation, hardness and modulus of elasticity for a series of cast irons melted in a basic hot blast or an acid cold blast cupola furnace. Quality assessment in terms of degree of maturity. New approach is used to assess elasticity and toughness of matrix in terms of microstructure. (E10, Q27a, Q29n, Q21, 3-71; CI)

134-E. Diecasting. H. K. Barton. Engineers' Digest, v. 21, Dec. 1960, p. 75, 77-126.

Al, Zn, Mg, Cu, Sn and Pb alloys are stamped, pressure diecast, molded, extruded, pressed, sintered and coated according to size, accuracy, complexity and cost requirements. Design of diecasting equipment including cold or hot chamber and shot-sleeve machines, some with automatic metal-feeding. (E13; Al-b, Cu-b, Mg-b, Pb-b, Sn-b, Zn-b)

135-E. Zinc Diecasting of Small Parts--Single Cavity Method Cuts Costs. John H. McDermott. Metalworking Production, v. 104, Nov. 16, 1960, p. 79-81.

Advantages of a single-cavity method with tools which produce finished parts built into the casting machine. Method is most effective when maximum size of the part is 1 1/2 in. and minimum run is 100,000 pieces. Secondary machining operations are eliminated. (E13; Zn)

136-E. Close-Tolerance Light Metal Castings. John Armstrong. Foundry, v. 89, Feb. 1961, p. 58-63.

Production of Mg and Al impellers, wave guides and other castings to tolerances of ±0.002 in. by shell molding, plaster molding and permanent mold processes. (E12, E16; Al, Mg)

137-E. Furan Hot Box Core Binders. Wayne H. Buell. Foundry, v. 89, Feb. 1961, p. 64-68.

Effect of curing time and temperature on tensile strength of resin bonded cores prepared from mixtures of furan resin and dry sand. Application of furan resins. (E21)

138-E. Sound Waves Improve Diecasting Quality. John A. Weber and Earle W. Rearwin. Foundry, v. 89, Feb. 1961, p. 69-71.

Application of ultrasonic and sonic wave length energy during diecasting to improve structure, mechanical properties and surface finish and to reduce rejects. (E13, 1-74)

139-E. Modernized Foundry Builds Business on Conversions. Robert H. Herrmann. Foundry, v. 89, Feb. 1961, p. 72-76.

Molding, melting, shakeout and annealing facilities for production of standard and pearlitic malleable iron castings. (E-general; CI-s)

140-E. Hold That Temper! W. P. Winter. Foundry, v. 89, Feb. 1961, p. 77-79.

Effect of moisture on bulk density, strength, permeability, deformation, toughness and flowability of molding sand. Mechanics of moisture control. (E18r)

141-E. Gating Magnesium Sand Castings. Robert C. Boehm. Foundry, v. 89, Feb. 1961, p. 80-87.

Design considerations for pouring basins, screws, screw bases, runners, risers and in-gates for sand casting Mg alloys. Screening practices. 10 ref. (E22p, E11; Mg-b)

142-E. Unit Simultaneously Performs Cleaning and Core Removal. George W. Powell. Foundry, v. 89, Feb. 1961, p. 134-136.

Simultaneous blast cleaning and core knockout of large pressure castings using a large abrasive separator barrel unit. (E24; 5-61)

143-E. Exothermic Riser Lining Gives Dual Benefits. Foundry, v. 89, Feb. 1961, p. 142.

Moldable exothermic compound which generates heat upon contact with molten metal and maintains high temperatures in the riser during the feeding process aids in casting curved, tapered high alloy steel mandrel and raises yield to 91.5%. (E22q; SS)

144-E. Refractory Mold Coating Aids Casting of Aluminum Gear Housings for Automatic Washers. Modern Metals, v. 16, Jan. 1961, p. 42.

Refractory coating for permanent mold minimizes scrap, guards against shrinkage and allows easy release of completed casting. (E12, W19c; Al)

145-E. Chevrolet Adopts European Casting Process for Corvair Engine. Metal Progress, v. 79, Feb. 1961, p. 84-87.

Adoption of low-pressure casting for producing engine components in this country required some changes over European practice. To meet demands of high production, Chevrolet engineers built heavier machines and added automatic controls for regulating temperature, pressure and mold manipulation. (E12, T21b; Al)

146-E. Meehanite Metal Solves Huge Casting Problem. Robert Austin. Western Metalworking, v. 19, Jan. 1961, p. 32-33.

Techniques employed in the vertical casting of 86,000-lb. Fe slabs. Castings are pit molded with slab cores to facilitate finishing. Knock-out cores are used in the risers. (E-general; Fe)

147-E. Modern Techniques in Melting and Casting. Engineer and Foundryman, v. 26, Nov. 1960, p. 45-46.

Electric furnace melting as a means of eliminating gaseous impurities in Cu castings. Horizontal casting of Cu in open Cu, sand or clay molds. (E10r, E11; Cu)

148-E. Specific-Surface and Grain Structure of Foundry Sands. F. Hofmann. Foundry Trade Journal, v. 110, Jan. 12, 1961, p. 45-47.

Method of finding actual specific surface is described and used in conjunction with sieve analysis to evaluate coefficient of angularity. Determination of the water absorption capacity of sands and its relationship to the actual specific surface. 5 ref. (E19r)

149-E. (Pamphlet.) The Technique of Gating Zinc Die Castings. R. L. Wilcox. May 1960, 43 p. American Smelting and Refining Co., 120 Broadway, New York 5, N. Y.

Gating rectangular, circular, tubular and multiple-cavity dies for production of ornamental automotive parts requiring finishing operations. (E22p, T21a)

150-E. Shell Cores and Sand Coating. A. W. Ulmer. Castings, v. 6, Nov-Dec. 1960, p. 9, 11, 13, 15, 17, 19.

Advantages of shell cores. Factors of grain fineness and distribution, purity, surface condition and clay content as they affect core sands. Cold, warm or hot methods of mixing sands and resins. (E19c)

151-E. Economy With the CO_2 Process. D. J. Cousins. Foundry Trade Journal, v. 110, Jan. 19, 1961, p. 79-80.

Production of CO_2 molding sand by charging reclaimed knockout into a roller-type mill, adding new, damp sand and sodium silicate to reduce lumps, then milling to original grading. (E18s)

152-E. GM Uses Semi-Permanent Molds to Cast Aluminum V-8 Blocks. Iron Age, v. 187, Feb. 16, 1961, p. 108-110.

Al alloy 356, clean scrap and chip metal are melted in gas-fired, reverberatory furnaces, tapped into delivery ladles, cast in semi-permanent molds having urea-sand cores and baked in vertical core ovens. (E12, E21, T21b; Al)

153-E. (French.) Solidification of Ferrous Alloys and of Industrial Gray Castings. John Obrebski. Metallurgie et la Construction Mecanique, v. 92, Dec. 1960, p. 1001-1003, 1005-1006, 1009, 1011.

Graphitization pressure and oxygen equilibria during slow solidification of gray castings. Structure and composition after solidification. (E25n, N8s; Fe-b, CI)

154-E. New Zinc Die Casting Alloy. Precision Metal Molding, v. 19, Feb. 1961, p. 29.

Development of a new Zn alloy containing 0.005-0.020% Mg and 0.005-0.02% Ni in ingot form which has improved castability and can be used for larger, more complex die castings with thinner walls and better surface. (E25p; Zn-b, Mg, Ni)

155-E. Standards in the Nonferrous Foundry. William A. Mader. Standards Engineering, v. 12, Dec-Jan. 1961, p. 8-10.

Sand, die, permanent mold, plastic mold, shell, centrifugal and investment casting of Al-Cu alloys. Dimensional tolerances for casting processes. Minimum section thickness for castings. Static design values (ultimate tensile, yield tensile, compressive yield and shear ultimate strength) for Al casting alloys. (E-general; Al-b, Cu)

156-E. The Permeable Plaster Precision Casting Process. W. A. Reid. Light Metals, v. 24, Jan. 1961, p. 7-9.

Development of plaster molds having a high degree of permeability by incorporating special inert fibrous materials, cement, finely graded sands, or talc, resulting in good surface finish (40 to 125 micro-in. C. L. A.) and closer dimensional tolerances in Al castings. Application of the method to investment and molding processes or with rubber core-boxes. (E16a; Al)

157-E. (Czech.) Centrifugal Casting of Gray Iron Cylinder Linings. Jiri Ptacnik.

Slevarenstvi, v. 8, Dec. 1960, p. 419-427.

Cast iron with approximately 4% C, 2-2.4% Si, 0.6-1.1% Mn, maximum 0.05% S, 0.3-0.9% P, 0.5-2% Ni, 0.5-2% Cu, 0.3-0.5% Mo, 0.15-0.50% V and 0.05-0.10% Ti is poured at 1420° C. into rotating hot molds. Effects of solidification range, kinetic viscosity, thermal conductivity of iron, diffusion of heat in the mold, solidification velocity, suppressed crystallization and complementary pressure on quality of castings. 12 ref. (E14; CI-n)

158-E. (Czech.) The Thermal Field of a Foundry Mold. Stanislav Slovak. Sbornik, v. 6, Jan. 1960, p. 25-32.

Computation of heat flow occurring during the solidification of castings, based on the values for latent heat of crystallization, specific weight of metal near the solidus point, linear solidification speed, heat accumulation in the mold, thermal conductivity, specific heat, temperature of mold surface and initial temperature of mold. 10 ref. (E25n)

159-E. (Czech.) Is Shrinkage of Nodular Cast Iron an Anomaly or the Rule? Josef Pribyl. Sbornik, v. 6, Jan. 1960, p. 51-68.

Volume change of gray, white and nodular cast iron during solidification. Effect of eutectic or hypoeutectic composition and of the carbon equivalent. 10 ref. (E25n; CI)

160-E. (Czech.) Effect of "Olzite" Additions During Ingot Casting on Quality of Deep Drawing Sheet. Josef Teindl and Bohuslav Otta. Sbornik, v. 6, Jan. 1960, p. 69-83.

Effect of 2-6 kg. "Olzite", a mixture of 70% Fe scale, 20% CaF_2 and 10% Na_2CO_3 added to a 6 ton ingot, on deep drawing properties of sheet manufactured from the ingot. Effect of phosphorus and sulphur. 12 ref. (E25q, G4, 17-52; ST, 4-53)

161-E. Sand Control in the Foundry. J. Gerin Sylvia. Current Engineering Practice, v. 3, Dec. 1960, p. 17-20, 28.

Review of structural, green, dry, hot and retained properties of foundry sands as they affect molding operations. (E18r)

162-E. (Czech.) Manufacture of Recuperator Tubing. Ludvik Bohacek. Slevarenstvi, v. 8, Dec. 1960, p. 429-430.

Recuperator tubing with internal and external fins is manufactured from cast iron containing 3.5% Cr and heat resistant steel by casting in green sand molds with bentonite, using cores with 1.1% oil, 1.25% dextrin and 0.4% water. (E11; CI, Cr, SS, SGA-h)

163-E. (Czech.) Technical Measurements Carried Out in a Cupola Furnace. Karel Satar. Slevarenstvi, v. 8, Dec. 1960, p. 435-436.

Measurement of blast quantity, pressure and humidity of gas and melt temperatures. Gas analysis. Automatic furnace control. (E10a)

164-E. (Czech.) Foundry Practice With Al Bronze CSN 423144. Zdenek Gause and Eduard Kohout. Slevarenstvi, v. 8, Dec. 1960, p. 443-446.

Casting of bushings and worm gears in sand molds containing 5.5-6% water and exhibiting a compression strength 500-550 g. per sq. cm. Design of pouring and gating systems. Tensile strength, ductility, hardness and specific weight of castings. (E11, T7; Cu-s, Al, 17-57)

165-E. (Czech.) Manufacture of Castings With Smooth Surfaces. Slevarenstvi, v. 8, Dec. 1960, p. 452-453.

To produce thin-walled gray iron castings of 0.60 kg. average weight, molds are made from a natural sand of a certain particle size. Mixture contains 70% sieved dry old sand, 23% dry new sand and 7% coal powder and has a moisture content of 8-9%. Composition of core mixture. (E11; CI-n)

166-E. (Spanish.) Production of Cast Aluminum Pieces. D. Itturioz. Metalurgia y Electricidad, v. 24, Nov. 1960, p. 93, 95, 97-99, 101, 103, 105-106.

Epoxy application for the production of patterns and pattern plates for Al castings. Preparation of the plastic, method for pattern production and storage of the patterns. Technique of Al casting with epoxy patterns. (E17, E-general, W19j; Al)

167-E. Jumbo Pump Impellers Cast in CO_2 Type Molds. Steel, v. 148, Feb. 20, 1961, p. 75.

Preparation of cores and molds for casting pump impellers composed of high Sn, manganese bronze, using the CO_2 process to produce a firm, hard mold surface. (E21, E19b, E13; Cu-s, Mn, Sn)

168-E. PT Process Licks Casting Shrinkage. Asarco Nonferrous Metals Digest, v. 2, Feb. 1961, p. 7.

Elimination of shrinkage and interconnected porosity in the casting of Al alloys by using a new pressure-tight refining process which can be applied to most standard Al sand and permanent mold casting alloys. (E25, C-general; Al-b)

169-E. (German.) Influence of Die Blackening on Formation of Gray Structure During Die-Casting. Edwin Bakovsky. Giesserei Technik, v. 6, Dec. 1960, p. 353-358.

Die casting tests are made on GG 26 cast iron using blackenings such as graphite-soda water-glass-water mixture, SiC, silicone, Al pigment and SiC at initial die temperatures of 100-520° C. Selection of proper blackening and die temperature to obtain gray microstructure. (E25q, E13; CI-n)

170-E. (German.) Special Operations in Cupola Melting. Pt. 4. Wolf Friedel. Giesserei-Technik, v. 6, Dec. 1960, p. 363.

Melting of cast iron at increased temperature in the cupola furnace with single, intermittent and continuous oxygen additions to blast (up to 23%) or with separate oxygen additions by nozzles directly into furnace. (E10a; CI)

171-E. (German.) Scrap in Gray Iron Die Casting. Causes and Methods of Prevention. Pt. 2. Klaus Herfurth. Giesserei-Technik, v. 6, Dec. 1960, p. 364-367.

Cause and elimination of die casting defects such as white structure, rough surface, sand and slag inclusions, blow holes, dimensional off-size, porosity, cracks, improper microstructure and improper composition. (E25; CI-n)

172-E. (German.) Hollow Sections in Pressure Die Castings. W. Rubisch. Giesserei-Technik, v. 6, Dec. 1960, p. 367-368.

Production and use of plastic cores in pressure die casting of complicated hollow shapes. Core is removed by annealing for 30 min. at 500° C. (E13)

173-E. Vacuum Units Enhance Investment Castings. Steel, v. 148, Feb. 27, 1961, p. 114-115.

Developments in the production of Ni alloy castings include vacuum investment casting, techniques for control of casting grain size and diffusion coatings to improve oxidation resistance. (E15, 1-73, L15; Ni-b)

174-E. Electrospark Forming: New Way to Shape Hard-to-Form Metals. Iron Age, v. 187, Feb. 23, 1961, p. 98-99.

Shaping of Ti, W and stainless steel by capacitor discharge electrospark forming, a new process in which controlled explosions create shock waves of high force which blow intricate contours into the metals in millionths of a second. (E24a; SS, Ti, W)

175-E. Developments Spur Interest in Investment Casting. C. L. Kobrin. Iron Age, v. 187, Feb. 23, 1961, p. 100-101.

New developments in production of Ni alloy castings include a vacuum investment casting process, technique for controlling grain size and pack-type process for diffusion coating. (E15 1-73; Ni-b)

176-E. Risering Magnesium Sand Castings. R. C. Boehm. Foundry, v. 89, Mar. 1961, p. 76-80.

Use of risers to eliminate shrinkage, provide vents, avoid the hydraulic ram effect, indicate when the mold is full and eliminate blows and misruns. Determination of correct riser size, shape and spacing. 20 ref. (E22q, E11; Mg)

177-E. Use of Wetting Agents in the Foundry. W. N. Richards. Foundry, v. 89, Mar. 1961, p. 81-83.

Use of water treated by wetting agents in mulling sand and bentonite molding sands to increase green compression strength, decrease mulling time and improve covering characteristics. (E18)

178-E. Producing High-Conductivity Copper Castings. V. R. Fulthorpe and F. M. Bunbury. Foundry, v. 89, Mar. 1961, p. 84-87.

Control of hydrogen and oxygen content to avoid porosity by melting alloy

under a cover of charcoal or under an oxidizing atmosphere or flux cover with cuprous oxides being eliminated by addition of calcium boride or lithium to the melt. Effect of heat treatment on hardness and electrical conductivity. (E10, Q29n, P15g; Cu, 5)

179-E. (Russian.) Molds for Large Steel Castings. A. V. Lomakin, F. L. Mirsky, N. D. Misochko and A. G. Alexandrov. Liteinoe Proizvodstvo, Nov. 1960, p. 29-31.

Casting of large 35T steel parts for forging machines in the "jacket" type mold, the mold being made in a tight flask (jacket) and assembled from sand-glass cores. Advantages of the process include precise dimensions of castings, decreased metal consumption and reduced production time. (E12, W22; ST)

180-E. (Russian.) Use of Pig Iron in Cupola Melting. V. M. Gorfinkel and L. V. Zhikin. Liteinoe Proizvodstvo, Nov. 1960, p. 31-32.

Improvement of mechanical properties of cast iron by decrease of steel scrap content in the charge and addition of 10% pig iron, keeping constant the sum (C + Si), with additional C in the pig iron making it possible to decrease content of Si and obtain the desired structure. (E25, E10a; CI)

181-E. (Russian.) Casting of Piston Rings From the Cupola and by Duplex Process. D. P. Glukhov. Liteinoe Proizvodstvo, Nov. 1960, p. 33-34.

Suggested change composition, temperature, hot blast and aftercharge for conventional and continuous casting of steel piston rings. Effect of C and Si content on quality of castings, optimum composition being 3.6-3.7% C and 2.4-2.6% Si. Disadvantages of casting by duplex process. (E-general, C5q, T21b, 2-60; ST)

182-E. Technical Control in Steel Foundries in North America. Clyde B. Jenni. Foundry Trade Journal, v. 110, Jan. 26, 1961, p. 101-106.

Continuation of a survey on North American foundry practice including molding, coremaking, sand reclamation and cleaning operations. (E-general)

183-E. Sand and Its Relationship to Efficient Production by CO_2 and Dry Sand Molding Processes. F. A. Butler. Foundry Trade Journal, v. 110, Jan. 26, 1961, p. 113.

Production of castings for the textile industry by the CO_2 process, using sand dried in a drying and cooling plant or sand containing moisture with parting spirit additions to prevent sticking. Methods of overcoming dummy and rough scabbing, swelling and collapse of molds during drying when molding by the dry sand process. (E19)

184-E. The First National Die Casting Congress. Machinery (London), v. 97, Dec. 28, 1960, p. 1475-1486.

Review of papers presented at the Congress, which dealt with the following topics; die design, die construction, metallurgical developments, processes competitive with die casting, casting costs, quality control and vacuum die casting. (E13)

185-E. Die-Making for the Automobile Industry by the Shaw Process. T. Murao. Foundry Trade Journal, v. 110, Feb. 2, 1961, p. 149-152.

Casting of large dies for press tool and die casting operations from heat resisting steel and cast iron. Cr percentage is increased to prevent cracking. Special attention is given to distortion caused by shrinking of plaster with a 1% shrinkage being allowed on castings. (E16a; CI, SS, SGA-h)

186-E. Eliminating Defects in Complicated Castings. W. R. Patterson. Western Metalworking, v. 19, Feb. 1961, p. 28-29.

Control or repair of defects such as cracks, centerline shrinkage and surface imperfections on complex castings such as turbine runners. (E25q)

187-E. (French.) Influence of the Introduction of Filters Into the Casting System for Magnesium Alloys. Jean Bonnetain and Michel Drouzy. Fonderie, Dec. 1960, p. 495-505.

Sand-casting tests with a Mg alloy (ZRE1) containing 3% Zn, 3% rare earth metals and 0.6% Zr, with or without the application of filters. Radiographic and micrographic analysis of structures and solidification phenomena. 5 ref. (E11, E25q; Mg)

188-E. Cracks in Mold Make Better Castings. Steel, v. 148, Mar. 6, 1961, p. 68-69.

Deliberately induced microcracks in a ceramic mold aid in the production of precision castings by eliminating preheating, reducing risering requirements and improving casting surface. (E15, E19)

189-E. (Japanese.) Ultrasonic Casting. Yoshiroh Hori. Ohm, v. 47, Nov. 1960, p. 54-57.

Ultrasonic cavitation and microstirring effects are applied to casting of Sn-Zn alloy, Al, Al-Cu alloy, Al-Si alloy, Al-Mg alloy, Pb dispersed Al alloy to determine effect on amount of casting inclusions and casting soundness and refined grain structure. (E-general, 1-74; Al-b, Sn-b, Cu, Mg, Si)

190-E. Castings on the Move. Foundry Trade Journal, v. 110, Feb. 9, 1961, p. 167-172.

Melting, molding and casting procedures in a foundry producing spheroidal graphite gray iron castings. Design of melting plant, coreshop, sand preparation plant and fettling department. (E-general; CI-n)

191-E. Mold Materials and the Mechanical Properties of Cast Non-Ferrous Alloys. M. R. Seshadri and A. Ramachandran. Foundry Trade Journal, v. 110, Feb. 9, 1961, p. 173-178.

Effect of nonmetallic mold materials such as silica sand, magnesite and SiC, and metallic mold materials such as anodized Al and cast iron on the mechanical properties of cast Al-Cu-Si alloys and Al bronze. 6 ref. (E25, Q-general; Al-b, Cu, Si, Cu-s)

192-E. Good Planning Precludes Snags in Casting Huge Impellers. Iron Age, v. 187, Mar. 9, 1961, p. 88-89.

Sand casting of 10,000 lb. high Sn Mn-bronze impellers using CO_2 molded cores and an annular riser over the heavy plate section. (E11; Cu-s, Mn, Sn)

193-E. (French.) Some SG Cast Irons With Special Reference to Austenitic Irons. Jacques Grilliat and Roger Poirot. Fonderie, Nov. 1960, p. 449-461.

Casting of boiler fittings, cam rings, valve housings, generator and gas turbine stators from ferritic and Ni, Cr and Cu alloyed austenitic SG irons. Data for tensile strength, yield points, elongation, modulus of elasticity, shear and compression strengths. 16 ref. (E11, Q-general; CI-r)

194-E. (German.) Metallic Materials and Ultrasonics. J. Kolb. Radex Rundschau, Dec. 1960, p. 323-331.

Production of ultrasonic frequencies by magnetostrictive and piezo-electric methods. Metallurgical application of high-intensity ultrasonics in degassing and dispersion of liquid metals in grain refinement during solidification of melts, magnetization of metals and surface purification during soldering. Use of ultrasonics in material testing and basic physical research. (E25, K7h, L10f, 1-74)

195-E. Electric Steel Degassing and Furnace Maintenance. Foundry, v. 110, Feb. 16, 1961, p. 207-209.

Vacuum-spray or ladle degassing of melts of 0.30% carbon steel to eliminate porosity and fisheye fracture in the castings. Castings show full tensile ductility without tempering or normalizing. (E25s; CN)

196-E. Hyper-Eutectic Aluminum-Silicon Casting Alloys. S. J. Ashton, J. Muir and W. M. Doyle. Metal Industry, v. 98, Feb. 17, 1961, p. 123-125.

Hyper-eutectic Al-Si alloys having high wear resistance and low coefficient of thermal expansion give satisfactory performance only when the microstructure contains small, uniformly distributed primary Si particles. Addition of phosphorus in small amounts to the melt prevents the formation of large Si particles and thus maintains the satisfactory performance of the alloy. 9 ref. (E25q, 2-60; Al-b, Si, P)

197-E. Influence of the Melting Condition on the Graphitization and the Casting Structure of White Cast Iron. Taira Okamoto and Masao Ibaraki. Imono (Japan Foundrymen's Society, Journal), v. 32, Nov. 1960, p. 772-780.

Graphitization rate and resultant microstructure as a function of temperature and holding time of melt after the addition of ferrosilicon, change in the content of gaseous N and O and of Fe-O being the rate controlling factors. 20 ref. (E25q, N8s; CI-p)

198-E. Chilling Effect of Fins on Castings. Masatoka Sugiyama and Tatsuichi Fukusako. Imono (Japan Foundrymen's Society, Journal), v. 32, Nov. 1960, p. 780-788.

Heat absorption and heat flow from the casting body as achieved by self cooling fins, the thin extended projection of the casting, as a function of fin size, shape, number and spacing and casting size. Application to directional solidification phenomena and influence on cooling rate. Effectiveness in chilling castings of Al, Al bronze, cast iron and yellow brass. 5 ref. (E22s, E25; Al-b, Cu-b, CI)

199-E. Gravity and Pressure Die Casting at the Works of Thomas Ashworth & Co., Ltd., Burnley. R. E. Green. Machinery (London), v. 98, Feb. 22, 1961, p. 439-443.

Examples of Al and Zn castings, the dies in which they are produced and auxiliary operations performed in the factory. Illustrated are an instrument mounting bracket, radar components and switch box for armored vehicles. (E13; Al, Zn)

200-E. (German-French.) Casting of Al Parts for Anodic Oxidation Coating. E. A. Bloch and H. Arbenz. Aluminium Suisse, v. 11, Jan. 1961, p. 34-43.

Solidification interval, shrinkage coefficient, hot cracking tendency, casting properties, oxidation tendency and tensile strength of the alloys GAl-3Mg, GAl-5Mg, GAl-5Zn-Mg, GAl-4Mg-Zn, GAl-2Si-Mn-Mg, GAl-5Si-Mn-Mg. GAl-5Cu-Ti and GAl-10Si-Mn-Mg. Molding and risering practices. Effect of casting defects on the quality of coatings. (E25, L19; Al-b)

201-E. Production Setups Extend Scope of Diecast Aluminum Engines. R. H. Eshelman. Iron Age, v. 187, Mar. 16, 1961, p. 120-122.

Production of six cylinder diecast engine blocks using a special machine with 2000 ton locking pressure. (E13, T21b; Al, 17-57)

202-E. "Cloud Nine"--Permanent Mold Casting of Steel. S. I. Smolensky, N. N. Guglin, G. F. Zasetsky, A. K. Provorny and V. A. Tutev. Modern Casting, v. 39, Feb. 1961, p. 40-43.

Russian technological report on pouring of large steel box-type castings. Test results on the longevity, warping and crack formation of steel molds used for castings as affected by chemical content, annealing, thickness, density and rigidity. Maximum production of 250 castings per mold is achieved through control of test factors. (E12; ST)

203-E. Modernization Slashes Costs, Castings Replace Stampings. John Vanhaver. Modern Castings, v. 39, Feb. 1961, p. 44-47.

Through modernized assembly line techniques and improved control over green sand mold preparation, pattern plate sticking and shakeout, increased efficiency and reduced costs are achieved in the production of semi-precision, thin-walled iron castings. (E15; Fe)

204-E. Lightweight Cellular Metal. L. Polonsky, S. Lipson and H. Markus. Modern Castings, v. 39, Feb. 1961, p. 57-71.

A foundry process for producing cellular Al billets and shaped castings. Before pouring, the molds are filled with soluble granules which are leached from the finished casting. Mechanical characteristics including infiltration efficiency, compression, microstructure and density are determined and industrial applications suggested. 4 ref. (E25q; Al)

205-E. Systematic Approach to Sand Design and Control. G. J. Vingas and A. H. Zrimsek. Modern Castings, v. 39, Feb. 1961, p. 93-109.

Investigation of a foundry sand-clay-water system using bentonite and fireclay to determine the effects of addition techniques and mulling time on green and dry compression and shear strengths, green tensile strength, strength ratios and density. (E18r)

206-E. Aircraft-Missile Steel Castings. S. A. McCarthy. Modern Castings, v. 39, Feb. 1961, p. 110-114.

Analysis of factors of design coordination and procedures, production concessions, riser placement problems, weight control and rejection standards with reference to steel castings for aircraft and missiles. Effect of these factors on stress distribution in application. (E-general, T24; ST, 17-57)

207-E. Hot Core Box Design and Engineering. E. E. Harkness. Modern Castings, v. 39, Feb. 1961, p. 115-120.

Factors of box and core expansion and heat, sand and chemical control as they affect core box design when using binders composed of various combinations of urea, formaldehydefurfural and single stage phenolic resins in shell molding process. (E19c; NM-f45)

208-E. (German.) Effect of Flux Additions During Mold Casting of Rimming Deep-Drawing Steel and Their Influence on Sheet Quality. Josef Teindle and Bohuslav Otta. Neue Hutte, v. 6, Jan. 1961; p. 17-22.

Addition of flux composed of 70% scale, 20% fluorospar and 10% soda during casting of test ingot. Subsequent mechanical testing, deep-drawing testing and chemical investigation of hot rolled sheet to determine mechanical and deep-drawing properties, aging behavior and sulphur segregation. (E25r, G4, 17-52, Q-general; ST-d)

209-E. Minicast Does it Cheaper for Tiny Parts. J. H. Cadieux. Product Engineering, Design Work Sheets, 14th Series, 1961, p. 68-69.

Small parts produced from Al alloys, carbon and stainless steels, Cu alloys and Co alloys by investment casting followed by sizing. Tolerances and surface finish obtained with plastic patterns and lost wax processes. (E15; Al-b, CN, Co-b, Cu-b, SS)

210-E. Practical Observations on Mold Stability as a Factor in Controlling the Soundness of Gray Iron Castings. A. D. Morgan and J. M. Greenhill. British Foundryman, v. 56, Feb. 1961, p. 45-53.

Porosity problems occurring in production of brake drum, large roll, valve body and crank shaft castings. Gaging mold wall movements by weight and dimensional measurements. Relationship between mold rigidity and the incidence of porosity. 8 ref. (E25q; CI-n)

211-E. What to Expect From Vacuum Diecasting. F. C. Bennett. British Foundryman, v. 56, Feb. 1961, p. 54-58.

Fundamental problems involved in pressure die casting under vacuum conditions with elevated molds. Evaluation of advantages of vacuum casting including reduction in injection pressure and porosity, improved surface and less oxidation of injected metal. Vacuum die casting machines. (E13, 1-73)

212-E. Evaluation of Feeding Heads and Feeding Aids for Castings. British Foundryman, v. 56, Feb. 1961, p. 66-90.

Effects of feeder design, pouring temperature, casting shape and use of insulating and exothermic feeding aids on percentage yield and soundness of gray iron, nodular graphite iron, malleable iron, carbon steel, Cu alloy and Al alloy test castings produced in green sand, dry sand or CO_2 processed molds. Design of feeders. 44 ref. (E23, E25; Al-b, CI, CN, Cu-b)

213-E. (Japanese.) Mold for Titanium Casting. Motoyuki Nakamura and Sorchiro Tachibana. Government Industrial Research Institute, Reports, Nagoya, v. 10, Jan. 1961, p. 8-14.

Casting Ti in an expendable graphite mold composed of graphite powder, pitch and rapid drying oil. Effect of mold surface condition and baking conditions on mold contamination. Optimum chemical composition and baking conditions for best expendable graphite mold. 8 ref. (E19, E16; Ti)

214-E. (French.) Serial Production of Cast Iron Piston Rings. Pierre Hemard. Ingenieurs de l'Automobile, v. 34, Dec. 1960, p. 653-658.

Stack casting of piston rings from a melt containing 3.40-3.80% C, 2-3% Si, 0.50-0.80% Mn, 0.20-0.80% P and max. 0.10% S. Molding and machining operations. (E11, T21b; CI, 17-57)

215-E. (French.) Casting of a Massive Bronze Part. Journal d'Informations Techniques des Industries de la Fonderie, Feb. 1961, p. 10-13.

Metal is melted under a flux composed of 50% MnO_2, 25% Na_2CO_3 and 25% quartz, then degassed at 1190-1200° C. by nitrogen, deoxidized by adding 0.5% Zn and 0.15% copper phosphide and sand cast at 1050-1060° C. Location of exothermal inserts and chill plates. Molding and risering. (E13, E25s, E-general, Cu-s)

216-E. (Pamphlet.) Sand and Permanent Mold Casting. Paper from "Federated Aluminum Casting Alloys Handbook". American Smelting and Refining Co., New York, 1960, p. 15-22.

Heating, pouring and degassing methods in sand, permanent mold and shell casting of Al alloys. Effect of moisture, gas absorption, dross content, pouring temperature and solidification phenomenon on crack formation and other aspects of casting quality. (E11, E12, E25; Al-b)

217-E. (Pamphlet.) Die Casting. Paper from "Federated Aluminum Casting Alloys Handbook". American Smelting and Refining Co., New York, 1960, p. 23-26.

Crucible, electric and reverberating furnace melting of Al-Si and Al-Cu-Si eutectic alloys for die castings. Causes of common casting defects and use of fluxes to eliminate dross, gas and foreign matter. (E10, E13; Al-b, Si, Cu)

218-E. Acid-Lined Cold Blast Cupola Performance-Effect of Tuyere Size and Determination of the Optimum Operating. H. J. Leyshon and R. B. Coates. BCIRA Journal (British Cast Iron Research Assoc.), v. 9, Jan. 1961, p. 24-45.

Tuyere ratios from 1:53 to 1:2.6 and blast rates from 1200-2400 cu. ft. per min. were used in a cupola of 29 in. internal diameter. The widely used design melting rate of 0.75 ton per sq. ft. per hr. is satisfactory but this rate may be increased provided that the coke:metal ratio does not necessitate a blast rate in excess of 440 cu. ft. per sq. ft. per min. (E10a)

219-E. Influence of Cold Blast Cupola Practice on Casting Properties and Iron Composition. K. E. L. Nicholas. BCIRA Journal (British Cast Iron Research Assoc.), v. 9, Jan. 1961, p. 46-66.

Effect of tuyere size and blast rate on the properties of hypo-eutectic gray iron produced in the BCIRA experimental cupola operating with acid lining and cold blast. Tuyere diameter has no effect on properties, composition and degree of eutectic nucleation but blast rate exerts a significant influence. (E10a)

220-E. Acid-Lined Cold Blast Cupola Performance--Effect of Tuyere Size and Determination of the Optimum Operating Condition. Pt. 2. Experimental and Operational Methods Used in the Cupola Investigation. H. J. Leyshon and R. B. Coates. BCIRA Journal (British Cast Iron Research Assoc.), v. 9, Jan. 1961, p. 67-94.

Selection and weighing of materials, measurement of blast rate, melting rate and metal temperatures; sampling and analysis of metal and slag and top gases; measurement of top gas temperatures and lining wear. Operational methods. Calculation of heat balances. (E10a)

221-E. Inoculation and Casting Expansion. K. E. L. Nicholas. BCIRA Journal (British Cast Iron Research Assoc.), v. 9, Jan. 1961, p. 103-116.

Inoculation of hypo-eutectic gray cast irons produces a rise in degree of eutectic nucleation and an increase in unsoundness. The characteristic unsoundness of inoculated gray cast irons is due to increased casting solidification expansion which is related to the degree of eutectic nucleation. The effect is most pronounced in light and medium section castings. (E25q)

222-E. De-Sanding of Cylinder-Heads With Molten Caustic Soda. C. S. Johnson and R. Williams. Foundry Trade Journal, v. 110, Mar. 2, 1961, p. 265-268.

Sand remaining on Fe castings after decoring, shakeout or shotblasting is removed by immersion in molten caustic soda at 500° C. (E24; Fe)

223-E. Shell-Molding of Motor-Cycle Cylinders. Lajos Kelemen. Foundry Trade Journal, v. 110, Mar. 2, 1961, p. 275-277.

Casting of MOV 28 quality cast iron in shell molds composed of resin coated sand. Slag formation and gas porosity are eliminated by proper runners and gates, proper casting position and ventilation. (E16c; CI)

224-E. Refinement of Aluminum-21% Silicon Casting. Myron G. Urdea and Yeshwant P. Telang. Metals Engineering Quarterly (American Society for Metals), v. 1, Feb. 1961, p. 54-67.

An effective cycle of melt preparation and modification with a copper-phosphorus brazing alloy rod has been developed. This treatment at 0.03% P level gives a consistently high degree of refinement 15 lb. heats; consequently, the ultimate tensile and yield strength levels of 43,000 and 40,000 psi. respectively, the hardness range of 126-156 Bhn and 0.5-2.0% elongation have been realized in precipitation hardened specimens. 15 ref. (E25q; Al-b, Si)

225-E. Present-Day Foundry Practice. L. C. Barton. Machinery Lloyd (Overseas Edition), v. 33, Feb. 4, 1961, p. 39-44.

Shell molding of ferrous and nonferrous metals including stainless steels, iron and Al with resin bonded, thermo setting sand to produce castings with tolerances to 0.0005 in. Effect of runner form and gate size on scrap rate. (E16c; Al, Fe, SS)

226-E. Cast Titanium by New Method. Iron Age, v. 187, Mar. 23, 1961, p. 85.

Development of Impel casting, a permanent mold technique for casting of Ti which permits production of at least 40 parts per mold. Castings have good surface finish, meet close tolerances and require little or no machining. (E12; Ti)

227-E. Exothermic Risering Effects on Properties of Cast Armor Steel. J. M. Ingraham. Watertown Arsenal Laboratories. U. S. Office of Technical Services, PB 161698, June 1960, 35 p. $1.

The use of moldable exothermic riser sleeves can help solve the problem of feeding castings of complex geometry and increase production. A limited study of the effects of exothermic risering on the physical and mechanical properties of a casting in the riser area demonstrates the value of using such sleeves. (E22q; ST)

228-E. Permanent Molds Lower Titanium Part Expense. Steel, v. 148, Mar. 27, 1961, p. 170.

Permanent mold casting of Ti pump housings, impellors and valve housings by a process in which double melted Ti is impelled into a die cavity. Cores up to 12 in. have been pulled successfully. (E12; Ti)

229-E. (French.) Quality Improvement of Loudspeakers by Die Cast Frames. Harold W. Bredin. Machine Moderne, v. 15, Feb. 1961, p. 49-50.

Die cast frames manufactured from Zamac 3 Zn alloy show higher rigidity and damping power in comparison to mold cast frames. (E13; Zn)

230-E. New Die Foundry in Lancashire. Light Metals, v. 24, Mar. 1961, p. 80-81.

Pressure and gravity die casting of Al and Zn followed by trimming on a hydraulic press. Design of plant. (E13; Al, Zn)

231-E. (French.) Sand Molding for Light Metal Casting. Pt. 1. Charles Roinet. Revue de l'Aluminium, v. 37, Dec. 1960, p. 1434-1442.

Design of models, core blowing and molding processes applied in light metal casting. Various types of flask and core boxes. (E19, E21; EG-a39)

232-E. (Czech.) Investigation of the Metal Flow in Pouring Systems and Molds by Means of Plexiglass Models. Miroslav Bednarik. Slevarenstvi, v. 9, Jan. 1961, p. 2-5.

The flow of water or mercury in transparent models is recorded by motion pictures to obtain information on shape of metal surface during casting, formation of eddies and conditions for the penetration of oxide films into the metal. 10 ref. (E-general, 17-57)

233-E. (Czech.) Use of CaC_2 in the Melting of Gray Cast Iron in the Acid Cupola Furnace. Drahoslav Strasky, Milan Kacirek and Otto Matousek. Slevarenstvi, v. 9, Jan. 1961, p. 8-10.

Technical index for charging a cupola with a metallic charge weighing 350 kg. containing 20% steel scrap, 11-12% coke, 3% limestone and 2-5% CaC_2. Effect of CaC_2 on melt temperature, furnace efficiency, lining wear, slag and waste gas compositions. (E10a, 2-60; CI-n)

234-E. (Czech.) The Bearing Alloy VUK_2. Alois Sosolik. Slevarenstvi, v. 9, Jan. 1961, p. 14-16.

Production of an Al alloy containing 7.5-8.5% Cu, 1-1.6% Fe, 1-1.25% Si, 0.5% Mg, 0.3% Mn and 0.2% Zn showing the phases Al, Al_2Cu+Al and Al_2Cu+Si+Al by melting in a graphite crucible and casting at 720-740° C. into sand molds containing no more than 4% moisture or in dry sand molds. Effect of casting temperature on tensile strength. 10 ref. (E11, M26, Q27, 2-61; Al-b, SGA-c)

235-E. Aluminum Generator Rotors Are Centrifugally Cast. Materials in Design Engineering, v. 53, Mar. 1961, p. 13.

Electric generator rotors produced by centrifugally casting Al around steel

laminations, magnets and binding rivets. (E14, T11q; Al, ST, 7-59, 17-57)

236-E. Investment Foundry Yields Zoom With New Feeding System. Steel, v. 148, Apr. 3, 1961, p. 86-87.

Reduction of the gating system in an investment casting resulting in retention of more heat within the molten metal, thus increasing production and decreasing scrap. 4330 and 5355 A steel investment castings formed by the method are tested for flaws using X-rays and macroetching. (E15, E22p; ST)

237-E. Design and Application of Investment Castings Produced by Centrifugal Methods. I. L. Gwynn. Engineering Materials and Design Conference, Proceedings, Feb. 1960, p. D1-D12.

Production of investment castings by the Picast method, with design consideration for mold and component forms. Application of the method to carbon, low alloy austenitic stainless, spring and toolsteels; age hardenable and case hardenable alloys; Ni, Al, Cr and Cu base alloys; and hard facing, heat and corrosion resistant high-strength, nondistorting and magnetic alloys. Data are given for material properties and applications. (E15; SGA, SGB, ST, Al-b, Cu-b, Ni-b, Cr-b, 17-57)

238-E. (Italian.) System of Casting, Riser and Gating. Fonderia, v. 10, Jan. 1961, p. 27-30.

Rigging practice in the casting of iron and steel. Size of riser and casting and cooling rate influences on technical parameters. (E22)

239-E. Plaster Die Gives Accurate Prototypes for Die Casting. William G. Newton, Jr. Product Engineering, v. 32, Apr. 3, 1961, p. 54-55.

Zn or Al alloy is injected into plaster molds at low pressure to make pre-production guides for die casting. (E13, 3-74, 17-56; Al-b, Zn-b, 17-57)

240-E. Casts Exhaust Port Valves on Automated Shell Mold Line. Robert H. Herrmann. Foundry, v. 89, Apr. 1961, p. 58-61.

Production and quality control procedures for Ni-Cr steel automobile engine exhaust port valves cast in four part, resin-bonded sand molds, including automatic mold-making, gate core and pouring cup, shakeout, degating, assorting and assembly line transportation techniques. (E11, E-general, T21b; SS, 17-57)

241-E. How to Save Brass Foundry Metal. Harry St. John. Foundry, v. 89, Apr. 1961, p. 65-67.

Achievement of minimum metal loss in brass foundry operation through adequate control of metal oxidation and volatilization during casting, reduction of nonproductive metal in castings and quality control of casting soundness. (E25; Cu-n)

242-E. Gating and Risering Investment Castings. Hyman Rosenthal. Foundry, v. 89, Apr. 1961, p. 68-72.

Review of the nomenclature, pattern design and orientation, flask-molding procedures and nesting systems relative to gating and risering of ferrous and nonferrous investment castings. (E22)

243-E. Developments Expected to Broaden Investment Castings Market. Foundry, v. 89, Apr. 1961, p. 170.

Increased utility of investment castings achieved through production developments including control of grain size, improved coring, use of protective coatings and vacuum melting and casting processes. (E15)

244-E. Do Old Theories Apply in New Technique of Gating? Leo E. Carr. Foundry, v. 89, Apr. 1961, p. 81-83.

Procedure used in casting sound 2 1/2 in. steel test cubes from a hollow sprue gating system achieving beneficial blanketing, thermal wedge, end and superheated sprue effects and resulting in reduction of warpage, shrinkage and hot tearing and increase in casting yield. (E22p; ST)

245-E. Overcoming Porosity. Metal Industry, v. 98, Feb. 24, 1961, p. 147-148.

Effect of feeding speeds and cycling rates on the porosity and soundness of Zn and Al pressure die-castings. (E13, 9-68; Al-b, Zn-b)

246-E. (Translation-Brutcher no. 5029.) Hot Cracking of Castings and Welds. A. A. Bochvar. Liteinoe Proizvodstvo, Oct. 1960, p. 47.

First attempt at generalizing the mass of data now available on the capacity of

metals to resist hot (crystallization) cracking in casting and welding. (E-general, K-general, 9-72)

247-E. (Translation-Brutcher no. 4898.) Crystallization of Castings Under the Action of Sonic and Ultrasonic Vibrations in the Liquid Metal. C. F. Balandin. Izvestiya Vuz-Mashinostronie, Apr. 1960, p. 24-31.

Examples of metal cast with the fountain instead of the mold vibrating; nature of effect of vibrations explained on basis of special experiments. Role of fragmented solid phase during crystallization; effect of slow versus high rates of cooling of metal poured through a vibrating funnel. (E25, 1-74)

248-E. (German.) Defects and Their Elimination on Gray Iron Castings. H. Lehmann and P. Lairich. Technik, v. 16, Feb. 1961, p. 83-87.

Elimination of material outgrowth on castings, blow and shrink holes, cracks, surface defects, nonfilled molds (incomplete castings), dimensional off-size, inclusions, improper microstructure and deviation from standards during production of castings. (E25; CI-n)

249-E. "Tailored" Grain Size Gives Needed Properties at Critical Points in Castings. Materials in Design Engineering, v. 53, Apr. 1961, p. 9.

Control of grain size during investment casting permits production of fine grained areas of high-tensile strength and larger grained areas of improved stress-rupture life in the same casting. (E15, E25q)

250-E. Shell Molding Processes Employed by Ford Motor Co., U. S. A. H. C. Grant. Machinery (London), v. 98, Mar. 15, 1961, p. 593-601.

Production and use of shell molds in the casting of various automotive parts. Design and operation of a turn table shell molding installation used to produce the shell molds, cylinder bores and refractory liners for dies. (E16c, T21)

251-E. Effects of Die Finishing. Metal Industry, v. 98, Mar. 24, 1961, p. 231.

High finishes are obtained on Al alloy pressure die castings by using specially finished die cavities. Reduced friction between the injected metal and the die wall reduces required injection pressure so that castings may be made on less powerful machines. (E13; Al-b)

252-E. (Czech.) Cast Austenitic Cr-Mn-N Steel. K. Lobl, A. Sustek and K. Hybek. Strojirenstvi, v. 10, Dec. 1960, p. 907-915.

In a laboratory furnace and an arc furnace various steel melts are prepared containing 0.05-0.17% C, 12.78-14.32% Mn, 0.47-1.16% Si, 0.023-0.045% P, 0.003-0.012% S, 16.18-17.15% Cr, 0.32-1.11% Mo and 0.304-0.352% N. Pouring properties, tendency for pipe formation and heat resistance at 1000-1150° C. on mechanical properties. Embrittlement by holding at 700° C. for 1000 hr. 17 ref. (E23, Q-general, Q26s; SS-e)

253-E. Air Flow in Cupolas. Foundry Trade Journal, v. 110, Mar. 9, 1961, p. 309-311.

Investigation of the effect of coke particle size and shape, air-flow rate and bed packing on the air pressure drop in a bed of coke. (E10a)

254-E. Relative Chilling Powers of Various Mold Materials With Aluminum and Its Alloys as Test Castings. M. R. Seshadri and A. Ramachandran. British Foundryman, v. 54, Mar. 1961, p. 130-137.

Evaluation of the relative chilling power of various mold materials including silica sand, magnesite, silicon carbide, Cu, cast iron and anodized Al. Data concerning grading of the nonmetallic materials and the properties of the various types of molds produced from them are presented in tabled form. Thermal properties. Solidification time and heat diffusivity. 8 ref. (E19; W19g; Al-b, CI, Cu, 17-57)

255-E. Effect of Metal Mold Reaction and Section Thickness on the Properties of Gunmetal Castings. F. Hudson. British Foundryman, v. 54, Mar. 1961, p. 137-146.

Large tensile test bars are cast in five different alloys under conditions promoting a variable degree of metal-mold reaction. After machining the bars are broken on a 1000 ton testing machine. Tabled data include effect of phosphorus and mold moisture contents on mechanical properties. Effect of metal-mold reaction on structure and fractures of test bars. 13 ref. (E19, E25; Cu-b)

256-E. Latest Findings for the Construction and Operation of Hot Blast Cupolas. Siegfried Tunder and L. Hohle. Engineer and Foundryman, v. 26, Jan. 1961, p. 17-28.

A paper covering the following areas: the metallurgy of the hot blast cupola, cupola design, the basic hot blast cupola, the shaking ladle and blast preheaters. Discussion includes instrumentation and charging equipment. (E10a)

257-E. (French.) Metallurgical Study of Electrical Furnaces. Examples of Production Processes. G. Grenier. Journal du Four Electrique, Jan. 1961, p. 27-28.

Casting from the electric furnace. Effect of casting rate and size of ingot on its chemical homogeneity. Quality control by analysis, temperature control and mechanical tests. 16 ref. (E10r)

258-E. American Foundry Technology. Foundry Trade Journal, v. 110, Mar. 16, 1961, p. 331-336.

Abstracts of papers presented to technical societies covering effect of inoculation on the risering of gray iron, materials for automobile engines tested for metal wear and machinability of spheroidal-graphite cast irons. (E-general, 10-54; CI)

259-E. Melting of Cast Iron Swarf in the Cupola. A. S. Bhaduri. Indian & Eastern Engineer, v. 103, Jan. 1961, p. 11, 13-14.

Outline of two methods of recovering cast iron scrap without preliminary preparation. The scrap is fed directly into the cupola at a temperature just above the melting point or charged into the cupola with a low pressure air blast. 7 ref. (E10a; CI)

260-E. (Japanese.) The Effects of Be Addition in Mg and Mg-Zr System Alloys. Riei Ichikawa. Nagoya Institute of Technology, Bulletin, Dec. 1960, p. 316-322.

Influence of small amounts of Be, added as $BeCl_2$ to the melt, on molten metal fluidity and burning, oxidation of the melt and the casting and surface state and casting structure of the alloys. 9 ref. (E25q; Mg-b, Zr, Be)

261-E. Permanent Mold Cast Titanium Slashes Die Casts, Hikes Output. Western Metalworking, v. 19, Apr. 1961, p. 31.

Quantity production of high-strength, corrosion resistant small parts from unalloyed Ti by Impel casting. Molten Ti is "impelled" into permanent mold die cavities to produce such parts as pump housings, impellers, valve bodies, fittings and pump sleeves. (E12, W13d; Ti, 17-57)

262-E. (German.) Some Investigations on Eloxal Cast Alloys and Castings. A. Buckeley. Metall, v. 15, Mar. 1961, p. 211-215.

Macrostructure investigation for evaluating influence of Ti additions (0.02-0.14%) to G-AlMg3 and G-AlMg3 (Cu) alloys on grain refinement for various casting and superheating temperatures. Investigation of brightness and hardness as influenced by Mg and Si. (E25q, M28, Q29n, 2-60; Al-b, Ti, Mg, Si)

263-E. (German.) Effect of Grain-Refining Additions on Grain Size of Solidified Pure Aluminum Melts With Emphasis on Grain Refiners Containing Boron. K. H. Wiedemann. Metall, v. 15, Mar. 1961, p. 221-224.

Addition of varying amounts of Ti and boron to test melts of pure Al at 780° C. with subsequent cooling and macrostructure examination of grain refinement as influenced by Ti and boron content. (E25q, M27, 2-60; Al-a, B, Ti)

264-E. Examining the Causes of Shrinkage Defects in Gray Iron Castings. A. G. Fuller and K. E. L. Nicholas. BCIRA (British Cast Iron Research Assoc.) Journal, v. 9, Mar. 1961, p. 173-184.

Effect of soft molds, unsuitable chemical composition, incorrect pouring temperature and the degree of eutectic nucleation on shrinkage. (E25n; CI-n)

265-E. Graphite Injection Through the Tuyeres of a Cold Blast Cupola. H. J. Leyshon, R. B. Coates and K. E. L. Nicholas. BCIRA (British Cast Iron Research Assoc.) Journal, v. 9, Mar. 1961, p. 189-198.

Injections of powdered graphite through cupola tuyeres, using compressed air as the carrier gas, are used to increase carbon pickup in the castings, thereby reducing chill and shrinkage. 8 ref. (E25)

266-E. Factors Influencing the Inoculation of Cast Iron. J. V. Dawson. BCIRA (British Cast Iron Research Assoc.) Journal, v. 9, Mar. 1961, p. 199-236.

Effect of ferro-silicon, Al, Zr, Mg, Ce, Ca, B, graphite, calcium silicide and SMZ alloy additions on physical properties and grain size of gray and nodular irons with emphasis on depth of chill. 8 ref. (E25q, 2-60; CI-n, CI-r)

267-E. Practical Notes on Ram-Off Defects. A. A. Timmins and A. D. Morgan. BCIRA (British Cast Iron Research Assoc.) Journal, v. 9, Mar. 1961, p. 237-243.

Causes of ram-off defects in castings are explained in terms of pattern, molding machine, molding box or sand practice. (E25)

268-E. Hot Tears in Steel Castings. Michael A. Notte. Castings, v. 7, Feb. 1961, p. 17, 20, 23.

Effect of design of heading and gating, liquid shrinkage and solid contraction, coremaking and molding practice, chilling and impurities on the formation of hot tears in steel castings. Design considerations for reducing high or unequal cool stresses in castings. 4 ref. (E-general, E25, 3-66, 3-69, 9-71; ST)

269-E. Viscous Shear as an Agent for Grain Refinement in Cast Metal. F. A. Crossley, R. D. Fisher and A. G. Metcalfe. Metallurgical Society of AIME, Transactions, v. 221, Apr. 1961, p. 419-420.

Grain refinement in cast Al alloys by solidfying under conditions of rotational acceleration produced mechanically or by magnetic stirring. Effect of the related viscous shear in the liquid on nucleation mechanisms. 4 ref. (E25q, N2; Al-b)

270-E. Boeing Uses Advanced Techniques in Sand Casting Turbine Engine Parts. K. B. Rhodie. Modern Metals, v. 17, Apr. 1961, p. 40, 43.

Olivine molding sand and CO_2 coring process used in manufacture of gas turbine castings. Melting in induction furnace. Physical properties determined for olivine. (E11, E18r, W11m)

271-E. Titanium Casting Technology. S. L. Ausmus, F. W. Wood and R. A. Beall. Metal Industry, v. 98, Mar. 31, 1961, p. 243-245.

Equipment and techniques used in spin casting of Ti alloy, Hf and Zircaloy. Grain structure and surface finish of the castings. Physical and mechanical properties, corrosion resistance and surface finish of extrusions made from the cast billets. (E14; Hf, Ti-b, Zr-b)

272-E. Magnesium Alloys Can Be Investment Cast. Kenneth Herrick and Harry Matthieson. Precision Metal Molding, v. 19, Apr. 1961, p. 43-45.

Data are given for dimensional, flatness and concentricity tolerances attainable with Mg investment castings. Tables show the correct rod for joining the castings by inert arc welding. (E15, 17-55, K1d; Mg-b)

273-E. Cerium Sulphide Cores. H. Kirtchik. Precision Metal Molding, v. 19, Apr. 1961, p. 46-47.

Development of a new core material which can be used up to 2000° C. and will permit designers to specify small diameter holes in investment castings. Cores are produced by pressing, sintering and swaging to size. (E15, E21)

274-E. Nickel Carbonyl Mold Making Process. Henry Lefer. Precision Metal Molding, v. 19, Apr. 1961, p. 48-50.

Production of pure Ni permanent molds, core boxes and patterns of great complexity with excellent physical properties by a process depending on the decomposition by heat of Ni carbonyl gas to Ni and carbon monoxide. (E19)

275-E. (Dutch.) Design of Castings. Alrik Ostberg. Gjuteriet, Feb. 1961, p. 15.

Risering, design of cast parts and pouring systems, application of chill plates. Practical examples. (E22, E23)

276-E. Titanium Casting Technology. S. L. Ausmus, F. W. Wood and R. A. Beall. Metal Industry, v. 98, Apr. 7, 1961, p. 271-273.

Effect of arc current, furnace pressure, alloy composition, ladle diameter, casting size and electrode on yield of metal, heat distribution, metal temperatures and melting rates of Ti alloys. (E25; Ti-b)

277-E. (French.) Metallurgical Blast Cupola. R. Doat, H. Doutreloux and H. de Rycker. Fonderie Belge, v. 31, Jan. 1961, p. 3-11.

Observations during industrial production of thermochemical processes at the tuyeres level and in the reducing zone of a 10 ton per hr. hot blast M. B. C. cupola furnace. (E10a, D11)

278-E. (Japanese.) Effects of Inoculation on the Solidification Process in Hypoeutectic Cast Iron. Osamu Fujita and Kiyoshi Kubo. Imono (Japan Foundrymen's Society, Journal), v. 33, Jan. 1961, p. 3-12.

The process of solidification and graphite formation at a given slow rate of cooling is investigated for samples innoculated with Ca-Si. Cooling curves are determined and microstructures formed during various stages of solidification are examined microscopically. 9 ref. (E25n, E25q, M-general, N8s, 2-60; CI, Ca, Si)

279-E. (Japanese.) Effects of Superheating and Inoculation on the Annealing Characteristics and the Casting Structure of a Malleable Iron. Taira Okamoto and Masao Tbaraki. Imono (Japan Foundrymen's Society, Journal), v. 33, Jan. 1961, p. 13-17.

Grain refinement and reduction of oxide and impurity content in the microstructure of 2.76° C. malleable Fe by inoculation with ferrosilicon and superheating at 1550° C. Effect of silica content on annealing characteristics. 6 ref. (E25q, M27, 2-60; CI, Si)

280-E. Development and Improvement of Gating and Risering for Ductile Iron. H. Otey Meriwether, Jr. Iron Worker, v. 25, Spring, 1961, p. 32-33.

Outline of a gating and risering system now in use. Formulas are given for the calculation of pouring time, effective sprue height, area of choke, runner size, ingate area and riser and riser connection size. (E22; CI-r)

281-E. Steel Castings. Charles W. Briggs. Foundry, v. 89, May 1961, p. 120-123.

Production of steel castings with improved melting, pouring, cleaning and inspection techniques. Modern coremaking and molding methods. (E-general; ST)

282-E. Aluminum Castings. Floyd A. Lewis. Foundry, v. 89, May 1961, p. 124-129.

Production of pressure tight, high-tensile Al castings through improved alloy compositions and advances in production methods and quality control. (E-general; Al-b)

283-E. Malleable Iron Castings. Hans J. Heine. Foundry, v. 89, May 1961, p. 130-135.

Improved melting, alloying and heat treating techniques for higher tensile strength, fatigue strength, wear resistance, corrosion resistance and machinability. (E-general; CI-s)

284-E. Brass and Bronze Castings. Richard A. Flinn. Foundry, v. 89, May 1961, p. 136-139.

Modern alloying and casting methods for use with Cu-base alloys having high-tensile strength, electrical conductivity, thermal conductivity, corrosion resistance, abrasion resistance, machinability and weldability. 4 ref. (E-general; Cu-b)

285-E. Magnesium Castings. Robert C. Boehm. Foundry, v. 89, May 1961, p. 148-151.

Alloying and fluxing for production of sand castings and die castings with good corrosion resistance, damping capacity and mechanical properties. Protective coatings. (E11, E13; Mg)

286-E. Quality Comes First at Boeing Airplane Co. Foundry. Jack C. Miske. Foundry, v. 89, May 1961, p. 194-200.

Sand casting of Al alloy aircraft parts in olivine sand molds. X-ray and penetrant inspection. (E11, T24; Al-b)

287-E. Gating and Risering Investment Castings. Hyman Rosenthal. Foundry, v. 89, May 1961, p. 220-228.

Experiments and actual jobs with Armco iron, 1020, 1095, 4140 alloy and stainless steels determine feeding distance as related to mold temperature, pouring temperature and freezing range. 9 ref. (E22, E15; Fe-a, SS)

288-E. Sand Moldability and Mold Quality. H. W. Dietert, A. L. Graham and T. H. Hanna. Foundry, v. 89, May 1961, p. 238-248.

Control of molding sand using tests to determine rammability, mold hardness, mold wall creep, permeability, wall voids, lift, density and penetration. (E18)

289-E. Diecasting at AC Spark Plug Division. Robert H. Herrmann. Foundry, v. 89, May 1961, p. 264-266.

Production of oil filter bodies, fuel pump parts and instrument panels in Zn, Al and Mg. (E13, T21b; Al, Mg, Zn)

290-E. (French.) Lost-Wax Castings Up to 45 Kg. Produced in Ceramic Shells. Laurence W. Collins, Jr. Machine Moderne, v. 55, Mar. 1961, p. 45-47.

Production of molds by lost-wax process by forming shells of alternate layers of refractory ceramic material. (E15)

291-E. (Italian.) Shell Molding. Italian Experiences With the Process. Angelo Azzolini. Fonderia Italiana, v. 10, Jan. 1961, p. 11-20.

Principles of the process. Sources of defects and remedies. (To be continued.) (E16c)

292-E. (Italian.) Carbon Dioxide Process. J. L. Leach and G. Haley. Fonderia Italiana, v. 10, Jan. 1961, p. 21-24.

Role of gassing time, gas pressure, granularity of the sand and quantity of bonding agents in the process of sand hardening by CO_2. (E19)

293-E. (French.) Risering of Sand Castings. Practical Rules of Calculating Risers. Michel Jeancolas. Fonderie, v. 181, Feb. 1961, p. 43-56.

Manner of solidification of ferrous and nonferrous alloys. Calculation of number, size, neck and zone of action of risers. 22 ref. (E11, E22q)

294-E. Investment Casting Molds. Metal Industry, v. 98, Mar. 1961, p. 210.

Fluidization technique for rapid investment of molds using a particle bed of alumina and silica fluidized by a porous refractory brick diffuse plate and a controlled fluid input. (E15, E19)

295-E. Centrifugal Casting. J. B. McIntyre. Foundry Trade Journal, v. 110, Apr. 13, 1961, p. 459-470.

Steel, bronze, Pb, Sn, Au, Pt, Ni, Cu, Fe and Sb are used in castings produced by horizontal and vertical centrifugal casting methods. Developments and operations of the technique outlined. Cr, Mo, Fe, stainless steel and carbon steel are used in molds. 17 ref. (E14; Au, Cu, Fe, Ni, Pb, Pt, ST)

296-E. (Japanese.) Burning of Silica Sand During Steel Casting. Tomoharu Yoshikawa. Railway Engineering Research Journal (Japan), v. 17, Nov. 1960, p. 455-463.

Sand burning reactions are studied for green, dry and permeable sand molds with analysis of the thermodynamics of the process, microstructure and FeO concentration of the burnt surface of the casting, slag layer formation and the effects of the fluidity of the melt, mold permeability and use of mold wash. (E11, E25, 9-71; ST)

297-E. High-Volume Aluminum Sand Castings. V. A. Williams. Production, v. 47, May 1961, p. 47-49.

Production line sand casting of Al to produce automotive engine timing chain covers. Stabilization is by heat treatment. (E11, T21b; Al)

298-E. Tailored Alloy Help to Solve Investment Casting Problems. R. H. Eshelman. Iron Age, v. 187, May 11, 1961, p. 114-115.

Examples show how the chemistry of an alloy and heat treatment procedures may be altered to permit successful investment casting. (E15)

299-E. Production of Sound Grey Iron Castings. I. C. H. Hughes. Foundry Trade Journal, v. 110, Apr. 20, 1961, p. 491-497.

Survey of research covering directional solidification, inoculation and feeding techniques for controlling shrinkage, graphite cell structure and other aspects of soundness of gray iron castings. 7 ref. (E25; CI-n)

300-E. Gravity Diecasting in a General Foundry. D. Redfern and I. E. Brown. British Foundryman, v. 54, Apr. 1961, p. 189-192.

Casting temperature, pouring arrangements, casting properties and heat treatment techniques used in gravity diecasting of Al alloy cylinder and crankcase

castings for compressors and exhaustors. (E13; Al-b)

301-E. Gating Zinc Die Castings. Ralph Wilcox. Precision Metal Molding, v. 19, May 1961, p. 40-41.

Effect of the location, size and shape of the gate through which molten Zn alloy is injected into a die casting upon the soundness and surface finish of the casting. (E22p, E13; Zn)

302-E. How Die Casting Affects Tooling Costs. C. F. Hannon. Precision Metal Molding, v. 19, May 1961, p. 43-44.

Effect of gating on porosity and finish of Al and Zn base alloys die cast in air-hardened steel dies. (E13, E22p; Al, Zn)

303-E. Cupola Melting Process. Technical Information Service, National Research Council (Canada), Dec. 1959, p. 1-7.

Cupola furnace design and operation technology with attention to fuel requirements, heat and slag control, use of hot blasts and charging practice. (E10a)

304-E. Foundrymen Quick to Adopt New Ductile Iron Test. Modern Castings, v. 39, Mar. 1961, p. 37-39.

Development of a standard test coupon for microscopic examination of graphite configuration and structure of ductile Fe castings. (E25q, M21, 1-54; CI-r)

305-E. New Concept Reduces Casting Cleaning Costs. Elmer Kreger. Modern Castings, v. 39, Mar. 1961, p. 51-53.

Innerbore gates and risers, replacing multiple headers, are used to produce sound, clean steel castings with high metal yield. The new rigging technique is applied to circular castings which are symmetrical about a central axis such as combination drums and sprockets, jaw clutches, bevel gears and drum laggings. (E22, T7)

306-E. New Sand Mix Doubles Core Production. Modern Castings, v. 39, Mar. 1961, p. 54-56.

A sand mix having a urea formaldehyde resin as the binder is used for shell cores in permanent mold casting of 356 Al alloy cylinder heads. Complete collapsibility at 1350° F. and consequent easy clean-out is attributed to the mixture. (E12, E18, E21; T21b, Al-b)

307-E. Hypereutectic Aluminum-Silicon Casting Alloys Phosphorous Refinement. F. L. Arnold and J. S. Prestley. Modern Castings, v. 39, Mar. 1961, p. 61-69.

Optimum conditions and limitations of the phosphorous refinement process are investigated for a 16% Si casting alloy using a commercial nucleant containing 20% red phosphorous and a 15% P-Cu alloy as inoculants with permanent mold and sand casting. Solidification phenomena and structural transformations are examined metallographically. (E25; Al-b, Si)

308-E. Feeding Distance of Bars in Investment Molds. H. Present and H. Rosenthal. Modern Castings, v. 39, Mar. 1961, p. 70-72.

The influence of mold temperature, pouring temperature and carbon content of the alloy in the feeding range in ceramic molds is investigated for 1020 and 1095 steel and Amco Fe cast at 1200-2000° F. (E15, 2-60, 2-61; CN)

309-E. Magnesium-Base Alloys Investment Cast Properties. K. Herrick. Modern Castings, v. 39, Mar. 1961, p. 111-120.

Investigation of mechanical properties and soundness of AZ92A, AZ91C, AZ218A and AM1--A alloys to determine castability for use with the investment casting process. Average grain size and massive compound ratings are determined as a function of section size, investment mold temperature and metal pouring temperatures. Tensile properties are compared to those of shell castings and castability classifications are made in terms of microshrinkage tendencies. (E15, E25p, Q27; Mg-b)

310-E. The Carbon Dioxide Process. G. D. Haley and J. L. Leach. Modern Castings, v. 39, Mar. 1961, p. 121-124.

Investigation of the effect of gassing time and pressure, grain fineness of the sand and the amount of binder on the CO_2 molding process. Data are given for tensile and compressive strength of molds and cores with a proposal for a standard method of testing. (E18, E19)

311-E. (French.) Pressure Casting. Hiram K. Barton. Metallurgie et la Construction Mecanique, v. 93, Feb. 1961, p. 99-101, 103, 105, 107-108.

Pressure casting of Zn, light and ferrous alloys. Characteristics of the alloys at room and elevated temperatures. Casting methods and properties of the castings. (E13; Fe-b, Zn, EG-a39)

312-E. (Japanese.) Decrease of Residual Stress by Self-Chilling Fins in Casting. Toshiro Owadano. Imono (Japan Foundrymen's Society, Journal), v. 33, Feb. 1961, p. 43-48.

Chill casting experiments with a 2.36% C, 2.53% Si, Fe alloy and a Silumin alloy. Variance of chilling effects on solidification and transformation periods and on residual stress is attributed to the difference in the thermal conductivity of the castings. 5 ref. (E22r, E25n, Q25h; Al-b, Fe-b)

313-E. (Swedish.) Design of Castings. Pt. 2. Alrik Ostberg. Gjuteriet, v. 51, Mar. 1961, p. 37-46.

Directions for adequate feeding, chilling, choice of fillet radii and outer radii and design of wall intersections. 7 ref. (E22)

314-E. Grain Refinement by Vibration. J. L. Walker. Journal of Metals, v. 13, May 1961, p. 379.

Subsonic vibration during solidification of metal ingots and casting effects thermal gradients, supercooling constituents and nucleation and can thus be applied to control grain size. 6 ref. (E25q)

315-E. (French.) Sand Casting of Light Alloys. Charles Roinet. Revue de l'Aluminium, v. 38, Jan. 1961, p. 113-122.

Sand casting of unalloyed Al and Al-Cu, Al-Si, Al-Mg and Al-Zn alloys. Influence of additions on corrosion properties. Melting techniques. Use of deoxidizing, degassing and refining fluxes. (E11; Al-b)

316-E. Forgeable Refractories With Micro-Grain Structure. Australasian Manufacturer, v. 46, Apr. 8, 1961, p. 54-56.

A combination of electron-beam processing and critical composition control reduces the grain size of cast W and Mo ingots to improve ductility and workability. Same technique is applied to alloys of Cb and Ta (90%) with W (10%). (E25q; Cb-b, Mo, Ta-b, W)

317-E. Production of Blackheart Malleable. Foundry Trade Journal, v. 110, Apr. 27, 1961, p. 523-533.

Molding, casting and annealing operations in production of malleable iron castings. Mechanical and physical properties as affected by composition. Manufacture of pearlitic malleable. (E-general; CI-s)

318-E. Cheaper Titanium Castings. Materials in Design Engineering, v. 53, May 1961, p. 9.

Process of Impel casting, in which a double melted Ti electrode is melted under vacuum and pushed into a steel die cavity, permits mass production of Ti impellers, valve bodies, fittings and pump housings and sleeves. (E13; Ti)

319-E. (Czech.) Die Casting. Slevarenstvi, v. 9, Feb. 1961, p. 60-62.

Effect of velocity of metal flow on surface quality and porosity. Formation of drops as a function of casting pressure, plunger velocity and shape of castings, factors which in their turn influence the flow velocity. Casting time depends on weight, density, cross section of gate and flow velocity. (E13)

320-E. (Czech.) Centrifugal Casting of Pressure Tubing. Jiri Neumann. Slevarenstvi, v. 9, Feb. 1961, p. 67-70.

Centrifugal casting in mold made from a synthetic sand mixture containing 6% of a binder and 4-5% of moisture and having a compression strength of 600-700 g. per sq. cm. and permeability of 250-300 units. The cast iron used contains 3.20-3.60% C, 1.8-2.4% Si, 0.6-0.8% Mn, 0.5-0.8% P and 0.06-0.1% S and is poured into the rotating mold at a temperature of 1290-1310° C. (E14; CI)

321-E. (Czech.) Quantitative and Qualitative Control of the Cupola Operation. Karel Jiranek. Slevarenstvi, v. 9, Feb. 1961, p. 70-72.

A charge composed of coke, raw iron, cast iron scrap, steel scrap, ferromanganese and limestone is processed in a cupola with forehearth of an ID of 850 mm. It is blown from six tuyeres of 120 mm.

diameter and six tuyeres of 50 mm. diameter. Metal temperature, C, Mn, Si, P, S and Cr contents as functions of the operation time. 3 ref. (E10a)

322-E. (Czech.) Manufacture of Large Kaplan Turbine Blades. Josef Ernst. Slevarenstvi, v. 9, Feb. 1961, p. 73.

A 6000 kg. blade is cast from CSN 422905 cast iron in a fire clay mold, dried by gas burners for 12 hr. at 400-450° C., allowed to stay for 12 hr. without heating and then held at 600-650° C. for 24 hr. The casting is heat treated. (E11, T7h; CI)

323-E. (French.) Application of Zirconium and Olivine Sand to Casting Steel and Cast Iron. Michel Jeancolas and Xavier Virolle. Fonderie, no. 182, Mar. 1961, p. 112-121.

Natural characteristics, physical and chemical properties and behavior of the sands during casting. (E18r)

324-E. Some Operational Details of a Large Electric Melting Shop. W. S. Walker and T. H. Harris. Iron and Steel Institute, Journal, v. 198, May 1961, p. 5-12.

Carbon steel and steel alloys containing C, S, P, Mn, Si, Cr and Fe are melted in an electric arc furnace. Data describe the slag process and the working procedure. (E10r; AY, CN)

325-E. Production of Sound Grey-Iron Castings. I. C. H. Hughes. Foundry Trade Journal, v. 110, May 4, 1961, p. 563-568.

Porosity, shrinkage and eutectic cell formation in gray-iron castings as affected by Si, Ti, C, P, S and Mn content, pouring temperature and cooling rate. 13 ref. (E25q; CI-n)

326-E. (Portuguese.) Melting Techniques and Their Effect on Copper Castings. Isaac Berezin. Boletim da Associacao Brasileira de Metais, v. 17, no. 62, 1961, p. 81-97.

The effect of hydrogen and oxygen absorption on the quality of castings is studied on test pieces cast from a Cu melt that was obtained without any protective addition or with charcoal or phosphor copper additions. Macrostructures and microstructures. Variation of the electrical conductivity with the P, Si, Fe, As, Be, Al, Ni, Mg, Sn, Zn, Ca, Cd and Ag contents. 9 ref. (E25, E10, P15g; Cu)

327-E. Investment-Cast Waveguide Components. Electronics, Oct. 7, 1960, p. 68-70.

Lost-wax casting of microwave waveguide components. (E15, T1)

328-E. How AC Spark Plug Die Casts Magnesium. S. L. Strong. Modern Metals, v. 17, May 1961, p. 48, 50, 52.

Melting and vacuum casting techniques. (E-general, 1-73; Mg)

329-E. (Japanese.) Influence of Temperature and Humidity on Friability of Mold Surface. Arao Kita and Tsuneyuki Okakura. Imono (Japan Foundrymen's Society, Journal), v. 33, Mar. 1961, p. 171-178.

Surface stability index and hardness of molds from sand mixes containing bentonite, fire clay, silica sand and up to 4% moisture after drying at 100-600° C. (E18)

330-E. (Japanese.) Measurement of Back Pressure Cavity Surface of Molds. Kazuro Suzuki and Hiroshi Yamaoka. Imono (Japan Foundrymen's Society, Journal), v. 33, Mar. 1961, p. 179-182.

Manometric measurement of back pressure from gas generated during pouring of molten alloy in a shell mold at 1570° C. Relation of back pressure to blow hole and cavity formation in castings. (E25)

331-E. (Japanese.) The Alloying Limit of Nitrogen in High Cr-Fe Alloys and in 20% Chromium Steels and Some Related Notes. Masazo Okamoto and Takeshi Naito. Japan Institute of Metals, Journal, v. 25, Feb. 1961, p. 120-124.

Effect of 0.1-1.0% nitrogen additions on fluidity, ingot soundness and porosity, microstructure, crystallization temperature and mechanical properties. Determination of maximum alloying limit of nitrogen in Fe-Cr-N alloys as a function of composition, particularly the content of minor components such as Ni and C and as a result of phase transformations. 11 ref. (E25, Q-general, 2-60; Fe-b, Cr, N)

332-E. Some Experiences With the CO_2 Process in the Production of Copper-Base Alloy Castings. G. W. Brown and C. B. Searles. British Foundryman, v. 54, May 1961, p. 205-208.

Effect of silicate content, gassing time and rammed density on the handling and knockout performance, compression strength and permeability

number of CO_2 molds for gunmetal castings. Silicate variation of silicate viscosity with temperature. 3 ref. (E19, E11; Cu-s)

333-E. The Fluidities of Some Cast Stainless Steels and Ni-Resist Cast Irons. A. M. Patton. British Foundryman, v. 54, May 1961, p. 208-211.

Determination of the effect of pouring temperature and superheat on the fluidity and casting quality of Ni-resist I and II, and on 18-8, 18-10, 13 Cr and Si steels, using a spiral run. 3 ref. (E25p; CI-q, SS)

334-E. Problem Castings and Some Success in Using Denseners. F. C. Baselow. British Foundryman, v. 54, May 1961, p. 211-215.

Pilot plant studies of the reduction of porosity in gray and malleable iron castings caused by slow cooling and variance in freezing by placing denseners in the mold. A mechanism is proposed for the origin of the gas, causing mold blowing in close proximity to the denseners. (E25, 9-68; CI-s)

335-E. Pattern-Flow Moulding at Soho and Tame Bridge Foundries. A. J. Shore. British Foundryman, v. 54, May 1961, p. 225-238.

Production of medium-sized gray iron castings utilizing the principle of pattern flow in green sand molding. Review of the steps in development from traditional loose pattern molding to flow production. 3 ref. (E17, E19a, E11; CI-n)

336-E. Developments at the Works of Hills Precision Die Castings, Ltd. Machinery (London), v. 98, May 17, 1961, p. 1151-1153.

Production of Zn alloy, Al alloy and Pb castings by die or gravity casting, using unit-sized dies. (E11, E12, E13, W19n; Zn-b, Al-b, Pb)

337-E. Semipermanent Mold Process Makes Aluminum Engine Castings. Automation, v. 8, June 1961, p. 86-88.

Coremaking, molding, casting and finishing operations in mass production of Al cylinder heads and blocks. (E12, E-general, L-general, T21b; Al-b, 17-57)

338-E. A New Concept of Mechanized Castings Production. Robert H. Herrmann. Foundry, v. 89, June 1961, p. 62-65.

Assembly line techniques for mass production of sand castings for automobile engine blocks including scheduling, molding, sprues and core handling. (E11, E-general, T21b)

339-E. What Causes Pinhole Porosity in Gray Iron? Ernest Haack. Foundry, v. 89, June 1961, p. 80-83.

Porosity in gray iron castings as related to oxidized shot-like particle, gas and graphite film formation and iron-mold compatibility. Effect of Al addition of Al on graphitization and microstructural homogeneity. 6 ref. (E25, N8s, 9-68; CI-n)

340-E. Gating Shell Mold Castings. P. J. Ahern and F. C. Quigley. Foundry, v. 89, June 1961, p. 84-87.

General principles governing the gating of green sand castings are applied to shell molding with modifications dependent on pouring arrangements and number of casting cavities. (E19, E22)

341-E. Carbon Sand Minimizes Penetration. Angelo Paoli. Foundry, v. 89, June 1961, p. 170-171.

Carbon sand, a molding material with a high carbon content, is used for reducing penetration and sand expansion defects on heavy gray iron castings. Comparative thermal expansion values are given for carbon and silica sands. (E-general, E18; CI, NM-f45, 17-57)

342-E. Composite Molds Developed for Shaw Process. Foundry, v. 89, June 1961, p. 176-181.

A microcrazed, reclaimable ceramic facing is used with silica sand backup material for mass production of Shaw process molds for metal casting. (E19)

343-E. Effect of Bismuth Mould Wash on Soundness, Structure and Properties of Grey Iron Castings. M. J. Clifford. BCIRA Journal (British Cast Iron Research Assoc.), v. 9, May 1961, p. 377-381.

Comparison of the effects of Te and Bi mold washes on the local unsoundness in gray iron castings shows that the Bi is equally effective and has less undesirable side effects. (E25q; CI-n)

344-E. Importance of Process Control in Producing Dross-Free Nodular Iron Castings. R. Barton and A. G. Fuller. BCIRA Journal (British Cast Iron Research Assoc.), v. 9, May 1961, p. 406-418.

Production of dross-free nodular Fe castings is achieved by careful control of the treatment process with Ni-Mg alloy, Mg-Si alloy and Mg ingot at 1390-1600° C. Recommendations are made for controlling residual Mg content, carbon equivalent value and casting temperature. Effect of desulphurization on incidence of dross defects. (E25; CI-r)

345-E. (French.) Casting of Vats for the Meat Packing Industry in A-G3 T. Journal d'Informations des Industries de la Fonderie, no. 124, Mar. 1961, p. 1-3.

Chill casting of large vats of 22 mm. wall thickness from A-G3 T steel, a corrosion resistant alloy containing 4% Be. (E22r, T29p; AY, 17-57)

346-E. Calculating Risers for Steel Castings. F. J. Drake. Castings, v. 7, Mar. 1961, p. 15, 17.

Position, shape and size of risers for sand casting of steel are determined in relation to casting surface area, volume and freezing rate. 6 ref. (E22q; ST)

347-E. Recent Developments in Die Casting by the Alumasc Low-Pressure Process. R. E. Green. Machinery (London), v. 98, Apr. 26, 1961, p. 953-958.

Equipment, layout and operation of die casting foundry for the production of Al alloy automotive castings by a low-pressure process. Design and operation of induction furnaces and dies. (E13, 3-74, T21; Al-b, 5-61, 17-57)

348-E. Developments in the Pressure Die Casting of Steel. V. M. Belov and S. A. Kazennov. Machinery (London), v. 98, Apr. 26, 1961, p. 958-963.

Design and operation of the die and induction furnace. Effects of injfection pressure, plunger speed, vacuum method and gate depth to casting thickness ratio on mechanical properties of castings. (E13, Q-general; ST, 5-61)

349-E. Sound Waves Improve Diecasting Quality. Australasian Manufacturer, v. 46, May 6, 1961, p. 54-59.

Vibration techniques are used to improve density, microstructure and mechanical properties of die cast Al and Zn alloys. Vibration breaks up and refines the dendritic structure during solidification, allowing the remaining molten metal to completely fill the spaces between adjacent arms of crystals. (E25q, E13; Al-b, Zn-b)

350-E. (Spanish.) Casting in Sand Molds Containing Plastics. Pt. 2. D. Iturrioz. Metalurgia y Electricidad, v. 25, Mar. 1961, p. 77-85.

Permeability and thermal conductivity of molds containing plastic binders. Effect of mold composition on the quality of toolsteel, Alnico brass and mild steel castings. (E11; Al-b, CN, Cu-n, Ni-b, TS)

351-E. Casting High Integrity Steel. Modern Castings, v. 39, Apr. 1961, p. 40-44.

High integrity casting process for producing uniform, reliable, high-strength castings suitable for aircraft and missile applications. Three-stage heat treatment is used to produce ultra-high strength. (E-general, J-general, T24; ST, 5)

352-E. Melting Practise for Aluminum Die and Permanent Mold Casting. Donald Colwell. Modern Castings, v. 39, Apr. 1961, p. 50-54.

Alloy composition, chemical activity of Al and melt agitation and moisture content as they affect melting practice. 28 ref. (E10, E12, E13; Al-b)

353-E. Cast Steel Nonmetallic Macroinclusions Sources and Prevention. R. A. Flinn, W. B. Pierce and L. H. VanVlack. Modern Castings, v. 39, Apr. 1961, p. 57-61.

Research indicates that use of a whirl gate trapping system and alumina or magnesia refractories eliminates the type of macroinclusions composed of corundum crystals in a glassy silicate groundmass. (E25q; ST)

354-E. Refractories as Sources of Macroinclusions. L. H. VanVlack, J. E. Brokloff and R. A. Flinn. Modern Castings, v. 39, Apr. 1961, p.62-71.

Evaluation of four principal types of refractories, silica, fireclay, alumina

and magnesia, for their stability in the presence of molten steel. Effect of metal composition, contact time and temperature on the molten metal-refractory reaction. (E25q; ST)

355-E. Copper-Base Casting Alloys. R. A. Flinn and H. Kunsmann. Modern Castings, v. 39, Apr. 1961, p. 72-84.

Investigation of the castability of Ca-base alloys 80-10-10, 85-5-5-5, 88-8-0-4, Al bronze, Mn bronze, silicon brass and nickel silver. Using a test bar, the variation in density, leakage, microstructure and mechanical properties is measured as a function of position in the bar. Solidification patterns as shown by cooling curves and drainout experiments. (E25p; Cu-b)

356-E. Heavy White Iron Section Casting and Annealing. R. W. Heine, T. W. Mueller and J. W. Widmeyer. Modern Castings, v. 39, Apr. 1961, p. 85-92.

Casting heavy sections in white iron and annealing them to malleable iron. Chemical analyses of Fe and additions to the melt for casting heavy sections such as white iron with no mottle spots on a fractured surface. Time-temperature requirements for annealing sections to produce malleablized iron. Use of Ce for prevention of mottling. 5 ref. (E25; CI-p)

357-E. Permanent Mold Design. John Wall. Modern Castings, v. 39, Apr. 1961, p. 103-104.

Advantages of the permanent mold process. Gating and risering design, usage of mold coatings and shrinkage factors. Automotive applications of the process. (E12)

358-E. (Italian.) Suggestions for the Melting of Copper-Chromium Alloys. Fonderia, v. 10, Apr. 1961, p. 137.

Crucible melting of Cu-0.9% Cr alloys with surface protection of the melt by coal powder, glass or a mixture of Na and Ca fluorides and rapid heating and deoxidation with Cu-Mn, Li or Zn. Castings are poured at 1120-1130° C. with subsequent heat treatment. (E10p, E25; Cu-b, Cr)

359-E. (French.) Melting of Copper Alloys. Journal d'Informations Techniques des Industries de la Fonderie, no. 125, Apr. 1961, p. 3-5.

The structure resulting after solidification is investigated by the casting of test pieces in refractory molds. The piece is allowed to cool to 600° C. and then water quenched. The fracture allows conclusions on grain size, oxidation, impurities and gas absorption. (E10, M27c, R1h, 9-51; Cu-b, 5)

360-E. Hills New Die-Casting Foundry. Foundry Trade Journal, v. 110, May 11, 1961, p. 605-608.

Pressure die casting, machining, polishing and plating facilities are described, including equipment for the manufacture of Al alloy castings and for plating with Cu, Ni, Cr, brass, Au and Ag. (E13, L17, 1-53; Al-b)

361-E. (Italian.) Some Unusual Materials Used in Forming and Casting. Fonderia, v. 10, Mar. 1961, p. 111-114.

Sillimanite, mullite, forsterite, olivine, glauconite and exothermic materials as addition agents to sand for casting light alloys (Zn, Al, Mg, Cu and Ni). (E18p, E11, NM-f45; Zn, Al, Mg, Cu, Ni)

362-E. Changes Speed Casting Process. Steel, v. 148, June 19, 1961, p. 106-107.

A composite mold has a low cost sand type backing with a special ceramic facing. Reduced burnoff cycle time required may permit mass production of precision castings by the Shaw process. (E15, E19)

363-E. Vacuum Die Casting--A New Evaluation. Modern Castings, v. 39, June 1961, p. 56-58.

Problems encountered when applying vacuum to pressure die casting. Advantages such as reduced pressure, porosity, oxidation and improved surface. Design problems in equipment including vacuum pumps, molds and hot and cold chamber machines. (E13, 1-73)

364-E. Solidification of Gray Iron. H. D. Merchant and J. F. Wallace. Modern Castings, v. 39, June 1961, p. 63-72.

Mold wall movement, carbon equivalence, solidification behavior and cooling curves as influenced by inoculation. 24 ref. (E25n; CI-n)

365-E. Cast Metals and Cast Shapes. J. B. Caine. Modern Castings, v. 39, June 1961, p. 73-79.

Specifications for castings having improved fatigue life, greater load carrying ability and reduced stress concentrations due to modifications in design. 6 ref. (E-general, 17-51)

366-E. Inoculation Influence on Gray Iron Structure at Various Carbon Equivalences. H. D. Merchant, L. I. Toriello and J. F. Wallace. Modern Castings, v. 39, May 1961, p. 109-116.

Comparison of eutectic cell size, graphitic structure, matrix and hardness in inoculated and uninoculated hypo and hypereutectic gray irons. 10 ref. (E25q; CI-n)

367-E. (Spanish.) Hot Cracking of Cast Steel. Kurt Beckius, Meton C. Flemings and Howard F. Taylor. Instituto del Hierro y del Acero, v. 14, Jan. 1961, p. 10-26.

Carbon steel containing 0.25-0.51% carbon is cast into tensile samples at a casting temperature of 1600-1704° C. to study the effects of composition, casting temperature and compression strength of sand on hot cracking, pipe and microstructure. 10 ref. (E25, 2-60, 2-61, 9-72; CN)

368-E. Reclaimable Composite Molds Automate Casting Lines. Iron Age, v. 187, June 15, 1961, p. 108-109.

Combined development of a reclaimable ceramic-faced sand mold and a more rapid bakeout process permits precision casting at mass production costs. (E15, W19g)

369-E. (Dutch.) New Developments in the Foundry Industry. W. M. Hogendorn. Polytechnisch Tijdschrift, v. 16, Mar. 10, 1961, p. 181b-182b.

Review of new ferritic and nodular irons including casting technology and solidification phenomena, chemical reactions between mold and metal surface and gas absorption. Survey of applications including in cast water pipe and hydraulic clutch wheels for ships. (E-general, T-general, 17-57; CI-r, 10-54)

370-E. New System for Producing Bath Castings. Harvey Berman. Mechanical Handling, v. 48, May 1961, p. 280-286.

Study of a high-speed jolt molding system which combines three systems to produce raw castings for today's baths; melting of metal; preparation of the mold and pouring; sand conditioning. (E19, E-general, 1-52)

371-E. Slip Casting of Metal Powders and Metal-Ceramic Combinations. Henry H. Hausner and Arnold R. Poster. Paper from "Powder Metallurgy". Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1961, p. 461-506.

Factors found to influence the stability of the slip and of the resulting casting are: liquid-to-metal ratio, type and amount of binders and deflocculants, particle morphology, oxide content of the powder and agitation speed and time and stability of the slip with time. Examples of the effects of a number of these variables are given using slips made with stainless steel, Mo and W powders. 48 ref. (E16; Mo, SS, W, 6)

372-E. Freeze Casting Titanium Carbide. E. M. Grala. Paper from "Powder Metallurgy". Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1961, p. 507-524.

Method of casting full-size cermet turbine blades from TiC. An extremely thick slip of TiC is prepared by mixing TiC powder with a small amount of binder. The slip is then cast into a mold by vibration, centrifuged and frozen to retain the shape of the mold. The casting is then dried in an absorbent sand and vacuum sintered. The prepared porous TiC turbine blades are of good appearance and free of flaws. (E16, T7h; Ti, 6, 14-68)

373-E. What's New in Malleable? Foundry Trade Journal, v. 110, May 1961, p. 655-660.

Summary of proceedings at Birmingham University Conference, Apr. 27 and 28. Topics include mechanism of graphitization including growth of temper-carbon nodules, mechanical and physical properties of blackheart and pearlitic malleable iron as a function of composition, heat treatment and quenching, and quality control in production. (E25n; CI-s)

374-E. (Spanish.) Molds Containing Plastic Binders. Pt. 1. D. Iturrioz. Metallurgia y Electricidad, v. 25, Feb. 1961, p. 75-85.

Review of analysis of sands and resin used in shell molding. Strength of mold and of the outer crust of solidified metal as a function of the time elapsed after

pouring. (E19c, W19g; NM-d34, NM-f45)

375-E. Surface Fine-Structure of Castings. W. Patterson and P. Schneider. Forschungsberichte des Landes Nordrhein-Westfalen. no. 962, 1961, p. 3-4.

Test casting of GAlSi 12 alloy and cast iron in molds of varying sand conditions. Surface quality of castings as influenced by molding sand, casting temperature and material properties such as surface tension using a mechanical and a pneumatic surface measuring device. (E25q; Al-b, Si, CI)

376-E. Which Core Process in the Non-Ferrous Foundry? C. E. Coulter. Current Engineering Practice, v. 3, Mar. 1961, p. 31-32.

Use of oil-sand, phenolic resin, CO_2 and baked urea cores in brass, Al and Mg foundry practice. Choice of core is influenced by cost, finish required, size of the casting and the dimensional accuracy specified. (E-general; Al, Cu-n, Mg)

377-E. Gating Zinc Die Castings. Ralph Wilcox. Precision Metal Molding, v. 19, June 1961, p. 39-41.

Design and application of several types of gate and runner systems with specific use in die casting circular or tubular Zn automobile parts. (E22p, E13, T21; Zn, 17-57)

378-E. Criteria for Using Investment Castings. Precision Metal Molding, v. 19, June 1961, p. 69-71.

Investment casting of a variety of shapes from Al, Co, Cu, Be, Cu or Mg alloys, carbon steels, stainless steels and other alloys. Design criteria are given for size, dimensional tolerances and surface finish of the castings. (E15, 17-51; Al, Cu-b, Co, Mg-b, Be, ST)

379-E. (Spanish.) Aluminum Castings. Pt. 4. D. Iturrioz. Metalurgia y Electricidad, v. 25, Jan. 1961, p. 173-182.

Effects of melt temperature, holding time, inoculation with Ti and B compounds, solidification velocity and overheating on grain size, mechanical properties and tightness of Al alloy castings. (E25, M27c, Q-general; Al-b)

380-E. Casting 10,000-lb. Pump Impellers. Western Machinery and Steel World, v. 52, June 1961, p. 52.

Casting of high silicon-manganese-bronze pump impellers using a special cope with arbor fabricated from steel H-sections and pipe. Metal is bottom poured at 1850° F. (E-general; Cu-s, Mn, Sn)

381-E. Advanced Foundry Techniques Can Save Money in Production of Large Marine Castings. Western Machinery and Steel World, v. 52, June 1961, p. 53-54.

Prevention of defects in large castings may be accomplished by studying design contours to determine solidification centers, use of feeding heads or chills and employing various methods of mold collapse. (E25)

382-E. Risering Shell Mold Castings. P. J. Ahearn and F. C. Quigley. Foundry, v. 89, July 1961, p. 65-67.

Comparison of data on solidification time versus volume surface area ratio for Al, nodular iron, gun metal and steel castings poured in sand or shell molds. Suggested risering procedures for various solidification rates. 8 ref. (E22q, E16c; Al, Cu-b, CI-r, ST)

383-E. Casting Small Parts of Refractory Metals. A. R. C. Westwood. Foundry, v. 89, July 1961, p. 68-71.

Development of a method specifically for casting of Ti parts. A solid Ti block is melted by a tungsten arc until the molten pool is of sufficient diameter after which the underside of the block is melted and the melt falls into a mold mounted directly beneath. 5 ref. (E10r, E-general; Ti)

384-E. Use of Chills in Casting Steel. Thomas E. Rieger. Foundry, v. 89, July 1961, p. 100, 102.

Use of chills to control solidification in steel castings. Data are given for composition, size, shape, location and type. (E16; ST)

385-E. Large Work Simplified With CO_2 Cores. William M. Flint. Foundry, v. 89, July 1961, p. 117, 118, 120.

Ball, socket and gland castings for a steel ball joint assembly are produced to close dimensional accuracy by the CO_2 process. (E21; ST)

386-E. A New Type of Lightweight Cellular Material. L. Polonsky. Pitman-Dunn

Laboratories Group (Frankford Arsenal). U. S. Office of Technical Services, PB 161770, Apr. 1960, 66 p. $1.75.

Experimental foundry process for the casting of Al-base cellular metal with a void volume of up to 70%. Process consists of preparing a refractory mold, filling the mold with soluble granules which correspond to the size and shape of the pores desired in the metal and then infiltrating the molten metal into this soluble aggregate. After leaching with a suitable solvent the metal has a void structure of interconnecting cells which correspond to the shape and size of the soluble aggregate. (E16; Al)

387-E. Facets of Pressure Die Design. W. Goode. Metal Industry, v. 98, June 16, 1961, p. 471-475.

Examination of problems encountered in designing and pressure die casting of gearbox extension die. Precision and absence of distortion of the product is achieved by special methods. (E13, T21c)

388-E. (Russian.) Intensification of the Melting Process During Delivery of Oxygen Into the Hearth of a Cupola Furnace. I. S. Matveenko and I. A. Zotkin. Izvestiya VUZ--Chernaya Metallurgiya, Feb. 1961, p. 133-137.

Investigation of a new method of blowing oxygen into the hearth of a cupola furnace for melting Fe. Influence on output, maximum temperature time, metal losses by burning, reduction action on the Fe, ferric oxide content in the slag and refractories deterioration. 9 ref. (E10a; Fe)

389-E. Wetting Agents in the Foundry. Australasian Manufacturer, v. 46, May 20, 1961, p. 90-93.

Controlling moisture content of molding sand with surface active agents which allow the use of less water. Effect of moisture content on flowability, workability, moldability, green strength, cohesion and adhesion. (E18r)

390-E. (Russian.) Production of Cast Iron-Magnesium Alloy in a Cupola Furnace. S. F. Gorbunov and M. M. Levitan. Liteinoe Proizvodstvo, Mar. 1961, p. 1-4.

Development of a method for melting cast iron-Mg alloys for casting machine parts for automobiles, tractors, etc., to replace malleable cast iron, some steels and pearlite cast iron of high strength and wear resistance. Instructions for preparation of a Fe-Si-Mg alloy by using liquid Fe-Si. (E10a, E-general, T21, T3n; CI, Mg)

391-E. (Russian.) Technology of Centrifugally Casting a Sleeve. A. A. Svarika. Liteinoe Proizvodstvo, Mar. 1961, p. 8-9.

Centrifugal casting of lead-bronze and brass sleeves, mold handling methods, optimum melt temperature, formula for turning speed of mold during casting, mold treatment after solidifcation. (E14, E-general, T7; Cu-n, Cu-s, Pb)

392-E. (Russian.) Drying Cores by Burners With Infrared Radiation. A. M. Levin and O. N. Bryukhanov. Liteinoe Proizvodstvo, Mar. 1961, p. 10.

Small cores made of a sand, loam and dextrine mixture and containing 8.5% moisture are dryed with infrared radiation delivered by ceramic plates which are heated to 900° C. by gas burners. (E21, W19g)

393-E. (Russian.) Scale Formation and Decarburization of Investment Castings. V. N. Ivanov and A. V. Baranov. Liteinoe Proizvodstvo, Mar. 1961, p. 19-21.

Methods and equipment for investigating scale formation and depth and speed of decarburization of investment castings in neutral atmosphere, low melt temperature and different cooling media. (E25, 1-52; 5-62, 9-52)

394-E. (Russian.) Process of Gas Formation in Dry Foundry Molds and Cores. A. F. Spasskii and A. A. Ryzhikov. Liteinoe Proizvodstvo, Mar. 1961, p. 22-24.

Development of formulas for theoretical calculation of the quantity of gas formed during filling of foundry molds with metal taking in consideration the thermo-physical properties of the metal, foundry sand for the mold and core and physical-chemical properties of the binder. Experiments show that calculations which make use of the formulas are correct. 7 ref. (E-general)

395-E. (Japanese.) Effect of Deoxidation and Desulphurization on the Nodular Graphite Formation in Cast Iron. Hiromu Tanimura and Shinjiro Wakuri. Imono (Japan Foundrymen's Society, Journal), v. 33, May 1961, p. 327-335.

Cast iron melts prepared from scrap, charcoal and FeSi and melted under reducing slag containing CaC_2 are inoculated with CaF_2, MgF_2 and CaSi mixtures to determine the effectiveness of the inoculants in producing nodular graphite formation as a function of oxidation and desulphurization phenomena. Nodular graphite formation is related to supercooling mechanisms as a function of oxygen and sulphur contents. 9 ref. (E25g, D11n, D11r, 2-60; CI-r, AD, 17-57)

396-E. (Japanese.) Study of Castings Solidified Under Impact and Pressure. Masataka Sugiyama. Imono (Japan Foundrymen's Society, Journal), v. 33, May 1961, p. 347-354.

Mechanical properties, porosity and microstructures determined for pure Al and Al and Cu-base alloys cast in shell and sand molds with pressure and impact applied during solidification. Effect of impact and pressure on solidification mode. 7 ref. (E25n, M27, N12, P10, Q-general, 3-68, 3-74; Al-b, Cu-b)

397-E. (Japanese.) A Study on the Centerline Shrinkage and Mechanical Properties of Steel Castings. Satoru Okazoe and Kyozo Yahagi. Imono (Japan Foundrymen's Society, Journal), v. 33, May 1961, p. 355-362.

Investigation of the lateral distribution of centerline shrinkage and related mechanical properties of cast plate, bar and hollow cylinder carbon steel specimens. Data are given for tensile and fatigue strength as a function of casting soundness and specimen dimensions. 4 ref. (E25, P10c, Q-general; CN-g, 5)

398-E. Practical Foundry Testing. E. Heap. Castings, v. 7, May 1961, p. 9, 11, 13, 15.

Sand testing, including moisture and permeability, compressive, shear and tensile strength, deformation and hardness. Metal tests include temperature measurement and chemical composition and physical properties. Tests on furnace and ladle lining materials. (E18r, E-general, 1-54)

399-E. Effect of Tuyere Size on the Performance of a Cold Blast Cupola. H. J. Leyshon, R. B. Coates and K. E. L. Nicholas. Iron & Steel, v. 34, July 1961, p. 344-348.

Experiments on cupola performance using a wide range of blast velocities and operating with 2, 4, 6 and 9 in. diameter tuyeres. Cupola performance is assessed in terms of melting rate, metal temperature and metal quality as indicated by chemical composition and casting properties. (To be continued.) (E10a, W18d)

400-E. Works of Hills Precision Die Castings, Ltd. R. E. Green. Machinery (London), v. 98, June 28, 1961, p. 1485-1492.

Layout and operations in a pressure die casting plant including Zn and Al foundries and machine, polishing, plating and assembly shops. Method of production and quality control. (E13, G17, L10, L17, L25g, 1-52; Al, Zn, 5-61)

401-E. (Russian.) Excavator Cable Drum Cast in Chill Molds. A. V. Kochetkov. Liteinoe Proizvodstvo, Dec. 1960, p. 9-10.

Chilling method and sand technology for casting Fe drums in upright mold assembly. Effect of technique on mechanical properties of castings. (E22r, E18, T28h; Fe)

402-E. (Russian.) Processes at the Metal and Mold Boundary. M. N. Bogdanovski and V. I. Repkina. Liteinoe Proizvodstvo, Dec. 1960, p. 30-32.

Investigation of chemical, mechanical and thermal processes on the mold-metal interface for obtaining metal surfaces free from burned-on sand, to improve appearance and machinability and to lower production costs of Fe and steel castings. Studies of macroscopical and microscopical samples showing formation of quartz grains, fayalite and tridinite. Equilibrium diagram of SiO_2-FeO from 1200 to 2000° C. (E25, M-general; Fe)

403-E. (Translation-Brutcher no. 5044.) Segregation in Centrifugal Steel Castings. N. N. Reutov. Liteinoe Proizvodstvo, Jan. 1960, p. 35-36.

Previously abstracted from original. See item 263-E, 1960. (E14, E23, E25q; ST)

404-E. (Translation-Brutcher no. 5137.) Electroslag Remelting of Roller Bearing

Steel for Improved Quality. Pt. 2. I. Petram and I. Kasik. Hutnicke Listy, v. 15, Nov. 1960, p. 842-851.

Previously abstracted from original. See item 89-E, 1961. (E10, E25; ST)

405-E. (Translation-Brutcher no. 5075.) Electroslag Remelting of Roller Bearing Steel for Improved Quality. Pt. 1. I. Petram and I. Kasik. Hutnicke Listy, v. 15, Nov. 1960, p. 839-842.

Previously abstracted from original. See item 89-E, 1961. (E10r; ST)

406-E. (Japanese.) Back Pressure of Shell Molds for Steel Castings. Kazuro Suzuki and Hiroshi Yamaoka. Imono, (Japan Foundrymen's Society, Journal), v. 33, Apr. 1961, p. 253-259.

Low-carbon steel is cast in shell molds having different contents of phenolic resin binder and with different backup materials to determine conditions for occurrence of blowholes and in particular, factors causing back pressure. Investigations are made of gas generation from heated phenols as a function of phenol content, effect of variation in thickness of the molds and grain size of the sand and influence of the nature of the backup material on back pressure. (E16c, 3-74, 9-68; CN-g)

407-E. (Japanese.) Study of Adsorption Phenomena of Spheriodal Graphite Using Radioisotopes. Hiromu Tanimura, Kimio Matsuda and Shinjiro Wakuri. Imono (Japan Foundrymen's Society, Journal), v. 33, Apr. 1961, p. 260-265.

The mechanism of nodular graphite formation in cast iron, in terms of adsorption of nodulizing agents on graphite nodules, is investigated by adding $Ca^{45}Si$ and metallic Ce^{141} to molten Ni-1.87% C. alloys with resultant structures being examined by autoradiography and metallographic methods. The agents are not absorbed on the graphite nodules and are enriched in the eutectic structures formed between the nodules. 10 ref. (E25q, 1-59; Ni-b, C)

408-E. (Japanese.) Inoculation of Vacuum-Metal Iron. Masuteru Maruyama. Imono (Japan Foundrymen's Society, Journal), v. 33, Apr. 1961, p. 266-271.

Investigation of the role of deoxidation and desulphurization mechanisms in spheroidal graphite formation in cast iron. Comparison of effects of Fe-Si and Ca-Si inoculants as spheroidizing agent. (E25q, D9r, 1-73, D11; CI, AD, 17-57)

409-E. (Japanese.) Flow and Solidification of Aluminium in a Modified Channel. Goro Ohira and Mahito Koizumi. Imono (Japan Foundrymen's Society, Journal), v. 33, Apr. 1961, p. 277-281.

Pure Al and 1.6% Si-Al alloy are cast from 700-750° C. into a straight narrow channel attached to a small well to investigate relations between distance of flow and temperature variations in the running metal. Solidification phenomena are observed as influenced by the chilling action of the lower temperature metal on the metal of higher temperature. (E25r, E25p, 2-61, E22; Al-b, Si)

410-E. Which Aluminum Casting Process? W. R. Butler and S. L. Fahnestock. Modern Metals, v. 17, June 1961, p. 42, 44, 46.

Evaluation of advantages and limitations of sand, plaster mold, permanent mold and die casting of Al and Al alloys. (E-general; Al)

411-E. New Casting Procedure Perfected for Titanium. Modern Metals, v. 17, June 1961, p. 54.

Ti castings up to 148 lb. with dimensions of 72 x 36 x 24 in. are produced by permanent mold casting process called Impel casting. Process relies on fluidity of Ti in production of high-strength, accurate, intricate and stable parts such as impellers. (E12; Ti)

412-E. Vacuum Process Produces Super Purity Die Castings That Can Be Anodized. Modern Metals, v. 17, June 1961, p. 58, 60.

Al die castings of 99.99% purity are produced in a furnace which melts, degasses and holds the metal which is subsequently automatically siphoned into an injection chamber of a die casting machine. Applications. (E13, 1-73, 1-52; Al, 5-61, 17-57)

413-E. What's Needed to Make Vacuum Die Casting Work Properly. Earle Rearwin. Modern Metals, v. 17, June 1961, p. 60, 62, 63.

Experimentation with Al and other metals to determine factors required for successful vacuum operation. Results indicate vacuum must be present during entire casting cycle. Additional conditions are outlined. (E13, 1-73; Al)

414-E. Low Pressure Casting Process Produces Integral Wheel-Brake Drum Assembly. F. H. LeJeune. Modern Metals, v. 17, June 1961, p. 64, 66.

Nonporous wheel hub and drum are produced by submerging an Fe liner in a 1400° F. bath of 99.5% Al until an Fe-Al alloy of 0.008-0.001 in. thickness is formed on the surface of the Fe liner. The liner is removed from the bath and placed in the mold which is then filled with Al alloy at about 1400° F. (E12, 3-74, T21c; Al-b, Fe)

415-E. Measurement of Epoxy-Resin Mixes. M. Callaghan. Foundry Trade Journal, v. 111, July 6, 1961, p. 9-13.

Method for quantitative measurement of various constituents used in production of epoxy-resin patterns involves estimating weight of gross quantity, estimating quantity of each constituent and estimating amount of acceleration. (E17)

416-E. Control of Product Quality. Frank Nixon. Foundry Trade Journal, v. 111, July 6, 1961, p. 15-19.

Specification and inspection of specified standards; causes and elimination of nonconformance and economy of operation in control of foundry product quality. 7 ref. (E25, S22)

417-E. Plastic Resins Seal Castings to Take High Pressures. Iron Age, v. 188, July 20, 1961, p. 98-99.

Sealing of Al, Mg and other metal castings using plastics such as diallylphthalate polyester. The process is applicable to parts such as filter housings, valves and casings, cylinder liners and aircraft fuel control systems. (E25n, L26p; Al, Mg, 5)

418-E. CO_2 Process and Die-Casting in Brazil. D. C. Nevin. Foundry Trade Journal, v. 110, June 29, 1961, p. 821-830.

Preparation of sand molds and cores and their use in CO_2 gravity and pressure die casting of a variety of parts used in the production and distribution of gas and electrical power. (E-general, W11)

419-E. Gating Permanent Mold Aluminum Alloy Castings. George Bier. Foundry, v. 89, Aug. 1961, p. 38-41.

Description of types of permanent mold gating systems; proper gating design. 6 ref. (E22p; Al-b, 5)

420-E. Casting Ingot Molds and Stools. R. C. Harrell. Foundry, v. 89, Aug. 1961, p. 42-47.

Mold and pattern equipment, sand preparation, sand ramming, pattern removal, coremaking, stool making, preparation for pouring and pouring operation, shakeout, chipping and cleaning and chemistry of hot metal. (E-general, W19c, W19e)

421-E. Handling and Control of Metal for Aluminum Diecastings. F. William Foss. Foundry, v. 89, Aug. 1961, p. 56-59.

Ingot specifications, metal handling, melting technique, melt agitation, fluxing and maintenance of correct metal temperature. (E-general, A5a, S22; Al, 5-61)

422-E. Controlled Cooling of Castings. Foundry, v. 89, Aug. 1961, p. 96-97, 99-100.

Ductile iron foundry line provides for automatic production and handling of tractor and implement castings. Layout consists of a variable speed mold conveyor and traveling transfer bridges all operated by a programming console. Castings are cooled while still in the mold. (E-general, 1-52)

423-E. British Foundry Conference. M. M. Hallett. Foundry, v. 89, Aug. 1961, p. 124, 126, 129-132.

Topics discussed at the annual conference of the Institute of British Foundrymen at Cheltenham, May 15-18, 1961 include metal feeding techniques, high phosphorous iron, mold stability, structure and properties of gunmetals, plant maintenance problems and Fe foundry planning, melting, heat treating cast irons, impact testing of cast iron, influence of trace elements, permanent molding, die casting machines, vacuum die casting, vacuum investment casting, shell molding Cu-base alloys and chilling. (E-general)

424-E. Investment Casters Study Metal Solidification. Wallace D. Huskonen. Foundry, v. 89, Aug. 1961, p. 156, 158-159.

Fundamentals of melting and solidification of metals, gating and risering of investment castings, cause and prevention of hot tearing in investment castings, heat transfer and metal-mold reactions. (E25n, E10, E22; 5-62, 9-71)

425-E. (Czech.) Refining of Aluminum Alloys. Vladimir Malik. Slevarenstvi, v. 9, May 1961, p. 170-171.

Removal of Al_2O_3 from molten Al-Si, Al-Cu and Al-Mg alloys by addition of AlSiL 680, 713, 750 or ALMAG salt mixtures containing lime, soda, potash, chlorides, fluorides, hexachlorethane, cryolite, sodium sulphide and borax previous to modification and inoculation. 16 ref. (E25, 9-69; Al-b, Si, Cu, Mg, AD-n, 17-57)

426-E. (Czech.) Use of Calcium Carbide in Cupolas of the TMA Foundry, Hodonin, Czechoslovakia. Josef Lampard. Slevarenstvi, v. 9, May 1961, p. 175.

Operation of a 7.5 ton cupola furnace with forehearth. A metallic charge composed of 55% pig iron, 10% ingot mold scrap, 5% cast iron scrap, 6% steel scrap and 20% returns is melted with a quantity of CaC_2 amounting to 1.9% of the metallic charge. Development of a greater slag quantity showing the tendency to adhere on the tuyeres, increased wear of the lining and formation of slag residues in the cupola are observed as a function of CaC_2 content. (E10a, E25, 2-60; CI, AD-n, 17-57)

427-E. (Czech.) Metal Penetrations in Steel Castings and How to Avoid Them. Leo Rotter. Slevarenstvi, v. 9, May 1961, p. 175-178.

Metal penetration is eliminated by using mold and core mixtures containing additions of MgO, Cr_2O_3, CaO and FeO showing high thermal conductivity. 5 ref. (E18a, E25, 9-69; ST)

428-E. (Czech.) Alcohol Hardening of Molds and Cores. Drahomir Suchomel. Slevarenstvi, v. 9, May 1961, p. 179-180.

Hardening of molds and cores containing waterglass by spraying or painting with, or immersion in, methanol or ethyl alcohol of high concentration. By addition of 10% OB resin to the alcohol 15 times higher hardness is obtained. After hardening, the excess alcohol is removed by drying at 20-200° C. or by burning. (E18, E19, E21)

429-E. (Czech.) Use of CaC_2 in Cupola Charges of the Foundry "N.p. Prerovske Strojirny," Prerov, Czechoslovakia. Alois Soslik. Slevarenstiv, v. 9, May 1961, p. 184-185.

CaC_2 is added to a cupola charge in quantities of 0.1-1% of the metallic charge to study the effect on slag composition, temperature and Fe composition. (E10a, E25q; CI, AD-n, 17-57)

430-E. (Czech.) Difficulties in the Manufacture of Heavy Steel Castings With Bentonite Molding Mixtures. Vaclav Lupac and Vaclav Kyba. Slevarenstvi, v. 9, May 1961, p. 186-188.

Elimination of metal penetrations in green sand casting by selection of optimum mold composition, facing with dextrin or sulphite solutions and by using special molding mixtures in heat exposed sections of the mold; for example, a mixture of crushed magnesite bricks, bentonite, dextrin, clay and soda. (E19, E-general; ST, NM-f45, 17-57)

431-E. Special Heating Requirements in Production of Precision Investment Castings. Edward M. Broad. Industrial Heating, v. 28, July 1961, p. 1278-1282, 1284.

Plant layout and operations for melting, curing the investment molds, investment casting and heat treating of the finished castings. Design of furnace. (E15, E-general, J-general, W18, W27, 17-51; 5)

432-E. (French.) Foundry Oxidation Loss for Copper Alloys. Influence of Charge Composition and Melting Conditions. P. J. Le Thomas and D. Arnaud. Revue de Metallurgie, v. 58, May 1961, p. 437-445.

Using shaped foundry ingots reduces oxidation losses while the quality and uniformity of the product are greatly improved. Handling and storage of the ingots are facilitated and melting time is shortened. 7 ref. (E10; Cu-b)

433-E. Inserts in Light-Metal Castings. Russell H. Garner. Machine Design, v. 33, Aug. 3, 1961, p. 97-98.

Design parameter for combining several types of inserts (shafts, bearings and sleeves) with light metal castings. Inserts are composed of mild steel, toolsteel, Cu, brass, stainless steel and Al alloy and can be plated with Ni, Cr or Cu. (E-general, Ni, Cr, Cu-b, Al, ST, 7-59)

434-E. Desulfurization by Calcium Inoculation Improves Properties of Cast Steel. D. A. Colling and P. J. Ahearn. Watertown Arsenal (WAL TR 311/45). U. S. Office of Technical Services, PB 171384, Jan. 1961, 23 p.

Mechanical properties of high-strength steels can be increased by new methods of lowering the sulphur content to between 0.001-0.002% through inoculation of Ca (Ca-Mn-Si) under conditions of high slag basicity. Broken tensile bars of 4325 and 4340 steels that were desulphurized show improved ductility and toughness over normal sulphur steels at the same strength levels. (E25q, D11n, Q-general, 2-60; ST)

435-E. Core Production in Hot Boxes at the Renault Works. P. Fasson. British Foundryman, v. 54, July 1961, p. 309-319.

Definition and evaluation of the hot box core production process. Specification of sands bound by hot box hardenable binders. Technology of the process including filling and heating the boxes, stripping the core and mass production units. Use of hot box coring in the production of other cores and mold parts. (E21)

436-E. The Effect of Running Conditions on the Reproductibility of Melting Results in Cupolas. F. Neumann and W. Patterson. British Foundryman, v. 54, July 1961, p. 320-331.

Factors affecting reproducibility of melting results are examined and remedies suggested. Influence of blast volume and coke charge on melting results. Optimum running conditions with particular attention to Fe temperature. Influence of coke condition and coke properties relative to the running of the cupola. 25 ref. (E10a)

437-E. Progress at International Combustion Ltd. Foundry Trade Journal, v. 110, June 22, 1961, p. 789-797.

Foundry layout, equipment and operations at Derby, England. New installations include a mechanical cupola charging-plant, coreshop and mold-drying ovens, an electric furnace and a castings cooling conveyor. (E-general, 1-52)

438-E. New Zinc Die Casting Techniques Produce More Efficient Parts at Less Cost. Asarco Digest, v. 3, no. 1, p. 15.

Al timer set shaft and gear used in kitchen ranges and gear and pinion combinations are produced as one part by Zn die casting. Assembly of parts and misalignment rejects are eliminated. (E13, T7; Zn)

439-E. Accent on Bigness--Continuously Cast Copper Cakes. Asarco Digest, v. 3, no. 1, p. 17-19.

Method of casting Cu cakes up to 25 ft. long and 36 in. wide and weighing 17,000 lb. using a "bottomless" water-cooled graphite mold. Molten Cu is poured continuously into the mold cavity, cooled rapidly so that it solidifies as it passes through the mold and emerges from the orifice as a smooth, dense Cu cake. (E16; Cu)

440-E. (French.) Casting of White Iron Pump Housings. Journal d' Informations Techniques des Industries de la Fonderie, May 1961, p. 1-3.

Casting of housings weighing 750 kg. with a Brinell hardness of 420-460 and water tightness at a pressure of 2 kg. per cm.^{2}. Design of pouring system and risers and use of chills in molding. A cast iron containing 3.45-3.50% C, 0.60-0.70% Si and 0.45-0.50% Mn is recommended. (E-general; CI-p)

441-E. (English.) Vacuum Degassing of Steel. Tatsuo Tejima. Institute of Physical and Chemical Research Japan, Scientific Papers, v. 55, Mar. 1, p. 52-55.

Investigation of the degassing phenomenon in vacuum casting of steel using a high-speed camera. Utilization of a specially designed nozzle-stopper to facilitate degassing. (25s, 1-73, 1-52; ST)

442-E. Cast Pearlitic Malleable Gets an Ordnance Break. Steel, v. 149, July 31, 1961, p. 62.

Production of 81 mm. mortar and artillery shell bodies from cast pearlitic malleable Fe by the shell core process. Yield strenghts are controlled from 50,000-100,000 psi. by varying the annealing process. Ultrasonic testing. (E16c, Q23b, 2-64, S13g, T2j; CI, 17-57)

443-E. (French.) Defects in Cast Steel. R. A. Boustred. Fonderie Belge, v. 31, Apr. 1961, p. 97-105.

Effects of size and distribution of sand particles, binders used, degree of baking of cores, pouring systems, moisture and permeability, hydrogen absorbed by the metal, deoxidation, design of part, ramming of molds, casting temperature and sand and metal composition on the formation of blowholes, pinholes, shrinkage cavities, sand penetration, hot cracking and misruns. (E-general, E25, 9-67, 9-68, 9-72)

444-E. Reducing Metal Losses in a Brass Foundry. H. St. John. Foundry Trade Journal, v. 111, July 13, 1961, p. 45-46.

Methods for reducing metal losses in all production stages of brass and bronze foundry practice. Reclamation of metal from discarded molds, reducing casting rejects, better gating procedures and use of die trimming instead of grinding. (E24h, E26, E22p; Cu-n, Cu-s, 5)

445-E. (Japanese.) Study on Aluminum Alloy Sheet Ingot. Pt. 3. Relation Between the Structure and Continuous Casting Conditions. Tojiro Kobayashi and Hisao Otsuji. Light Metals, v. 11, May 1961, p. 151-157.

Effect of the height of molten metal in the mold and of casting speed on microstructure, uniformity, segregation and impurity distribution in semicontinuous cast Al ingots. (E25q, C5q, M27, 9-69; Al, 5-59)

446-E. (Japanese.) Reactions Between Aluminum Alloys and Fire Bricks. Tomonobu Kanno, Torazo Uehara, Gohei Marukawa, Masaro Saito, Shigehi Mizuno and Homei Kato. Light Metals, v. 11, Mar. 1961, p. 107-124.

Specimens of pure Al, Silumin (Al-12% Si), Lautal (Al-3% Cu-9% Si) and Hydronalumin (Al-4% Mg) are heated in Carborondum, Al_2O_3, MgO and SiC to determine the nature of hard spots, due to nonmetallic inclusions, formed by aluminum oxides reaction with the fire brick during casting. (E25, 9-69; Al-b, RM-h, 17-57)

447-E. Neutron-Moderation Gages Water in Foundry Sand. Harvey A. Burley and Milton J. Diamond. Nucleonics, v. 19, Aug. 1961, p. 45-47.

Measurement of moisture in foundry sand by a 2-curie Pu-Be fast neutron source and thermal neutron detectors result in increased uniformity in foundry sand, reduced scrap loss and casting cleanup and fabrication of more complicated castings such as crankshafts. 4 ref. (E18, 1-54, 1-59)

448-E. Castings--And Some Inspection Problems in Relation to Design and Planning for Machining. D. E. Mallet. Quality Engineer, v. 25, May-June 1961, p. 81-82.

Core design, foundry practice, pattern equipment and intraplant liaison as factors in quality control of castings. (E-general, E21g, E11, 1-52)

449-E. (Italian.) Molding With Shaw's Process. J. Lubalin and R. Cristiensen. Fonderia Italiana, v. 10, May 1961, p. 161-168.

Applications of the Shaw process in making flexible, heat and crack resistant investment molds. Standards of quality and precision can be maintained, as for aerospace and chemical industries. Other applications include the production of tools, dies and other castings which are usually machined. (E15)

450-E. (Italian.) Production of Tight Castings at High Pressure With Copper Alloys. E. Brunhuber. Fonderia Italiana, v. 10, May 1961, p. 179-180.

Casting with Cu alloys and silicon bronze is discussed in terms of the effects of the alloying elements on microporosity developed during solidification. (E25n, 9-68; Cu-b, Sn-b)

451-E. (Russian.) Losses of Metal During Melting of Iron Shavings in Cupolas. K. T. Butzel'. Izvestiya VUZ--Chernaya Metallurgiya, Dec. 1960, p. 124-127.

Effect of the form of the charge and the method of charging on metal loss, oxygen consumption, slag composition and temperatures in the

cupola are investigated for cupola melting of burdens composed of briquettes and shavings. (E10a)

452-E. (German.) Modern Electroplating. Heinz Gerlach. Maschinenbau, v. 10, Apr. 1961, p. 136-140.

Applications of electroplating in corrosion protection and improvement of wear resistance, electrical contact resistance and reflectivity. Survey of modern processes including cathodic deposition and galvanoplastic techniques (electroplating of nonconductive surfaces). (L17, L25h, 10-54)

453-E. (Book.) Engineered Castings. Glenn J. Cook. 1961. 257 p. McGraw-Hill Book Co., Inc., 330 W. 42nd St., New York 36, N. Y. $8.50.

Survey of design, material specifications, production and applications of castings. Topics include sand and permanent mold, investment and die castings; and cleaning, inspecting and testing of gray, malleable and ductile iron, steel, brass, bronze and Al, Mg, and Co alloy castings. (E-general, 10-54; Al-b, Cu-b, Co-b, Mg-b, CI, ST)

454-E. Development of "As-Cast" Grain Refiner for Cast Steel. G. K. Turnbull, G. W. Form and J. F. Wallace. Journal of Steel Castings Research, no. 22, July 1961, p. 14-18.

As inoculants applied to molten low-carbon steel, titanium carbide and vanadium boron are particularly effective while Cb and Ti are suitable solute additions to interrupt grain growth. Mechanical properties are determined for those castings in which appreciable grain refinement of the as-cast structure obtained. Improvement in strength is generally accompanied by a loss in ductility. (E25q, Q-general, 2-60; AD-p35)

455-E. (Italian.) Phosphorus in Gray Cast Iron. Fonderia, v. 10, June 1961, p. 271, 273.

Influence of phosphorus in excess of 0.03% on castability, wear resistance, hardness, tensile stress resistance, flexibility and workability of gray cast iron. Relationship between the percentage of phosphorus, temperature and castability of cast iron. (E25p, Q-general, 2-60, 2-61; CI-n, P)

456-E. Centrifugal Casting of Thin-Walled Magnesium Parts. Warren C. Smith. Metal Progress, v. 80, Aug. 1961, p. 101-102.

For complex shapes difficult to produce, the centrifugal process is providing sound Mg castings that are often metallurgically superior to those produced by other casting methods. (E14; Mg)

457-E. (Italian.) Controlled Directional Solidification of 100-Ton Steel Casting. Pietro Tavolotti and Giuseppe Jaccarino. Fonderia Italiana, v. 10, June 1961, p. 191-199.

Methods for controlling cooling of steel castings in order to achieve a compact casting of high quality and tonnage. Economic considerations. (E25n; ST, 5)

458-E. Gravity Diecasting in Aluminium Bronze. R. W. Firth. Engineering Material and Design, v. 4, Aug. 1961, p. 526-529.

BS 1400 AB1-C and AB2-C alloys are economically used in production of aluminum bronze gravity diecasting. Die design and manufacture are discussed as a function of mechanical properties and material cost. (E13, 1-52, 17-51; Cu-s, Al)

459-E. Behavior of Clay-Bonded Sands in a Foundry. W. B. Parkes. BCIRA Journal (British Cast Iron Research Assoc.), v. 9, July 1961, p. 461-498.

Importance of milling time and value of disintegrators. Methods for controlling moisture content. Use of green strength and shatter index to indicate the ability of the sand to deform is explained in relation to molding and stripping properties. Patterns of mold hardness distribution obtained with different molding methods. Castings defects caused by sand washing, gas and expansion. (E18, E19; 5, 9)

460-E. Influence of Chromium Content on Chill and Mottle Formation. J. W. Boyes. BCIRA Journal (British Cast Iron Research Assoc.), v. 9, July 1961, p. 499-505.

Effect of 0.01-0.06% Cr on depths of chill and total chill plus mottle in two sizes of chill test casting is measured in both uninoculated and inoculated irons. (E22r, 2-60; Fe-b, Cr)

461-E. Chilling Mechanism of Chromium on Cast Iron. W. Oldfield. BCIRA Journal (British Cast Iron Research Assoc.), v. 9, July 1961, p. 506-518.

Effect of 0.015-1.019% Cr on the chilling tendency of cast iron is studied in terms of two equilibrium freezing temperatures. The two eutectic temperatures are ascertained from cooling curves obtained from continuous temperature measurements taken in the centers of bars of different diometers cast simultaneously. 6 ref. (E22r, 2-61, S16b; CI, Cr)

462-E. Dimensional Accuracy and Soundness of Grey Iron Castings Produced in Green Sand Molds. K. E. L. Nicholas and W. R. Roberts. BCIRA Journal (British Cast Iron Research Assoc.), v. 9, July 1961, p. 519-536.

Effect of mold wall movement on shrinkage defects as influenced by variations in molding sand moisture content and additions of clay (3-7%), coal dust (2-6%), hydrated lime (0.025-1%), pelleted pitch (2-3%) and wood flour (1%). 15 ref. (E25, 2-60, E19a; CI-n, 5, 9-67)

463-E. Gating Zinc Die Castings. Ralph Wilcox. Precision Metal Molding, v. 19, July 1961, p. 42-43.

Arrangement of cavities in the die block. Cooling considerations. Effects of turbulence in the runner system and gate runner direction on surface finish. Commercial applications of multiple cavity arrangements and the unit die system. Advantages and disadvantages of the unit die system. (E22p; Zn, 5-61)

464-E. Mechanized Foundry for Repetition Castings. Iron & Steel, v. 34, Aug. 1961, p. 368-370.

Increased production of castings weighing a continuous mold conveyor having variable speed control to carry molds through coring up, closing, casting, cooling and knock-out operations. Melting facility is increased by modifying existing cupolas. (E-general, E11, 1-52)

465-E. Effect of Tuyere Size on the Performance of a Cold Blast Cupola. H. J. Leyshon, R. B. Coates and Kel Nicholas. Iron & Steel, v. 34, Aug. 1961, p. 390-395.

Under certain conditions variation of tuyere ratio does not affect cupola performance and tuyere size does not affect metal composition and temperature. Increase of the blast rate at a constant coke charge-metal ratio increases melting rate and metal temperature, decreases latent heat of stack gases and decreases FeO content in slag. 11 ref. (E10a; Fe)

466-E. High Output Expected at Automated Bronze Foundry. Steel, v. 149, July 24, 1961, p. 92.

Use of conveyors to carry mold and core sand from storage silos and hoppers to the molding stations and a carbon arc and induction furnace to produce the molten bronze. Sand and cores are automatically separated from castings. (E-general, 18-74; Cu-s)

467-E. (Spanish.) Problems of Solidification and Crystallization in Steel Ingot Casting. Bernhard Matuschka. Instituto del Hierro y del Acero, v. 14, Jan.-Mar. 1961, p. 253-262.

Solidification and crystallization in Fe and sand molds are studied by filling the mold with liquid steel and pouring out the part that has not yet solidified after 1-20 min. of spontaneous cooling. Sulphur segregation is studied on Baumann prints. Formation of blowholes in molds of various shapes. (E25n, E11; ST, 9-68)

468-E. Making Super-Alloy Blades by Vacuum Casting. David Fishlock. Metalworking Production, v. 105, Aug. 2, 1961, p. 49-53.

Investment casting of turbine wheel blades composed of Vacumelt G64, a complex Ni-base alloy with 11% Cr, 4% W, 2.8% Mo, 2% Cb, 6% Al and 0.03% B which is melted in carbon-arc vacuum furnaces. Furnace design and construction, arc-melting cycle and quality control by fluorescent dip and X-ray techniques. (E15, 1-73, T7h, W18s; Ni-b, Cr, W, Mo, Cb, Al, B)

469-E. New Model, New Methods at Volkswagen. Anderson Ashburn. Metalworking Production, v. 105, Aug. 2, 1961, p. 54-56.

Techniques and equipment used for die casting and maching of

Mg crankcases and shell-mold casting of cast iron cylinders on continuous lines. (E13, E16c, G17, 1-52, T21; Mg, CI)

470-E. Synthetic Resin Bonded Shell Cores in Present and Future Foundry Practice. W. C. Capehart. Current Engineering Practice, v. 3, May 1961, p. 8-15.

Production of shell cores. Resin and sand selection and coating procedures. Sand or mix additives; core box design and construction materials; and core box heating. Shell core production problems including sticking, false void, thin walls, peel back, low strength and nonuniform production. (E21)

471-E. Eaton Gray Iron Castings by the Permanent Mold Process. George R. Frye. Current Engineering Practice, v. 3, May 1961, p. 16-17.

Casting of modified gray iron into permanent air-cooled cast iron molds. Application of soot to the mold surface separates molten iron from the Fe of the mold and serves as an insulator. Effect of soot coating thickness on cooling rate and microstructure. (E12, M27; CI)

472-E. On Stickiness of Molding and Core Sand Mixtures. Douglas C. Williams. Current Engineering Practice, v. 3, May 1961, p. 38-39.

Elimination of sand mixture sticking to pattern and core box surfaces by placing all water used in the preparation of the sand mixture into the nonstoichiometric immobilized condition of silica gel. (E18p, E18r)

473-E. Some Aspects of Solidification of Simple Shaped Castings. M. R. Seshadri and A. Ramachandran. Current Engineering Practice, v. 3, May 1961, p. 40-44.

Effect of size and shape on solidification time of Al, Al-Si and Al-Cu castings. 4 ref. (E25n, 3-73; Al-b, Si, Cu, 5)

474-E. More Efficient Cupola Melting. Union Carbide Metals Review, v. 4, Summer 1961, p. 16-18.

Installation of two water-cooled hot blast units used to cast gray iron and ductile iron frames and housings for motors and generators. Design and construction of units. Strength of castings. (E10a, Q27a, W18d; CI)

475-E. (Translation-Brutcher no. 5125.) Computer for Calculating the Temperature Distribution in Cupolas. L. M. Marienbakh and A. M. Shapiro. Liteinoe Proizvodstvo, Sept. 1960, p. 25-28.

Previously abstracted. See item 728-E, 1960. (E10a; CI)

476-E. (Translation-Brutcher no. 5197.) Inoculation of Magnesium Cast Iron. A. V. Chornovol. Dopovidi Akademii Nauk Ukrainskoi RSR, Feb. 1961, p. 183-187.

Study of efficiency of additions of calcium silicide as against ferrosilicon for suppression of chill in Mg-treated cast irons, the latter being known to solidify with formation of eutectic cementite and to show a marked propensity to chill formation. Cooling curves of Mg cast irons uninoculated and inoculated with FeSi or CaSi, respectively. (E25q; CI)

477-E. Productive Materials--Key to Die Casting Efficiency Gains. H. E. Eriksen. Production, v. 48, Aug. 1961, p. 70-77.

Die casting of automobile engine blocks, torque converters and transmission castings from Al alloys and scrap. Design and operation of the die casting machines and the trim presses. Methods of reducing amount of Al used in the components produced. (E13, 1-52, T21; Al-b)

478-E. The Gating of Aluminium Die Castings. H. K. Barton. Machinery (London), v. 99, July 26, 1961, p. 209-216.

Gating arrangements which cause early sealing of cacity vents. Adverse effects of cold runners, effect of ribs on metal flow in the cavity and comparison of thin with heavy gating. (E22p; Al, 5-61)

479-E. Carbon Sand Provides On-The-Job Economy. Jack Elliott. Modern Castings, v. 40, Aug. 1961, p. 31-33.

Advantages of carbon sand for coremaking operations during casting of gray iron, brass and bronze to produce machine tool components, jigs, fixtures and dies. (E21, E-general; CI, Cu-n, Cu-s, NM-f45)

480-E. Green Sand Properties. A. B. Draper and H. A. Knappenberger. Modern Castings, v. 40, Aug. 1961, p. 49-55.

Green compression strength and permeability of synthetically-bonded green sand as affected by median grain size. 7 ref. (E18r, 2-59)

481-E. Structural Uranium Alloy Melting, Casting and Heat Treating Techniques. G. D. Chandley and D. G. Fleck. Modern Castings, v. 40, Aug. 1961, p. 56-64.

Vacuum and inert gas melting, molding, chemical analysis and inspection and vacuum heat treating of uranium alloy high-strength castings. Physical metallurgy. 4 ref. (E-general, J-general, 1-73, S11, S13; U-b, 5)

482-E. (German.) Investigation of Gas Porosity in Steel Cast in Green Sand and Means of Control. H. Uhlitzsch, L. Rietz and G. Wycisk. Technik, v. 16, June 1961, p. 435-440.

Occurrence of various types of gas holes in green steel castings as influenced by casting rate and time, molding sand materials, moisture content of refractory and melting technology (deoxidation). Reduction of failures by close control of process parameters and materials. (E11, E19a, E25q; ST, 9-68)

483-E. Die-Casting Defects--Some Causes--Some Remedies. T. P. Barbicane. Machinery, v. 67, Aug. 1961, p. 102-110.

Effect of flow of material in the die cavity on surface finish and solidity of Zn and Al die castings. Means of finishing and lubricating die surfaces for elimination of surface markings which weaken castings. Methods of soldering and repairing of cracked and eroded surfaces. (E13, 9-71; Al-b, Zn-b)

484-E. (Russian.) Fundamentals of Designing Runner Systems for Die Casting. V. M. Plyatski. Liteinoe Proizvodstvo, Jan. 1961, p. 6-12.

X-ray investigations of 65 variations of gating systems show the influence of gating design on metal turbulence, air inclusions and casting properties. Formulas for determination of filling time and recommendations for gating selection. (E22p, 17-51, E13)

485-E. (Russian.) Study of Processes in a Cupola Using Partial Substitution of Natural Gas for Foundry Coke. G. I. Kletskin, N. L. Sobol, V. E. Dyakonov, V. D. Rabinovich and Van Zhu-Yao. Liteinoe Proizvodstvo, Jan. 1961, p. 19-25.

Design of a cupola to obtain optimal efficiency by using a combination of gas and coke with special devices to insure safe distribution of air and gas. Analysis of stock gases and thermobalance of both fuels. Controlling of bed heights by changes in gas-air ratio. (E10a, W18d, 17-51)

486-E. (Russian.) Nonmetallic Inclusions in Malleable Cast Iron. P. N. Bidulya, G. Yu. Shulte, B. H. Pelikh, A. A. Mladova, A. A. Sherstyuk and L. S. Miroshnichenko. Liteinoe Proizvodstvo, Jan. 1961, p. 25-27.

Malleable cast iron having a sulphur content of up to 0.2% is inoculated with 0.005-0.06% Al to increase number and decrease size of nonmetallic inclusions. Optimum inoculation, relative to C + Si content, decreases annealing time and improves physical and mechanical properties. 13 ref. (E25q; CI, 9-69)

487-E. (Russian.) Process of Filling the Die Mold Cavity and Estimation of the Cross Section of the Ingate for Die Casting. Chzhu-Sen-Yuan. Liteinoe Proizvodstvo, Jan. 1961, p. 30-33.

Formulas are developed on the basis of empirical and theoretical investigations. Filling time, velocity of metal, temperatures on the die metal boundaries and pressure. 9 ref. (E13)

488-E. (Russian.) Raising Resistance of Chills. V. V. Gusev. Liteinoe Proizvodstvo, Jan. 1961, p. 43-48. (From Giessereiwesen Giessereitagung, May 1958, Pt. 1.)

Chills for glass molds, steel, cast iron and centrifugal castings. Influence of various alloys, inoculants and heat treatment on prevention of cracks and growth of chills. (E22r, 2-60, 2-64; ST, CI, 5-65)

489-E. (French.) Casting in Sand Cement. Jean le Borgne and Marcel Jaumain. Fonderie, v. 185, June 1961, p. 209-219.

Casting of steels in molds fabricated of different types of cement.

Basic mold pieces are constructed of conventional cement and finer cements containing silica and zircon sand are used as contact surfaces for the molten steel. Various cast pieces are described and their method of casting given. (E18, E11, 1-53, 17-57)

490-E. (French.) Oxidation Losses in the Founding of Copper Alloys. Pierre Julien le Thomas and Dominique Arnaud. Fonderie, v. 185, June 1961, p. 220-228.

Oxidation losses in founding of Cu alloys are discussed as functions of charge composition and melting conditions. The influence of various additives on oxidation. (E25, 2-60; Cu-b, AD-r)

491-E. Biggest Steel Castings Poured at CSF. Canadian Metalworking, v. 24, Aug. 1961, p. 57.

Technological considerations in the production of 12 300,000-lb. castings, 32 ft. long, 14 ft. wide and 38 in. thick by Canadian Steel Foundries Ltd., Montreal. Castings are used to make steel rolling mills. (E-general; ST)

492-E. Explains New Way to Gate Steel Castings. T. Finlay. Canadian Metalworking, v. 24, Aug. 1961, p. 62-64.

Experimental method and results in fin gating mild, stainless and manganese steel castings. (E22p; CN, SS, AY, 5)

493-E. Aluminum Castings for Anodic Oxidation. E. A. Bloch. Foundry Trade Journal, v. 111, Aug. 1961, p. 161-165.

Production of Al castings for subsequent decorative anodic oxidation. Relationship between reflectivity and Mg content. Defects due to melting and casting errors and means of prevention. Principles of gating and feeding. (E-general, L19, P17a; Al-b, Mg, 5, 9)

494-E. Cast-Iron Kitchenware. Foundry Trade Journal, v. 111, Aug. 10, 1961, p. 167-170.

Production processes at a mechanized foundry and enameling plant. Enamel preparation and spraying, firing in a continuous roller hearth furnace and drying. (E-general, L27, T10a; CI, 17-57)

495-E. Composite Mold Development Promises High Production of Precision Castings. Industrial Heating, v. 28, Aug. 1961, p. 1556-1560, 1562.

Technique for the production of a composite mold constructed of an easily reclaimable ceramic facing and a chomatte-type sand backing. Application of this mold technique in the automatic mass production of precision metal castings. (E15, 1-52, 17-57)

496-E. (Book.) Foundry Moulding Sands of India. Jatinder Mohan, R. M. Krishnan, B. R. Nijhawan, P. K. Gupte and B. V. Somayajulu. 1961. 180 p. Council of Scientific & Industrial Research, New Delhi, India.

Testing foundry molding sands including natural, crude silica, high silica and zircon for fineness, size distribution, mineral constituents, moisture, permeability, compressive strength, shear strength, air set strength, shatter index, hardness, flowability, bulk density and fusion point. Bonding clay is tested for pH value, specific gravity, swelling index and chemical and bonding properties. (E18r, 1-53, 17-57, NM-f45)

497-E. Slip Casting--Economical for Refractory Metals. Western Metalworking, v. 19, Aug. 1961, p. 30-31.

Powder metallurgy consolidation of high melting point, reactive and other difficult-to-cast or form metals by casting as a slurry in absorbent molds with subsequent sintering. Intricate shapes involving re-entrant angles, inside and outside threads and solid and hollow parts are produced from Cb, Ta, W, Cr, Si, their alloys and other metals. (E16b, H-general; EG-d37, Ta-b, Cb-b, W-b, Cb-b, Si-b, Cr-b)

498-E. Nodular Iron Foundry. Jack C. Miske. Foundry, v. 89, Sept. 1961, p. 62-67.

Review of melting, molding, inoculation and heat treatment techniques for a foundry producing nodular iron. Design and layout of equipment including basic cupola, sand system and molding lines. (E-general; CI-r)

499-E. Converting From Natural Sand to Synthetic Sand. Andre Herrault and Harry Heron. Foundry, v. 89, Sept. 1961, p. 68-70.

Description of conversion procedures at 2, 4, 50 and 100% rates used in a

foundry casting Al and Cu alloys. Data given for green strength, moisture content and permeability of the resulting sand mixtures. (E18)

500-E. Risering Permanent Mold Aluminum Alloy Castings. George A. Bier. Foundry, v. 89, Sept. 1961, p. 71-73.
Discussion of riser, ingate and nozzle relationships required to compensate for solidification contraction and allow for proper venting during casting. A redesigned gating system is illustrated. (E22q, E12; Al-b)

501-E. Army Buys Newly Developed Pearlitic Malleable 81-mm Shell. Foundry, v. 89, Sept. 1961, p. 104-106, 109.
Sand casting, continuous heat treating and ultrasonic inspection are used to meet specifications for artillery and mortar shells made with malleable iron. (E11, T2j; CI-s, 17-57)

502-E. Diecasting Offers Improved Rotor Assembly Method. Delbert Ritzhaupt. Foundry, v. 89, Sept. 1961, p. 136, 139-140.
Die casting of Al rotors as solid units using a hydraulic press with an ejection ram. Press casts metal at 1300° F. under a pressure of 22 tons to bind the laminations together. (E13, T7h; Al, 17-57)

503-E. Conversion to Casting Cuts Costs 54%. Wallace D. Huskonen. Foundry, v. 89, Sept. 1961, p. 146-148.
Production of cast gray iron gas-oil burner heads using shell cores and green sand molds. (E11, E16c, E19, W13a; CI-n, 17-57)

504-E. High Green Strength Can Offer Advantages. Harry W. Dietert. Foundry, v. 89, Sept. 1961, p. 167, 170.
Data from creep tests are used to show the relationship between sand green strength, mold creep and casting weight increases. (E18r, E19a)

505-E. The Pressure Die Casting Industry in the U.S.A. B. Trautmann. Metall, v. 15, Aug. 1961, p. 757-760.
Survey of current status of Zn, Al, Mg and brass die casting with respect to production, casting machinery and melting equipment. Review of developments in the past ten years and predictions for future development. (E13, 10-54; Al, Zn, Mg, Cu-n)

506-E. Design Clues for Investment Casting. A. A. Knapp. Design Engineering, v. 7, Aug. 1961, p. 45-47.
Technological parameters of the investment casting process and its advantages are reviewed with evaluation of surface finish and dimensional tolerances obtainable in the as-cast condition. (E15)

507-E. New Mold Methods Stir Interest in Reactive-Metal Casting. Iron Age, v. 188, Sept. 7, 1961, p. 102-103.
Machined graphite molds are combined with rammed graphite cores for casting reactive metals into impellers and other complex shapes. Unalloyed Mo, Cb and W are cast experimentally by the process. (E16c, E19; Mo, Cb, W)

508-E. (Italian.) Employment of New Synthetic Resins and Traditional Equipment in Making Precise Cores. M. Jacques Roth. Fonderia, v. 10, July 1961, p. 279-288.
Technique for forming cores with formic-phenolic resins as sand binding elements instead of traditional oils or silicate and CO_2. Preservation, finishing, weight and economic considerations. (E21g, E18n, 1-52; NM-d)

509-E. (Italian.) New Tests for Controlling Sand Mixtures for Shell Molding. Fonderia, v. 10, July 1961, p. 289-294.
Determination of the point of fusion, permeability, tensile strength, heat, flexion and transversal resistance of sand mixtures and specimens by using special apparatus and techniques. (E18r, 1-53)

510-E. Measuring Moisture Content of Foundry Sand. H. A. Burley, A. D. Block and M. J. Diamond. Metal Industry, v. 99, Aug. 18, 1961, p. 122-124.
Description and operation of a moisture gage which measures average moisture content of 3200 lb. batch of sand to an accuracy of ± 0.05% at the 3% level in less than 1 min. (E18r, 1-53)

511-E. Production of Die Cast-Iron Bar. J. Cumberland. Glass Technology, v. 2, June 1961, p. 114-116.
Static and continuous die casting of medium phosphorus gray iron or nickel-chromium alloyed iron. Bars are discussed emphasizing applications of cast iron in the glass bottle industry. (E13; CI, P, Ni, Cr, 4-55)

512-E. Design Clues for Investment Casting. A. A. Knapp. Design Engineering, v. 7, Sept. 1961, p. 51-53.

Summary of tolerances and shrinkage allowances for precision investment casting of tubes, shapes, bars and sections. Data are given for flatness, straightness, concentricity, roundness, hole positioning and length for the metal castings, wax patterns and cores. Minimum wall thicknesses are suggested for bronzes, brasses and Cu-Be alloys. (E15, 17-55; Cu-b)

513-E. The Theory and Practice of Sandslinging. R. Kennedy. British Foundryman, v. 54, Aug. 1961, p. 338-345.

Review of function of the ramming head, the quantity and quality of the sand that is processed and the effect of varying the speed with which the head moves over the mold. Parameters of operation and applications of technique. (E18, 1-52, 17-57)

514-E. The Use of Oxygen in Cupolas. J. V. Harding and J. A. Charles. British Foundryman, v. 54, Aug. 1961, p. 365-370.

Routine use of oxygen enrichment to increase metal temperatures, increase carburization, decrease Si loss, lower sulphur content and economize on coke consumption. Comparison with similar effects of hot blast and evaluation of use of other industrial gases in steelmaking. 25 ref. (E10a, 1-52, 17-57)

515-E. Aluminium in Practice. Aluminium Courier, no. 54, June 1961, p. 24-25.

Pressure die casting of Al industrial components. Equipment and design guides. Reduction of machining time, economic considerations, porosity and shrinkage. (E13, 1-52; Al, 5-61, 9)

516-E. Vienna Congress Papers. Pt. 2. R. Rinesch, P. Neudecker and J. Eibl. Foundry Trade Journal, v. 111, Aug. 17, 1961, p. 197-203.

Summaries of 14 papers presented at the International Foundry Congress covering the L-D process for steel castings, production of thin-walled molds, phosphorus embrittlement in steel castings, flowability of molding sands, gas blowing and injection processes, ultrasonic flaw detection, solidification of steel castings, development of eutectic cells, production of S-g. iron, use of sodium silicate-bonded molding sands, magnetic properties of cast steel and desulphurization of carbon steel. (E-general, D11n, P16, Q26s, S13g; ST, 5)

517-E. Mould Materials. J. H. Edgington. Glass Technology, v. 2, June 1961, p. 116-120.

Foundry techniques including heat treatment for processing ferrous and nonferrous alloys, ductile iron and stainless steels to achieve desirable microstructural and physical properties for applications in glassmaking. (E-general, M27, Q-general, T29a, 2-60, 2-64)

518-E. Gate Sizes in Aluminum Die-Casting Design. John Lapin and Richard V. Stumph. Product Engineerging (Design Digest Issue), v. 32, Sept. 4, 1961, p. 164-166.

Wall thickness versus casting filling time; casting weight versus gate area; length of the casting (distance of gate to farthest extremity) versus gate velocity. (E13, E22p; Al)

519-E. Casting the Volga Cylinder Block. Metal Industry, v. 99, Aug. 11, 1961, p. 105.

Techniques and materials for pressure die casting of Al alloy cyclinder blocks. (E13, 3-74, T21b; Al-b)

520-E. (Spanish.) Centrifugal Casting of Gray Cast Iron and SG-Iron. Heinrich A. Nipper. Instituto del Hierro y del Acero, v. 14, Apr. 1961, p. 323-341.

Comparison of solidification, segregation and phase transformation processes in sand molds and permanent molds. Microstructure of centrifugal castings as influenced by Fe composition, thermal conductivity of molds and cooling methods. Casting defects and their causes. (E-general; CI)

521-E. Cast Steel Bells Ring True. Modern Castings, v. 40, Sept. 1961, p. 50-52.

Survey of coremaking, mold making, pouring and cleaning techniques for casting steel bells. (E-general, T9r; ST, 17-57)

522-E. Fin Gating--New Cost-Cutting Steel Technique. T. Finlay. Modern Castings, v. 40, Sept. 1961, p. 53-55.

Production of long, thin-section stainless and mild steel castings using a fin gating system to assure cleaner metal in the mold cavity. Designs are given for gating systems producing flanges, valves and gear blanks. (E22p; ST)

523-E. Olivine Wins Scandinavian Approval. G. S. Schaller. Modern Castings, v. 40, Sept. 1961, p. 56-59.

Applications of olivine sand in foundries casting gray iron, alloy and stainless steels and manganese steel. (E11; CI, ST, NM-f45, 17-57)

524-E. Precision in the Foundry. A. Short. Modern Castings, v. 40, Sept. 1961, p. 69-81.

Methods of improving dimensional accuracy, surface finish, definition of detail and metallurgical soundness during sand casting, die casting, shell molding, investment casting and other processes applicable to Mg and Al alloys, Fe and steel. (E-general, 17-51; Al-b, Mg-b, Fe, ST)

525-E. Solidification of Steel Castings and Ingots. M. C. Flemings, R. V. Barone, S. Z. Uram and H. F. Taylor. Modern Castings, v. 40, Sept. 1961, p. 82-95.

Methods for obtaining directional solidification in cast steel and effects of solidification variables on structure, segregation and mechanical properties. Experiments on plate-like and cylindrical 4330 and 4340 steel castings frozen under a variety of thermal gradients in different types of molds. 29 ref. (E25n, D9, M27, Q-general; ST)

526-E. Horizon Requirements for Castings. S. R. Carpenter. Modern Castings, v. 40, Sept. 1961, p. 96-101.

Comparison of steel, Ti, Zr, Mo, Ta, Be and Cb castings to forgings in terms of costs and the designs required to restrict chronic defects in castings for aircraft applications. (E-general, T24, 17-51, 17-53; ST, Ti, Zr, Mo, Ta, Be, Cb, 17-57)

527-E. Magnesium-Silver-Didymium-Zirconium Casting Alloy QE22A. D. J. Whitehead. Modern Castings, v. 40, Sept. 1961, p. 102-116.

Mechanical and physical properties and castability ratings are given for a 2.2% Di-2.5% Ag-0.6% Zr casting alloy based on Mg which combines high yield strength at 20° C. with good tensile properties at up to 316° C. The alloy also has good fatigue characteristics and resists stress corrosion. 11 ref. (E25p, A-general, P-general, Q-general, R-general, 2-60; Mg-b, Ag, Zr, EG-g)

528-E. Aluminum Bronze Hard Spots. Norman A. Birch. Modern Castings, v. 40, Sept. 1961, p. 117-124.

Review of causes, effects and control methods for hard spots, unalloyed metallic inclusions of almost diamond hardness which appear in aluminum bronze castings. Data are given for microstructure and chemical composition of several spots and for their effect on mechanical properties and casting serviceability. (E25, Q-general, 9-69; Cu-s, Al, 5)

529-E. CO_2 Process Improvements. D. A. Taylor. Modern Castings, v. 40, Sept. 1961, p. 125-132.

Summary of methods for facilitating core removal, improving surface finish and reducing the amount of new silica sand required. Effects of clay and water content on the properties of the silicate bonds. (E19)

530-E. British Steel Castings Research Assoc. Foundry Trade Journal, v. 111, Aug. 3, 1961, p. 127-132.

Review of papers covering Apr. 1, 1960-Mar. 31, 1961, and Annual General Meeting Proceedings. Topics include casting technology and mold practice, physical chemistry relations, solidification phenomena and structure control and microstructure, physical and mechanical properties as affected by composition and inclusion content. (E-general, D11, P-general, Q-general, 2-60, 3-69)

531-E. Vienna Congress Papers. Pt. 1. Foundry Trade Journal, v. 111, Aug. 3, 1961, p. 133-138.

Summaries of papers presented at the International Foundry Congress, June 19-24, 1961, include microscopic examination of microstructure, melting techniques, rigging, mechanical properties of cast piston rings, thermal analysis of Al and the effect of slag on properties of cast iron. (E-general, D11n, M21, Q-general, 11-63, 17-57; CI, Al, 5)

532-E. (Italian.) New Casting Procedure for Titanium, Hafnium and Zirconium. Alluminio Nuova Metallurgia, v. 30, June 1961, p. 312-316.

Centrifugal casting of Ti, Hf and Zr using an arc furnace in which the metal to be fused functions as the electrode. Use of graphite molds is discussed with regard to their physical properties and costs. (E14, E10r; Ti, Hf, Zr)

533-E. Costs Cut in Precision Casting Process. Materials in Design Engineering, v. 54, Aug. 1961, p. 13.

Review of techniques for production of a composite mold consisting of sand backing with a special ceramic facing as a substitute for the solid ceramic mold previously used to produce castings by the Shaw process. Details of mold production. (E15, E19, 17-51)

534-E. Hollow Castings and Vessels--A Suggested Novel Method of Production. R. H. T. Dixon and J. E. White. Foundry Trade Journal, v. 111, Sept. 7, 1961, p. 281-283.

Successful extension of the principles of centrifugal casting to two-plane spinning in order to produce hollow spherical shapes. (E14)

535-E. A Microscopic Study of Rammed Sand Surfaces. T. B. Caine, E. H. King and J. S. Schumacher. Journal of Steel Castings Research, no. 21, Apr. 1961, p. 1-9.

Testing procedure includes determination of sand surface density by observation and by weighing sample; study of erosion by liquid metal (Hg); and establishment of the relation between density, green permeability, green compression strength and green hardness. (E18r)

536-E. Die Casting From a Technical Viewpoint. Richard Stenberg. Society of Automotive Engineers, no. 389C, 1961, 3 p.

Parameters for design and production of Al alloy castings for automotive applications including heat treatment, Shaw Process and casting control by composition analysis and testing by X-ray and water pressure. (E-general, 1-52, T21; Al-b, 5-61)

537-E. Versatility of the Aluminum Sand Casting Process. A. H. Hinton. Society of Automotive Engineers, no. 389D, 1961, 3 p.

The use of synthetically bonded foundry sand, epoxy resin patterns, additional core supports and CO_2 type cores, and the exploration of increased chill and proper directional solidification all affecting the yield strength, tensile strength and elongation of the casting. (E-general, 1-52, Q-general; Al, 5-60)

538-E. Five Malleable Castings Cut Costs. Materials in Design Engineering, v. 54, Sept. 1961, p. 123.

Winning designs in the Malleable Founders Society design contest. Designs are shown for a gear rack, gear and shaft unit, equalizer bar, mounting bracket and cultivater front arm. (E-general, 17-51, 17-57; CI-s)

539-E. (Russian.) Inoculation of Cast Steel. N. S. Kreshchanovsky. Liteinoe Proizvodstvo, Feb. 1961, p. 1-8.

Formulas for determination of optimum amount of inoculant based on the relationship between surface tension and crystalline grain growth and the influence of B, Mg, Ca and Ce on physical and mechanical properties of the steel. Study of surface tension at fluid-gas boundaries and of chemical activity in processes of deoxidation and desulphurization. 19 ref. (E25q, N16, P-general, Q-general; ST, B, Mg, Ca, Ce)

540-E. (Russian.) Gating for Ductile Iron Castings. I. A. Shapranov and A. A. Tetman. Liteinoe Proizvodstvo, Feb. 1961, p. 13-16.

Experiments with ductile iron, gray iron and steel castings to derive formulas for calculation of gating systems for ductile iron. Velocity, fluidity and inclusions are determining factors. 13 ref. (E22p, 1-52; CI, ST)

541-E. (Russian.) Influence of Deoxidation and Solidification Conditions of Steel in Mold on Development of Hot Tears in Castings. N. A. Trubitzyn. Liteinoe Prozvodstvo, Feb. 1961, p. 17-19.

Experiments with steel deoxidizers including Al, Ti and silicomanganese to determine the role of preshrinkage, expansion, recrystallization and nonmetallic inclusions in the development of hot tears. 6 ref. (E25, D11r, 9-72; ST, AD-r, 17-57)

542-E. (Russian.) Analysis of Preshrinkage Expansion and Volume of Shrinkage Cavities in Cast Irons. N. G. Girshovich. Liteinoe Proizvodstvo, Feb. 1961, p. 27-31.
Influence of mold wall resistance, dendritic growth, graphite separation and solidification phenomena on shrinkage. 8 ref. (E25n, E25q; CI, 9-67)

543-E. (Russian.) Solubility of Magnesium in Cast Iron. M. A. Essen and F. I. Tavadze. Liteinoe Proizvodstvo, Feb. 1961, p. 31-34.
Influencing factors include content of C and Si, pressure, temperature and time. Nodularization by Mg, Zn and Ca, spheroidization and graphitization as related to Mg content. 9 ref. (E25q, N8, P12e, 2-60, 2-61, 2-67; CI, Mg)

544-E. (Russian.) Technological Problems in Production of Ductile Iron. B. P. Pavlov. Liteinoe Proizvodstvo, Feb. 1961, p. 37-38.
Treatment of Fe with Mg welded on steel rod in a mixing ladle, inserted and held under the surface. Mass production. (E25q, 1-52; CI-r)

545-E. (Translation-Brutcher no. 5147.) Cupola Melting Process Accelerated by the Injection of Oxygen Into the Hearth. I. S. Matveenko and I. A. Zotkin. Izvestiya VUZ--Chernaya Metallurgiya, Feb. 1961, p. 133-137.
Previously abstracted. See item 388-E. (E10a; Fe)

546-E. Lost Wax Casting. L. C. Barton. Machinery Lloyd (Overseas Edition), v. 33, Aug. 1961, p. 57-51.
Investment casting of light metal and steel alloys and Stellite with attention to the Misco Mono Shell process. Preparation of wax patterns and ceramic molds including use of vitreous grits in the Glascast process. Review of process parameters such as temperature control effects on surface quality of castings. (E15, 10-54; EG-a39, ST)

547-E. New Mold Making Development Speeds Precision Casting Results. Industrial Gas, v. 40, Aug. 1961, p. 10-13.
Reclaimable ceramic-faced sand molds made automatically in application of the Shaw process for mass production. Design advantages include strippability, thermal shock resistance, dimensional stability, gas-free molds and soundness. (E15, W19g, 1-52, 17-51)

548-E. Factors Influencing Molding Sand Properties. Willis H. Lawrence. Foundry, v. 89, Oct. 1961, p. 61-67.
Determination of green, dried and high temperature properties of silica sand-bentonite-water compositions from data based on the amount and distribution of each phase. 5 ref. (E18r, E19, 2-60, 2-61; NM-f45)

549-E. Mixing and Molding Foundry Green Sand. Richard W. Heine. Foundry, v. 89, Oct. 1961, p. 68-75.
Behavior of molding sand during squeeze and jolt molding as affected by changes which occur in the sand during mixing. The latter include agglomeration, attrition, lumping, aeration and mechanical properties. 4 ref. (E18r, E19a; NM-f45)

550-E. Be Your Own Sand Detective. Joseph S. Schumacher. Foundry, v. 89, Oct. 1961, p. 76-81.
Method of green sand evaluation based on physical properties, screen analysis and effective clay content as determined by a green shear test, carbon requirements for effective peel and response to ramming. 4 ref. (E18r; NM-f45)

551-E. How Materials Affect Oil Bonded and Shell Cores. E. C. Zuppann. Foundry, v. 89, Oct. 1961, p. 82-87.
Results of jolt overhang and jolt sag tests on sands containing cereal binders show the effects of the amount of additive characteristics, sand grain size and the interrelationships of the core mix materials on sand properties. (E21, 2-59, 2-60; NM-f45)

552-E. How to Use CO_2 Process and Furan Cores. Robert J. Mulligan. Foundry, v. 89, Oct. 1961, p. 88-93.
Gassing methods for use with the CO_2 process. Uses of furan binders in the hot corebox, conventional dielectric oven baking and core-oil and furan combinations. Comparison of various core and mold making methods. (E-general; NM-f45)

553-E. Gating and Risering Permanent Mold Gray Iron Castings. Foundry, v. 89, Oct. 1961, p. 120-121, 124, 126.

Description of flat, round and flash mold cavity feeding systems. Risering requirements are shown to be minor. 7 ref. (E22; CI-n)

554-E. (Russian.) Heat Exchange Between Castings and Molds. K. L. Sheptunov. Tsvetnye Metally, June 1961, p. 72-76.

Formulas for determination of temperature exchange between melted metal and sand, concrete, graphite or cast iron molds at the contact surfaces or at any distance from contact surface for any given time. 8 ref. (E25)

555-E. (Japanese.) The Effects of Inoculation With Ferrosilicon on the Graphite Form of Vacuum-Melted Iron. Masuteru Maruyama. Imono (Japan Foundrymen's Society, Journal), v. 33, June 1961, p. 412-420.

Nucleation and formation of flake or spheroidal graphite during solidification of molten Fe as dependent on changes in surface tension between the Fe and graphite as a function of temperature, amount and grain size of the Fe-Si addition, Si segregation and the O and S contents of the melt. 28 ref. (E25q, 2-60, 2-61; CI)

556-E. Air Flow in Cupolas. Castings, v. 7, July 1961, p. 23, 27, 29.

Investigation of air pressure drop in coke bed as affected by coke particle size and shape, air flow rate and bed packing. (E10a, 1-52; RM-j43)

557-E. The Use of Oxygen in the Cupola. E. Heap. Castings, v. 7, July 1961, p. 31, 33, 35.

Effect on metal temperature and melting rates of oxygen enrichment of the blast and oxygen injection in the furnace well. (E10a, 1-52)

558-E. (Italian.) Useful News for Die Draftsman and Die Foundryman of Small Zinc Castings. Fonderia, v. 10, Aug. 1961, p. 324.

Die casting of small mechanical parts using single and multiple dies and automatic machines, producing 300 pieces per min. with close tolerances. (E13, 1-52, 18-54; Zn)

559-E. (Italian.) New Automatic Plants for Molding. Hans Bergmann. Fonderia, v. 10, Aug. 1961, p. 327-335.

Coremaking with automatic equipment including molding machine, squeezers, jolters and conveyers in a line adaptable to the casting of malleable and gray iron. (E21q, 1-52; CI-n, CI-S)

560-E. (Italian.) Aluminum Casting for Chilled and Die Castings. Fonderia, v. 10, Aug. 1961, p. 341-345.

Die and chill casting of Al, Al-Si and 356 Al alloy using three different furnaces for heating and rapid melting of the charge. Temperature control, Si modification by Na and grain refining of Ti, B, Zr, Be, Na and P. (E-general, 1-52; Al, 5-61, 5-66)

561-E. (Japanese.) High Temperature Properties of Molding Sands as Affecting Surface Defects of Casting. Takeo Banno and Kazuyoshi Noritomi. Imono (Japan Foundrymen's Society, Journal), v. 33, July 1961, p. 475-496.

Hot compression strength, stress deformation and ductility of foundry sands are related to the occurrence of scabbing and rat tail defects in Meehanite sand castings. 24 ref. (E11, E18r, 2-61, 9-71; CI)

562-E. Vienna Congress Papers. Pt. 3. Foundry Trade Journal, Aug. 31, 1961, p. 257-262.

Summary of papers presented at the 1961 International Foundry Congress. Topics include hot tearing of cast steel, effect of core properties on casting gas holes, pouring time for steel cast in green sand molds, vacuum melting and inoculated cast iron structure, foundry statistical methods, low-pressure die casting, slab-mold service life and blowhole prevention. (E-general, 1-52, 11-63; ST, CI)

563-E. (German.) Technology of Casting of Ship Parts. Karl Weber. Freiberger Forschungshefte, no. B 59, 1961, p. 132-153.

Review of molding, casting, annealing at 950° C. and testing procedures in the fabrication of heavy parts from cast open-hearth or electric steel. Chemical composition and mechanical properties are determined. (E-general, J23, Q-general, S11, T22; ST, 5)

564-E. (German.) Theoretical Analysis of Heat Flow in Steel Castings. Karl Weber.

Freiberger Forschungshefte, no. B 59, 1961, p. 154-167.

Data and equations are given for the mathematical expression and analysis of temperature distribution, heat flow and other solidification phenomena. (E25)

565-E. Aluminum Casting at Central Foundry Division General Motors Corporation. John Lapin. Society of Automotive Engineers, 389B, 1961, 15 p.

Comparison of four processes used in the production of automotive components: sand molding, semipermanent mold, permanent mold and die casting. (E-general, T21b, T21c; Al-b)

566-E. Italian Equipment to Produce Volga Engine. Light Metals, v. 24, Sept. 1961, p. 256.

Pressure die casting of Al alloy cylinder blocks for automobile engines in Gorkii City Works. Alloying elements include Si, Mg, Mn and Fe. Specifications are given with technological parameters for design and semi-automatic operation of the machine. (E13, 1-52; Al-b, Si, Mg, Mn, Fe)

567-E. (Dutch.) Double Turbine Wheel Cast by the Precision Investment Casting Method. Gjuteriet, v. 16, Jan. 31, 1961, p. 29.

Alloy steel containing 0.18% C, 13% Cr and 1% Ni is melted in a medium-frequency furnace and heated above melting temperature. After adequate heat treatment of the material, a tensile strength of 80-85 kg. per sq. mm., yield strength of 60 kg. per sq. mm., elongation of 16% and a notch impact strength of 6 kg. per sq. cm. are measured. (E15, J-general, Q-general, 1-52; ST)

568-E. What Metal Shall I Use...for Die Castings? Metal Progress, v. 80, Oct. 1961, p. 97.

Of the major die casting alloys those of Al are strongest and have the highest thermal and electrical conductivity. Mg alloys are lightest; Zn alloys are toughest and have the lowest melting point. Cu alloys are strong and corrosion resistant, but are relatively difficult to cast. (E13; Al-b, Zn-b, Cu-b, Mg-b, Co-b, 17-52)

569-E. (Dutch.) Comparison of a 2-Ton Per Hr. Cold Blast Cupola With a Low-Frequency Induction Furnace. H. A. Baron van Raders. Polytechnisch Tijdschrift, v. 16, Feb. 1961, p. 108a-114a.

Technical indexes and melting economics are compared for processing of Holland I type and Holland II type raw iron, hematite iron, converter iron, cast iron scrap, steel scrap, rail steel and toolsteel. (E10; CI)

570-E. The CTIF-Ulmer Hot-Blast Cupola. British Foundryman, v. 54, Sept. 1961, p. 382-387.

Cast iron melting using a cupola equipped with a double-shell recupertor of 30% efficiency acting on all flue gases to maintain hot blasts of 300-400° C. Equipment design and operating principles for pilot and production furnaces. (E10a, 1-52; CI)

571-E. Developments in Melting Practices, Refractories and Metal. G. Littler. British Foundryman, v. 54, Sept. 1961, p. 388-391.

Composition, metallurgical properties and industrial applications of spheroidal graphite irons and refractory concretes for use in foundry equipment. Use of oxygen in melting operations including openhearth, electric arc and cupola furnaces and the Kaldo, Rotor and L-D processes. (E-general, E10, Q-general, 2-62; ST, RM-h40, 17-57)

572-E. Core Assembly. B. Bird. British Foundryman, v. 54, Sept. 1961, p. 392-394.

Casting of complex or unwieldy forms using series of sand cores assembled in the molding box to make the desired structure. Application of a core assembly mold to casting of a steel kaplan hub weighing over 7 tons. (E21, E22, E11; ST)

573-E. The Efficient Operation of Oil-Fired Tilting Furnaces. A. L. Sharp and C. Docherty. British Foundryman, v. 54, Sept. 1961, p. 394-399.

Metal losses in Cu and Ni foundries are reduced by supercharge preheating methods including melting under charcoal or degassing with nitrogen. Flame and metal corrosion resistance is determined for SiC, alumina, sillimanite dry ramming and castable concrete refractory bricks. (E10, E25, W18c; EG-d37, NM-f43, 17-57)

574-E. Precision in the Foundry. A. Short. British Foundryman, v. 54, Sept. 1961, p. 400-409.

Process developments in sand, die, investment, shell mold and CO_2 casting methods for obtaining dimensional accuracy and desired surface finish in Fe, steel and Mg and Al alloys. (E-general, 10-54; Fe, ST, Mg-b, Al-b)

575-E. Controlled Cooling of Ductile Iron Castings. Australasian Manufacturer, v. 46, Sept. 9, 1961, p. 62, 65-66.

Properties usually obtained through a separate anneal are realized by delaying shakeout. (E25, J2, 1-52; CI-r)

576-E. Metal Choice. Precision Metal Molding, v. 19, Oct. 1961, p. 43-54.

Castings and extrusion of bronze, nickel-brass, Al, Cu, Zn, beryllium copper, Mg, stainless steel, Ti and cobalt-brass alloys for applications utilizing the mechanical and physical properties of the materials. (E-general, F22, 17-57; Al, Be-b, Co-b, Cu, Cu-b, Mg, Ni-b, SS, Ti)

577-E. Mass Production Shell-Moulding. Foundry Trade Journal, v. 111, Sept. 14, 1961, p. 315-321.

Foundry plant layout, equipment, pattern and flow production, component design and development and process control for nonferrous castings including Ni-Ag, LM 8 (WP) Al and Zn-base alloys and Monel metal. (E15c, 1-52; Ni-b, Al-b, Zn-b)

578-E. Fully Mechanized Shell Moulding. Iron & Steel, v. 34, Oct. 1, 1961, p. 480-481.

Achieving a high production rate for shell molding and core making with a polyram machine consisting of a 12-ft. circular table, carrying six standard manipulator units mounted radially at 60° intervals. (E19c, E21, 1-52)

579-E. Improvement of Gating and Feeding for Ductile Iron. H. Otey Meriwether. Foundry Trade Journal, v. 111, Sept. 26, 1961, p. 359-361.

Formulas and calculations with reference to practical variables, such as shrinkage and slag, involved in the gating and risering of ductile iron. (E22, 1-52; CI-r)

580-E. Plastic Inserts Reduce Corebox Wear. Modern Castings, v. 40, Oct. 1961, p. 50-51.

Epoxy resin inserts, used in place of Fe or steel inserts in coreboxes to reduce wear by sand, are being produced at low cost in multiple cavity molds and require curing times of only 7 hr. (E21g, 1-52; NM-d)

581-E. Dust and Vapor Control for Shell Molding Operations. Elijah B. Henby. Modern Castings, v. 40, Oct. 1961, p. 65-67.

Description of hazardous compounds, their origin and general toxic effects during molding, curing, gluing and core-making operations. Recommendations for types of dust collectors best suited for shell mold exhaust systems. (E-general, A8a, 1-52)

582-E. Tilt Pouring Permanent Mold Castings. G. W. Stahl. Modern Castings, v. 40, Oct. 1961, p. 68-70.

Comparison of casting soundness, appearance, production rates and relative costs of castings and molds when using the tilt pouring technique or simple vertical gating. (E22, E23, 1-52)

583-E. Aluminum Pattern Castings. W. E. Sicha. Modern Castings, v. 40, Oct. 1961, p. 71-74.

Control of warpage, porosity and surface smoothness during sand casting of Al alloy patterns and coreboxes. Pressure casting techniques for matchplates using plaster molds. Determination of optimum pattern alloy compositions with emphasis on a 7% Cu, 5% Si, 0.15% Ti alloy. (E17, E21, E25; Al-b, Cu, Si, Ti)

584-E. Specialty Melting as a Service Function in a Research Laboratory. W. F. Moore. Modern Castings, v. 40, Oct. 1961, p. 75-85.

Description of vacuum induction melting, consumable and inert electrode arc melting, atomic hydrogen melting and zone melting techniques and equipment applications to melting of various metals and oxides. Requirements for crucible materials. (E10, 1-53)

585-E. Molding and Core Sand High Temperature Strength Testing. R. W. Heine, J. S. Schumacher and E. H. King. Modern Castings, v. 40, Oct. 1961, p. 96-102.

Test method using a dilatometer to show how compressive strength changes with time of exposure to elevated temperatures. Effect of clay content and type and moisture content are investigated with the technique. 21 ref. (E18r, 2-60, 2-62)

586-E. How Much Superheat Is Lost in the Runner? J. W. Hlinka, V. Paschkis and F. S. Puhr. Modern Castings, v. 40, Oct. 1961, p. 119-126.

Heat loss in the runner as affected by runner length and perimeter, flow rate, critical design characteristic, mold material and specific heat of the metal. (E22, E25, 1-52)

587-E. How Coremaking Puts Precision Into New Cast Iron Engine. Iron Age, v. 188, Oct. 19, 1961, p. 142-144.

Precision casting of Fe to produce thin-walled automobile engine components. Urea-formaldehyde binder is added to the foundry core sand mixture and metal core boxes are preheated to produce accurate, hard cores. High-pressure molding techniques are used to make hard molds of similar accuracy. (E13, E18, E21, 1-52, 3-74; CI)

588-E. Non-Ferrous Metal Melting. Machinery Lloyd (Overseas Edition), v. 33, Sept. 30, 1961, p. 45.

Rapid melting of phosphor bronze and leaded gunmetal in a specially designed furnace to minimize oxidation, gas pickup and metal losses. (E10, 1-52; EG-a38, Cu-b, Pb)

589-E. (French.) Gases in Cast Metals. Georges Blanc. Fonderie, no. 186, July-Aug. 1961, p. 251-271.

Investigation of sources and effects of gases absorbed by the metal in liquid or solid state. Effects of the C, Si and Mn content in steel and of the Ni, Sn and Al content in Cu on the solubility of N or H. Oxygen solubility in eutectic cast iron as a function of the melt temperature. Gas solubility in solid Cu and Fe at various temperatures. 121 ref. (E25q, P12e, 2-60, 2-61, 3-69; ST, Cu, Al, C, Mn, Ni, Sn, EG-n, EG-p, Eg-q)

590-E. (French.) How to Interpret Sand Tests. Journal d'Informations Techniques des Industries de la Fonderie, no. 128, July-Aug. 1961, p. 11-14.

Distribution of particle sizes in new and recovered sand. Permeability and compressive strength of the same sand as functions of the water content. (E18, 1-53)

591-E. (French.) Prevention of Metal Penetration on the Surface of Cores Used in Bronze Casting. Journal d'Informations Techniques des Industries de la Fonderie, no. 128, July-Aug. 1961, p. 23.

A 0.5 to 1 mm. thick asbestos foil is fastened to the core surface using a thin wire of steel or brass, or the foil is glued to the core with a dextrin or potato starch solution. Green sand molds may be protected in this way in places exposed to erosion and metal penetration. (E21g, 1-52)

592-E. (French.) How to Order and Inspect Gravity Cast Light Metals. Fernand Dabel. Fonderie Belge, v. 31, June 1961, p. 150-161.

Process operations for sand permanent mold and die casting of light metals with related machining, straightening and welding techniques for reworking castings. Determination of tensile and yield strength, elongation and Brinell hardness; microscopic examination of surface defects, porosity, inclusions and pipe. (E-general, E25q, Q-general, 9; EG-a39)

593-E. Casting Titanium Shapes. R. G. Hardy. Metal Industry, v. 99, Sept. 15, 1961, p. 202-206.

Technological parameters for furnace design, melting procedures, mold materials, molding, gating and risering of Ti alloys. Comparison of Ti castings with steel sand castings on the basis of machinability and applications, especially in aircraft and corrosion resistance. (E-general, G17k, R-general, T24s, 1-52; Ti-b, ST, 5, 17-57)

594-E. Automatic Shell Molding. Metal Industry, v. 99, Sept. 15, 1961, p. 207-208.

Mold and coremaking for the same component at the same time by a unit which carries out all processes in the production of a casting except closing the molds and pouring them. Uniformity is achieved by precise temperature control of pattern equipment and accurately timed investments. (E-general, E16c, 1-52)

595-E. (French.) Molding and Casting a 5500 Kg. Anvil. Ivan Lamoureux. Fonderie Belge, v. 31, July-Aug. 1961, p. 185-188.

Sand casting of an anvil from cupola melted cast iron containing 3.05% carbon, 2.20% graphite, 0.75% Si, 0.70% Mn, 0.075% phosphorus and 0.118% sulphur. Determination of density, tensile strength, ductility, Brinell hardness and machinability. (E11, G17k, P-general, Q-general; CI-r)

596-E. (Italian.) New Light Alloys for Die Castings. Fonderia, v. 10, Sept. 1961, p. 360.

Aging and die casting of 364 Al alloy. Alloy is corrosion resistant and offers good castability. Effect of temperature and of Cr, Be, Fe and Mg content on tensile strength, elongation and ductility. Linear-dimensional tolerances of castings. (E13, Q-general, R-general, 2-60, 2-61, 17-52, 17-55, 17-57; Al-b, Be, Cr, Fe, Mg)

597-E. Induction Slot Furnaces and Their Employment in the Foundry. Fonderia, v. 10, Sept. 1961, p. 379-396.

Comparison of induction slot furnace with arc and crucible melting furnace; their use, application and characteristics. Techniques for melting Fe, Al, Cu, brass, Al alloys, bronzes and steels. (E10, 1-52; Fe, ST, Al, Al-b, Cu, Cu-b)

598-E. (Italian.) Quality Control in Castings by Fluorescent Magnetic Particles. Fonderia, v. 10, Sept. 1961, p. 397-403.

Cast iron castings are magnetized and inspected for defects by fluorescent magnetic particles. (E25q, S13, 1-52; CI)

599-E. Melting Aluminium Bronze and Hardener Alloys. Metal Industry, v. 99, Sept. 22, 1961, p. 222-225, 232.

Oil-fired furnaces are used for the production of billets and ingots of Al bronzes; electric high-frequency furnaces are used for high melting point, rich and hardener alloys, either Cu or Al-base. (E10)

600-E. Die-Cast Magnesium Saw. Metal Industry, v. 99, Sept. 8, 1961, p. 187-188.

Production of light weight chain-saw components using an automatic pressure die casting unit. Induction and gas-fired melting furnaces are used, giving an hourly throughput of about 1200 lb. per hr. (E13, E10, T6n, 1-52; Mg)

601-E. BICTA Annual Conference Proceedings. Foundry Trade Journal, v. 111, Oct. 5, 1961, p. 422-432.

Discussion of papers presented at the Third Annual Conference of the British Investment Casters' Technical Assoc., London, England, 1961. Topics covered include casting quality control, foundry record keeping and accounting, vacuum melting and alloy development for gas turbine rotor blading. Alloys cited are EPE10, Nimonic 80A, 90 and 105, G74, G55, G64 and G67, nickel alloys and BS 3146. (E-general, E15, T7h, 11-63, 17-57; Ni-b)

602-E. (Pamphlet-French.) Inverse Chill. Centre Technique des Industries de la Fonderie, 12, Ave. Raphael, Paris 16^{e}, France, July 1961, 61 p.

Experimental casting of Fe containing 2.66-3.40% C, 0-2.77% Si, 0-1.0% Mn, 0-0.22% S, 0-0.35% Cr, 0-1.5% Ni and 0-1.97% P. The inverse chill phenomenon is thought to be influenced by the S:Mn ratio, the shape of castings and a cooling rate that varies in different parts of the casting. 26 ref. (E25n, 1-53; CI)

603-E. Aspects of South African Foundry Technology. A. V. Kulkarni, B. J. Lombard and J. L. Handley. Foundry Trade Journal, v. 111, Sept. 28, 1961, p. 377-381.

Papers presented at the third annual conference of the South African branch, Institute of British Foundrymen, discuss cupola practice including patching, charging, tapping and total-carbon control and the CO_2 process for mold and coremaking. (E10a, E19, E21, 1-52, 10-54)

604-E. Sculptor Uses New Foundry Technique. Foundry Trade Journal, v. 111, Sept. 28, 1961, p. 389-390.

Styrocell, an expanded polystyrene, is used to make a foundry pattern, set into a molding box and packed with sand. When molten LM-6 Al-Si alloy is poured in, the plastic melts and volatilizes, its place being taken by the Al which then solidifies into the required shape. (E16)

605-E. Melting Costs in Crucible Furnaces. R. Ogilvy. Castings, v. 7, Aug. 1961, p. 11, 13, 15, 17, 19-20.

Labor, fuel, wasted metal due to overheating, crucible life, furnace linings, pattern design and reclamation of scrap and swarf are considered as they affect costs. (E-general, E10p, 17-53)

606-E. (Italian.) Foundry Materials for Molders and Core Makers. Duilio Magri. Fonderia Italiana, v. 10, Aug. 1961, p. 341-343.

Effect of humidity, grain size, shape and distribution, pressure and Ca, Mg and Fe_2O_3 impurities on permeability of Si and alumina molds. (E18r, 2-59, 2-66, 3-69, 3-74; NM-f45, 17-57)

607-E. (Russian.) Use of Pressure Crystallization in Casting Magnesium Alloys. A. V. Kurdumov and I. A. Shestyrev. Izvestiya VUZ--Tsvetnaya Metallurgiya, Mar. 1961, p. 125-128.

Reduction of porosity in Mg alloys crystallized under pressures of 3-5 atm. and determination of the optimum temperature of alloy prior to pouring; prevention of Mg combustion by pressure and by a layer of powdered sulphur. (E16, P10m, S18s, 2-61, 3-74; Mg-b)

608-E. (French.) Solidification of Steel Ingots in a Mold With Water Cooled Bottom. P. Ravizza and V. Giacomazzi. Revue de Metallurgie, v. 58, Aug. 1961, p. 655-660.

Effect of bottom cooling on pipe and top discard, segregation and structure homogeneity of ingots cast in water cooled molds is studied by removal of nonsolid metal from the mold at various times during cooling. 14 ref. (E25n; 5-59, 9-67, 9-69)

609-E. Precision Casting of Aluminum. Morris Bean and Lawson Marsh. Society of Automotive Engineers, 389A, 1961, 4 p.

Comparison of the molding techniques involved in precision casting of Al with less specialized classes of castings such as sand casting, freezing casting, CO_2 molding, etc. Special consideration is given to cast components of ordinary size with overall dimensions of 6 in. to 12 ft. or more, made from permanent and nonpermanent molds. (E-general; Al)

610-E. Grain Refinement of Steel Ingots by Solidification in a Moving Electromagnetic Field. Frederick C. Langenberg, Guenter Pestel and C. Richard Honeycutt. Metallurgical Society of AIME, Transactions, v. 221, Oct. 1961, p. 993-1001.

Solidification during electromagnetic stirring is tested for altering the as-cast grain structure of ingots 410, 310 and 302 stainless and S-816 alloy conditions for optimum grain refinement are analyzed and an empirical design constant presented with evaluation of the effect of the grain refinement on hot workability. (E25, D9p, 1-69, M27, Q23q; SS)

611-E. (Italian.) Casting of Copper-Chromium Alloy Heated With Lithium Is Fused With Copper Serpentine. Angelo Azzolini. Fonderia Italiana, v. 10, Sept. 1961, p. 368-374.

Casting and controlled cooling of Cu-Cr alloy castings having 0.05% Li. Determination of hardness, heat of solidification, conductivity, diffusion coefficient and structure in subsequent fusing with serpentine. (E25, K-general; Cu-b, Cr, Li)

612-E. Induction Furnace Produces Cast Iron for Valve Bodies. Metal Progress, v. 80, Nov. 1961, p. 9.

Cupola metal is duplexed in an induction furnace before being poured. This treatment is needed because cupola iron ordinarily has about 3.50% C and 2.50% Si. About 5% low-carbon steel is added to the Fe to dilute and so reduce the C and Si contents. (E10, 1-52, 2-60, T7b; CI)

SECTION F

PRIMARY MECHANICAL WORKING

1-F. This Is Split Die Forging. Materials in Design Engineering, v. 52, Nov. 1960, p. 130-131.

Mechanical properties and tolerances of split die forged aircraft components. Applicability of die forging to alloy steels, superalloys, high-strength steels, stainless steels and other alloys. (F22n, T24; AY, SS, ST, SGB-a, SGA-h, 17-55)

2-F. (Polish.) Graphical Definition of Cold Rolling-Mill Efficiency. Wilhelm Gorecki. Hutnik, v. 27, July-Aug. 1960, p. 286-295.

Rolling mill efficiency dependent on steel strip dimensions, weight of material, rolling rate and metal losses during trimming using nomographic representation. 3 ref. (F23, 1-52, 1-67; ST)

3-F. (German.) Drawing Equipment Used in Processing and Manufacture of Thin-Walled Tubing From Steel and Nonferrous Metals. Wilhelm Pottner. Industrie-Anzeiger, v. 82, Nov. 1, 1960, p. 1473-1475.

Cross section reductions to 50% in one drawing are achieved during tube-making with modified drawing tools, using special lubricants, after heat treatment and pickling. (F26r, 2-64; ST)

4-F. The Manufacture and Inspection of Seamless Steel Tubes. G. S. Marshall. Quality Engineer, v. 24, Sept-Oct. 1960, p. 142-151.

Survey of fabrication and heat treating techniques; spark and steeloscope testing. (F26, S10d; ST)

5-F. Fillet-Rolling Diesel-Engine Crankshafts. Walter Egger. Machinery, v. 67, Nov. 1960, p. 127-130.

Fillet rolling of forged 4145 steel and shell-molded, cast modular-Fe crankshafts. (F23, T21b; CI-r, ST, 4-51, 5)

6-F. (German.) New Hot Extrusion Processes. Draht, v. 11, Oct. 1960, p. 645-648.

Production of a high strength core with corrosion resistant coating by co-extrusion. Use of transverse extrusion, a process wherein the flow of material is deflected by 90° during extrusion to obtain a more uniform distribution of mechanical properties in the product. (F24)

7-F. (German.) Cold Rolling. Manfred Muller. Fertigungstechnik und Betrieb, v. 10, Oct. 1960, p. 582-588.

Relationship of cold rollability to degree of elongation. Flow of material during cold rolling of a thread on CrV steel. (F23, 1-67; ST, Cr, V)

8-F. (German.) Tolerances for Hammer Forgings. Robert Meier. Fertigungstechnik und Betrieb, v. 10, Oct. 1960, p. 591-592.

Specifications for seamless steel rings and seamless bushings produced by hammer forging. (F22, T7d; ST)

9-F. Rolling of Beryllium Sheet Takes Special Technique. B. H. Hessler. Iron Age, v. 186, Dec. 1, 1960, p. 136-138.

Be slabs are machined, inspected, clad with mild steel and formed into sheet by a cross rolling method at 1400-1500° F. (F23, L22; Be, CN, 4-53)

10-F. Controlling Copper Rod and Wire Mill Scrap and Losses. John A. Bell.

Wire and Wire Products, v. 35, Nov. 1960, p. 1522-1525.

Electrolytic and chemical recovery of Cu from mill scale, pickling solution, rolling scrap and wire drawing compounds during hot rolling of Cu bar to 19-26 gage wire. 4 ref. (F23, 1-66, A11d; Cu, 4-61)

11-F. Ring Rolled Sintered Moly. A. J. Moser. Fansteel Metallurgy, Oct. 1960, p. 1.

A sintered hollow Mo preform is heated to 2400° F. and rolled directly without prior forging by a standard ring rolling machine. Rings ranging from 9 in. O. D. to 14 in. O. D. with wall thickness from 5/8 in. to 3/8 in. are rolled. (F23, 1-66; Mo, 6-72)

12-F. (German.) Working Forces in Breaking-Down Pass Rolling. Gustav Zouhar. Freiberger Forschungshefte, no. B52, 1960, 201 p.

Test rolling of square and round billets of Cu, pure Al and MSt 3b, CK 45, MK 73, St 7, 16MnCr5, 100 Cr, 18 Mn 5, 65 Si 7 and 55 SiMn steels in various breaking-down pass sequences and to evaluate rolling force, torque moment, deformation resistance and specific rolling work at rolling temperatures from 980-1240° C. 37 ref. (F23n, 1-66; Al, Cu, ST)

13-F. Fundamentals of Wire Drawing. Pt. 4. Slip on Wire Drawing Machines. C. P. Bernhoeft. Wire Industry, v. 27, Oct. 1960, p. 1007-1009.

Wire drawing with constant slip from block to block or accumulative slip. Loss of horsepower through slip. Calculation of drawing block circumferential speed. (F28)

14-F. Grinder Breaks Speed Barrier. Iron Age, v. 186, Nov. 24, 1960, p. 95.

Special unit grinds stainless steel slabs at 12,500 sq. ft. per min. (F21f; SS)

15-F. (Russian.) Developmental Trends in Blooming Mills. S. V. Makaev. Stal', Oct. 1960, p. 915-919.

The reduction rate during rolling of blooms is raised to 100-110 mm. per pass to increase the uniformity of transverse, horizontal and vertical reduction and improve mechanical properties of the billet. (F23n; ST, 4-52)

16-F. (Russian.) Vacuum Rolling Mill. V. M. Amonenko, A. S. Stron, V. V. Mukhin and V. A. Tarasov. Stal', Oct. 1960, p. 920-922.

Rolling of highly deformation resistant W, Mo and Cb alloys in a new two-high reversible mill having rollers enclosed in a vacuum chamber. (F23, W23, 1-73; Cb-b, Mo-b, W-b)

17-F. High Velocities Form Tungsten for Structural Uses. Machinery, v. 67, Dec. 1960, p. 145.

Tests conducted on high velocity Dynapak extruding and forging machines indicate that if the metal is formed fast enough, extensive grain refinement occurs, with a striking improvement in the ductility of the metal and its consequence toughness. Reductions up to 45 to 1 can be obtained without the need for cladding or lubricant. (F22, F24; W)

18-F. (Russian.) Mechanism of Metal Destruction During Transverse Rolling. P. K. Teterin and Yu. F. Lusin. Stal', Oct. 1960, p. 930-932.

Effect of axial and lateral tensile stresses produced during hot rolling on the axial destruction of 1KH18H9T steel billets. (F23, 3-66; ST)

19-F. Textures in Extruded Uranium. R. B. Russell. Paper from "Advances in X-Ray Analysis", v. 3. Plenum Press, Inc., New York, 1960, p. 315-330.

Effect of extrusion variables such as prior texture, billet and liner temperatures, reduction in area and ram speed on the texture of extruded uranium rods and tubes is examined by crystallographic (inverse) pole figures. 2 ref. (F24; U, 4-60)

20-F. (German.) Fabrication Process Development and Problems With Broad and Parallel Flange Joists. Kurt Bollmann and Gerhard Kuchenbuch. Stahl und Eisen, v. 80, Oct. 27, 1960, p. 1501-1507.

Historical review of rolling mill operations in the rolling of steel flanges with description of some modern mills. Effect of ratio of vertical to horizontal revolutions on quality of rolled product. Problems encountered in determination of roll wear mechanism, deformation

phenomena and power requirements. (F23, W23; ST, 4-57)

21-F. (German.) Influence of Technical Progress on Tube Fabrication Processes. Helmut Nierlich. Stahl und Eisen, v. 80, Oct. 27, 1960, p. 1507-1517.

Development of processes and machinery for production of seamless and welded steel tubes by skew-rolling, cold shaping, extrusion, electric and autogeneous butt and lap-welding. Corrosion protection by plastic coatings. (F24, F26; ST)

22-F. (German.) Contributions of German Works to the Development of Large-Size Forgings. Heinz Gummert. Stahl und Eisen, v. 80, Oct. 27, 1960, p. 1517-1524.

Development of hammers and presses and auxiliary equipment such as manipulators for producing forgings up to 290 tons. Forging and inspection techniques for steel. Fabrication of special products such as seamless tires, shell rolls and back-up rolls. (F22, 10-54, W22; ST)

23-F. (German.) Evaluation of Roll Forces and Power Demand in Hot Rolling of Steel Sections by Computation. Alexander Geleji. Archiv fur das Eisenhuttenwesen, v. 31, Oct. 1960, p. 571-576.

Measurement of roll pressure and motor power in rolling mine rails and U-profiles of unalloyed 0.17-0.48% C steel at temperatures from 970-1210° C. (F23; CN, 4-57)

24-F. Fabrication Methods Evaluation. J. G. Frantzreb. Modern Castings, v. 38, Dec. 1960, p. 97-106.

Evaluation of the status of the various competitive methods of fabrication such as forging, shaping, machining and joining. (F-general, G-general, K-general)

25-F. High Head Alloy Slab Heating for Planetary Mill Rolling. Oscar J. Zanatta. Iron and Steel Engineer, v. 37, Oct. 1960, p. 121-135.

Alloy steel slabs for planetary rolling rapidly heated without scale formation in an in-line, atmosphere-controlled furnace operating on the high thermal head principle. (F21b; AY, 4-52)

26-F. High Speed Rod and Merchant Mill. A. H. Griffiths, Iron and Steel Engineer, v. 37, Nov. 1960, p. 139-143.

Rolling of steel billets to produce rods, flats and skelp using a three-strand rod and merchant mill. Design, operation and capacity of the mill. (F23, W23, 1-52; ST, 4-52)

27-F. Remote Control Used on Plutonium Rolling Mill. Iron and Steel Engineer, v. 37, Nov. 1960, p. 155-156.

Rolling of Pu in a remote-controlled mill enclosed in an airtight steel vessel filled with argon gas. (F23, W23, 1-52; Pu)

28-F. Forgings for Missiles and Space Vehicles. Jose R. Canal and William C. Kunkler, Jr. American Society of Mechanical Engineers, Paper no. 60-WA-316, 1960, 15 p. $1.

Forging of steel, Ti, Be, Al, Ni and refractory metals for application in reentry and space vehicles, missile frames and guidance systems, solid propellant rocket motors, liquid propellant rocket engines and nuclear rocket motors. 13 ref. F22, T24e; Ti, Be, Ni, AY)

29-F. New Line Boosting Pipe Plant Output. Steel, v. 147, Nov. 14, 1960, p. 112-113.

Production of high strength large diameter steel pipe in a mill using automatic machines to plane, form, weld, expand and test the pipeline sections. (F26, W24, 1-52; ST)

30-F. Roll Forces and Torques in Hot Rolling. Z. Wuzatowski and B. Hoderny. Iron & Steel, v. 33, Nov. 1960, p. 558-560.

Experimental hot rolling of mild steel samples to show the effects of torque, force, temperature, speed, draft coefficient, reduction percentage and ratio of sample to roll dimensions on final dimensions, configurations and rollability. 7 ref. (To be continued.) (F23, 1-66; CN)

31-F. Helical Rolling of Short Components. O. Tedder. Iron & Steel, v. 33, Nov. 1960, p. 562.

Production of steel balls and cylinders for bearings and crushing mills by a deforming operation using revolving helical dies which prevents cavity and porosity formation. (F23, T7d; ST)

32-F. (Russian.) Skewing of the Edges and Curving of Blooms During Rolling. N. F. Gritsuk and S. V. Merekin. Metallurg, Oct. 1960, p. 26-27.

Wear and skewing of the first rolls, shape of the first bloom end, uniformity of heating, steel grade of the ingot, deformation degree and dimensions of the ingot as factors influencing skewing and curving of the blooms. (F23; ST)

33-F. Over Estimates of Load for Some Two-Dimensional Forging Operations. W. Johnson. 3rd. U. S. National Congress of Applied Mechanics, Proceedings, 1958, p. 571-579.

Estimation of the largest load which is likely to be encountered during forging with dies of unequal size, whose width exceeds the material thickness and with partly open dies. For thin material the forging pressure is determined using discontinuous velocity patterns for equal width rough dies. The pressure to forge thick material with two dies of unequal width is derived using a slip-like field. 13 ref. (F22)

34-F. Precision Forging. L. R. Beesly. Machinery, v. 97, Nov. 16, 1960, p. 1145-1148.

Formation of rifling in small arms barrels composed of 1% CrMo alloy steel by a precision cold forging process using a vertical forging machine and mandrel composed of a 2% C-12% Cr die steel. Effect of cold forging on the physical and mechanical properties of the material being worked. (F22, 1-67, T2m, P-general, Q-general; AY, Cr, Mo)

35-F. Continuous Buttweld Mill Modernizes Pipemaking. Steel, v. 147, Dec. 12, 1960, p. 80, 88, 90.

Coiled skelp is fabricated into buttweld pipe at speeds of 150-700 ft. per min. by forming, welding, reducing and sizing rolls. Interstand speed ratios are kept constant by a hydraulic, differential drive system. (F26p; 4-53)

36-F. (Pamphlet.) Cold Roll Formed Products. 4 p. n.d. Solar Steel Corp., 651 Lehigh Ave., Union, New Jersey.

Flat strips of carbon and stainless steel, Al, bronze, brass, Cu and Zn are progressively formed into desired shapes by a series of rolls arranged in tandem. Uniformity, accuracy, surface finish, strength-weight ratio, fabricability and weldability of the roll formed products. Applications. (F23, 1-67; Al, CN, Cu, Cu-n, Cu-s, SS, Zn, 4-53)

37-F. (French.) The Manufacture of Plate for Large-Diameter Welded Pipe. M. Filliatre. Soudage et Techniques Connexes, v. 14, Sept-Oct. 1960, p. 370-374.

Description of high-speed plate rolling mill at Ste. Lorraine-Escaut's Longwy plant. Rolling operations in which 4 to 25 ton steel ingots are fabricated into plate of high dimensional accuracy and good surface appearance in widths ranging from 100-3800 mm., minimum thicknesses of 4.76 mm. and unit weights to 15 tons. (F23, W23b; ST)

38-F. (French.) Manufacture of Large-Diameter Welded Pipe for Pipe-Lines. H. Bouchon. Soudage et Techniques Connexes, v. 14, Sept-Oct. 1960, p. 375-391.

Description of Ste. Lorraine-Escaut's Sedan pipe mill. Roll-forming operations, external and internal welding, cold hydraulic expansion and finishing operations to produce steel pipe of 20 to 40 in. diameter, 40 in. length and 1/4 to 1/2 in. wall. Variations in mechanical properties of material at each stage of manufacture. Inspection methods. (F26, W23h; ST)

39-F. (Italian.) Determination of Working Time in Wire-Drawing of Steel. Giuseppe Ranzi. Ingegneria Meccanica, v. 9, Aug. 1960, p. 17-21.

Formulas for precalculation of optimum drawing speed and of drawing time. Example in case of dry drawing. (F28)

40-F. (German.) Modern Forging and Pressing. Helmut Cramer. Glasers Annalen, v. 84, Sept. 1960, p. 499-508.

Processes and machinery for hot and cold working of steel including hammer forging, die forging, forge rolling, bulging, automatic forging, deep drawing and cold pressing. Preparation of material by induction heating in gas, oil or coke furnaces. Production of dies. 14 ref. (F21b, F22, G1, G4b, G14, 1-52)

41-F. (Japanese.) Influence of Sulphur in Heavy Oil Used for an Ingot-Reheating Furnace on Rolling. Tomoyuki Mori and Masashi Kamakura. Tetsu-to-Hagane (Iron and Steel Institute of Japan, Journal), v. 46, Nov. 1960, p. 1533-1538.

Oxide scale formation on ingots during rolling after reheating in a continuous furnace at 1170-1215° C., using bunker C-oil of high and low sulphur content. Data for microstructure and scale composition. 3 ref. (F21, F23, 9-52, M27; ST, S)

42-F. Aluminium Production at Rogerstone. Metal Treatment and Drop Forging, v. 27, Nov. 1960, p. 470-472.

Al sheet, strip and plate with good mechanical properties are produced at high rate by expanded plant facilities including continuous strip mill and tunnel furnace at the Rogerstone works of Alcan Industries Ltd. (England). Hot and cold rolling and annealing. (F23, J23; Al, 4-53)

43-F. Manufacture of Weldless Steel Tubes. Edgar Allen News, v. 39, Nov. 1960, p. 241-245.

Automatic processes for tube manufacture including magnetic lifting of the steel bars, sawing by oxy-ferrolene flame, hydraulic charging of the billets, heating, shaping, piercing, polishing, cooling and finishing. Description of the older, standard Pilger process. (F26; ST)

44-F. What Factors Influence Design of Glass-Extruded Steel. J. H. Rice. Iron Age, v. 186, Dec. 22, 1960, p. 59-61.

Extrusion of stainless, carbon and other steels using glass lubricants to lower friction, insulate and absorb the shear stress which builds up during extrusion. Effect of metal deformability and press geometry on the process. (F24; CN, SS)

45-F. Iron Ore and Raw Materials. Notes on the Manufacture of Open-Hearth Bridge-Steel. N. W. Shed. Blast Furnace and Steel Plant, v. 48, Nov. 1960, p. 1194.

Bridge steel containing 0.13% sulphur and a small amount of pig iron is rolled satisfactorily. The effect of sulphur is neutralized by treatment in an openhearth furnace. (F23, 2-64; ST, S)

46-F. (Russian.) Widening of Titanium During Hot Rolling. V. I. Shilov and M. P. Lednev. Tsvetney Metally, Sept. 1960, p. 75-77.

Determination of deformability and cracking of the edges of VT-ID Ti sample during hot rolling at 800° C. and comparison with deformability of 45 steel. Influence of rolling speed on widening. (F23, 1-66, Q23q; Ti)

47-F. Reheating Aluminum Ingots. Metal Industry, v. 97, Nov. 25, 1960, p. 444.

Al ingots are reheated to 440-630° F. in an oil-fired reheat furnace controlled by iron-constantan thermocouples, electronic circular scale contact controllers and a strip chart recorder to a temperature within 1° F. of the desired value. (F21b, X9s; Al, 5-59)

48-F. Aspects of Heavy Press Utilization. J. Brayman. American Society of Mechanical Engineers Paper no. 60-WA-317, 1960, 5 p. $1.

Closed-die forging and cylindrical billet extrusion of Al alloy, stainless steel, alloy steel, toolsteel, Be, Mo and W to produce aircraft and missile components. Use of auxiliary tooling and mechanical handling and heating equipment. (F22, F24, T24, W22p; Al-b, AY, Be, Mo, SS, TS, W)

49-F. (Russian.) Selection of Optimum Temperature Range for Press-Forging of Carbon Steels. B. F. Trakhtenberg. Kuznechno-Stampovochnoe Proizvodstvo, May 1960, p. 21-26.

Highest and lowest temperature limits for press forging of large and small (50 mm. and over 70 mm. cross section) forgings of hyper and posteutectic steels. Temperature range is selected with consideration of grain size, degree of deformation, composition and size of forging. (F22; CN)

50-F. Large Continuous Pipe-Forming and Welding Plant. Machinery (London), v. 97, Nov. 30, 1960, p. 1239.

Tubes produced from flat steel plate by a continuous rolling process are seam-welded to form pipe by a high frequency resistance welding technique. (F26, K3; ST, 4-53)

51-F. Versatile Heat Exchange Material. Light Metals, v. 23, Dec. 1960, p. 326-327.

Fabrication of tubular passageways in Al sheets or strips by inserting rods composed of an inert material into slabs prior to casting. Tubes may be of different sizes and of variable spacing within same strip. After rolling, the rods are removed, the tubes then being inflated by hydraulic or pneumatic pressure. Possible applications are in oil and hot water radiators and multiple gas or liquid pipelines. (F26s; Al, 4-53)

52-F. Reinforced Light Metal Extrusions. Light Metals, v. 23, Dec. 1960, p. 330.

Extrusion of Al sections with an open, longitudinal groove or series of grooves to accommodate steel reinforcing rods or stranded cable. Resulting sections have high tensile strength and good corrosion resistance. (F24, Q27a, R-general; Al)

53-F. Press to Forge the Impossible. Steel, v. 148, Jan. 9, 1961, p. 60-61.

Design of a multiple ram press for forging, blocking, forming and extrusion of ferrous metals, Mo, W, Ta and Cb for aircraft and missile components. (F22, F24, W22p, T24; Cb, Fe-b, Mo, Ta, W)

54-F. Filter System Upgrades Ultra-Thin Steel Strip. Steel, v. 148, Jan. 9, 1961, p. 76-77.

Production of stainless steel foil for use in honeycomb sections for aircraft and missile components. During rolling of strip, beta ray gages monitor the thickness and filter system removes solid particles that would cause dents and scratches. Chemical processing removes soluble material that would stain the steel. (F23, L-general; SS, 4-53)

55-F. Fillet Rolling. Walter Egger and Gerald X. Diamond. Machine Design, v. 33, Jan. 5, 1961, p. 112-119.

Effect of fillet rolling on the residual compressive stress, work hardness, surface finish and corrosion fatigue of the workpiece. Comparison with results obtained by shot peening. Data are given for fillet rolling tolerances and work hardenability of steel, cast iron, Al and Mg. 10 ref. (F23; Al, CI, Mg, ST)

56-F. Huge Press to Make Record Forgings. Missiles and Rockets, v. 8, Jan. 9, 1961, p. 32.

Production of complex steel, Mo, Ta, W, Cb, Mo-W, Ta-W and high density alloy forgings and extrusions with uniform physical properties. Nuclear and space applications. (F22, P-general, W22p; Cb-b, Mo-b, ST, Ta-b, W-b)

57-F. Roll Forces and Torques in Hot Rolling. Z. Wuzatowski and B. Hoderny. Iron & Steel, v. 33, Dec. 1960, p. 578-581.

Torque tests during rolling of low carbon steels to determine relationship between mean resistance to deformation and temperature and total torque as a function of degree of reduction at specified temperature. 7 ref. (F23, 1-66; CN-g)

58-F. Graphite Die Lubricant Cuts Forging Costs. Western Metalworking, v. 18, Dec. 1960, p. 50.

A colloidal graphite die lubricant is applied to preheated dies as operational lubricant in the forging of 650 Al alloy. (F22, 18-73; Al-b)

59-F. (German.) Problems in Manufacture and Estimation of Quality of Aluminum Deep Drawing Sheets. Karl-Robert Vassel. Neue Hutte, v. 5, Nov. 1960, p. 652-655.

Selection of deep drawing tests and of mechanical properties such as yield point, true maximal strength elastic elongation and necking which indicate quality of drawing sheets. Sequence of operations used in homogenizing before rolling at 550° C., process annealing at 400-450° C., final annealing at 230-300° C. and rolling. (F23, J23, G4, 17-52; Al, 4-53)

60-F. Forge-Shop Controls Minimize Machine-Shop Woes. E. M. Hunt. American Machinist/ Metalworking Manufacturing, v. 104, Dec. 26, 1960, p. 65.

Truck drive shafts composed of 4140, 8640 and 4340 steel are upset forged under carefully controlled conditions to minimize stock removal for machining. (F22; AY)

61-F. (Czech.) Effect of Extrusion Process on Properties of Al Rods Used in Forging. Josef Kreuter. Hutnicke Listy, v. 15, Nov. 1960, p. 851-857.

Cylindrical rods are extruded from ingots of the alloys CSN 422401 and CSN 424205 at 380-480° C. and with heating times from 3-16 hr. Effects of extruding velocity recipient-diameter, rod-diameter, ratio, temperature and heating time on the formation of coarse grain and surface defects. 7 ref. (F24, 2-61, 3-67; Al, 5-59)

62-F. Extrusion of Hard Alloys. A. B. Graham. Metal Industry, v. 97, Dec. 1960, p. 455-458.

Design criteria for dies, mandrels and containers used in extrusion of very hard alloys such as Monel, Ni, Inconel, stainless steel, stainless iron, Nichrome

and high speed steel. (F24; Ni-b, SS, SGB-q)

63-F. Tube-in-Strip, a New Fabricating Method. Metalworking Production, v. 104, Dec. 14, 1960, p. 68-72.

Fabrication of Cu or Al strip having integral tubes by inserting rods of inert material in the mold before casting, pouring the metal around them and rolling the slab to strip. Application of the tube-in-strip in heat exchangers, stiffening panels and pipelines. (F26; Al, Cu)

64-F. Basic Features of the Cold Forging Process. A. M. Cooper. Metal Treatment and Drop Forging, v. 27, Dec. 1960, p. 480-486.

Types of cold forging machines; basic sequence of operation of split-die and solid-die headers; cold forging limitations with regard to upset ratio, length and radii. Materials for cold forging; design drawing and specification. (F22, 1-67)

65-F. New Developments in Copper Wire Rod Mills. M. M. Feuer. Wire and Wire Products, v. 35, Dec. 1960, p. 1675-1677.

Rolling of Cu wire bar to 5/16 in. diameter rod by a rolling mill featuring automatic handling and automatic coiling. Bars are heated in a walking beam furnace. (F23, W23d; Cu, 4-55)

66-F. (Translation-ConBur.) Glass Lubricants in Metallurgy. L. K. Kovalev and V. A. Ryabov. Glass and Ceramics, v. 15, Sept. 1960, p. 352-357.

Applications of glass lubricants in the drawing and hot pressing of steel, Mo, W and Ti alloys. (F26r, G1, 1-66, 18-73; Mo, ST, Ti-b, W)

67-F. Forge Furnace Takes Minimum Space but Handles King Size Ingots. Steel, v. 147, Dec. 26, 1960, p. 62-63.

Ingots are heated to 2400° F., stress relieved and equalized in a car-bottom furnace with an automatic pressure control system, roof flues and high velocity burners in the upper sidewalls. Advantages are low initial cost, small space requirement, versatility and large capacity. (F21b, 1-55; 5-59)

68-F. Spiral Pipe Machine Welds Inside, Outside Seams. Steel, v. 147, Dec. 26, 1960, p. 64.

Description of a machine which winds steel strip into a spiral train and butt-welds the edges, inside and out, into a continuous pipe. Auxiliary units permit corrugating of the pipe and ultrasonic testing of weld quality. (F26p, K-general, W29; ST, 4-53)

69-F. Columbium Forgings Weigh Over One-Half Ton. Steel, v. 147, Dec. 26, 1960, p. 72.

Forgings weighing up to 1300 lb. are produced from Cb-1% Zr alloys at extremely high temperatures (2100-2250° F.) Ceramic coating of forgings. (F22, 1-66, L27; Cb-b, Zn)

70-F. (French.) Effect of Aluminum Nitride on the Forgeability of Steels. Paul Bastien and Philippe Portevin. Comptes Rendus, v. 251, Nov. 21, 1960, p. 2347-2349.

Steels containing 0.29-0.35% C, 0.12-0.24% Si, 0.62-0.9% Mn and 0.0045-0.09% Al are tension and torsion tested in a controlled atmosphere at 700-1200° C. to study hot shortness caused by the Al content. (F22, 17-52, Q26s, Q1, 2-60; ST, Al)

71-F. (Russian.) Effect of Forging Reduction Ratio on the Sound Permeability of Forgings of High Alloy Heat Resistant Steels and Alloys. M. Ya. Dzugutov, Yu. V. Vinogradov and V. P. Stepanov. Kuznechno-Shtampovachnoe Proizvodstvo, Mar. 1960, p. 10-13.

Problems of false defect impulses in ultrasonic control of high alloy heat resistant forgings with large grain structure zones. Sound permeability as a function of composition, size of semi-product, reduction ratio and subsequent heat treatment. (F22, S13g; SGA-h, SS)

72-F. (Russian.) Formation of Laps During the Open-Die Forging of Ring-Shaped Blanks. A. V. Altykis. Kuznechno-Shtampovochnoe Proizvodstvo, June 1960, p. 10-12.

Influence of the height and inner and outer diameters of the rings on lap formation on the inner surface. Data are given for the relationship between degree of reduction and direction of metal flow and for optimum ring dimensions to eliminate surface laps. (F22, 9-71)

73-F. (Russian.) Drop Forging Large Blades of Irregular Shape. P. M. Pavlovich. Kuznechno Shtampovochnoe Proizvodstvo, June 1960, p. 41-42.

Roll and drop forging of large steam turbine blades composed of 2Kh13 steel and Ti alloy. Heating, forming, drop forging, trimming, straightening, heat treating and finishing operations. Ratio of net weight of forging to consumed weight. (F22, T7h; ST, Ti-b)

74-F. (Russian.) Forging Heat Resistant Steel Ingots. F. M. Valyavkin. Kuznechno Shtampovochnoe Proizvodstvo, July 1960, p. 8-13.

Elimination of surface cracks and pores during production of large steel machine shafts by light preliminary deformation of the billet followed by heating at the rate of 100-120° C. per hr., forging with steam-hydraulic press at 1160-920° C. and punching with dies of rhombic shape having a cylindrical contact surface. 5 ref. (F22, T7; ST, SGA-h, 4-52)

75-F. (Russian.) Increased Durability of Forging Press Piston Rods Attained by Cold Rolling. M. Ya. Belkin. Kuznechno Shtampovochnoe Proizvodstvo, July 1960, p. 36-38.

Cold surface hardening of heavy duty 45 Kh steel piston rods by uni and multi-roller rolling machines. Design and operation of equipment. Data for maximum attainable hardness depth. 6 ref. (F23, 1-67, T21b; ST)

76-F. (Russian.) Special Dies for Working of Tungsten and Molybdenum on Rotary Forging Machines. B. S. Sekun. Kuznechno Shtampovochnoe Proizvodstvo, July 1960, p. 42-43.

Production of durable dies for roll-forging of tungsten and Mo wire by compressing powdered W and Mo carbides in steel press-forms at 1400-1500° C. Design and operation of forging machine. (F22p, H14, W22a; Mo, W, 4-61)

77-F. Basic Features of the Cold Forging Process. A. M. Cooper. Wire Industry, v. 27, Dec. 1960, p. 1189-1194, 1204.

Characteristics of basic types of cold forging machines. Calculation of limitations on upset ratio, length and finished shape. Methods of extruding, underhead forging and pointing. (F22, 1-67, W22)

78-F. The Fundamentals of Wire Drawing. Pt. 6. Profile of a Drawing Wire. C. P. Bernhoeft. Wire Industry, v. 27, Dec. 1960, p. 1197-1198, 1225.

Relationship between drawing cone angle, height of drawing cone and reduction in wire area when drawing wire through dies. (F28)

79-F. Expansion of Rogerstone Aluminum Strip Mill No. 1. J. M. Waldram. Engineer, v. 210, Dec. 15, 1960, p. 635-638.

Design of an Al strip mill in which slab ingots for rolling are made by remelting commercial purity Al, alloying it and casting it by a continuous process. Ingots are then scalped, preheated and rolled in the hot roughing and finishing mills to produce 10 ft. wide plate 50 ft. long. (F23, 1-66, W23; Al)

80-F. Low Cost Reversing Narrow Strip Rolling Mill. Engineer, v. 210, Nov. 28, 1960, p. 652.

Stainless steel, Ni, Zr, Pt, beryllium copper, Au plate and clad materials including thermostatic bimetal In-Al and Ag-Sb are reduced to close tolerances in a two-way rolling mill. Cold reduction of 6 in. widths at 250 ft. per min. (F23, 1-67, W23f; Ag, Al, Au, Be-b, Cu-b, Ni, Pt, SS, Zr)

81-F. (Russian.) New Method for Determination oi the Friction Coefficient in Cold Rolling of Tubes. Ya. F. Shevakin and A. M. Ritikov. Tsvetnye Metally, Oct. 1960, p. 76-78.

Method based on measurements of the forces resulting from metal flow with the contact surface kept constant during deformation. Dependence of friction forces upon the deformation degree is tested during deformation of a Cu sample. (F26s, Q9p, 3-68; Cu)

82-F. Teflon-Insert Die Tames Toughies. Steel, v. 148, Jan. 16, 1961, p. 87.

Cold working and forming thin pieces of Ti and stainless steel for aircraft and space vehicle parts using Teflon insert dies. Design of the steel box, punch and die. (F-general, 1-67, T24, W24n; SS, Ti)

83-F. Paper Thin Tantalum, Columbium Cut Weight. Steel, v. 148, Jan. 16, 1961, p. 92-93.

Drawing, swaging and annealing thin walled Cb and Ta tubes. Corrosion resistance, thermal and gettering properties and dimensions of the tubing. Applications of the tubing in heat exchangers, thermocouples and vacuum tubes. (F26r, F25, J23, R-general, P11; Cb, Ta, 4-60)

84-F. (Russian.) Improvements in Forging Methods. F. Sh. Rabaneev. Kuzechno-Shtampovochnoe Proizvodstvo, Feb. 1960, p. 39-40.

Outline of a new method using slabs cut to special dimensions and heated to 400-1100° C. for production of forgings for gears, flanges, hubs and pinions composed of alloy and carbon steel. (F22; AY, CN, 4-52)

85-F. (Japanese.) Surface Faults of Hot Rolled Stock. Takashi Ikeno. Light Metals, v. 10, Nov. 1960, p. 386-393.

Study of factors controlling surface conditions of hot rolled stock for obtaining good surface finish on cold rolled sheet without pickling. Photomicrographic examination of defects in hot and cold rolled Al-Mg alloy after anodizing. 4 ref. (F23, 9-71; Al-b, Mg)

86-F. Extrusion of Hard Alloys. A. B. Grahman. Metal Industry, v. 97, Dec. 16, 1960, p. 502-504.

Extrusion of high Ni alloys by a process in which the billet is clad with Ni and coated with molten glass to facilitate extrusion. Tables of heating time required for 4 in. billets before extrusion. (F24; Ni-b, SGB-q, 8)

87-F. Extrusion of Hard Alloys. A. B. Graham. Metal Industry, v. 97, Dec. 9, 1960, p. 480-482.

Extrusion of high Ni alloys coated with glass lubricants. Viscosity-temperature curves for 23H and "E" type glasses. (F24; Ni-b, SGB-q)

88-F. The Extrusion of Lead and Other Soft Metals. Claude E. Pearson and Redvers N. Parkins. Chapter from "Extrusion of Metals", 2nd Edition. John Wiley & Sons, Inc., New York, N. Y., 1960, p. 20-30.

Design of vertical hydraulic presses operating by the inverted process to extrude Pb pipe and sheathing. Methods of avoiding defects. (F24; Pb)

89-F. The Extrusion of Cable-Sheathing. Claude E. Pearson and Redvers N. Parkins. Chapter from "Extrusion of Metals", 2nd Edition. John Wiley & Sons, Inc., New York, N. Y., 1960, p. 31-73.

Extrusion of Pb and its alloys to produce protective sheathing for electrical conductors and telegraphic transmission lines. (F24, T1b; Pb)

90-F. Equipment for the Hot Extrusion of Hard Metals. Claude E. Pearson and Redvers N. Parkins. Chapter from "Extrusion of Metals", 2nd Edition. John Wiley & Sons, Inc., New York, N. Y., 1960, p. 74-141.

The study of the hydraulic and mechanical auxiliaries used to increase the speed of extrusion operations and the quality of extrusion products. (F24, 1-66, 1-52; SGB-q)

91-F. Flow in Metals During Extrusion. Claude E. Pearson and Redvers N. Parkins. Chapter from "Extrusion of Metals", 2nd Edition. John Wiley & Sons, Inc., New York, N. Y., 1960, p. 142-179.

Study of metal flow during extrusion of Al, brass, Mg and Sn to determine the degree and distribution of the distortion undergone by the metal and the cause of piping, a defect occurring frequently on extrusions. (F24; Al, Cu-n, Mg, Sn)

92-F. The Pressure of Extrusion. Claude E. Pearson and Redvers N. Parkins. Chapter from "Extrusion of Metals", 2nd Edition. John Wiley & Sons, Inc., New York, N. Y., 1960, p. 180-200.

Effect of deformation, extrusion speed, temperature and friction on the amount of pressures required to extrude Al, Sn, Mg, Cd and Zn alloys. (F24, 2-61, 3-68, 3-74; Al-b, Cd-b, Mg-b, Sn-b, Zn-b)

93-F. Theoretical Analysis of Flow in Extrusion. Claude E. Pearson and Redvers N. Parkins. Chapter from "Extrusion of Metals", 2nd Edition. John Wiley & Sons, Inc., New York, N. Y., 1960, p. 201-222.

Study of extrusion variables to determine the optimum extrusion ratio, temperature and speed in relation to the metals to be extruded. Parameters are correlated for Cu, brass, Pb, Sn, Al and Te. (F24; Al, Cu-b, Pb, Sn, Te)

94-F. Metals and Alloys for Hot Extrusion. Claude E. Pearson and Redvers N.

Parkins. Chapter from "Extrusion of Metals", 2nd Edition. John Wiley & Sons, Inc., New York, N. Y., 1960, p. 223-273.

Recommended temperatures for hot extrusion of Cu alloys, nickel silver, high Ni alloys, steel and Al alloys. Tensile strength and elongation of the extrusions as extruded and after annealing. (F24, 1-66, 2-61; Al-b, Cu-b, Ni-b, ST)

95-F. Properties of Extruded Metals. Claude E. Pearson and Redvers N. Parkins. Chapter from "Extrusion of Metals", 2nd Edition. John Wiley & Sons, Inc., New York, N. Y., 1960, p. 273-296.

Effect of inclusion of impurities on the quality of extrusions. Amount of deformation and its distribution over the length and cross section of the extruded part as it affects physical properties. (F24, P-general, 3-68, 3-69)

96-F. Some Special Applications of Extrusions. Claude E. Pearson and Redvers N. Parkins. Chapter from "Extrusion of Metals", 2nd Edition. John Wiley & Sons, Inc., New York, N. Y., 1960, p. 319-329.

Combination of forging and extruding techniques to produce valves, projectile shells, cylinder sleeves, pistons, valve bodies, turbine blades and nozzles composed of chrome-steel alloys and nickel chromium. (F24, F22, T7; Ni-b, ST, Cr)

97-F. Steelcord Tire and Wire Production Techniques. Arthur F. Weber. Preprint no. 278B, Society of Automotive Engineers, 485 Lexington Ave., New York 17, N. Y. 1960. 5 p.

Production of a Firestone Steelcord W-2 tire in which high quality steel rods composed of 0.70% C, 0.60% Mn, 0.25% Si, 0.025% S and P and traces of Cu and Cr are used as cords and enclosed in rubber. Methods of rod selection, patenting, cleaning, brass plating, drawing and stranding to produce steel cord. (F28, J25, L17, T21; ST)

98-F. Manipulation of Metals. Welding and Metal Fabrication, v. 28, Dec. 1960, p. 499-502.

Developments in the fields of extrusion, precision forging, forming by rolling and sheet forming considering only methods which do not involve mechanical or gas cutting. (F-general, G-general)

99-F. Extrusion of Hard Alloys. A. B. Graham. Metal Industry, v. 97, Dec. 23, 1960, p. 521-524.

Die container and liner materials and design; extrusion stems; extrusion of high Ni-containing materials. (To be continued.) (F24; Ni-b)

100-F. Plate Mill Furnaces at Consett. Iron & Steel, v. 34, Jan. 1961, p. 12-15.

Odd shaped and thick slabs for rolling are heated to 900-950° C. in two triple-fired furnaces or in soaking pits which are partly oil-fired and partly electrically heated. Both itms of equipment are completely described. (F21b, 1-52; 4-52)

101-F. Edge Cracking of a Steel Band Conveyor. G. C. C. Parker, T. Furman and K. W. Chandler. Engineer, v. 210, Dec. 30, 1960, p. 1099-1104.

Cracks in the 170,000 psi. steel strip operating over three types of troughing rollers are detected by stress analysis, using strain gages attached to the strip to record eddy current patterns. Cracking is prevented by installing articulated rollers. (F2, W12r; ST, 4-53)

102-F. Designing for the Extrusion Process. Pt. 2. W. F. Walker. Mass Production, v. 36, Dec. 1960, p. 93-99.

Extruding temperature range and speed for extrusion of Al, brass, bronze, Cu, Mg and Ni alloy tubes and hollow sections on various 250-8000 ton horizontal and vertical hydraulic extrusion presses. (F24; Al, Cu-b, Mg, Ni-b)

103-F. (German.) Deformation Theory in the Light of Physical Metallurgy. Hein-Peter Stuwe. Stahl und Eisen, v. 80, Dec. 22, 1960, p. 1963-1969.

Theoretical discussion of the significance of material properties during strip rolling with emphasis on external friction and yield stress. Relation between yield stress and material flow. Influence of temperature, degree of deformation and deformation rate on yield stress. (F23, Q23b, 2-61, 3-68; 4-53)

104-F. Forging Firm Redesigns, Cuts Part Costs 25%. Steel, v. 148, Feb. 6, 1961, p. 74-75.

Outline of a forging cost reduction program in which uniform, rapid heating of the steel, use of contemporary

die design, holding a constant parting line and maintenance of scale-free forgings are the four key points. (F22; ST)

105-F. Ring-Rolling. D. M. Potter. Aircraft Production, v. 22, Dec. 1960, p. 468-474.

Description of a ring mill designed to give uniform circularity, hardness and grain size and circumferential grain flow in Al and Al-bronze products. (F23, Q29n, M27c; Al-b, Cu-b, 4-60)

106-F. Cold Forging Gun Barrel Rifling. L. R. Beesly. Metalworking Production, v. 104, Nov. 16, 1960, p. 63-66.

Chipless forming of a rifle barrel composed of 1% Cr-Mo alloy steel using a vertical cold forging machine which freezes the workpiece between a number of hammers with a predetermined stroke and position. Greater resistance to corrosion and wear and improved surface finish are attributed to the process. (F22, 1-67, T2m; AY, Cr, Mo)

107-F. New Developments in Metal Working. E. L. H. Bastian, I. Rozalsky and K. F. Schiermeier. Lubrication Engineering, v. 17, Jan. 1961, p. 40-47.

Energy transfer and lubrication requirements for forming of refractory metals, super alloys and ordinary metals by cold press and rotary extrusion, radial draw forming, roll forming, hot forging, spark-discharge machining, chemical milling, electrolytic machining and ultrasonic machining. 43 ref. (F-general, G-general, 18-73; SGA-h, SGB-d)

108-F. (Russian.) Automatic Regulation of Thickness of Hot Rolled Strip in Semicontinuous Mills. F. D. Ivanov. Stal', Nov. 1960, p. 1008-1012.

Automatic pressing of steel strip ends and automatic tension of the strip by varying the speed travel through the rolls for regulation of the thickness. Basic principles of the device used for producing tension in the strip. (F23; ST, 4-53)

109-F. (English.) Roller Straightener. Report 1. Straightening of Sections. Haruo Tokumaga. Bulletin of JSME, v. 3, Nov. 1960, p. 572-579.

Calculation of the bending radius required for straightening sections on a roller straightener. Tensile and bend testing of mild steel SS41, hard steel S45C and forged brass BSBF to determine the tensile and hysteresis properties, which must be known in order to use the proper power and axial thrust on the straightener. 5 ref. (F29r, Q5, Q27, Q21; CN, Cu-n, SGB-q)

110-F. Rock-Forging "Irons" Welds to Give Quality Tubing. J. A. Seme. Iron Age, v. 187, Feb. 2, 1961, p. 88-89.

Rock-forging technique does not cold draw tubing. Instead it compression forms the stock by rocking over an internal mandrel. A polished, taped mandrel controls the inside diameter while cam dies control the outer diameter. (F26)

111-F. (German.) Rolled and Drawn Tube Joints in Boiler Production. Horst Buldt. Industrie-Anzeiger, v. 82, Dec. 20, 1960, p. 1739-1745.

Methods and machinery for joining tubes to boiler bottoms and walls by rolling and drawing. Comparison of rolling and drawing operations. Working faults. (F26, K-general, T26q)

112-F. Power Spinning. Charles H. Wick. Chapter 6 from "Chipless Machining". Industrial Press, New York, 1960, p. 145-199.

Description of a cold rolling process for production of cones, cylinders and curved wall sections in which material is plastically deformed to the shape of a rotating mandrel by power fed rolls. Increases in tensile strength and fatigue resistance of steel after rolling are attributed to the process. Thickness of material to be formed is major limitation. 18 ref. (F23, 1-67, Q27a, Q7; ST)

113-F. Rotary Swaging. Charles H. Wick. Chapter 7 from "Chipless Machining". Industrial Press, New York, 1960, p. 200-228.

Reduction process for shaping bars, tubes or blanks by uniformly spaced hammer blows applied in rapid succession by rotating dies. Selection of materials, design and applications. Tooling. 7 ref. (F25)

114-F. Internal Swaging, Rotary Forging and Cold Forming of Multiple-Diameter Shafts. Charles H. Wick. Chapter 8 from "Chipless Machining". Industrial Press, New York, 1960, p. 229-256.

Description of three new chipless forming processes to improve tolerances, surface finish and mechanical properties of metal parts. 7 ref. (F25, F22, G-general, 1-67)

115-F. How to Forge Astroloy. John Luchok. Metal Progress, v. 79, Feb. 1961, p. 91-93.

Large forgings, up to 1000 lb. in weight and 35 in. in diameter, are now being made of this alloy, the newest member of the Ni-base superalloys. Continuing research is expected to make the alloy even more useful as time goes on. (F22; Ni-b, SGA-h)

116-F. Designing for the Extrusion Process. W. F. Walker. Mass Production, v. 36, Nov. 1960, p. 72-81.

Problems in design of Al alloy, brass and Zn extrusions. Effect of extrusion shape on die life and tolerance. Typical materials for extrusions. (To be concluded.) (F24; Al-b, Cu-n, Zn)

117-F. Precision Rolling of Flat Products With Small Diameter Work Rolls. M. G. Sendzimir. Australian Institute of Metals, Journal, v. 5, Nov. 1960, p. 187-200.

Theory, practice and equipment involved in the Sendzimir planetary hot strip and Sendzimir cold strip mills. (F23)

118-F. Some Problems Relating to Hot-Strip Mill Operations. Shigeo Hosoki. Australian Institute of Metals, Journal, v. 5, Nov. 1960, p. 201-208.

Difficulties encountered include problems with roll wear and rolled-in scale and difficulties in temperature control during rolling and coiling. (F23)

119-F. Basic Features of the Cold Forging Process. Pt. 2. A. M. Cooper. Wire Industry, v. 28, Jan. 1961, p. 53-55.

Cold drawing of carbon steel, alloy steel, stainless steel, Cu, Ag, brass and bronze to produce cold heading wire. Effect of cold drawing and impurity content on area reduction, elongation and tensile strength. Dimensional tolerances. (F28, 1-67, Q23p, Q27a; Ag, AY, CN, Cu-b, SS)

120-F. Works Problems. Wire Industry, v. 28, Jan. 1961, p. 67.

Heating and soaking of mild carbon steel at 680-700° C. prior to cold drawing eliminates need for annealing during production of 14 S. W. G. wire from 1/4 in. m. s. rods. Description of the McQuaid Ehn grain test which consists of carburizing the steel sample at 927° C. and examining it microscopically. (F28, 1-67, M27c; CN, 4-61)

121-F. The Fundamentals of Wire Drawing. C. P. Bernhoeft. Wire Industry, v. 28, Jan. 1961, p. 69-70.

Methods of calculating drawing angle, ratio of drawn size of wire to inlet size of wire and area reduction and the relationships between them. (F28)

122-F. Modern Trends in the Manipulation of Metals. C. G. Keil. Aircraft Engineering, v. 32, Nov. 1960, p. 327.

Summaries of papers presented at the Institution of Production Engineers Conference held at Brighton include methods of cold extrusion, cold and precision forging, spline and thread rolling, explosive forming, fluid forming and tube-in-strip process. (F-general, G-general)

123-F. Ductile Vanadium: Techniques That Make Fabrication Easier. T. W. Merrill. Iron Age, v. 187, Feb. 9, 1961, p. 110-112.

Methods for avoiding contamination and oxidation during heating for hot working. Cold working of vanadium without excessive hardening. Heat treatment, drawing, extruding and machining techniques. (F21b, J-general, G17, F24, F27; V)

124-F. Application of Flow Research to Industrial Furnaces With Particular Emphasis on Soaking Pits. Herbert Boenecke. Iron & Steel, v. 33, Dec. 19, 1960, p. 630-634.

Observation of flow patterns using smoke tests in model and full scale one-way soaking pits for achieving rapid and intensive mixing of the fuels using as few burners as possible. Experiments show that the gas volume to be circulated can be influenced by the pre-pressure of gas and air at the burner, without having to change the

furnace chamber pressure. Effect on temperature differences between top and bottom of individual ingots during soaking. (F21b, W20g, 1-54)

125-F. Economy of Metal in the Rolling Process. I. M. Pavlov. Paper from "Contemporary Problems of Metallurgy". Consultants Bureau, Inc., New York, 1960, p. 383-391.

Survey of rolling characteristics of light metals, refractory metals, steels, cast iron, reactive metals, bimetals and composite metals. Savings of metal during rolling is discussed in terms of rolling process variables and workpiece size and shape, pretreatment and surface condition, defects, initial cost and ratio of dimension of finished product to the original dimensions. 16 ref. (F23; ST, CI, EG-a, EG-d, 7-59)

126-F. Modernization of Blooming Mills. P. A. Aleksandrov. Paper from "Contemporary Problems of Metallurgy". Consultants Bureau, Inc., New York, 1960, p. 416-442.

Equipment design and technological parameter for rolling steel blooms and billets. Investigation of the ingot reduction process and consolidation of cast steels, with attention to defects producing stress caused by workpiece size and weight increase. Application of modernized blooming-slabbing equipment to production of carbon and alloy steel and slabs. 24 ref. (F23n, W23a, 17-51; ST)

127-F. (German.) Steel Extrusion Profiles. N. Fromm. Stahlbau, v. 30, Jan. 1961, p. 30-32.

Hot extrusion of steel at 1100-1300° C. using steel dies with glass as lubricant (Ugine-Sejournet process). Mechanical properties, surface quality and gage accuracy of extruded profiles. Applications. (F24, 1-66, Q-general; ST)

128-F. Fillet-Rolling Operation on Diesel-Engine Crankshafts. W. Egger. Machinery (London), v. 98, Feb. 1, 1961, p. 276-278.

Fillet radii of main and pin journals of diesel engine crankshafts are rolled by wedge shaped rollers under a pressure of 175 lb. Rolling operation increases the hardness value of the fillet and improves surface finish. (F23)

129-F. Largest Titanium Forgings Made in Closed Die. N. G. Arrell and J. E. Coyne. Materials in Design Engineering, v. 53, Feb. 1961, p. 20-21.

Production of rocket motor cases from 13V-11Cr-3Al beta Ti alloy by closed die forging or extrusion. (F22, F24, T24b; Ti, 17-57)

130-F. Net Size Forging for Stainless Steel. JL Explorer, v. 2, 1961, p. 8-9.

Forging of 302 and 321 stainless steel into turbine blades, housing bells and pressure vessel caps by a high-energy rate forging technique. The forging machine (Dynapak) uses ultra-high pneumatic velocities to create pressures up to 200 psi. (F22, T7h; SS, 17-57)

131-F. Operations of the Wide Strip Rolling Mills at Fairless Works. K. L. Johannsen. Paper from "Production of Wide Steel Strip". Iron and Steel Institute, London, England. May 1960, p. 76-91.

Hot rolling slabs and blooms directly from steel ingots with width and thickness of hot strip controlled by photoelectric cells and X-ray gages. Design and layout of soaking pits, slabbing mill, hot strip mill and cold reduction mill. (F23, 1-66, W23a, 17-51; ST, 4-53)

132-F. Metallurgical Principles and Practice in the Manufacture of Cold-Reduced Tinplate. W. J. S. Roberts. Paper from "Production of Wide Steel Strip". Iron and Steel Institute, London, England. May 1960, p. 95-102.

Production of a prepared steel base from rimming steel, Al killed steel, capped steel by hot rolling, cold reducing and temper rolling followed by strain aging and pickling. Coating with tin by hot dipping or electrolytic plating. Influence of base metal on surface quality. (F23, L16, L17; ST, Sn, 4-53)

133-F. The Rolling of Very Thin Tinplate. M. D. Stone. Paper from "Production of Wide Steel Strip". Iron and Steel Institute, London, England. May 1960, p. 103-111.

Quality and economic considerations and production problems in manufacture of thin tinplate by a single pass through a higher-speed 6-stand tandem cold

mill, by rolling twice through a 5-stand mill and by cold rolling after electrotinning. (F23; ST, Sn, 4-53, 8)

134-F. (French.) Pieces Precision-Forged and Extruded by the Dynapak Process. F. A. Monahan. Machine Moderne, v. 54, Dec. 1960, p. 19-23.

Fabrication of metals to high tolerances by a high energy forming method using compressed air. Application to stainless steel superalloys, refractory metals, bronze and Al. (F22, F24)

135-F. (French.) Production of the "Simca-Aronde". Production of Direction and Relay Levers. Machine Moderne, v. 54, Dec. 1960, p. 41-49.

Metalworking, machining and polishing operations and machinery used in manufacturing direction and relay levers made from forged pieces of 16 NC 6 steel. (F-general, G17; ST, 4-51)

136-F. Works Practice in the Manufacture of Nonferrous Extruded and Rolled Products. J. N. Morris. South African Institute of Mining and Metallurgy, Journal, v. 61, Dec. 1960, p. 264-283.

Processes employed in the melting, casting, extrusion and rolling of Cu alloys. (F23, F24, C-general, E-general; Cu-b)

137-F. (Japanese.) Nickel Base Heat Resisting Alloys. Pt. 1. Effect of Aluminum and Titanium on the Forgeability and the Age-Hardening Property of Nimonic-100 Type Alloys. Renpei Yoda, Heitaro Yoshida and Sennosuke Takahashi. Japan Institute of Metals, Journal, v. 24, Nov. 1960, p. 723-727.

Specimens containing 0.72-6.89% Al and 0.74-4.64% Ti are hot worked after solution treatment, quenching, oxidizing and aging at 900-1200° C. for various times. Data are given for deformation and oxidation resistance, forgeability, age-hardening characteristics, metallographic structure, constitutional diagram and hardness as a function of composition, Al and Ti concentration and heat treatment time and temperature. 9 ref. (F22, 17-52, Q-general, 2-60, 2-64; Ni-b, Al, Ti)

138-F. High Strength Steel Forgings. H. J. Henning and F. W. Boulger. Defense Metals Information Center, Battelle Memorial Institute, DMIC Rept. 143, Jan. 5, 1961, 62 p. (Available as PB 151102 from U. S. Office of Technical Services, Washington 25, D. C.)

Forging of martensitic-hardenable and semi-austenitic precipitation-hardenable steels. Data are given for ultrasonic quality, magnaflux quality and grain flow of the materials and for mechanical properties of the finished forgings. (F22; SS, SGB-a)

139-F. Cold Forging of Steel. Machinery Lloyd (Overseas Edition), v. 33, Jan. 7, 1961, p. 37-39.

Finished components are cold forged from low carbon steel rod following cropping, phosphating, lubricating, preforming, deburring and chamfering. (F22, 1-67; CN-g)

140-F. Forging Turbine-Blades. Aircraft Production, v. 23, Jan. 1961, p. 2-4.

Rough and close forging of Nimonic alloys to form gas turbine blades. (F22, T7h; Ni-b)

141-F. What's Needed to Produce Bright Drawn Aluminum Tube. Vern G. Gerschutz. Modern Metals, v. 17, Feb. 1961, p. 56.

Influence of proper lubrication and the finishing draw on the successful production of bright finish drawn Al tubing. (F26r, 18-73; Al)

142-F. Skelp Welder Speeds Tubemaking. Steel, v. 148, Mar. 6, 1961, p. 72.

Design of an automated continuous line handling steel skelp up to 3/16 in. thick and 15 in. wide. Coil ends are angle cut and aligned, then butted together for arc welding. (F26p, K1; ST)

143-F. The Fundamentals of Wire Drawing. Wire Industry, v. 28, Feb. 1961, p. 166-169.

Relationship between the breaking load of Al and Al alloy wire and the die pull necessary for producing a sound quality wire. Die pull as affected by kind of material drawn, its size and temper and the area reduction given per pass. (F28)

144-F. (French.) Heating of Special Steel Ingots and Billets. Metallurgie et la Construction Mechanique, v. 92, Nov. 1960, p. 973, 975, 977, 979.

Heating of electric steel ingots and billets in electric soaking pits. Description of continuous crane operated pits. Temperature control. (F21b; ST)

145-F. Modern Trends in the Manipulation of Metals. D. F. Galloway. Production Engineer, v. 40, Feb. 1961, p. 83-98.

Production of steel, Al, Cu and Sn sections and finished components by extrusion, forging, precision rolling and sheet forming. (F24, F23, F22; Al, Cu, Sn, ST)

146-F. Inland's New Automatic Slabber. E. R. McGaughey. Iron and Steel Engineer, v. 38, Feb. 1961, p. 105-123.

Tandem and hot rolling of steel ingots by an automized slabbing mill controlled by punched cards. Measuring devices include electromechanical device, Pt-Rh thermocouple and infrared hot metal detector. Ingots are handled by an automatic positioned, cable driven ingot buggy. (F23, 1-52; ST, 5-59)

147-F. X-Ray Gages Increase Output on Fast Foil Mills. Iron and Steel Engineer, v. 38, Feb. 1961, p. 132.

Rolling of Al on foil mill and cold mill at 800-2000 ft. per min. with thickness controlled automatically by X-ray gages to tolerances of 2% in the range of 0.007-0.002 in. and 1% in the range of 0.002-0.025 in. (F23, S14e; Al)

148-F. Forming Beryllium. Metalworking Production, v. 105, Feb. 15, 1961, p. 66.

Rolling, forging, forming or extrusion of Be above 1400° F. using metal clad in a mild steel, covered with a protective coating or handled under an inert atmosphere. (F23, F22, F24; Be)

149-F. Rotary Swaging Goes Automatic. Metalworking Production, v. 105, Feb. 15, 1961, p. 77-79, 81.

Profiles are formed on the inside diameter of cylindrical workpieces by a rotary swaging machine to produce starter motor clutch housings for automobiles. Increases in hardness, tensile strength and fatigue strength are attributed to the process. (F25, T21b)

150-F. (German.) Engineering Techniques in Manufacturing Nonferrous Semi-Finished Products. Pt. 1. Problems in Modern Metal Rolling Processes. O. H. C. Messner. Zeitschrift fur Metallkunde, v. 52, Jan. 1961, p. 57-68.

Cold and hot rolling of Cu and alpha brass sheet and strip is discussed in terms of machinery (roll, stands, auxiliary equipment such as reels, manipulators, cutting machines); rolling conditions (rolling temperature, initial and final dimensions); intermediate surface treatments and lubrication and cooling of rolls. (F23, 1-52; Cu-b, 4-53)

151-F. (German.) Engineering Techniques in Manufacturing Nonferrous Semi-Finished Products. Pt. 2. Drawing of Metal Rods and Tubes by Modern Drawing Machines. Heinrich Makelt. Zeitschrift fur Metallkunde, v. 52, Jan. 1961, p. 69-75.

Design and operation of an automatic 25 ton drawing bench for brass and Cu rods and tubes. Computation of drawing forces and presentation of results by nomogram. (F26r, F27, 1-52; Cu-b)

152-F. Extruded Magnesium Pellets. R. S. Busk. Precision Metal Molding, v. 19, Mar. 1961, p. 50-51.

Comparison of a commercial Mg pellet alloy, (P) ZK60B, with ZK60A as to mechanical properties, composition and ease of extrusion. Production of pellet, foam and wool extrusions or extrusions containing dispersed oxides. (F24, Q-general; Mg-b)

153-F. Drop-Forging Titanium Alloys. J. C. Bell and E. Leybourne. Metal Treatment, v. 28, Feb. 1961, p. 45-47.

Drop forging of Ti billets at 400-920° C. by oil hardened steel dies to produce aircraft parts. Finishing by sand or shot blasting. Data are given for tensile properties of heat treated part. (F22n, L10c, Q27, T24; Ti-b)

154-F. Press-Forged Titanium Components. E. T. Stewart-Jones. Metal Treatment, v. 28, Feb. 1961, p. 48-49.

Press-forging of Ti alloys such as ICI 314A and EX013C by a hydraulic press and steel dies. Tensile properties, ductility and hydrogen and oxygen affinity of vacuum melted Ti. Comparison with Al and steel. (F22, Q27, Q23p; Ti-b)

155-F. Titanium Compressor-Blade Forgings. G. P. Eccles. Metal Treatment, v. 28, Feb. 1961, p. 50-52.

Mechanical or electrical upsetting, extrusion at up to 850° C. and forging at up to 1040° C. of Ti, T150A Ti alloy, T75 ICI Ti alloy and G79 Ti alloy. Finishing by sand blasting, electropolishing and chemical etching. (F22j, F24, L10, L12, L13p; Ti-b)

156-F. Close-to-Form and Close-Tolerance Forgings. Metal Treatment, v. 28, Feb. 1961, p. 53-58.

Forging techniques at temperatures up to 1140° C. for steels, Nimonic alloys, Ti, Al alloys, Hiduminium and Mg alloy. (F22; Al-b, Mg-b, Ni-b, ST, Ti)

157-F. Temperature Changes Occurring During the Extrusion of Aluminum, Tin and Lead. A. R. E. Singer and J. W. Coakham. Institute of Metals, Journal, v. 89, Feb. 1961, p. 177-182.

The temperature at which extrusions emerge from the die is measured in the case of commercially pure Al, super pure Al, Sn and Pb extruded at ram speeds varying from 1-30 in. per min. on a 100 ton laboratory press at 20-400° C. Emergent temperature rises of up to 200° C. occurring in three stages, rapid, slow and sharp, in that order, are observed as a function of the physical properties of the metal and the extrusion ratio and speed. 6 ref. (F24, 2-61; Al-b, Pb, Sn)

158-F. German Gear Process Often Bypasses Machining Step. Steel, v. 148, Mar. 20, 1961, p. 100-101.

Production of gears by a forging process in which blanks are cut from a rod so that grain flow in the finished piece will run parallel to the gear axis, then heated, rough forged, finish forged and trimmed to remove flash. (F22, T7a)

159-F. Tapco Explores Tungsten Fabrication. John F. Judge. Missiles and Rockets, v. 8, Mar. 13, 1961, p. 36-37.

Extrusion techniques for production of W-15% Mo alloy bar stock. Description of research on the compatibility of tungsten aircraft components with other materials. (F24, T24; W-b, Mo)

160-F. Forging Effects on the Mechanical Properties of Three Boron-Treated Steels. E. DiCesare. Watertown Arsenal Laboratories. U. S. Office of Technical Services, PB 151814, July 1959, 50 p. $1.25.

Forging characteristics of structural steels containing boron and rare earths. Three alloys were hot forged (225° F.) by upsetting and drawing out (swaging) with reduction ratios up to 8:1 and 13:1 respectively. Heat treatment gives optimum tensile properties and toughness in both the upset forged and the drawn-out ingots. There is about a 66% reduction for the swaged ingots, 50% reduction for the upset-forged 14B35 alloy and no reduction for the upset-forged 145B50 and 10R70 alloys. (F22, 17-52; ST)

161-F. Do Molybdenum Disulphide Containing Wire Drawing Lubricants Have a Place in Your Mill? Walter A. Smigel and William A. Stillwell. Wire and Wire Products, v. 36, Mar. 1961, p. 313-314, 376.

Drawing of high carbon and spring steel, Al core wire welding rod and wire rope using lubricants containing MoS_2. Data are given for drawing speed and die wear as influenced by lubrication. (F28; Al, CN-r)

162-F. New Temper Mill Slashes Processing Time. Western Metalworking, v. 19, Mar. 1961, p. 42.

Rolling of carbon, stainless and alloy steel strip in a new two-high temper mill. Design features and capacity. (F23, W23c, 17-51; AY, CN, SS)

163-F. (French.) General Study of Drop Forging. Pt. 5. Heating in Drop Forging. Pratique des Industries Mecaniques, v. 47, Jan. 1961, p. 1-5.

Heat economy in drop forging. Influence of coal, coke, light and heavy fuel oil and natural gas heating on production costs. Application of resistance and induction heating. (F21b, F22n)

164-F. Strength of Castings Multiplied by Forging. John F. Judge. Missiles and Rockets, v. 8, Mar. 20, 1961, p. 30.

Press forging of 17-4-PH-stainless steel and 18-8 stainless steel at -100° F. to impart higher tensile strengths and increase yield and proof strengths without the ductility increase associated with heat treatment alone. (F22; SS, 5)

165-F. (Russian.) Production of Steam and Gas Turbine Blades. B. N. Bohatov,

V. N. Martinov and V. S. Povarov. Kuznechno Shtampovochnoe Proizvodstvo, Jan. 1960, p. 17-19.

Roughing, extrusion, rolling, lubricating, heat treating and finishing techniques in production of turbine blades. Economy in metal usage and machining time as influenced by machining sequence. (F22, T7h)

166-F. (Translation-ConBur.) The Use of Glass Lubricants for Hot Deformation of Chrome-Nickel and Titanium Alloys. L. K. Kovalev. Glass and Ceramics, v. 17, Dec. 1960, p. 181-183.

Metal blanks are covered with molten glass film to insulate hot metal from atmospheric air, to prevent oxidation and scale formation and to increase the working interval. Glass is easily separated from metal surface by hammer blows. (F-general, 18-73; Ni-b, Cr, Ti-b)

167-F. (German.) Production of Fuel Elements by Extrusion. Hans Pischel. Kerntechnik und Isotopentechnik, v. 2, Nov. 1960, p. 366-369.

Review of extrusion and coextrusion techniques using presses of 315-1000 tons pressing force. Extrusion of Al, Zr, Cu and alloy steel and of uranium in the gamma and alpha phase. Coextrusion of U-Al and Pu-Zr combinations. Use of protective atmosphere and of protective salt. (F24; Al, AY, Cu, Zr)

168-F. Extrusion of Steel. D. A. Edgecombe. Journal of Metals, v. 13, Mar. 1961, p. 211-214.

A brief review of forward, inverted and piercing extrusion methods and an outline of the specific production techniques for tubular and solid-shape steel and steel alloy extrusions. Emphasis is given to glass lubrication and to pressure and flaw considerations. (F24; ST)

169-F. (French.) Use of Heat Reflectors in Forging. D. Flament. Metallurgie et la Construction Mecanique, v. 93, Jan. 1961, p. 15-17.

Forging of round low carbon steel stock into a hexagonal cross section, using a steel tube surrounding the rod to be forged as a protection against heat losses. Factors influencing the degree of protection are the reflecting power of the internal tube surface and the tube diameter. (F22; CN-g)

170-F. Pipe Mill, Most Modern of Its Kind, Completed at Lorain. U. S. Steel Quarterly, v. 15, Feb. 1961, p. 3.

Production of black and galvanized steel pipe of 1 1/4-4 in. diameter in a continuous butt welding pipe mill, with elongation and reduction in a stretch reduction mill and quality control by hydrostatic testing. (F26, 1-52; ST)

171-F. Temperature Changes Associated With Speed Variation During Extrusion. A. R. E. Singer and S. H. K. Al-Samarrai. Institute of Metals, Journal, v. 89, Mar. 1961, p. 225-231.

Al and Pb are extruded at several extrusion ratios, using constant ram speeds, stepped variations and speed programs. The temperatures at which the extrusions emerge from the die are measured and related to the process variables, with theoretical analysis of heat flow. 12 ref. (F24, P11k, 1-66; Al, Pb)

172-F. (German.) Friction Welding. U. Oestmann. Maschinenbau, v. 9, Dec. 1960, p. 356-359.

Butt welding of cylindrical parts and tubes of steel, cast iron, Cu, Ti, light metal and plastics on a lathe by friction heating without external heating or welding additions. Principles of reaction mechanism and design of equipment. (F26p, 1-52; ST, CI, Cu-b, Ti, EG-a39, NM-d)

173-F. (German.) Investigation of Power Demand and of Kinetics in Blooming (Rolling). E. Kiss. Technical University for Heavy Industry, Publications (Miskolc, Hungary), v. 21, 1960, p. 313-323.

Production test rolling of 3100-5100 kg. steel ingots to measure kinematic rolling data such as temperature changes during rolling, roll pressure and force and power consumption for correlation with optimum rolling time. (F23; ST, 5-59)

174-F. (German.) Evaluation of Power Demand in Rod Drawing Using Drawing Dies With Curved Profiles. I. Mecseki. Technical University for Heavy Industry, Publications (Miskolc, Hungary), 1960, p. 303-311.

Derivation of formulas for computation of drawing forces and correlation with production and laboratory tests in measuring drawing force, drawing angle

and drawn surface on Cu and brass rods. (F27; Cu-b)

175-F. (German.) Influence of Die Shape and Lubricant on Hollow Drawing of Al 99.5 Tubes. G. Devenyi. Technical University for Heavy Industry, Publications (Miskolc, Hungary), v. 21, 1960, p. 281-302.

Test drawing of predrawn and annealed 99.5% Al tubes of given mechanical properties using dies of various drawing angles and with various lubricants such as beeswax and organic and inorganic oil. Determination of drawing force and surface quality of tubes as influenced by shape of die and lubricant. (F26r; Al)

176-F. Elongation vs. Reduction--A New Precept. Anton F. Mohrnheim. Wire, no. 51, Feb. 1961, p. 21-24.

The elongation factor is suggested for wire and tube drawing calculations in place of the per cent reduction in area as a principal measure of plastic deformation. A clearer conception of different mechanical and metallurgical influences on the process and the material is attributed to the derived mathematical relationship. 7 ref. (F26r, F28, Q24)

177-F. (Japanese.) Cold Rolling With a Sendzimer Mill. Kyou Ouhama and Yoshiaki U'eda. Japan Society of Mechanical Engineers, Journal, v. 63, Nov. 1960, p. 1500-1505.

Construction and mechanism of the mill; application and process parameters in the rolling of stainless steel strip. (F23, W23f; SS, 4-53)

178-F. (Czech.) Joining of Low Carbon Steel With Stainless Steel in the Manufacture of Clad Steel. Milan Zidek. Hutnicke Listy, v. 16, Jan. 1961, p. 19-28.

Solid face bonding of composite ingots cast from carbon steel containing 0.14-0.5% C, 0.39-0.43% Mn and 0.16-0.30% Si and alloy steel with 0.07-0.13% C, 0.42-1.60% Mn, 0.33-0.98% Si, 11.85-19.20% Cr, 0-12.90% Ni, 0-0.51% Ti and 0-1.80% Mo by rolling. Effect of diffusion and heat treatments on structure of contact zone and shear strength. 15 ref. (F23, K5k, L22, N-general, 2-64; SS, CN)

179-F. Introduction to the Theory and Practice of Flat Rolling. Pt. 7. C. W. Starling. Sheet Metal Industries, v. 38, Mar. 1961, p. 211-218.

Mechanical, electromechanical, hydraulic, electrical and optical methods of measuring roll force on a rolling mill. Devices for measuring torque. (F23)

180-F. The Transient Temperature Distribution Within Slabs Heated in Continuous Furnaces. A. H. El-Waziri. Iron and Steel Engineer, v. 38, Mar. 1961, p. 130-138.

Prevention of longitudinal temperature variation in steel slabs to be rolled into steel strip and consequently the periodic gage variation in the finished strip. Methods are proposed for control during heating involving raising the skid coolant temperature and changes in the geometrical configuration of the skids. 8 ref. (F21b)

181-F. The Drawing of Stainless Steel and Nickel Chrome Alloys. Wire Industry, v. 28, Mar. 1961, p. 261, 286.

Ni-Cr alloys and stainless steel are drawn using an oxalate coating which automatically disperses during annealing of the wire. (F28, 18-72; SS, Ni-b)

182-F. The Fundamentals of Wire Drawing. Pt. 9. Die Pull. C. P. Bernhoeft. Wire Industry, v. 28, Mar. 1961, p. 266-267, 272.

The relation between the breaking load of wire and die-pull is shown for pure Al and Al alloy. The die-pull increases as the breaking load increases. (F28; Al-b)

183-F. Portable Radiant Heater Simplifies Hot Forming Work. Douglas B. Hugill. Modern Machine Shop, v. 33, Apr. 1961, p. 116-119.

Design and operation of a heating unit built into a caster-equipped carriage frame and consisting of an extendable and retractable lamp bank which is used for difficult hot forming operations on Al, Mg, Ti, Mo and U. (F23b, 1-52; Al, Mg, Ti, Mo, U)

184-F. Combined Town/Gas Fuel Oil Flames for Heating Ferrous Metals. E. A. K. Patrick and N. G. Patel. Insitution of Gas Engineers, v. 1, Mar. 1961, p. 157-183.

Application of gas and oil burners to the heating of "35" carbon steel,

carbon case hardening steel and Ni-Cr-Mo steel for forging. Effect of types of fuel (i.e., fuel oil, town gas and various mixtures of fuel oil and town gas) at differing excess air pressure and times of heating on the quantity and adherence of scale formed on mild steel and alloy steels. 32 ref. (F23b, 1-52, 9-52; CN, ST, 5-59)

185-F. Forging Research in Sweden. Erik Tholander. Metal Treatment and Drop Forging, v. 28, Mar. 1961, p. 89-94.

Description of research on forging of Pb in open and closed dies to determine the effect of the internal pressure of the metal on the behavior of the metal during a forging blow. (F22; Pb)

186-F. Precision Forging of Steel Shafts. Metal Treatment and Drop Forging, v. 28, Mar. 1961, p. 95-98.

Multiple-diameter steel shafts are produced from hot billets by a vertical or horizontal forging machine having multiple hammers arranged to reciprocate at high speed. Surface finish does not require additional machining. (F22; ST)

187-F. Straightening of Steel and Aluminum. Michael V. Zaustin. Tool and Manufacturing Engineer, v. 46, Mar. 15, 1961, p. 69-74.

Manual, roller and rotational straightening methods. Calculation of bending moments, using the ratio of the plastic section modulus to the elastic section modulus to define variational limits. Deformation mechanisms. (F29r; Al, ST)

188-F. (German.) Influence of Back Pull in Drawing of Steel Wire on Drawing Technology and Properties of Drawn Wire. Manfred Martin, Heinrich Koch and Fritz Fischer. Stahl und Eisen, v. 81, Mar. 16, 1961, p. 349-356.

Drawing of Pb-patented, pickled steel wire (5.2 mm. diameter) with sorbitic microstructure and 0.62-0.82% C at various intensities of back-pull. Influence of back-pull on drawing force, drawing work drawing temperature and on mechanical properties of drawn wire. (F28; ST)

189-F. (German.) Some Principles of the Plasticity Theory of Strip Rolling and an Approximate Estimation of the Position of the Nonslip Point. Alex Troost and Karlheinz Holling. Zeitschrift fur Metallkunde, v. 52, Feb. 1961, p. 95-100.

Novel quasi-linear solution of the differential equation of strip rolling for evaluating stress distribution in rolling gap. Comparison of computed results with those obtained in cold rolling of Al and hot rolling of steel. (F23; Al, ST)

190-F. Composite Tubing and Piping. J. B. Ulam. Steel Horizons, v. 23, no. 2, 1961. Insert.

Production of composite tubing from dissimilar metals by a hot extrusion process. Sizes, tolerances, corrosion resistance, mechanical and thermal properties of combinations of several types of steel, steel alloys and Inconel. Technique used in welding composite tubing. 4 ref. (F24, Q-general, K-general; Ni-b, ST, 4-60, 7-59)

191-F. Works Practice in the Manufacture of Nonferrous Extruded and Rolled Products. J. N. Morris. Engineer and Foundryman, v. 26, Jan. 1961, p. 31-40.

Foundry technique for Cu, Cu alloys, Al and Al alloys cast into suitable shapes for subsequent work. Description of rolling mill operations including scalping and blanking, cold rolling and annealing and pickling. Tube and hollow shape production by extrusion. (F23, F24; Al-b, Cu-b)

192-F. Basic Features of Cold Forging. A. M. Cooper. Machinery Lloyd (Overseas Edition), v. 33, Mar. 4, 1961, p. 41-45.

Cold forging of Cu, Ag, brass, bronze, carbon, alloy and rimmed steels and 18-8 stainless steel to increase tensile strength, area of reduction and elongation while reducing the ductility. (F22, 1-67; Ag, AY, CN, Cu-b, SS)

193-F. The Manufacture of Sheet Metal for Porcelain Enameling. P. A. Reynolds. Paper from "Porcelain Enamel Institute Forum, Proceedings". v. 20. Porcelain Enamel Institute, Inc., Washington, D. C., 1958, p. 4-7.

Ways of enhancing flatness, formability, enamelability, resistance to sag and surface texture during casting, rolling and normalizing operations on steel sheets for porcelain enameling. (F23, D9, J24; ST)

194-F. Double Advantages for Carbon and Alloy Steel Tubing. Electrified Industry, v. 25, Apr. 1961, p. 33-35.

Production of seamless steel tubing by combining arc furnace melting and a new extrusion process results in a pipe with better grain structure, improved physical properties, more uniform wall thickness and high steel quality. (F24, D5; AY, CN)

195-F. (German.) Progress in Processing of Sinter Aluminum. A. Akeret. Metall, v. 15, Mar. 1961, p. 199-200.

Methods of processing sintered Al containing 5-13% Al_2O_3 such as die forging, impact extrusion, drawing, cold pilgering, hot and cold rolling and cold pressing; dyzacking, deep drawing and bending of sheet; and machining. (F-general, G-general; Al-b, 6-70, 6-72)

196-F. (German.) Use of Divided Strip of Killed and Rimming Steel Quality in Manufacturing Longitudinally Welded Tubes. Klaus Edelmann. Neue Hutte, v. 6, Feb. 1961, p. 81-87.

Test welding of 0.08-0.10% C steel tubes (12-45 mm. diameter, 1-2.5 mm. wall thickness) with subsequent investigation of segregation by sulphur prints and chemical analysis and technological testing of tubes by tensile, expansion, folding, flanging and bursting tests. (F26p, Q-general, S13; ST, 4-60, 17-57)

197-F. (German.) Investigation on a Tube Cold Rolling Pilger Mill. Willi Jackel, Horst Neumann and Wolfgang Hofmann. Neue Hutte, v. 6, Feb. 1961, p. 87-91.

Calibration of a cold pilger machine for production of seamless steel tubes (57 mm. diameter, 5 mm. wall thickness) by various methods and subsequent measurement of rolling forces and roll wear in cold pilger rolling. (F26q, 1-52; ST)

198-F. (German.) Process Techniques in Nonferrous Semifinished Products Industry. Fritz Zeunert. Zeitschrift fur Metallkunde, v. 52, Mar. 1961, p. 152-158.

Production of high-quality seamless tubes (12-92 mm. diameter) by stepwise rolling and cold pilgering through a combination of a mechanical and hydraulic press or cross rolling mill and a single or multiple high-speed pilger mill. (F26q, 1-52)

199-F. Greater Integration for Broader Product Lines. H. K. Darby. Modern Metals, v. 17, Apr. 1961, p. 60, 62, 64-66.

Hot rolled coil of 5055 Al alloy is reduced to various gages in a cold rolling mill. Processes include annealing and vinyl coating. (F23, J23, L26; Al-b)

200-F. Brinsworth Cold Mill Features Latest Control Techniques. British Steelmaker, v. 27, Apr. 1961, p. 102-103.

Design and operation of a mill for rolling gage ranges of 0.010-0.160 in. in widths to 18 in. for all qualities of steel but primarily for cold rolling of low-carbon steels in all tempers. (F23, W23f; ST)

201-F. Recent Advances in the Theory of Drawing of Thin Shells. W. Szczepinski. Applied Mechanics Reviews, v. 14, Mar. 1961, p. 173-176.

Analysis of principles with derived equations for drawing rotationally symmetric shells and shells with arbitrary double curvature. 25 ref. (F27, 10-51)

202-F. (Translation-Brutcher no. 5090.) Effect of Temperature and Time of Reheating of Large Ingots for Forging Upon Steel Properties. M. P. Braun. Izvestiya Vuz-Chernaya Metallurgiya, Dec. 1960, p. 111-113.

Search for ways of speeding up hot working processes with special reference to the use of higher than usual reheating temperatures for 30-40 ton forging ingots of low-alloy Cr, Cr-Ni and Cr-Ni-Mo steels. (F-general, 1-66; ST, Cr, Mo, Ni)

203-F. Press-Furnace Setup Boosts Forging Capacity. Steel, v. 148, May 1, 1961, p. 59.

Forgings of 8620 and 4718 steel are produced in three strokes using a setup including a rotary hearth billet heating unit and a forging press. (F22, 1-53; ST)

204-F. New Trends in the Technology of Plastic Working of Metals. Czechoslovak Heavy Industry, Apr. 1961, p. 2-8.

An international symposium discussing problems in plastic working of metals including utilization of high-energy rate, piercing at high speed, friction

problems in hot and cold drawing sheets, plastic working by radial molding and extrusion from rings, rolling of serrated shafts and forging and production of forging dies. (F-general)

205-F. Experimental Investigation of the Extrusion of Metals. H. Ll. D. Pugh and M. T. Watkins. Production Engineer, v. 40, Apr. 1961, p. 256-282.

Effect of extrusion method, billet dimensions, ram speed, extrusion ratio, tool geometry and lubrication on the pressure required to extrude sample shapes from 99.5 Al, DTD 363 Al alloy, Cu, 70-30 brass, Cb, Ti and carbon, alloy and stainless steels. 29 ref. (F24; Al-b, AY, Cb, CN, Cu-b, SS, Ti)

206-F. Basic Features of the Cold Forging Process. A. M. Cooper. Production Engineer, v. 40, Apr. 1961, p. 283-296.

Cold forging and drawing of bronze, brass, Ag, Cu, Carpenter 10, 305 steel, EN 1 A, EN 58 E, 18-8 stainless and ferritic steels. Effect of carbon content on tensile strength, elongation, yield point and reduction in area. (F22, 1-67, F27, Q-general; Ag, Cu-b, SS)

207-F. The Fundamentals of Wire-Drawing. Pt. 10. The Parallel in the Die. C. P. Bernhoeft. Wire Industry, v. 28, Apr. 1961, p. 388-390.

Effect of parallel length on die pull and of lubricant on heat and gliding friction during drawing of Al wire. (F28, 18-73; Al-b)

208-F. Mass Production of Non-Ferrous Forgings at Harvey Aluminum. Industrial Heating, v. 28, Mar. 1961, p. 456-458, 460, 462, 464.

All types of forgings including precision, no-draft, blocker and impact types are produced on mechanical and hydraulic presses after heating to controlled temperature in a continuous heating furnace. Tensile properties and hardness are given for various forged alloys. (F22; Al-b)

209-F. Simultaneous Extrusion. George E. Henning. Engineer, v. 5, Apr. 1961, p. 39-41.

Multicoat extrusion line insulates and jackets a Cu conductor with polyethylene and polyvinyl chloride respectively by the use of a common extrusion head at the rate of 1500 ft. per min. Application in telephone wire. (F24; Cu)

210-F. The Attenuation of Dimensional Variations in Rolling. J. F. Wallace and K. Bayley. Sheet Metal Industries, v. 38, Apr. 1961, p. 242-246.

Development of reactive and resistive methods for attenuating and controlling variation in gage and profile of rolled sheet. Application of prestressing technique to continuous bar mills with short rolls. 3 ref. (F23; 4-53, 4-55)

211-F. An Introduction to the Theory and Practice of Flat Rolling. Pt. 8. C. W. Starling. Sheet Metal Industries, v. 38, Apr. 1961, p. 247-252.

Design principles and metallurgical features of the planetary mill method of rolling. Mechanical features and performance characteristics of the mill with suggested applications. (F23, W23)

212-F. Close-to-Form and Close Tolerance Forgings. E. W. Peel. Production Engineer, v. 40, Mar. 1961, p. 197-206.

Close-to-form forging of aircraft parts and automotive components in Nimonic alloys, alloy steel, Ti alloys, Mg alloys and Al alloys. Metals are heated to 900-1100° C. and deformed by powered drop hammers, hydraulic presses or mechanical presses. (F22, T21, T24; Al-b, AY, Mg-b, Ni-b, Ti-b)

213-F. (German.) Scale Investigation on Differently Rolled Heavy Plates. Paul Funke, Jr., and Werner Lueg. Archiv fur das Eisenhuttenwesen, v. 32, Mar. 1961, p. 133-144.

Investigation of pickling behavior, microstructure and composition of scale and of surface quality of differently heated (soaking pit with wet and dry slag) and differently rolled (three-high and four-high reversing mill) heavy St. 37 steel plates. Test annealing of low-carbon or surface decarburized steel sheet to investigate influence of carbon on scaling. (F23, J2, 9-52; ST, 4-53)

214-F. Internal Swaging Performs a Wide Variety of Jobs. Charles Wick. Machine and Tool Blue Book, v. 56, May 1961, p. 121-123.

Applications of internal swaging to cold forming of stainless steel, other corrosion-resistant materials, Ti, Ta, Zr and high-strength high-temperature alloys. Description of the intraform

machine in which hollow cylindrical stock is placed over a mandrel and plastically deformed by pulsating, rotating dies. (F25; SS, Ta, Ti, Zr)

215-F. Welding Polaris Missile Cases. R. D. Libert. American Machinist/Metalworking Manufacturing, v. 105, May 1, 1961, p. 90-91.

Hot edge-upsetting methods are used to reinforce welds in Polaris fuel chambers and prevent weld failures. (F22j, T24e; 7-51)

216-F. How to Plan Production Runs With Precision in Mind. W. N. Redstreake. Iron Age, v. 187, May 11, 1961, p. 105-112.

Production tips for rolling of thin foils, precision casting, forging, precision punching and rotor brazing operations used to produce aircraft and missile components to close tolerances. (F22, E15, F23, K8, T24e)

217-F. Complex Rotors Cast to Shape. Iron Age, v. 187, May 11, 1961, p. 113.

Use of semicold forming process to cast ultra-high purity Al rotors to close tolerances in one step. (F-general, 1-67; Al)

218-F. Folded Metal. Metal Industry, v. 98, Apr. 14, 1961, p. 295-296.

Al, brass, Cu and stainless steel sheet which has been corrugated, lanced, slotted, perforated and offset may be sheared, rolled, stretched and embossed on standard presses to form screens, ventilation grills, curtain walls and heat exchanger parts. (F23, F29q; Al, Cu-b, SS, 4-53)

219-F. Discussion on Extrusion. R. J. Wilcox and P. W. Whitton. Metal Industry, v. 98, Apr. 14, 1961, p. 286-288.

Review of papers presented at the Institute of Metals spring meeting, Mar. 23, 1961, covering extrusion of pure Al, Cu, Sn, Pb and Al-Mg and Al-Mn alloys at 20-550° C. and with speeds of 1-30 ipm. Extrusion pressures and temperature rise in the metal are related to physical properties, extrusion ratio, speed, die angle and containiner wall friction. Attention is given to the occurrence of "fir-tree" and "mottled-surface" defects in the process. (F24, 10-54; Al-b, Cu, Sn, Pb)

220-F. Ausform Steels, Ultra-High Strength Materials for Lightweight Rocket Casings. American Society of Mechanical Engineers, Paper no. 61-AV-40, 1961, 4 p.

Description of Ausform, a thermomechanical treatment capable of upgrading the mechanical properties of alloy steels to ultra-high-strength levels. (F-general, N8; AY)

221-F. Forming of Hi-Temperature Metals. I. J. Wilson. American Society of Mechanical Engineers, Paper no. 61-AV-6, 1961, 8 p.

Techniques for forming structural components subject to high-temperature use from precipitation-hardening stainless steel, H-11 toolsteel, heat treatable Ti alloys and Ni-base alloys. (F-general; Ni-b, SS, Ti, TS, SGA-h)

222-F. The Cold Rolling of Very Thin Ferrous Tapes. G. W. Lord. Post Office Electrical Engineers' Journal, v. 54, Apr. 1961, p. 51-52.

Special tensioning equipment and adaptors are applied to a rolling mill to allow cold rolling of magnetic Ni-Fe alloy tapes of less thickness than its designed limit (to 0.001 in. or less). (F23, 1-52; Fe-b, Ni, 4-53)

223-F. Effect of Carbide Stringers on the Distortion of Die Steels During Heat Treatment. K. Sachs. Metal Treatment and Drop Forging, v. 28, Apr. 1961, p. 157-164.

Effect of different forging methods, heavier deformation in forging and cast structure on amount of distortion. 23 ref. (F22, 9-74, 3-71; TS)

224-F. Preparation of Steel Blanks for Cold Forging. Metal Treatment and Drop Forging, v. 28, Apr. 1961, p. 168.

Cropping of steel barstock, preforming or flattening of the cropped blank and deburring or chamfering of the cropping burr on an automatic installation which carries out all three operations. (F21; ST)

225-F. (German.) Direct Resistance Heating in Rolling Mills. H. J. Forst. Elektrowarme, v. 19, Jan. 1961, p. 20-28.

Short-time electrical resistance heating of steel billets to rolling temperature. Metallurgical advantages such as prevention of sealing and surface decarburization and achievement of even temperature distribution. Design of plant, power consumption, efficiency. (F21b; ST, 4-52)

226-F. (Russian.) Approximate Method of Solving Volume Stationary Problems of Viscous-Plastic Flow. G. A. Smirnov and G. Ya. Gun. Izvestiya Vuz-Chernaya Metallurgiya, Sept. 1960, p. 62-67.

Mathematical analysis, including the LaGrange principle, used to investigate plastic deformation in rolling with emphasis on contact surface velocities and forces. 3 ref. (F23, Q24)

227-F. (Russian.) Application of Fourier Series Toward Calculating Deformation of Plate Rolls. S. S. Chepurkin. Izvestiya Vuz-Chernaya Metallurgiya, Sept. 1960, p. 68-78.

Fourier and differential equations in conjunction with theory of elasticity used to formulate heat and contact deformation equations for mill rolls with sample calculations. 11 ref. (F23, Q24)

228-F. (Russian.) Investigation of Scale and Rolling Conditions of Automatic Steel in Relation to Questions of Friction. I. M. Pavlov, I. K. Suvorov and Yu. E. Fomenko. Izvestiya Vuz-Chernaya Metallurgiya, Sept. 1960, p. 95-101.

Hot rolling of automatic steel ingots at 600-1200° C. with examination of scale formation kinetics. Analysis of sulphur content in scale and steel with reference to location and number of passes. 5 ref. (F23, 1-66, 2-60, 9-52; ST, S)

229-F. (Russian.) Specific Pressure of Metal on Rolls During Cold Rolling of Tubes. Yu. F. Shevakin and F. S. Seidaliev. Izvestiya Vuz-Chernaya Metallurgiya, Sept. 1960, p. 102-109.

Cold rolling of tubes is examined mathematically for determining energy balance, dimensional changes, work of deformation and formula for average specific pressure. Comparison of theory with forward and reverse rolling of 1Kh18N9T steel. Effect of coefficient of friction and roll size on specific pressure. 4 ref. (F26s, 3-74; ST)

230-F. (Russian.) Investigation of Forward Flow on an Uninterrupted Light-Section Mill. V. N. Vidrin, V. P. Volosnikov, I. N. Sardinskii and P. N. Amosov. Izvestiya Vuz-Chernaya Metallurgiya, Sept. 1960, p. 110-115.

Use of an electromechanical speed controller system with sample calculations to relate roll and sheet velocities and effects of forward and reverse sheet tensions. (F23)

231-F. (German.) Drawing Rate in Iron and Steel Wire Production. Fritz Kohlhase. Draht, v. 12, Mar. 1961, p. 110-113.

Dry and wet drawing at high-drawing rate is discussed in terms of mechanical requirements of drawing machinery; water and air cooling of dies; lubrication; pickling, lining and coating. Computation of drawing rate and drawing time. (F28, 3-67, 18-73; Fe-b, ST)

232-F. (German.) More Economical Hammer Forging. Martin Fritsche and Horst Hanfland. Fertigungstechnik und Betrieb, v. 11, Feb. 1961, p. 79-82.

Critique of current standards and acceptance tests for hammer forgings. Improved heating and forging operations in hammer forging of a C 30 steel 395 kg. clutch bar of given mechanical properties. (F22, F21; ST)

233-F. (German.) Determination and Selection of the Ratio of Reduction by Forging. Gustav Tittel. Fertigungstechnik und Betrieb, v. 11, Feb. 1961, p. 83-86.

Definition of the ratio of reduction by forging in terms of bulging and stretching parameters. Comparative investigation of notch-impact strength of an alloy steel block after various forging operations such as stretching only, and bulging and successive stretching. (F2, F22, Q6n, Q23p; AY, 4-51)

234-F. (German.) Methodological Engineering in the Forging Plant. Application to Manufacture of Forgings From Stainless Steel. Eberhard Pflaume. Fertigungstechnik und Betrieb, v. 11, Feb. 1961, p. 87-89.

Analysis of heat treatment operations such as heating before and annealing after forging as related to steel properties and of forging operations required for proper material flow in die forging of

X 22 CrNi 17 stainless steel. (F22n, F21b, J23; SS)

235-F. Metalworking. Pt. 4. Rolling, Drawing and Extrusion. OTS Selective Bibliography SB-463. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.10.

Listed are reports of the Department of Defense and other government agencies in addition to U. S. and foreign technical literature. Government owned patents on metalworking processes available for license also are included. (F23, F24, F27)

236-F. Stainless Steels Gain Strength. Iron Age, v. 187, May 18, 1961, p. 138-140.

Cold rolling at subzero temperatures alters the tensile strength of stainless steel. Explosive forming also affects strength and hardness levels in ultracold setups. (F23, G-general, NM-k34, 1-67; SS)

237-F. Zerolling Boosts Strength of Stainless Sheet. Materials in Design Engineering, v. 53, May 1961, p. 10-11.

Plastic deformation at subzero temperatures is used to increase the yield and tensile strengths of austenitic stainless steels as much as 70%. (F23, 1-67; SS-e)

238-F. Aus-Worked 12% Chromium Steel With High Yield Strength and Fracture Resistance. J. E. Srawley and T. C. Lupton. Report of NRL (Naval Research Laboratory) Progress, Feb. 1960, p. 7-10.

Aus-working, severe plastic deformation of an austenitized steel at temperatures where the austenite is unstable yet does not start to transform for several hours, is applied to a 12% Cr 0.15% carbon steel to improve yield strength, fracture toughness and transition temperature for full shear fracture. 6 ref. (F23, 1-66, J22; SS-e)

239-F. Extrusion Press Increases Seamless Tubing Output. Steel, v. 148, May 22, 1961, p. 134.

A vertical extrusion press, weighing 1800 tons, at Gulf States Tube Corp., Rosenberg, Texas, converts 24 x 4 in. billets into steel hollows 9 1/2-42 ft. long with outside diameters of 2 1/4-3 3/4 in. in about 20 sec. The press extrudes 150 billets per hr., producing 80-260 ft. of hollow stock per min. (F24; ST)

240-F. Mechanized Extrusion of Copper Alloys. Metal Industry, v. 98, May 5, 1961, p. 356-358.

Extrusion of Cu alloys using an oil hydraulic extrusion press. The billets are heated to 850° C. before extruding by frequency induction heaters. (F24; Cu-b)

241-F. Installation for the Preparation of Steel Blanks for Cold Forging. Metallurgia, v. 63, Apr. 1961, p. 189-190.

Continuous and automatic production of steel blanks of uniform mass and shape. Three distinctly separate operations may be carried out including cropping from bar-stock, flattening or preforming of the cropped blank and deburring or chamfering of the inevitable cropping burr. (F21; ST)

242-F. High-Strength, Landing-Gear Forgings--The Manufacture of Ductile Components From Air Melted Steels. R. L. Roshong. American Society of Mechanical Engineers, Paper no. 61-AV-54, 1961, 8 p. $1.

Press forging techniques to produce high-strength forgings with outstanding transverse ductility from air-melted steels. Billet stock properties are compared with forging properties for several landing gear configurations and grades of steel. (F22, T24a; ST)

243-F. Forging 900 Track Links an Hour. American Machinist/Metalworking Manufacturing, v. 105, May 15, 1961, p. 133.

A mechanized forging line incorporates automatic handling of billets through gas-fired furnace and press for high-speed forging of tractor track links. The four-stage die process includes two blocking operations, finishing, trimming and coining. Rapid transfer and a short heating cycle for billets at 2200° F. results in longer die life. (F22, T3n)

244-F. Russians Develop Heavy Helical Rolling. Metalworking Production, v. 105, May 10, 1961, p. 68-69.

Design, operation and performance characteristics for a heavy-duty three-roller helical-rolling machine for

rolling steel bar stock of 4 3/4 in. in diameter by 13 ft. 6 in. in length using a hydraulic tracing unit for controlling profiles. Stock is preheated in a 500 kW electric induction furnace in two stages to 723° C. and 723-1250° C. with automatic control of cycles. (F23, F21, W23d; ST, 4-55)

245-F. Gear and Pinion Forging. W. W. Collier. Metal Treatment and Drop Forging, v. 28, May 1961, p. 201-203.

Control of grain flow stability for prevention of distortion during forging of spiral hypoid gears and ring gears from 4620 steel billets. (F22, Q24c, T7a; ST, 17-57)

246-F. Slitter Saves Quality in Thin Gage Strip. Steel, v. 148, May 29, 1961, p. 81-82.

Steel strip with good surface quality and close dimensional tolerances is turned out at a rate of 300 miles per hr. on a slitting line. Accurate edge control on the payoff reel helps melt width tolerances and hardened and ground stripping maintain surface quality. (F29n; ST, 4-53)

247-F. Precision Forging of Steel Shafts. Robert Speck. Production Engineer, v. 40, May 1961, p. 321-324, 335.

Forging preheated steel and steel alloy billets with vertical hammer-forging machine to produce shafts of numerous sizes and shapes with tolerances to 0.010 in. (F22; ST)

248-F. Tandem Cold Rolling. Iron & Steel, v. 34, May 1961, p. 178-180.

Cold rolling of low-carbon steels in all tempers from hard bright unannealed to dead soft and intermediate tempers in the annealed condition, on a Davy-United four-stand, four-high tandem mill. (F23, 1-67; CN-g)

249-F. (English.) Continuous Production of High Strength Lead Strip by Direct Powder Rolling. S. Storchheim and A. Cross. Planseeberichte fur Pulvermetallurgie, v. 9, Apr. 1961, p. 21-25.

Production of high-strength and creep-resistant Pb strip capable of shielding aircraft nuclear reactors at 300° F. by horizontal and vertical rolling of commercially pure Pb powders at room temperature using acrylic resins dissolved in acetone as a lubricant. Tensile and stress-rupture strength; creep resistance. (F23; Pb, 6-68)

250-F. Stretch-Reducing Operations at Colorado Fuel and Iron's Seamless Tube Mill. C. C. Crawford. Iron and Steel Engineer, v. 38, Apr. 1961, p. 77-84.

Design, construction and operation of a stretch-reduction mill which increases the rate of production of seamless pipe of sizes of 2 3/8 through 9 5/8 in. (F26s, W23h)

251-F. Analysis of Today's Tube Welding Processes. Norbert C. Rubin. Iron and Steel Engineer, v. 38, Apr. 1961, p. 115-119.

A review of inert arc, resistance and induction welding of steel and non-ferrous tubes, in terms of type of material, wall thickness, weld quality, process speed, grain growth in the weld area, surface appearance, tube size and intended use. (F26p, K-general; ST, EG-a38)

252-F. (German.) Trends in Development of Processing Technology. K. Thamm. Maschinenbau Technik, v. 10, Jan. 1961, p. 2-12.

Development of processing techniques and machines for pressing, extrusion, pressure die casting, hammer and die forging, rolling, impact extrusion, stamping, drawing, bending, bevelling and sectioning. Economics; future development. (F-general, G-general, 1-53)

253-F. Analytical Investigation of the Cold Rolling of Bar Stock. Alvin S. Weinstein, Carl F. Zorowski and Frank J. Loss. Iron and Steel Engineer, v. 38, May 1961, p. 135-143.

Mathematical treatment of the cold rolling of bar stock between flat rolls. Pressure distributions, rolling loads and torques may be predicted from the model. 9 ref. (F23, 1-67)

254-F. Production of Suspension Cable Wire for the Forth Road Bridge. Wire Industry, v. 28, May 1961, p. 461-463.

Manufacturing of high-tensile steel wire for use as bridge suspension cables. Steel rods are heated to 950° C. and quenched in Pb at 510° C. The rod is then pickled in HCl, drawn, galvanized in Zn, spun and stored as coiled cable wire. (F28, Q27a, T7g; ST)

255-F. The Fundamentals of Wire Drawing. Pt. 11. The Size of the Pellet. C. P. Bernhoeft. Wire Industry, v. 28, May 1961, p. 481, 483, 484.

Rules and regulations for wire drawing using brittle tungsten carbide pellet and diamond dies. Relationship between pellet size and wire diameter. (F28)

256-F. Cold Rolling Answers Design Change Demands. Lawrence J. Curran. Tooling and Production, v. 27, June 1961, p. 45-46.

Splines are formed on a universal joint yoke shaft composed of 1035 normalized steel by a cold rolling process in which forming rocks roll the part about its own axis as they move in opposite directions to generate splines. (F23, 1-67; ST)

257-F. Tubing Quality Is Built in--Tests Cannot Produce It. Steel, v. 148, June 5, 1961, p. 90, 93.

Control of melting, heating, rolling and soaking processes permits production of flow-free seamless tube rounds for subsequent piercing. (F26, 9)

258-F. Press-Forging for Higher Strength Steel Castings. J. T. Berry and T. Watmough. Product Engineering, v. 32, June 12, 1961, p. 68-69.

Application of the hybrid process (casting followed by forging) to existing production parts. Cast alloys AMS 5363, 17-4 PH and SAE 4340 are press-forged. AMS 5363 gives best results with an increase in yield strength of 600% and ultimate strength of 250%. (F22, Q23b, Q27a; AY, 5)

259-F. Fabrication of Beryllium Sheet. B. H. Hessler. Light Metal Age, v. 19, Feb. 1961, p. 10-12.

Production of Be sheet from a hot pressed Be slab. Cladding, rolling equipment, rolling temperatures, cladding removal, flattening of sheet, reduction ratios, sheet width, joining and research. (F23, L22, K-general, Ag; Be, 4-53)

260-F. Automation in Extrusion. Edwin E. Clark. Light Metal Age, v. 19, Feb. 1961, p. 15, 18.

Examples of automation in Al extrusion plants. Advantages. (F24, 18-74; Al)

261-F. (German.) Influence of Roll Design on Course of Deformation and Defects in Tube Production. M. Hildebrand. Neue Hutte, v. 6, Apr. 1961, p. 251-257.

Investigation of bite conditions and course of deformation in terms of surface rate of rollings and deformation work and of occurrence of surface defects (formation of chips) as influenced by roll angle during rolling of steel tubes in a piercing mill. (F26s; ST)

262-F. (German.) Measurement of Rolling Force and Starting Moment in Hot Rolling and Computation of Deformation Strength. Winfrid Dahl, Erwin Wildschutz and Jurgen Langer. Archiv fur das Eisenhuttenwesen, v. 32, Apr. 1961, p. 213-219.

Measurement of rolling force and starting moment for three steels (ST 42, X 8 CrTi 17 and X 10 CrNiMoCb 18.10) during rolling from 900-1200° C. from 5-100 sec.$^{-1}$ mean deformation rate and at 10, 20 and 40% deformation. Comparison of results with "Sims theory" of hot rolling. (F23, 1-66; ST)

263-F. Forging Unclad Beryllium. J. P. Denny and J. D. McKeogh. Journal of Metals, v. 13, June 1961, p. 432-433.

Be forgings with improved tensile and yield strengths over those of conventionally hot pressed products are produced by preheating to 1400° F., restricting the starting blank size using a special solid lubricant and maintaining a high (800-900 °) die temperature. (F22; Be, 6-66)

264-F. At 85 MPH, Press Ram Gives Formed Parts Special Properties. Steel, v. 148, June 26, 1961, p. 62-63.

Production of high-quality W, Mo, Ti, Cb and Zr forgings for the aircraft industry on a high-energy rate forming machine designed to create large pressures in the die cavity. Parts have improved grain flow, strength, surface finish and dimensional tolerance. (F22, W22p, T24; Cb, Mo, Ti, W, Zr)

265-F. The Quantity Production of Poppet Valves. Pt. 2. R. E. Green. Machinery (London), v. 98, May 24, 1961, p. 1164-1174.

Roll-straightening, cutting and finishing operations in production of heat treated and tempered automobile valves of austenitic and carbon steel. (F29r, G17, L-general, T21b; CN, SS-e, 17-57)

266-F. Theory and Practice of Flat Rolling. Pt. 9. C. W. Starling. Sheet Metal Industries, v. 38, June 1961, p. 451-457.

Control of physical properties during processing of flat-rolled steel products including width, gage, length, cross section, flatness and surface finish. Regulation of track and firing time to insure constant ingot temperature. (F23)

267-F. Extrusion Die Development--Titanium and Steel. G. A. Moudry. Harvey Aluminum Inc. (Aeronautical Systems Center). U. S. Office of Technical Services, PB 171529, July 1960, 137 p. $2.75.

Program aimed at developing die materials to permit the extrusion of Ti and steel alloy structural sections with the dimensional stability and surface finish of their Al counterparts. Effect of extrusion variables on die wear; minimum strength requirements for prospective die materials. (F24, W24n; ST, Ti)

268-F. Preparing Steel Blanks for Cold Forging. Engineering, v. 191, May 5, 1961, p. 634-635.

Production of preformed and deburred steel blanks for cold forging. Cropping, preforming and chamfering operations with adaptable conveyor system achieve flexibility and versatility for varying production requirements. (F21; ST)

269-F. Copper-Base Extrusions. Precision Metal Molding, v. 19, June 1961, p. 27-30.

Standard commercial tolerances for extruded Cu and Cu-base alloy shapes with physical and mechanical properties given as a guide to material selection. (F24, P-general, Q-general, 17-52; Cu-b)

270-F. Automatic Production of Ring Gears. Metal Progress, v. 80, July 1961, p. 111-112.

Preheating, forging and heat treatment operations for production of 4718 H and 8720 H steel ring gear forgings. Description of rotary hearth furnace and forging press design. (F21, F22, J-general, T7a; ST)

271-F. Formation of Rifling in Small Arms Barrels by a Precision Forging Process. L. R. Beesly. Production Engineer, v. 40, June 1961, p. 382-388.

Precision forging and swaging of a rifle barrel manufactured from a 1% chromium molybdenum alloy steel hardened at 850° C. and tempered at 600° C. Mechanical properties before and after forging. Tolerances and surface finish of the barrel bore. (F22, F25; AY, Cr, Mo)

272-F. Tube-In-Strip and Associated Products. A. A. Blanco. Production Engineer, v. 40, June 1961, p. 389-400.

Casting, rolling and inflation of tubes during production of tube-in-strip, a Cu or Al metal sheet which incorporates a number of parallel tubes integral with the sheet. Methods of jointing, coating, cutting and bending the strip for use in solar heaters, evaporators and cooling screens. (F26s, E-general; Al, Cu)

273-F. Hot Extrusion. R. Cox. Production Engineer, v. 40, June 1961, p. 401-414.

Extrusion of 18-8 stainless steel, high-speed steel, Ti, Zr and Co-base alloys. Design and composition of the die blank and mandrel. Microstructure and physical properties of the extrusions. (F24, 1-66; Co-b, SS, TS-m, Ti, Zr)

274-F. Two Mandrel Forging Methods Shape Aluminum Cylinders. C. H. Maak. Iron Age, v. 187, July 6, 1961, p. 74-75.

Production of forged seamless 7079 Al alloy cylinders using a combination of loose and tight mandrel forging techniques. Improvements in mechanical properties are attributed to the process. (F22; Al-b)

275-F. Forging Tough Metals in One Blow. Rupert Le Grand. American Machinist/Metalworking Manufacturing, v. 105, June 26, 1961, p. 72-73.

Forging of aircraft quality 4130 steel, tough-pitch Cu or Cu powder compacts on a vertical machine having a ram fired by the sudden release of gas compressed to 2000 psi. (F22; Cu, ST, 6)

276-F. (German.) Processes in Semi-finished Nonferrous Metal Products Industry. Pt. 1. Drawing of Tubes by Tube Drawing Machines. N. D. Benson. Zeitschrift fur Metallkunde, v. 52, May 1961, p. 371-373.

Review of development, mechanism and machinery for tube drawing with emphasis on drawing of Al and Cu tubes from very small diameters (capillary tubes) up to 25 mm. diameter. (F26r; Al, Cu)

277-F. (Italian.) Drills Manufactured by Hot Rolling and Twisting. Macchine, v. 16, May 1961, p. 541-543.

A cylindrical steel rod is heated up to 850° C. and given the cross-section characteristic for a drill by multi-stage rolling. Subsequently the still hot drill blank is given a torsional deformation by twisting, then subjected to various heat treatments and grinding operations. (F23, 1-66, W25p; ST)

278-F. Fabrication of One-Inch Thick, Ten-Inch Diameter Welded Inconel Pipe. W. L. Fleischmann and R. F. Gurnea. Welding Journal, v. 40, June 1961, p. 620-628.

Hot forming methods and Tig and Mig welding techniques used in manufacturing Inconel pipe. Effects of successive heating and cooling and forming on mechanical properties and microstructure and base metal fissuring in the weld heat affected zone. (F26p, K9, Q-general; Ni-b, 7-51)

279-F. Fundamentals of Wire-Drawing. Pt. 12. The Drawing of Fine Wire on Slip Machines. C. P. Bernhoeft. Wire Industry, v. 28, June 1961, p. 591-592, 604.

Arrangement of passes and calculation of slip on a fine wire-drawing machine. Tabulation of data includes cone speed, speed difference and die elongation. (F28, 1-52)

280-F. (Russian.) Calculation of Forces Required for Hot Drop Forging. I. Ya. Tarnovskii, O. A. Ganago and P. A. Vaisburd. Izvestiya VUZ--Chernaya Metallurgiya, Feb. 1961, p. 51-61.

Calculation of expansion center of plastic deformation during finish drop forging. Formula found for calculating forces for drop forgings of any configuration. Formulas are simple and take into consideration fundamental drop forging parameters. 13 ref. (F22n, 1-66)

281-F. (Russian.) Experimental Determination of Pressures and the Coefficient of Axial Sliding During Piercing of Large Ingots. V. V. Shveikin, P. N. Ivshin and L. N. Karpenko. Izvestiya VUZ--Chernaiya Metallurgiya, Feb. 1961, p. 62-67.

Determination of the specific pressure during piercing of ingots and comparison with pressure used during rolling of the same size ingots in a blooming mill. When metal enters pressure on rolls is 8-22% greater than when it leaves. New groove design reduces axial sliding without increasing pressure on rolls, reduces the specific energy expenditure and piercing time and improves the outside appearance of the tubes. 2 ref. (F26q, 1-52, 17-51)

282-F. (Russian.) Distribution of Specific Pressure and Specific Friction Along the Contact Arc During Rolling. A. P. Chekmarev and P. L. Klimenko. Izvestiya VUZ--Chernaya Metallurgiya, Feb. 1961, p. 68-76.

Investigation of Pb and square shaped mild steel specimens. Values found confirm theoretically derived formula. (F23; Pb, CN)

283-F. (Russian.) Conditions of Static Equilibrium of Metal During Rolling. Yu. M. Fainberg. Izvestiya VUZ--Chernaya Metallurgiya, Feb. 1961, p. 86-92.

Application of static equilibrium of metal during rolling for calculating forward flow and rolling forces. 9 ref. (F23)

284-F. Precision Tubes for Nuclear Applications. D. F. Waterhouse. Australasian Engineer, v. 52, Apr. 1961, p. 87-91.

Cold drawing, sintering, hot extrusion and impact extrusion to produce gilled tubes of mild steel, stainless steel, Ti, Zr, Ni, Ta, V, Mo, Be, Mg and Al. Ultrasonic testing and eddy current testing to detect variations in thickness and curvature. (F24, F26; SS, Ti, Zr, Ni, Ta, V, Mo, Be, Mg, Al)

285-F. (French.) Effect of Aluminum Nitride on the Forgeability of Steels. Technique Moderne, v. 53, Apr. 1961, p. 159-160.

Torsional cycling and tensile testing of carbon steel containing 0.29-0.35% C, 0.12-0.24% Si, 0.62-0.9% Mn and 0.0045-0.090% Al from 700-1200° C. Dependence of the reduction of area, number of torsional cycles and temperature of low forgeability values on Al content and deformation velocity. (F22, 17-52, Q1, Q27, Q23p, 2-60, 3-68; CN, Al)

286-F. (German.) Representation of Deformation Ratios in Reduction Rolling

by Stress-Strain Diagrams. M. Vater. Materialprufung, v. 3, May 20, 1961, p. 176-179.

Diagrams showing the relationships between the rates of axial, radial and circumferential deformation on one side and the longitudinal rolling stress on the other are constructed for determination of forces and energies needed in the reduction rolling of tubing. (F26s, Q24, Q25n)

287-F. (German.) Improvement of Service Life and Manufacture of Impeller Rotors. M. Pfender. Materialprufung, v. 3, May 20, 1961, p. 181-189.

Design and die forging of impeller blades from an Al-Mg-Si alloy. Evaluation of stresses developing in the forging die and the effect of profile on the fatigue strength of rotor blades. (F22n, Q7a, 3-73, 3-66, T7h; Al-b, Mg, Si, 17-57)

288-F. Forging of Unclad Beryllium. Light Metal Age, v. 19, June 1961, p. 11.

Ultimate strength of 67,300 psi., yield strength of 49,000 psi. and elongation of 5.1% are achieved without excessive oxidation or rupture by hot pressing with blanks preheated to 1400° F. (F22, 1-66, Q27a, Q23b, Q23p; Be)

289-F. Fabrication of Beryllium and Titanium for the Space Capsule. Light Metal Age, v. 19, June 1961, p. 18.

Forging and machining operations on Be used as a heat shield for exposed areas of capsule. Welding of Ti sandwich structures. Increase in structure stiffness achieved by "rigidizing" or beading. Pressure testing. (F22, G17, K-general, Q23, T24e; Be, Ti, 7-59)

290-F. Special Fabrication Techniques. Reactor Core Materials, v. 4, May 1961, p. 51-64.

Review of literature on melting, casting and extrusion of reactive and refractory metals; electroplating, cladding, rolling, swaging, extrusion cladding, canning, welding, brazing and nondestructive testing of nuclear fuel elements; pressure and diffusion bonding of stainless and Zircaloy to UO_2; co-extrusion stainless steel and ZrO_2; coating steel with boron by hydrogen reduction. (F-general, L-general, C5, K-general, T11g; EG-d37, SS, Zr-b)

291-F. (Translation-Brutcher no. 5091.) Study of Titanium Alloyed Free Cutting Steels. I. M. Pavlov, I. K. Suvorov and Yu. E. Fomenko. Izvestiya VUZ--Chernaya Metallurgiya, Nov. 1960, p. 61-65.

Difficulties encountered in the rolling of sulphur bearing free cutting steel. Data on formation of sulphur compounds in steel and other quantitative relationship to Ti in the Fe-Ti-S and Fe-Ti-C-S systems. (F23; ST, S)

292-F. Mass Production Method Scores in Short Runs. Steel, v. 149, July 10, 1960, p. 80.

Chipless machining technique is used to spline and thread shafts ranging in length from 4-40 in. (F23q, G17f, T7j)

293-F. How They Made the US Space Capsule. William Dubusker and Ted Schafers. Metalworking Production, v. 105, June 21, 1961, p. 69-71.

Resistance heating and die forging of components from Ti sheet and Rene 41 alloy together with glass-fibre insulation which are Tig welded, arc welded and spot welded to make up the assembly. (F21b, F22p, K-general, T24e; Ti, SGA-h, 4-53, 17-57)

294-F. (Russian.) Forging Uranium. P. I. Seredin. Kuznechno-Shtampovochnoe Proizvodstvo, Jan. 1961, p. 14-18.

Preparation of alpha uranium ingots and slabs for forging and rolling operations. Heating and deformation technology. Protection of forgings against oxidation. 8 ref. (F22, Q24, R1h; U)

295-F. Post War Progress in the Extrusion of Aluminium and Copper. D. R. Sinton. Australian Institute of Metals, Journal, v. 6, May 1961, p. 99-103.

Improvements in the design of extrusion presses, production of billets for extrusion and preheating of billets. (F24; Al, Cu)

296-F. Modern Developments in the Extrusion of Aluminium Alloys With Particular Reference to Tool Design and Materials. P. G. Dodd. Australian Institute of Metals, Journal, v. 6, May 1961, p. 124-136.

Review of improvements in press and die design with emphasis on dies for hollow and semihollow sections. Tool materials and methods of die manufacturing. 21 ref. (F24, T6r, T6n, 17-51; Al-b)

297-F. (German.) Fundamentals in Theory and Practice of Roll Pass Design. Christian Martin Kruger. Stahl und Eisen, v. 81, June 22, 1961, p. 858-870.

Concept and graphical means for a three-dimensional interpretation of roll pass design rather than conventional two-dimensional approach is discussed for rolling of rail profiles. (F23, 17-51)

298-F. The Hot Extrusion of Pure Aluminium and an Al-Zn-Mg-Cu Alloy. K. Ashcroft and G. S. Lawson. Institute of Metals, Journal, v. 89, June 1961, p. 369-375.

The influence of temperature on the maximum pressure required to extrude 1 in. diameter slugs of Al of 99.5% purity and of an Al-Zn-Mg-Cu alloy at various extrusion ratios from 20-500° C. is investigated with the onset of hot shortness also being studied as a function of temperature. 8 ref. (F24, 1-66, Q26s, 2-62, 3-74; Al-b)

299-F. 535,000 lb. Ingot Forged Into High Strength Rotor. Steel, v. 149, July 17, 1961, p. 130.

A rotor having a yield strength of 70,000 psi. and a tensile strength of 92,000 lb. is produced from a vacuum poured Ni-Mo-V alloy steel ingot with improved soundness. (F22, Q-general)

300-F. Strength and Weight Combine in Vital Steel Structure. Iron Age, v. 188, July 20, 1961, p. 94-95.

Forming, flattening, galvanizing and enameling techniques used in fabricating steel radar antennas. (F-general, G-general, T26; ST, 17-51)

301-F. (Russian.) Heating Previous to Forging Without Oxidation. S. I. Klyuchnikov. Metallovedenie i Termicheskaya Obrabotka Metallov, Apr. 1961, p. 15-19.

Elimination of oxidation and decarburization by heating in reverberatory furnaces with controlled atmospheres equipped with recuperators, regenerators or a complete-combustion chamber serving for air preheating. Description of other furnace types where the steel forging blank is protected by He, vacuum, liquid glass or a salt. 4 ref. (F21b, F22; ST)

302-F. 1700-Ton Extrusion Press Installation. Engineer, v. 211, May 12, 1961, p. 768-770.

Use of induction heaters, an oil-hydraulic extrusion press and special coiling equipment in the production of brass and Cu bar, rod and strip. Plant layout and sequence of operations. (F24, F21b, 1-52; Cu, Cu-n)

303-F. (Russian.) Effect of Jacket Thickness on Plastic Flow During Extrusion. L. N. Moguchii. Tsvetnye Metally, Mar. 1961, p. 75-81.

Cylindric samples of Duralumin D16 are fitted into cups of Al with 3-8 mm. wall and 10-12 mm. bottom thicknesses and extruded together to study the effect of wall thickness on the plastic flow. 8 ref. (F24, Q24, 3-73; Al-b, 8-66)

304-F. (German.) Deformation Forces During Roughening Passes in Rolling. Gustav Zoukar. Neue Hutte, v. 6, May 1961, p. 291-300.

Test rolling of steel (MSt 3 b, CK 45, St 7, St 52, 100 Cr 6, 16 Mn Cr 5, 55 Si Mn 7, 65 Si 7, X 120 Mn 12, X 20 Cr 13, X 10 CrAl 24, 90 WV 48.25, 45 W Cr V 7) from 1140-1260° C. and of Cu and Al in a pilot plant. Measurement of rolling forces and starting moment by piezoelectric gases and inductive meters. 11 ref. (F23, 1-54; ST)

305-F. (Czech.) Heating of Ingots in a Two-Way Gas-Fired Soaking Pit. S. Cernoch, I. Repisky and E. S. Spakovsky. Hutnicke Listy, v. 16, May 1961, p. 335-342.

Use of thermocouples built into the ingot to measure temperature rise and distribution. Temperature of soaking pit walls, roof and waste gases and composition of atmosphere as functions of time. 14 ref. (F21b, S16b; 5-59)

306-F. (Czech.) Principal Computation Methods for Hot Rolling Pressures and Comparison of the Results With Those Obtained by Measuring. Jaromir Jedlicka. Hutnicke Listy, v. 16, May 1961, p. 342-350.

Height-pressure, height-rolling energy, temperature-deformation resistance, temperature-yield point, temperature-tensile strength and forward slip-rolling energy relationships in the rolling of carbon steel ingots, blooms and billets into sheet or blooms and billets respectively. 17 ref. (F23; CN, 5-59, 4-52)

307-F. Planer-Scarfing of Formed Shapes. Kenneth H. Schultz. American Machinist/Metalworking Manufacturing, v. 105, July 10, 1961, p. 90-91.

Machine scarfing of air compressor casings with cam-controlled tools which incorporate air-actuated tool lifters, interchangeable fixtures with adjustable locators and clamp assemblies. (F21e, 1-52; 4-57)

308-F. Forging Progress Anticipates Space Demands. H. W. Bredin. Machinery, v. 67, July 1961, p. 96-107.

Vacuum melting, closed die forging at 1600-2100° F. and spectrographic inspection of superalloys, refractory metals and high-temperature steels to produce aircraft and missile parts with service temperatures from 1000-1800° F. Mechanical properties. (F22n, C25, Q-general, S11k, T24; SGA-h, EG-d37, ST)

309-F. Quality Control in the Rolling and Annealing of 430 Stainless Steel. Industrial Heating, v. 28, July 1961, p. 1342-1344.

Effects of rolling and annealing conditions, stabilizing elements and oxygen content on mechanical properties, number of inclusions, surface "ribbing" and Cr depletion in 430 stainless steel strip. (F23, J23, Q-general, 2-60; SS, 4-53, 9-69)

310-F. (Russian.) Moments and Energy Expenditure During Rolling of Steel in Grooved Rolls. A. P. Chekmarev, V. M. Klimenko and M. P. Toporovskii. Izvestiya VUZ--Chernaya Metallurgiya, Apr. 1961, p. 79-88.

Energy expenditure during the rolling of different profiles on 330 mm. diameter rolls and the distribution of moments between the individual rolls. 4 ref. (F23; ST)

311-F. (Russian.) Dynamics of the Main Line of a Pilger Rolling Mill Taking in Consideration the Blow of the Sleeve Into the Rolls. A. V. Prazdnikov. Izvestiya VUZ--Chernaya Metallurgiya, Apr. 1961, p. 184-191.

Maximum dynamic moments (when the sleeve hits the rolls) developing in a Pilger rolling mill during rolling of 8 in. tubes. (F26q)

312-F. Soaking Pit Expansion and Slabbing Mill Installation at Kaiser Steel's Fontana Plant. Merle L. Gruver. Iron and Steel Engineer, v. 38, July 1961, p. 112-118.

Engineering and production problems associated with the installation of 40 bottom-fired soaking pits of 120-ton capacity which preheats ingots for two primary mills, a modified 46-in. high-life blooming mill and a 46 x 90 in. universal slabbing mill. Soaking pit practice and production statistics. (F21b, W20g, W23a; ST, 5-59)

313-F. Square and Rectangular Structural Tubing Produced by National Tube. Iron and Steel Engineer, v. 38, July 1961, p. 148.

ASTM A7 and ASTM A36 carbon steels are hot rolled into hollow tubing. Ductility and weldability for fixed load-bearing structural applications. (F26s, 1-66, K9s, Q23p; CN)

314-F. Biggest Dynapak in Operation at Brake Shoe. Missiles and Rockets, v. 9, July 31, 1961, p. 28.

Steel, W, Mo, Ti, Cb and Zr are forged and extruded in intricate shapes with close tolerances by a vertical metalworking machine which is based on the principle of pneumatics. Description of machine operation. Products require little machining and have longer fatigue life. (F22, F24, 1-52; ST, W, Mo, Ti, Cb, Zr)

315-F. On-Line Computer Control of Steel Billet Cutting. Metal Treatment and Drop Forging, v. 28, July 1961, p. 295-296.

Use of a digital computer to control steel billet cutting specifications. Billet length measurement, calculation of optimum cutting points, transmission of information to operators and recording of data. (F22h, 18-74; ST, 4-52)

316-F. Helical Welding. Machinery Lloyd (Overseas Edition), v. 33, July 1961, p. 51-52.

Design and operation of a spiral weld pipe mill which produces helical welded tube from stainless steel or Ni alloy flat strip. Sizes and pressure strength of the pipe. (F26p, Q10b; SS, Ni-b, 4-60)

317-F. High Frequency Welder Speeds Up Tube Mills. C. J. Vlahos. Mill & Factory, v. 69, Aug. 1961, p. 71-73.

Electronic device for welding of hot and cold rolled steels, stainless steel, Cu, brass, Al, Zr and Ti strips at high speed into tubing of various diameters and wall thicknesses. (F26p, 1-52; ST, Cu, Cu-n, Al, Zr, Ti)

318-F. Cold Rolling Medium-Width Steel Strip. Metallurgia, v. 63, May 1961, p. 213-216.

Tandem mill rolling, annealing, temper rolling and slitting of low-carbon steel strip. (F23, J23, G2k; CN-g, 4-53)

319-F. The Fundamentals of Wire Drawing. C. P. Bernhoeft. Wire Industry, v. 28, July 1961, p. 671.

Shaving process for overcoming surface defects of wire during drawing operation and methods of lubrication of shaving equipment. Evaluation of shaving loss as related to wire dimensions and shaving volume and weight. (F28, 1-52)

320-F. (Russian.) Work of Pressure Apparatus in Bloom Under Automatic Control. T. M. Golubev, N. A. Chelyshev and N. P. Kaftanov. Izvestiya VUZ--Chernaya Metallurgiya, Dec. 1960, p. 151-160.

Blooming mill operations including roll pressures, movement and speeds are analyzed by oscillograph in both automatic and manual applications. (F23, 18-74)

321-F. (German.) Investigation of Rolling With a Three-Stand Cold Rolling Mill. Paul Funke, Jr., and Werner Lueg. Stahl und Eisen, v. 81, July 6, 1961, p. 909-920.

Measurement of roll forces using strain gages and data for starting moment and characteristics of roll drive in cold test rolling of steel strip. Compensation of fluctuation of strip thickness. (F23; ST)

322-F. Continuous Strip Casting and Rolling. Pt. 2. H. W. Brand. Metal Industry, v. 99, July 21, 1961, p. 45-46.

Production of Al strip by a 6000-lb. melting furnace, a rotary casting machine, a rolling mill (convertible from hot to cold rolling) and ancillary equipment. Consideration of economic factors governing extent of automation. (F23, C5q, 1-52, 18-67; Al, 4-53)

323-F. Wide Extrusions Make Strong Trailer Floors. G. Keith Glaza. Modern Metals, v. 17, July 1961, p. 52-53.

Use of a 13,200-ton press to produce Al floor surfaces and cross members as one extruded shape. Floor surface sections are 2 ft. wide, 8 ft. long and 4 in. deep. The I-beam shaped cross members are spaced 6 in. apart. (F24, 1-52; Al)

324-F. A Review of Metal-Processing Literature--Plastic Working. Francis W. Boulger. American Society of Mechanical Engineers, Paper no. 61-PROD-12, 1961, p. 7-9.

Forging, rolling, sheet forming and extrusion. 27 ref. (F-general, G-general, 11-65)

325-F. British Iron and Steel Research Association. Sheet Metal Industries, v. 38, July 1961, p. 488-92.

Extracts from the annual report, 1960, concerning hot and cold rolling, pickling, annealing, tinning, electrophoretic deposition of Al, finishing processes, a stress level recorder, primary mill automation, annealing, pilot plant control, corrosion, instrumentation, continuous inspection of steel sheet and tinplate, a strip-speed meter for temper-mill control, tandem-mill control and fluid cushioning. (F23, J23, L-general, R-general, S13, W23, 18-74; ST)

326-F. An Introduction to the Theory and Practice of Flat Rolling. Pt. 10. C. W. Starling. Sheet Metal Industries, v. 38, July 1961, p. 528-38.

Quality control in the production of mild steel including teeming, soaking pit, slabbing mill, slab reheating, roughing mill, cold reduction and annealing operations. Chemical composition, grain size, structure and cold work considerations. Effect of crystal size and finishing and coiling temperatures on mechanical properties. Problem of aging and preventive measures. 6 ref. (F23, D-general, Q-general, 2-59, 2-60, 2-61; CN)

327-F. (Japanese.) Metal Flow in Forging. Pt. 15. Rolling Force on Steel Ball Rolling Dies. Taikichi Awano, Massao Ochiai and Masaru Ito.

Government Industrial Research Institute, Reports (Nagoya), v. 10, June 1961, p. 359-368.

Setup and measurements of three rolling force components on steel ball rolling dies under various rolling conditions. Experiments show that rolling force is affected by the position of rolling dies, temperature, diameter of the blank and lubricant used. (F22p, 1-53)

328-F. Strip Rolling in the Ruhr. Iron & Steel, v. 34, Aug. 1961, p. 372-375.

Cold strip rolling of mild steel, carbon steel, Cu, Zn, and tungsten carbide sleeved rolls at several German plants. (F23, 1-67; CN, Cu, Zn, W-b)

329-F. New Installation for Preparation of Steel Blanks for Cold Forging. H. D. Feldmann. Wire and Wire Products, v. 36, June 1961, p. 759, 797.

Production of field blades of uniform mass and shape in three operations: cropping from barstock; flattening or preforming of the cropped blank; and deburring or chamfering of the cropping burr in an automatic sequence. (F21, F22, 1-67; St, 4-53)

330-F. Fabrication Requirements for Balanced Classes of Piping. H. S. Peterson and C. H. Voelker. American Society of Mechanical Engineers, Paper no. 61-SA-60, 1961, 20 p. $1.

Tabular summary of fabrication and inspection requirements for several classes of welded schedule-size steel pipe (24-in. NPS and smaller) including forming and assembling by girth and branch welds. (F26p, W13h; ST, 7-51, 11-62)

331-F. New Brass Rod Mill. Metal Industry, v. 99, July 28, 1961, p. 62-67.

Layout, equipment and operations in a rod mill including melting and continuous casting of billets and sawing, heating and extruding the billets into rod and strip. Transfer and automatic control devices used in the plant. (F24, C5q, G17h, 1-52; Cu-n)

332-F. Hot Ingot Milling Machine. Australasian Manufacturer, v. 46, June 24, 1961, p. 33-34.

Description and operation of a machine for hot peeling steel ingots as they come from the soaking pit at a temperature of 1200° C. to avoid splits or cracks. (F21a, 1-66, 1-52; ST, 5-59)

333-F. High-Volume Aluminum Can-Stock Line Placed in Operation in the Northwest. Western Machinery and Steel World, v. 52, Aug. 1961, p. 42-43.

Description of a line which cleans, inspects, flattens, coats, trims, shears and packages Al in both sheet and coil form for use in food cans. (F29, L-general, 1-52, T29p; AY, 4-53)

334-F. Firm Forges Solid Tungsten Shapes. Steel, v. 149, Aug. 14, 1961, p. 142.

Ingots are heated to 4000° F. in argon in a vacuum-argon furnace, extended and forged under carefully controlled temperatures to form thin sections. Data are given for tensile strength and stress rupture life after forging. (F21b, 2-66, F22, 2-61, Q27a, Q3q, 1-54; W, 5-59)

335-F. Forming, Trimming, and Edge Finishing of Molybdenum-0.5 Per Cent Ti Sheet Material. A. L. Pickrell. American Society of Mechanical Engineers, Transactions (Journal of Engineering for Industry), Paper no. 61-SA-36, 1961, 11 p.

Techniques and equipment for "hot" forming, metal removal and polishing of Mo alloy steel for production parts for airframes. Effect of brittle ductile transition temperature on hot workability. (F22, F24a, Q-general, 2-60, 2-62; Mo-b, Ti, 4-53)

336-F. Forgers Tame Tungsten Alloys. Iron Age, v. 188, Aug. 17, 1961, p. 106.

Forging of tungsten alloys, which melt at 6000° F., into thin structural shapes using a specially designed controlled atmosphere heating furnace and special coatings for the dies. Data are given for tensile strength and stress rupture life of the forgings at 3000° F. (F22, F21b, Q-general; W-b, 4-57)

337-F. Chipless Machining. Pt. 4. How You Can Save Material With Cold-Rolled Splines. Clifford P. Farr. Canadian Metalworking, v. 24, Aug. 1961, p. 47-48.

Cold rolling process for forming serrations and splines with an hydraulically actuated machine. Steel workpieces are held between centers and rolled to full depth in a single pass of a pair of traversing synchronized rack-type forming tools. (F23, 1-67, 1-52; ST)

338-F. Fabrication of Columbium Alloy Castings at Low Temperatures. J. A. DeMastry and E. L. Foster. Paper from "Columbium Metallurgy". v. 10. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1961, p. 75-83.

Successful initial breakdown of cast structures of consumably melted ingots of Cb-Cr, Cb-Mo, Cb-Zr, Cb-Ti-Cr and Cb-Ti-Mo alloys at 1000° F. by upset forging. Further refinement of the technique has allowed breakdown of cast structures of Cb-Mo and Cb-Ti-Cr alloys at room temperature. (F22j, 2-61; Cb)

339-F. Aluminium Pipework. Pt. 5. Helical-Weld Aluminium Pipe. Pipes & Pipelines, v. 6, Aug. 1961, p. 37-41.

Production of Al pipe 6-28 in. in diameter with up to 1/4 in. wall thickness by continuous forming and welding of Noral D54S (N 5/6) Al-Mg alloy strip. (F26, T26r; Al-b, Mg)

340-F. (Pamphlet.) Flat Rolled Electrical Steel. (Steel Products Manual). Aug. 1961. 36 p. American Iron and Steel Institute, 150 E. 42nd St., New York 17, N. Y.

Manufacturing methods and practices, classes and types, magnetic characteristics and tolerances for dimensions. Relationship between magnetic and mechanical properties. (F23, P16, Q-general; ST-f, 17-55)

341-F. Automatic Slug Line. Australasian Manufacturer, v. 46, July 15, 1961, p. 62, 64.

Automatic transfer of steel blanks through cropping, preforming and chamfering operations prior to forging. Design and construction of equipment. (F21, 18-74; ST)

342-F. Development of Optimum Methods for the Primary Working of Refractory Metals. K. B. Simonson. Harvey Aluminum Inc. (Wright Air Development Div.) U. S. Office of Technical Services, AD 257865, Jan. 1961, 183 p. $3.

Development program and metal working facility at Wright Patterson Air Force Base, Ohio, to provide wrought forms of high-temperature alloys for subsequent physical testing and evaluation. The facility consists of a 600-ton high speed horizontal extrusion press, a 500-ton vertical forge press, a laboratory-type rolling mill and various supporting equipment. (F-general, 1-52; EG-d37)

343-F. Forged Components for the Nuclear Reactor Pressure Vessel at the Senn Power Station, Italy. A. Bartocci and E. Marianeschi. Paper from "Steel for Reactor Pressure Circuits". no. 69. Iron and Steel Institute, London SW 1, England, 1961, p. 257-269.

Manufacture of steel pressure vessels for nuclear reactors with forged components eliminate the longitudinal welded joints which are mainly subject to stress during operation and reduces the total welding length. (F22, T26q; ST, 17-57)

344-F. Vapor-Cooled Transformer Speeds Pipe, Tube Welding. Welding Engineer, v. 46, Aug. 1961, p. 55.

Resistance welding transformer with immersion cooling system using nontoxic fluorocarbon permits increased production speed for steel tubing and pipe with reduced power input and less electrode dressing. (F26p, K3, 1-52; ST)

345-F. New Tube Mill Doubles Welded Steel Tubing Output; Extends Size Range From 3/8-2 1/2 in. Dia. Nat Wood. Western Metalworking, v. 19, Aug. 1961, p. 25-26.

Continuous rolling and welding of square and round, small diameter tubing from coiled steel strip for use in consumer goods. (F26s, F26p, W23h; ST)

346-F. Plate Edge Planer Speeds Production of Line Pipe. Steel, v. 149, Aug. 28, 1961, p. 76.

High-strength steel plates are squared and trimmed by a side planer in preparation for welding into large diameter line pipe. (F21, F26p, G17c; ST, 4-53)

347-F. New Plate Mill Is Built to Broaden Product Line. Steel, v. 149, Aug. 28, 1961, p. 78-80.

Design and operation of mill and auxiliary equipment used in heating, rolling and shearing steel ingots of up to 21,000 lb. (F21b, F23, W23, W24m, 17-51; ST, 4-53)

348-F. (Russian.) Forging and Stamping of Cast Iron. S. I. Kluchnikov. Kuznechno-Shtampovochnoe Proizvodstvo, Mar. 1961, p. 19-22.

Experimental data for optimum working temperature and amount of deformation and optimum amount of inclusions in white and gray cast iron, to produce maximum strength and elasticity. Processes include forging, closed-die stamping and rolling of cutter beads. 4 ref. (F22, G3, 1-52, 2-60, 2-61, 3-68; CI)

349-F. Duplex Gangslitter Cuts Both Ways. E. C. Hall. Metalworking Production, v. 105, Aug. 16, 1961, p. 72-75.

Coupled gang slitter arrangements for cutting 1/8-in. steel sheets up to 84 x 48 in. in size in two directions to produce blanks for domestic cooking stove components at a rate of 200-300 per hr. Automatic sheet feeding equipment is operated in conjunction. (F29n; ST, 4-53)

350-F. Colforg Equipment for the Production of Forging Slugs. Machinery (London), v. 99, Aug. 2, 1961, p. 267-269.

Cropping, preforming and chamfering operations applied to 1, 2 and 3-in. steel bars. Adaptation for cropping and preforming slugs of smaller diameter or for preforming in various ways including the cold forging stage. (F21; ST, 4-55)

351-F. Reflectors Save Forging Heat. Metalworking Production, v. 105, July 12, 1961, p. 47.

Tubular Al reflectors are used to reduce heating time during forging by slowing down the cooling rate. Other applications of the reflecting principle include a reflecting tunnel for use with a reheating furnace, shields for the transportation of hot material and for controlling cooling rates during sheet and bar rolling. (F21, F22, 1-52, 17-57; Al)

352-F. Forgings--Sure Path to Quality. B. J. Flannagan. Metalworking, v. 17, Aug. 1961, p. 48-49.

Design considerations for forgings and forging dies with attention to parting lines, fillet and quarter radii, connecting sweeps and draft angles. (F22p, 17-51)

353-F. (English.) Improved Rolling Techniques for Round Bars of Small Diameter and Changes in Rolling Facilities. Yawata Technical Report, no. 231, June 1960, p. 95-97.

Review of bar and rod mill modernization programs leading to increased capacity for heating, rolling and cutting of steel bars of 9 to 25 mm. in diameter. (F23, W23d, 17-51; ST, 4-55)

354-F. Forgers Extend Their Technology. Steel, v. 149, Sept. 11, 1961, p. 102-108.

Recent developments in forging of Be, Cb, Ta, W, superalloys, die steels, Ni and Mo alloys and other materials. Design of forging presses and other equipment for achievement of close tolerances. (F22, 1-52; ST, SGA-h, EG-d37, Be, Cb, Ta, W, Ni-b, Mo-b)

355-F. Extrusion of Lithium Wires of 1 Mil Diameter. J. Katzenstein and M. Sydor. Review of Scientific Instruments, v. 32, Aug. 1961, p. 989.

Alkali metal wires, in particular Li, are extruded in a CO_2 atmosphere on a die of special design to produce fine diameters with good surface homogeneity. (F24; Li, EG-e41, 4-61)

356-F. The Logarithmic Function of Equi-Reductions in Multiple Drawing Operations. Anton F. Mohrnheim. Wire and Wire Products, v. 36, Sept. 1961, p. 1133-1136, 1193.

Method and calculations for solving wire drawing problems in the processing of steel, Al and Ti wire using Log Log slide rule and use of the "elongation factor" combined with a knowledge of physical phenomena. (F28; ST, Al, Ti, 4-61)

357-F. Fabrication of Stainless Steel Clad Uranium Dioxide Fuel Elements by Tandem Rolling. J. W. Lingafelter. American Nuclear Society, Transactions, v. 4, June 1961, p. 151.

X-ray inspection to determine density of fused UO_2 within a Type 304 stainless steel tube after rolling. (F23, S11p, T11g; SS, 4-60)

358-F. Fabrication of Fuel Elements by Swaging. E. A. Lees. American Nuclear Society, Transactions, v. 4, June 1961, p. 151-152.

Hot swaging (975-1000° C.) with conventional steel dies and differential reduction with nylon dies of stainless steel cladding over fused UO_2 nuclear reactor fuel pellets to obtain maximum fuel rod density. Pellet breakage as affected by dimensional tolerances imposed on the pellets. (F25, 1-66, T11g; SS)

359-F. New Brass Rod Mill. Metal Industry, v. 99 Aug. 4, 1961, p. 87-89.

Straightening testing and pointing of coil stock in an extrusion plant of United Nonferrous Metals, Ltd. followed by drawing, straightening and finishing. (F-general, 1-52; Cu-n)

360-F. (French.) Manufacture of Seamless Tubing. Trempe, no. 39, Sept. 1961, p. 7-16.

Manufacture of seamless tubing used in pipelines, oil refineries and earth drilling equipment from 0.3% carbon steel, pearlitic Mo and chromium-molybdenum steels, ferritic Cr-Mo, 18/8 austenitic and carbon steels containing 0.4-0.5% C and 0.8-1.5% Mn. Cutting of blanks, heating up to 1260° C., piercing, various rolling processes, finish rolling and preparation for thread cutting. (F26, 1-52; CN, SS, ST, Cr, Mo, Mn, 4-60)

361-F. (Japanese.) Studies on the Three-Dimensional Deformation in Rolling. Samon Yanagimoto. Japan Society of Mechanical Engineers, Transactions, v. 27, June 1961, p. 800-808.

Investigation of rolling pressure distribution over the contact arc in the hot rolling process for steel plate. Calculations involve plate width, developing a three-dimensional distribution of rolling stress to the plate edge. 5 ref. (F23, 1-66, 3-73, 3-74; ST, 4-52)

362-F. Forgings Made by High Energy Process. Materials in Design Engineering, v. 54, Aug. 1961, p. 17.

Description and operation of a high energy rate metalworking machine which utilizes gas under pressure as its driving force for forging 4130 steel, tough pitch Cu and Cu powder compact aircraft parts. (F22, T24, W22; AY, Cu, 6)

363-F. Hammer to Strike Mighty Blow. R. H. Eshelman. Iron Age, v. 188, Sept. 14, 1961, p. 159.

Aircraft parts of Udimet, Waspalloy and Inconel die steels are precision forged by a high-speed mechanical press within tolerances of 0.004 in. (F22, 1-52, T24; SGA-h, 17-57)

364-F. (German.) Drawing of Copper and Brass Tubes in Movable Mandrel Rings. Horst Rusch. Neue Hutte, v. 6, July 1961, p. 411-416.

Test drawing of Cu and brass tubes from 27 mm. diameter, 1.25 mm. wall thickness to 17.3 mm. diameter, 0.9 mm. wall thickness using a tensile testing machine. Theoretic investigation of geometric dimensions of drawing tool and evaluation of drawing sequence. (F26r, 1-53; Cu, Cu-n)

365-F. Extrude Ingot Into Spiral Shape. Iron Age, v. 188, Sept. 28, 1961, p. 93.

Extrusion of a rotor with spiraled vanes from 6063 Al alloy using a specially machined die. The spiral effect is obtained by machining lead angles into the die lands. (F24, T7h; Al-b, 17-57)

366-F. Automatic Continuous Copper Rod Mill in New Jersey. Engineer, v. 212, Aug. 25, 1961, p. 346-347.

Production of 5/16 in. Cu rod from 4 in. x 4 in. wire bars at rolling rates up to 17 ton per hr. on an automatic rolling line incorporating gas-fired preheat furnaces and three-high roughing and two-high finish mills. (F23, W24k, 1-52; Cu, 4-61)

367-F. High-Energy-Rate Compacting. Engineer, v. 212, Aug. 25, 1961, p. 347-348.

Compacting, die forging, blanking and extrusion of intricate metal parts using the "Dynopak" pneumatic metal forming process. Shapes with close tolerances are formed from Al, W, Mo, Ti, Co, Zr, Cu powder, tough pitch Cu and 4130, C and stainless steels. Effect of forming velocity on mechanical properties of the materials. (F-general, G-general, H14, Q-general, 1-71, 3-67, 4-57)

368-F. Precision Calls for Clean Rooms. David Fishlock. Metalworking Production, v. 105, Sept. 13, 1961, p. 70-73.

Forging, machining, welding and assembling of precision machinery and nuclear reactor components in dust-free conditions obtained by atmospheric filtration, air conditioning, special clothing and temperature-humidity control. (F-general, G-general, K-general)

369-F. (French.) Study of Blooming Mills With Regard to Automation. C. Roger. Revue de Metallurgie, v. 58, June 1961, p. 513-522.

Screw tightening and the movement of ingots on the roller bed are considered in terms of rolling time and safety measures. (F23n, A7p, 1-52, 3-67, 18-74)

370-F. Republic's New Strip Mill to Roll Variety of Steels. Steel, v. 149, Oct. 2, 1961, p. 62, 64.

Production of standard grades of carbon steel, stainless, Si and high-alloy steel strip at rates up to 2400 ft. per min. with X-ray and infra-red control of thickness and width. (F23q, S14e, 1-52; CN, SS)

371-F. Some Analytical and Experimental Studies of Axi-Symmetric Cold Forging and Extrusion. Pt. 2. H. Kudo. International Journal of Mechanical Sciences, v. 3, Aug. 1961, p. 91-117.

Cylindrical specimens of Al, Cu and brass (30% Zn, 70% Cu) having various initial height-diameter ratios are compressed between two flat and roughened dies. The mean working pressure, fractional height reduction and yield stress are determined at room temperature. Extrusion, piercing and cold forging of Al, Cu and brass specimens at low speed and at room temperature. Experimental results are compared with theoretical results. 21 ref. (F22, 1-67, F24, 1-54; Al, Cu, Cu-n)

372-F. Preheating Titanium and Its Alloys in Bar Mill. Industrial Heating, v. 28, Sept. 1961, p. 1720, 1722.

Preheating furnaces for the treatment of Ti sheet and rod. The electric resistance furnaces used have a capacity for heating 1000 lb. of Ti per hr. to 1000° C. (F21b, W20h, 1-52; Ti, 4-53, 4-55)

373-F. (German.) Stress State in Plane and Rotation Symmetrical Deformation by Drawing and Pushing In Pt. 1. Stresses in the Deformation Zone During Drawing in Plane Distortion. Oskar Pawelski. Archiv fur das Eisenhuttenwesen, v. 32, Aug. 1961, p. 513-520.

Analysis includes computation of uneven stress distribution in deformation zone and of stress distribution in friction-free rod drawing as influenced by die angle and reduction ratio. (F2, F27)

374-F. (German.) Production of Compressor Blades of Light Metals. A. Burkhardt and H. Weisswanger. Werkstattstechnik, v. 51, Apr. 1961, p. 178-182.

Production of compressor blades of AlCuMg alloy and of special CuAl alloy by combination of extrusion, pressing and rolling operations. Design and production of working tools is discussed with technology of shaping and finishing operations. (F-general, 1-52, 17-51; Al, Cu, Mg)

375-F. Boeing Reduces Superthin, Superalloy Tubes. Steel, v. 149, Oct. 9, 1961, p. 118-119.

Rene 41 tubes are forced through tapered die and are reduced from 1.5 to 0.5 in. with wall thickness of 0.010 in. Test results indicate strength to withstand heat and stresses encountered in space flight. (F26r, 1-67, Q-general, T24a; SGA-h, Ni-b, 4-60)

376-F. Developments in the Forging of Materials for Service at High Temperature. Machinery (London), v. 99, Sept. 20, 1961, p. 687-694.

Components for missiles and space vehicles are forged at 1000-5000° F. from medium-high temperature alloys (Inco 901, A286, V57), Ni-base superalloys (Astroloy, Rene 41, Waspaloy) and refractory metals (Mo, Cb, Ta, W). (F22, T24e, 17-57; SGA-j, Ni-b, EG-d37, Cb, Mo, Ta, W)

377-F. Progress in Welding of Boiler Tubes and Pipelines for High Pressure Boilers. R. J. Hardess. Welding Fabrication and Design, v. 4, Aug. 1961, p. 20-30.

Review of tubing materials, welding techniques and nondestructive methods of testing and inspection during the welding and fabrication of tubes and pipelines into high pressure boilers. (F26p, S13, T26q, 17-57)

378-F. Heavy Presses in the Space Age. L. W. Mayer. Mechanical Engineering, v. 83, Sept. 1961, p. 44-45.

Space craft components are forged and extruded on presses from Be, Ti alloys, Ni-base alloys, refractory metals, Mg, Al, low-alloy steel and stainless steel. Effect of chemical composition and forging pressure on ductility and forgeability. (F22, F24, T24e, 1-52, 1-60; ST, Be, Ti-b, Ni-b, EG-d37, Al, Mg, 17-57)

379-F. Cold Rolling Mill for Steel Strip at Brinsworth. Engineer, v. 211, Apr. 7, 1961, p. 554-556.

Pickled steel coils received from an adjacent hot mill are rolled to strips 0.010-0.160 in. and up to 18 in. wide using automatic gage control equipment with subsequent annealing, tempering and slitting of the strips. (F23, J23, J29, W23c, 1-52; CN, 4-53)

380-F. Forgings for Missiles and Space Vehicles. William C. Kunkler, Jr., and Jose R. Canal. Mechanical Engineering, v. 83, Sept. 1961, p. 45-49.

Die forging, roll forming, extruding and machining of Be, Ti, Ni-base alloys, refractory metals and low-alloy steel. Tensile and stress-rupture properties are given for Be and Ni-base forgings. (F22, F24, G11, G17, T24e; Be, Ti, Ni, ST, 4-51, 17-57)

381-F. Aspects of Heavy Press Utilization. Jacob Brayman. Mechanical Engineering, v. 83, Sept. 1961, p. 50-51.

Die forging and deep drawing of Ti, Al, Be, V, Mo, W and stainless steel into panels used in space craft, missiles and tanks. Data are given for rigidity and tensile strength of the metals. (F22p, G4b, T2h, T24e, 4-53; Ti, Al, Be, V, Mo, W, SS, 17-57)

382-F. Cold Extrusion--A Review of Some Technical Information and Current Practice. D. F. Galloway. Microtechnic, v. 15, June 1961, p. 85-103.

Brief historical review of nonferrous and ferrous metals and alloys currently being extruded from the point of view of resistance to plastic flow. Effect of material condition and degree of required deformation on extrusion load and the influence of cold working on tensile strength, hardness and ductility. Tooling for cold extrusion and methods of producing extrusion slugs or billets. 18 ref. (F24, 1-52, 10-54, Q-general)

383-F. Intricate Forgings Are No Problem. Steel Horizons, v. 23, Fourth quarter 1961, p. 14-15.

Processing of stainless steels including superalloys, by forging, plating, soldering and electrochemical machining to produce parts with corrosion resistance and high temperature strength. (F22, G24d, K7, L17, 1-52; SS, SGA-g, SGA-h)

384-F. (Russian.) New Technological Process for Producing Blanks for Hollow Railroad Car Axles. A. I. Tselikov, S. P. Granovskii and V. I. Efanov. Kuznechno-Shtampovochnoe Proizvodstvo, May 1961, p. 4-5.

Production of blanks from a steel blooming billet, piercing and finishing on a three-high rolling mill. (F26, T23p, 1-52; ST)

385-F. New Electric Resistance Welder Increases Production Up to 60%. Western Machinery and Steel World, v. 52, Sept. 1961, p. 78-79.

Welding by an improved vapor-cooled machine that increases pipe and tube production. Use with fluid dielectrics, pertinent information on transformer cores and operating advantages. (F26p, 1-52)

386-F. Is There a Cold War in Cold Forging? K. W. Hords. Metalworking Production, v. 105, Sept. 27, 1961, p. 63-67.

Cold extrusion with a simple hydraulic ram, the cylinder extended to accommodate well-guided tooling to form metals within tolerances competitive with those produced by hot forging. Parameters for equipment, materials, design and operating sequence. (F24, 1-52, 1-67)

387-F. Planer-Scarfing Formed Shapes. Kenneth H. Schultz. Metalworking Production, v. 105, Sept. 27, 1961, p. 72-73.

Preparation of joint edges for continuous full-penetration welds made with automatic submerged-arc equipment by cam-controlled tools which machine-scarf the edges more accurately than conventional hand-chipping methods can do. (F21e, K1e, 1-52)

388-F. (German.) Precision Forging of Turbine Blades. H. Tarmann. Radex Rundschau, no. 4, Aug. 1961, p. 664-669.

Technological features and operation details for close-tolerance forging of steam and gas turbine blades of heat resistant metals such as 13% Cr steel, CrNiCo steel and Co-Ni alloys. (F22, T7h, 1-52, 17-55; SS, Co, Cr, Ni, SGA-h)

389-F. (German.) Mechanical Flame Scarfing of Semifinished Products in Manufacturing Seamless Tubes. Egon Ritter and Heinz-Gunter Schmitt. Stahl und Eisen, v. 81, Sept. 14, 1961, p. 1274-1283.

Mechanical flame scarfing of steel using square and round scarfing machines. Design of machines and comparison of scarfing technology in terms of scarfing depth as influenced by oxygen pressure, scarfing rate, ingot temperature and grade of oxygen. (F21e, F26, 1-52; ST)

390-F. (German.) Mechanical Cold Flame Scarfing of Slabs. Kurt Tschirschwitz. Stahl und Eisen, v. 81, Sept. 14, 1961, p. 1284-1287.

Design and mode of operation of a cold flame scarfing machine with stationary burners and semi-automatic control. Scarfing tests at constant burner angle with varying rates and pressures on steel slabs. Mean scarfing depth and oxygen consumption as influenced by oxygen grade. (F21e, 1-52; ST, 4-53)

391-F. Developments in Cold Rolling and Wire Mesh Production. British Steelmaker, v. 27, Sept. 1961, p. 279-280.

Production of strip and wire mesh from hot rolled steel rods at rolling speeds up to 400 ft. per min. Rods from 0.08-0.5 in. in diameter are drawn into wire at 400-800 ft. per min. (F23, 1-52, 1-67; ST, 4-53, 4-55, 4-61)

392-F. (German.) Processing Operations in Nonferrous Semifinished Products Industries. Pt. 7. New Development in Continuous Brass Strip Heating. Franz Deutz and Rudolf Jansen. Zeitschrift fur Metallkunde, v. 52, Aug. 1961, p. 503-507.

Design and operation of a two-story brass strip drawing unit with continuous gas radiant-tube heating which permits processing of heavy coils of up to 3000 kg. wt. (F23, 1-52, 1-66; Cu-n)

393-F. A Machine for Correcting the Shape of Strip. P. Brock, J. E. Bowers and D. D. Smith. Institute of Metals, Journal, v. 90, Sept. 1961, p. 1-6.

Design and application of a stretching device which consists of a number of small rods, followed by a series of progressively larger straightening rolls, over which metal strip can be pulled under tension resulting in correction of bad strip shape and the inherent tendency to edgeweise bow on subsequent slitting. Application in straightening and flattening bronze, brass, Be-Cu, Al and mild steel. Soft material is slightly hardened by treatment in the machine but the properties of half-hard, or harder, material are not significantly affected. (F29, 1-52; CN, Al, Be-b, Cu-b)

394-F. Roll Forging Speeds Ring Making. Iron Age, v. 188, Oct. 19, 1961, p. 146.

Forging of alloy, stainless or carbon steel blanks into rings with 15-80 in. OD for rocket and jet engines to tolerances of 1/16-1/4 in. Speed, load limit, rolling pressure and size of equipment. (F22p, T24b, 17-55; AY, CN, SS)

395-F. Sheet and Tube Starts Enlarged Hot Mill. Blast Furnace and Steel Plant, v. 49, Oct. 1961, p. 984.

Rolling steel slabs into 20-ton coils at a rate of 2250 ft. per min. Hot strip mill layout includes electronic inspection and closed-circuit TV which follows each slab through the mill. (F23, 1-66, 18-67; ST, 4-53)

396-F. Progress in Steelmaking--Automatic Flame Scarfer Finishes Bloom. Steel, v. 149, Oct. 16, 1961, p. 150.

Multiple orifice heads spray oxygen on steel to remove surface defects. Removal depth is determined by preset bloom speed and oxygen flow rate. (F21e, 1-52; ST)

397-F. Electric Billet Heater Replaces Oil-Fired Furnaces. Wild-Barfield Heat-Treatment Journal, v. 8, Sept. 1961, p. 13-14.

Manganese-molybdenum steel billets are induction heated to forging temperature using a heater arranged as two independent units. (F21b, W27k; AY, 4-52)

398-F. Large Die-Forged Propeller Blade. Metal Industry, v. 99, Sept. 15, 1961, p. 209-210.

Scalping, soaking, stamping, removal of flash and machining of Al alloy stock are followed by further soaking, upsetting, solution heat treatment and polishing. Final machining is followed by anodizing. (F21, F22, G17, J27a, L19, T24, 7-52, Al-b)

399-F. (German.) Stress State in Plane and Rotational Symmetric Deformation by Drawing and Pushing-In. Pt. 2. Stresses in Drawing and Pushing-In of Rods. Oskar Pawlewski. Archiv fur das Eisenhuttenwesen, v. 32, Sept. 1961, p. 607-616.

Approximate mathematical solution of the statically undetermined stress state in drawing and pushing of the blank into the drawing die. Computation of the external deformation forces--tool pressure, drawing force and pushing-in force. (F2, F27)

400-F. Processing Long Lengths of Superconductive Columbium-Tin Wire. K. M. Olsen, E. O. Fuchs and R. F. Jack. Journal of Metals, v. 13, Oct. 1961, p. 724.

Procedure achieves superconductivity at average current densities exceeding 150,000 amp. per sq. cm. in 88,000 gauss magnetic field. Application to construction of solenoid magnets. (F28, 1-52, 17-57; Cb, Sn, SGA-q)

401-F. (German.) Processing Technology in the Nonferrous Semifinished Products Industry. Pt. 8. Electronic Control. Fritz Orttenburger. Zeitschrift fur Metallkunde, v. 52, Sept. 1961, p. 592-595.

Review of development of control of electric roll drives from the Leonard transformer to current electronic systems. Design and operation of electronic control using transistors. (F23, 18-74; EG-a38)

402-F. (Czech.) Built-In Safety Units in Rolling Stands. Milan Hajduk and Antonin Fiala. Hutnicke Listy, v. 16, Aug. 1961, p. 539-545.

Protection of rolling stands against sudden excessive mechanical loads, set up from time to time under certain circumstances in rolling, by building in hydraulic safety units, safety components of cast iron steel or wedge-shaped components in places exposed to the main stress. (F23, 1-52, 1-66, A7p)

403-F. Flame-Cutting Goes Numerical. Machinery, v. 68, Sept. 1961, p. 122.

Fully automatic flame cutting operation is provided by control system receiving instructions on paper tape. (F22g, 18-74)

404-F. The Cold Extrusion of Steel. R. A. P. Morgan. Metal Treatment and Drop Forging, v. 28, Oct. 1961, p. 393-400.

Summary of annealing, pickling, rinsing, phosphating and lubricating operations and process parameters before cold extrusion. Description of backward and forward extrusion operations and the draw operation. Consideration of process economies and punch material selection including nominal composition, hardening and tempering. (To be continued.) (F21, F24, 1-67; ST)

405-F. Propeller Production. Aircraft Engineering, v. 33, Oct. 1961, p. 288.

Preheating, stamping, upset forging and machining of Noral 17S Al alloy cylinders for propeller blades. (F-general, G17, T24a; Al-b, 17-57)

406-F. (French.) Rolling Billets of Special Steels Manufactured by Continuous Casting. M. Cabane. Revue de Metallurgie, v. 58, Aug. 1961, p. 661-665.

Study of external and internal soundness, segregation, obtained during heating and rolling of carbon steel, stainless steel, toolsteel, high-speed toolsteel and heat resistant steel billets. Effect of degree of deformation during rolling on forgeability, density and homogeneity. (F23; ST)

407-F. (French.) A New Rolling Mill Line for 1 M. Wide Copper Strip. B. Lecry and C. Lachaud. Cuivre Laitons Alliages, no. 62, Aug. 1961, p. 9-17.

Process and equipment in which a slab of 700 x 135 mm. cross section is manufactured by continuous casting of induction melted Cu and is reduced to 8 mm. thickness by hot rolling with subsequent planing, descaling, washing, brushing, cutting to size and cold rolling to the final thickness--0.40 mm. minimum with annealing at 500° C. for 5 hr. after finish rolling or between two cold rolling passes. (F23, 1-52; Cu, 4-53)

408-F. Special Planing Equipment Squares Plate for Welded Pipe. Iron and Steel Engineer, v. 38, Sept. 1961, p. 227-228.

A heavy-duty planer with auxiliary equipment produces high squares, bevel or any shape desired on the ends of high-strength steel plates for large diameter expanded welded pipe. (F21, F26; ST, 4-53)

409-F. Wire Drawing--"Boundary" Lubrication Is Important. Digest of "Mechanisms of Boundary Lubrication--Boundary Lubrication of Copper, Mild Steel and Stainless Steel During Severe Cold Deformation". Paper 61-LUBS-5 presented at the Lubrication Symposium, A.S.M.E., Miami, Fla., May 1961. P. R. Lancaster and G. W. Rowe. Metal Progress, v. 80, Nov. 1961, p. 162-163.

The amount of lubricant carried through the die has an important bearing on the amount of reduction possible in drawing. Reductions of over 55% can be accomplished in ore pass if proper lubricating practices are employed. (F28, 1-52; NM-h)

410-F. Welding Molybdenum Tubes. Digest of "The Fabrication of Thin-Wall Molybdenum Shapes by Welding". Paper 60-WA-53 presented at the Winter Annual Meeting of A.S.M.E., N.Y. W. F. Brown and M. A. Pugacz. Metal Progress, v. 80, Nov. 1961, p. 178.

Techniques for welding tubes from thin-walled Mo sheet. (F26p, 1-52; Mo, 4-53)

411-F. (German.) Investigation of Heating of Forging Blanks. Eberhard Plaume. Neue Hutte, v. 6, Aug. 1961, p. 486-495.

Estimation of heating temperature and rate in preheating of carbon and alloyed steel in terms of thermal conductivity of steel and susceptibility to hot tearing as influenced by the carbon equivalent. Comparison with production results. 14 ref. (F21b, P11h, 2-60; ST, C)

SECTION G

SECONDARY MECHANICAL WORKING

1-G. The Cold Extrusion of Steel. S. C. Poulsen. Machinery (London), v. 97, Oct. 19, 1960, p. 876-886.

Use of adapted or modified deep-drawing presses. Advantages of cold extrusion as a first-stage operation followed by cold drawing. Parameters and applications. (G5; ST)

2-G. Machine Makes Smooth Cuts in Honeycomb Materials. Iron Age, v. 186, Nov. 17, 1960, p. 141-143.

Quenched-arc cutting of stainless steel, Zr, Ti and Al honeycomb structures using an Electro-Band machine which supplies a current through a cutting band immersed in a coolant. (G22h; Al, Ti, Zr, SS, 7-59)

3-G. Tungsten-Arc Welding Torch Cuts Light-Gage Metals. Iron Age, v. 186, Nov. 17, 1960, p. 152-153.

Arc cutting of Al, Mg, Cu and stainless steel workpieces using a heliarc welding torch operating at increased current density. (G22h, W29d, 1-52; Al, Cu, Mg, SS)

4-G. (German.) Explosive Cutting. K. H. Muller. Stahlbau, v. 29, Sept. 1960, p. 294-295.

Cutting of structural steel shapes by hollow charges during the removal of obsolete steel constructions. 4 ref. (G22; ST, 4-57, NM-k34)

5-G. How to Machine Molybdenum. Metalworking Production, v. 104, Oct. 26, 1960, p. 73-78.

Problems in machining; lubrication; special machining methods. (G17; Mo)

6-G. (German.) Automatic Punch Press for Sheet-Metal Caps With Tool Control. H. K. Werkmeister. Werkstatt und Betrieb, v. 93, Oct. 1960, p. 679.

Punching of 0.7 mm. thick steel or brass sheet using a fully automatic machine with eight oil greased and cooled punches. Pneumatic control instrument indicates puncher defects. (G2j, 1-52; Cu-n, ST, 4-53)

7-G. (German.) Flame and Electric Cutting of Steel and Nonferrous Metal Sheets. Hans H. Reinsch. Schweisstechnik, v. 14, Aug. 1960, p. 90-93.

Flame and electric cutting of unalloyed and alloyed steel, cast iron, Al and Cu. Operational parameters of current, voltage and cutting rate for varying sheet thickness. 6 ref. (G22; Al, Cu, AY, ST, 4-53)

8-G. New Technique Promises Faster Magnesium Forming. Steel, v. 147, Nov. 21, 1960, p. 101.

Drawing of Mg alloys at 400° F. in a 100 ton mechanical press at drawing speeds up to 50 ft. per min. Drawn cups of ZE10A-O and AZ31B-O alloys compare favorably in earing tendency, wall thinning and eccentricity with Al test sheets. (G4c; Mg-b, 4-53)

9-G. Automatic Grinder Line Upgrades Stainless Strip. Steel, v. 147, Nov. 21, 1960, p. 116-117.

A regeneration process for low grade coils in which the coils are passed through drag wipe, doctor roll and two grinding units with abrasive belts until defects are removed. Adjustable backup rolls and variable line speeds control stock removal. (G18k; SS, 4-53)

10-G. Hydraulic Bulge Tester Determines Sheet Drawing Quality. W. N.

Lambert, E. S. Madrzyk and F. E. Gibson. Journal of Metals, v. 12, Nov. 1960, p. 857-860.

Drawability of brass, Cu, Al and killed steel measured by a hydraulic bulge tester using the instability point of the metal under biaxial tension as a criterion. 19 ref. (G4, 17-52, Q10a, Q27g; Al, Cu, Cu-n, ST-c, 4-53)

11-G. Explosive Forming in the Missile Industry. L. C. Stuckenbruck and C. H. Martenez. Machinery, v. 67, Nov. 1960, p. 99-105.

Explosive forming of rocket engine components composed of Al, Cu, Ni, Ta, Zr, Cb and stainless steel. (G-general, T24c; Al, Cb, Cu, Ni, Ta, Zr, SS, NM-k34)

12-G. Steam Turbine-Bucket Increases Numerical Profiling Efficiency. Lawrence W. Collins, Jr. Machinery, v. 67, Nov. 1960, p. 112-117.

Milling of turbine buckets from hot forged 13% Cr-0.30% C steel by tape-controlled profiling machines. (G17b, 18-74, W25r; SS)

13-G. Pearlitic Malleable Iron--an Engineering Alloy of New Significance. Machinery, v. 67, Nov. 1960, p. 142-146.

Machinability in unhardened state and wear resistance, hardness and tensile strength after heat treatment of pearlitic malleable Fe. Applications. (G17k, Q-general, 2-64; CI-s)

14-G. (German.) Belt Grinding of Red Brass. G. Pahlitzsch and G. Becker. Metall, v. 14, Nov. 1960, p. 1077-1080.

Red brass containing 5-6% Sn, 3-5% Pb and 0.6% Zn is ground with various oil additions at various cutting speeds. Metal removal as a function of cutting speed, grinding time and contact pressure. 8 ref. (G18k; Cu-n, Sn, Pb, Zn)

15-G. Tapping High Tensile Strength Alloys With Carbide. J. F. McAuliffe. Carbide Engineering, v. 12, Nov. 1960, p. 15-18.

Tapping of high strength steels and alloys (Rockwell c 30-57) using solid WC taps or steel taps with WC tips. Effect of the ratio of tool hardness to workpiece material hardness on tool life. Data for tool geometry, hole depth, surface speed and torque requirements. Prevention of chipping and tap breakage. (G17f, T6n; ST, SGB-s, 6-69, 17-57)

16-G. Threading With Carbides. Horace Frommelt. Carbide Engineering, v. 12, Nov. 1960, p. 26-28.

Threading of SAE 1120 and SAE 1130 steel bushings, a stainless steel flange and a welded steel drill bit assembly using WC cutting tools. (G17f, T6n; SS, ST, 6-69, 17-57)

17-G. (German and French.) Modern Large-Size Flame Cutting Machines. M. Maier. Zeitschrift fur Schweisstechnik (Journal de la Soudure), v. 50, Sept. 1960, p. 268-272.

Cutting of steel plates and sheets for pressure boilers by an electron controlled three-flame cutting machine. (G22g, W29d; ST, 4-53)

18-G. (English.) Investigation of the Elementary Processes Occurring in Electric Spark Machining. Margit Toth-Bitskey and Jeno Pocza. Acta Physica, v. 12, no. 1, 1960, p. 77-83.

Spark machining using steel and brass anodes. Erosion is measured as a function of current frequency, voltage and electrical energy. 8 ref. (G24a; Cu-n, ST)

19-G. (German.) Cold Bulging and Cold Impact Extrusion Using Multiple-Step Cold Presses. B. Hatebur. Fertigungstechnik und Betrieb, v. 10, Oct. 1960, p. 574-582.

Mass production of screws, bolts and small machine parts by multiple-step presses of varying design. (G5, G14, 1-67)

20-G. (German.) Adjustment of Level Planes by Honing. Heinz Strey. Fertigungstechnik und Betrieb, v. 10, Oct. 1960, p. 619-620.

Comparison of surface quality of hand and machine scraped gray cast iron surfaces. Economics of machine honing. (G19n; CI-n)

21-G. The Cold Extrusion of Steel. S. C. Poulsen. Machinery (London), v. 97, Nov. 2, 1960, p. 988-995.

Examples of components produced by combining cold extrusion as a first-stage operation with cold drawing for supplementary working. Research

techniques include a plasticine analogy method for studying cold flow phenomena and the use of photo-elastic models for the investigation of tooling stresses. Tests on various lubricants. (G5; ST)

22-G. The Role of Friction in Metal Cutting. S. Kobayashi and E. G. Thomsen. Journal of Engineering for Industry, Series B (American Society of Mechanical Engineers, Transactions), v. 82, Nov. 1960, p. 324-332.

Friction mechanisms in cutting tests on SAE 1112 free cutting steel and SAE 4135 alloy steel in the as received condition with artificially controlled tool-chip contact areas and flank contact areas. 15 ref. (G17, Q9; AY, TS)

23-G. A Critical Comparison of Metal-Cutting Theories With New Experimental Data. S. Kobayashi, R. P. Herzog, D. M. Eggleston and E. G. Thomsen. Journal of Engineering for Industry, Series B (American Society of Mechanical Engineers, Transactions), v. 82, Nov. 1960, p. 333-347.

Orthogonal metal-cutting tests at varying cutting speeds, rake angles and feeds are made on annealed and as received SAE 1112 steel, SAE 1020 steel, SAE 4135 steel, 6061-O and 6061-T6 Al alloy and alpha brass. 20 ref. (G17, 10-51; ST, Al-b, Cu-n)

24-G. New Developments in the Theory of the Metal Cutting Process. Pt. 1. The Ploughing Process in Metal Cutting. P. Albrecht. Journal of Engineering for Industry, Series B (American Society of Mechanical Engineers, Transactions), v. 82, Nov. 1960, p. 348-358.

Theoretical development of force diagrams separating the ploughing force, which occurs because of the finite sharpness of the cutting edge, from other forces of the cutting process. Effect of cutting velocity upon tool forces, built-up edge, chip curling and residual stresses in the work surfaces. Real value of coefficient of friction on the chip-tool interface is related to rake angle. (G17, 10-51)

25-G. Impact Extruded Aluminium Beer Cans. Australasian Manufacturer, v. 45, Sept. 24, 1960, p. 44-46, 48-49.

Melting, casting and impact extrusion of Al cans on a slug production line. (G5; Al)

26-G. Tooling Tips for High Energy Rate Forming. F. A. Monahan. Western Metalworking, v. 18, Nov. 1960, p. 43-45.

Tooling for use in three new high energy forming processes, a hydropneumatic method which produces complex forgings and extrusions, a method using electrical shock wave energy and a method using electromagnetic field forces. (G-general; NM-k34)

27-G. Magnesium: New Cost Cutter From Tooling. Western Metalworking, v. 18, Nov. 1960, p. 46-47.

Machinability, weldability and dimensional stability of Mg tooling plate. Applications. (G17k, K9s, P10d; Mg, 4-53)

28-G. Cold Extrusion of Steel Parts From Wire. Alfred Braun. Wire and Wire Products, v. 35, Nov. 1960, p. 1538-1539.

Preparation and cold heading of slugs or billets to overcome inconsistancies in hardness, composition and pattern in the original rimmed steel wire. Degreasing and annealing of slugs. Equipment and techniques for extrusion. (G5, G10, 1-67; ST-d, 4-61)

29-G. Machining Thermal-Resistant High-Strength Materials. Pt. 1. Machining Steel Honeycomb Core With Disc Slicers and Hard Wheel Grinding. Western Machinery and Steel World, v. 51, Nov. 1960, p. 54-58.

Machining of stainless steel honeycomb cores using disk slicers and hard wheel grinding. Data for feed rate, cutting depth and cutter geometry. (G18; SS, 7-59, SGA-h, SGB-a)

30-G. Auto Expert Stresses Color on Steel Buildings. Steel, v. 147, Nov. 28, 1960, p. 114-115.

Application of mass production methods to manufacture of metal buildings. Fabrication of roof and wall panels from galvanized steel or Al strip by forming, cutting, bond coating, painting and baking in a continuous operation. (G-general, T26n; Al, ST, 4-53, 8-65)

31-G. (Russian.) Stamping of Clad Sheet Material. B. N. Shelevkin. Khimicheskoe Mashinostroenie, no. 2, 1960, p. 33-36.

Heat treatment and cutting, die forging, bending and drawing of clad austenitic Cr, steel, brass, Ti, Cu, Ag, Mo and Ni. 4 ref. (G3, F22n, J-general; Ag, Cu, Mo, Ni, Ti, Cu-b, SS-e, 8-66)

32-G. Some Controlled Metal-Cutting Studies With Resulfurized Steels. E. G.

Thomsen, S. Kobayashi and M. C. Shaw. American Society of Mechanical Engineers, Transactions, Paper no. 60-WA-115, 1960, 10 p.

Dynamic shear stress during cutting is determined from compression tests on hot rolled resulphurized steels with similar tensile properties. 12 ref. (G17, Q2j; ST)

33-G. Manipulation of Metals. Pt. 1. R. Tilsley, F. Howard, E. W. Peel, John Arnold and W. S. Hollis. Metal Industry, v. 97, Nov. 4, 1960, p. 381-384.

Abstracts of papers presented at a conference held at Brighton, England. Topics include extrusion of ferrous and nonferrous materials; close-to-form and close tolerance forgings; spline and thread rolling; and the process of explosive forming of metal. (G5, G12, G-general; NM-k34, 4-51)

34-G. Stretch-Forming. J. F. Wallace. Metal Industry, v. 97, Nov. 11, 1960, p. 395-398.

Stretch-forming of Al, Ti 130 and FV 520 stainless steel sheet. Determination of stress-strain and spring-back curves. Calculation of bending moment and longitudinal relaxation strain. (G9; Al, Ti-b, SS, 4-53)

35-G. Diamond-Wheel Grinding of Tool Steels. L. P. Tarasov. Tool Engineer, Oct. 1959, p. 109-117.

Grinding of high vanadium-high speed steels and high carbon-high Cr die steels using diamond wheels. Comparison of grinding costs when using diamond or Al_2O_3 wheels and of surface finish obtained when using natural or synthetic diamonds. (G18k, W25c; TS, C, Cr, V, NM-k37, 17-57)

36-G. Basic Formation of Chips. S. N. Agrawal, R. D. Harris and B. H. Amstead. American Society of Mechanical Engineers, Paper no. 60-WA-282, 1960, 8 p.

Orthogonal cutting of brass, Al and beeswax cold rolled 1018 steel and hot rolled A755T steel is studied by high speed motion pictures. Photographic and test data are given for chip formation, stress patterns, tool forces and edge build-up, compression phenomena and crack initiation and propagation. 11 ref. (G17, G25, M27; Cu-n, Al, ST)

37-G. An Analysis of the Mechanism of Orthogonal Cutting and Its Application to Discontinuous Chip Formation. Keiji Okushima and Katsundo Hitomi. American Society of Mechanical Engineers, Paper no. 60-WA-79, 1960, 11 p.

The concept of flow region, a fairly large transitional deformation zone which exists between the rigid region of work and the plastic region of steady chip, is developed. Mechanics of orthogonal cutting and discontinuous chip formation are analyzed and theoretical equations for angles of boundary lines of the flow region and for strain in chip are deduced and substantiated in cutting tests for Pb and carbon steel. 22 ref. (G17; CN, Pb)

38-G. Can Expolsive Forming Solve Your Design Problems? E. L. Armstrong. Iron Age, v. 186, Nov. 24, 1960, p. 85-87.

High energy forming applied to the fabrication of exacting parts for airframes and missiles. (G-general; NM-k34)

39-G. (French.) Determination of the Possibilities of Cylindrical Deep Drawing of Aluminum and Aluminum Alloys. Robert Chopin. Revue de l'Aluminum, v. 37, July-Aug. 1960, p. 881-888.

Since conventional testing of mechanical properties provides unreliable information regarding deep drawability of light alloys, full-scale practical tests on a hydraulic press are carried out on A-G3, A-U4G, A-G5, A5, A-SG and A-G1 cylindrical alloy blanks in various cold worked and heat treat states. Influence of metal thickness and condition, drawing speed, entering radius of die, pressure of blank clamp and clearance between sides of die and punch on deep drawability. (G4, 17-52, 2-64, 3-60; Al-b, 4-60)

40-G. Spinning Makes Stronger Rocket Cases. Lewis E. Zwissler. Metal Progress, v. 78, Dec. 1960, p. 71-77.

When many early rocket cases failed in weld zones, designers attempted to minimize the number of welds. Shear spinning appears to be a good method for fabricating surfaces of revolution which would require a minimum of welding for rocket cases. (G13, T2p; AY)

41-G. Constricted-Arc Process Cuts Metals Under Water. C. H. Wodtke. Metal Progress, v. 78, Dec. 1960, p. 91-93.

Torches of special design are being used successfully in the maintenance of nuclear reactors. Cutting is rapid and because the torch and work are completely submerged, spatter is confined and release of radioactivity to the air is reduced to a safe level. (G22)

42-G. Color Finishing of Galvanized Steel. Metal Progress, v. 78, Dec. 1960, p. 105-109.

Panels for prefabricated metal buildings are formed from galvanized strip and then primed with a bond coat which anchors a pigmented vinyl coating to give a long-lasting finish. (G11, L26n; ST, Zn, 8-65)

43-G. Flow Turning. Production, v. 1, Dec. 1960, p. 76-77.

302 stainless steel disks are formed into one piece, high tensile strength utensils by turn flowing, a process in which the machine flows the metal into the extended shape. Surfaces can then be polished smooth without grinding. (G17a, L10b; SS)

44-G. Fundamental Machinability Research in Japan. Katsundo Hitomi. American Society of Mechanical Engineers, Paper no. 60-WA-78, 1960, 12 p.

Review of studies on the mechanics of orthogonal cutting; cutting temperatures; tool wear processes; ceramic tooling; chatter; surface roughness and ultrasonic and silver-white chip cutting techniques. 38 ref. (G17k, A9)

45-G. Aluminum Cylinder Blocks Revolutionize Machining Procedure. Laurence W. Collins. Machinery, v. 67, Dec. 1960, p. 111-118.

One of the most noticeable differences in the shift from cast iron to the Al block is the absence of broaching in manufacturing. The Al block is milled by a transfer machine on the pan rails and starter pads at speeds of 1500-2000 sfm. Carbide tipped milling cutters are used. (G17b, T21b; Al)

46-G. Inside Chipless Machining. Laurence W. Collins, Jr. Machinery, v. 67, Dec. 1960, p. 122-125.

Placed over a mandrel and squeezed from the outside by rapidly pulsating dies, cold tubular blanks of M2 and M3 high-speed toolsteels are made to move by metal flow. The Intraform method accurately and rapidly produces complex inside profiles with extremely low-cost tooling, improves hardness, tensile strength and surface finish to a marked degree. (G17; TS-m)

47-G. Titanium Billets Turned With Increased Know-How. Machinery, v. 67, Dec. 1960, p. 141-144.

For optimum performance, carbides should be ground with a diamond wheel without further lapping. Use of carbide tools is not recommended if any slack or wear is evident in the machine tool. High speed tools should be used at lower cutting speeds and feeds. For continuous rough turning of Ti, grades C1 or C2 carbide are best, with cast nonferrous alloy tools and T-5 high speed steel tools as second and third choices, respectively. (G17a; Ti, 4-52)

48-G. Cold-Heading Stainless Steels and High-Temperature Alloys. S. E. Tyson and J. W. Keegan. Machinery, v. 67, Dec. 1960, p. 149-158.

The relative cold headability of a group of austenitic stainless and heat resisting steels determined by their respective work hardening rates. The relationship between tensile strength and percentage of cold work for several stainless steels is shown. The degree of cold work is determined from the reduction in area by wiredrawing. (G10, 1-67; SS, SGA-h)

49-G. New Processes Challenge Old. Iron Age, v. 186, Dec. 8, 1960, p. 110-111.

A review of new machining techniques such as electrolytic grinding, electromachining, chemical milling, electrodischarge machining to keep pace with the development of tool and die steels, refractory metals, cermets, ceramics and other materials. (G17, G24b)

50-G. Ultrasonic Vibration Paves Way to Greater Design Freedom. Iron Age, v. 186, Dec. 8, 1960, p. 112-114.

Basic principle of ultrasonic machining is that power is transferred through

a metal punch to a hard abrasive. This action makes cavities in materials that are harder than the tool tip. Vibration of the tool, at frequencies above the sonic range, drives the abrasive particles into the workpiece at a rapid rate. The process permits the machining of materials such as toolsteel, tungsten carbide, ferrites and magnesium oxide refractories. (G24c)

51-G. Have You Considered All Forms of Electrical Machining. Iron Age, v. 186, Dec. 8, 1960, p. 115-117.

Basic principals and applications of electro-discharge machining and electrolytic grinding. Typical parts that can be machined with little difficulty include carbide die blade roots and other hard workpieces. (G24)

52-G. How Heat Contours Metals. Iron Age, v. 186, Dec. 8, 1960, p. 118-119.

Advantages and application of tungsten-arc, electron-beam and plasma-jet flame cutting. (G24)

53-G. When Weight Creates a Problem Turn to Chemical Milling. Iron Age, v. 186, Dec. 8, 1960, p. 120-122.

The outstanding asset of the process is its inherent ability to remove weight in a controlled manner while holding strict structural tolerance. Al sheet can be chemically milled to within 0.001 in. or less in regular production. With other alloys, variation runs in the 0.002-0.005 in. range. (G24b; Al)

54-G. Each New Process Fills a Gap. Iron Age, v. 186, Dec. 8, 1960, p. 123-124.

Pointers to aid in the selection of new machining techniques such as electrolytic grinding, electromachining, ultrasonic machining, plasma-jet cutting, electron beam machining and chemical milling. (G17)

55-G. Closer Tolerance Stainless Strip for Aircraft, Missiles and Space Vehicles. Modern Machine Shop, v. 33, Dec. 1960, p. 112-115.

Grinding of stainless steel strip to precise tolerances using an abrasive belt grinding line. (G18k, T24e; SS, 4-53, 17-57)

56-G. Match Grinding to Millionths in Minutes. W. M. Stocker. American Machinist/Metalworking Manufacturing, v. 104, Nov. 28, 1960, p. 142-143.

Match grinding of 52100 alloy steel to produces fuel pump barrel and plunger assembly. Air gage holds tolerance to 0.00008 in. (G18; AY)

57-G. Diamond-Coated Bandsaws Do Impossible Jobs. L. H. Barron. American Machinist/Metalworking Manufacturing, v. 104, Nov. 28, 1960, p. 151.

Contour cutting of carbon steel, carbides, ceramics, ferrites, cerametes, Pyroceram and Ge using a diamond-coated steel bandsaw blade. (G17; CN, 6-69, 6-70)

58-G. Screw Machine Work on Aluminum. M. B. Baker. American Machinist/Metalworking Manufacturing, v. 104, Nov. 28, 1960, p. 169-171.

Methods for preventing breakage, chipping, chatter, edge buildup, cratering and chip clogging when using single-point, flat and circular form tools for screw machine operations on Al. (G17a, W25, 1-52; Al)

59-G. Bending Aluminum Strip, Plate, Shapes, Tubes. Modern Metals, Nov. 1960, p. 42-46.

Procedure for continuous roll forming; data on roll, draw and ram bending. (G6; Al)

60-G. A Study of Shear-Spinnability of Metals. Serope Kalpakcioglu. American Society of Mechanical Engineers, Paper no. 60-WA-187, 1960, 6 p.

The deformation zone in shear-spinning is idealized for a two-dimensional process and maximum permissible thickness reduction without fracture is predicted in terms of the stress system in this zone. Effect of deviation from the sine law on the maximum reduction before fracture is shown analytically to be due to the influence of distortions of the upspun flange on the state of stress under the roller. Comparison with experimental data obtained on stainless steels, Cu, cast iron and Al alloys. 6 ref. (G13, Q26r, 3-66; Al-b, CI, Cu, SS)

61-G. (French.) Electro-Erosion Machining. H. Robert. Revue de la Societe Royale Belge des Ingenieurs et des Industriels, Sept-Oct. 1960, p. 420-434.

Spark machining of stainless and alloy steels in a dielectric liquid using a tool-electrode as the cathode and an anode workpiece. (G24a; AY, SS)

62-G. (German.) Influence of Microsurface on the Behavior of Sheets in Deep-Drawing. Frith Fischer, Karl-Heinz Schmitt-Thomas and Vincent Seul. Stahl und Eisen, v. 80, Oct. 27, 1960, p. 1524-1531.

Deep-drawing tests of steel sheets of varying surface roughness using a 800 ton press at deformation degrees of 40-60%. Development of a process and apparatus for measuring surface roughness. 26 ref. (G4, S14; ST, 4-53)

63-G. Operation Bootstrap Aids Wire Plant. Steel, v. 147, Dec. 5, 1960, p. 117-118.

Drawing of stainless steel and Ni alloys using diamond dies, precision slitters and a Sendzimir mill. (G4; Ni-b, SS, 4-61)

64-G. Ferrous, Nonferrous Metals Yield to Plasma Torch. Steel, v. 147, Dec. 5, 1960, p. 121.

Cutting of stainless steel, Al, Cu, cast iron, W, Mo and Ta by a plasma cutting torch operating on Ar, N and H mixtures. Torch can be used for die shaping, scarfing, skinning, beveling for welding and piercing. (G22g, W29d, 1-52; Al, CI, Cu, Mo, SS, Ta, W)

65-G. European Aerospace Firms Push Advanced Production Methods. Christopher Dawson. Space/Aeronautics, v. 34, Nov. 1960, p. 66-67.

Machining and spot welding of Al and stainless steel materials for heat exchangers and missile components. (G-general, K3n, T24e, W13b; Al, SS, 17-57)

66-G. Expanded Theory Explains Paradoxes of Metal Cutting. Paul Albrecht. Space/Aeronautics, v. 34, Nov. 1960, p. 79-80, 83, 85, 87, 89, 91-92.

Theory of metal cutting taking into account ploughing action, rounding of the tools' cutting edge and chip removal and deformation processes as they are affected by thrust and cutting force and coefficient of friction. 3 ref. (G17, 10-51)

67-G. Machining for Mach 3+ Structures. Alfred G. Jones. Space/Aeronautics, v. 34, Nov. 1960, p. 97, 99, 101, 103.

Chipless and conventional machining splice-welding, etching, pocketing by electrolytic, electric discharge and chemical milling of high strength materials for aircraft structural components to improve tolerances and surface finish. (G17, G24b, K-general, T24a; SGB-a, 17-57)

68-G. Pressure Blanking and Piercing With Die Cushions. D. A. Rogers. Tooling and Production, v. 26, Dec. 1960, p. 37-39.

Effect of clearance between the blanking or piercing punch and the die opening on the blank contours or pierced holes. A hydraulic jack is used to reduce shaving operations to a minimum. (G2h, G2j, W24n)

69-G. Breakthrough in Electrochemical Machining. Tooling and Production, v. 26, Dec. 1960, p. 47-48.

Machining of steels for turbine blades using an electroshaping process in which direct current removes electrons from the workpiece to two electrodes through a rapidly moving electrolyte. (G24b, T7h; ST)

70-G. Belt Grinding Betters Stainless Tolerances. Iron and Steel Engineer, v. 37, Nov. 1960, p. 159-160.

Crown and imperfections are removed from stainless steel strip by an abrasive belt grinding line composed of two vertical belt grinders driving cloth belts. (G18, W25c; SS, 4-53)

71-G. (Czech.) Repair of Defects in Medium Alloy Cast Chromium-Nickel-Steels by Flame or Arc Cutting Prior to Welding. Karel Mazanec and Lubomir Huvar. Slevarenstvi, v. 8, Oct. 1960, p. 347-351.

Material in the vicinity of cracks is removed by oxy-acetylene flame cutting or arc cutting with a carbon electrode, prior to repair welding. Microstructure of heat affected zone. 3 ref. (G22g, G22h, K-general, M27; AY, Cr, Ni)

72-G. Cold Extrusion of Steel. A. G. Thompson. Machinery Lloyd (Overseas Edition), v. 32, Oct. 1960, p. 37.

Cold extrusion of Armco iron, alloy steel and carbon steel billets using a 150 ton crank press. (G5; AY, CN, Fe-a, 4-52)

73-G. Review of Some Unconventional Methods of Machining. Francis W. Boulger. Defense Metals Information Center, Battelle Memorial Institute, DMIC Memo. 75, Nov. 29, 1960, 20 p. (Available as PB 161225 from U. S. Office of Technical Services, Washington 25, D. C.)

Review of methods used for processing high strength and temperature resistant materials, including electrical-discharge machining, electrolytic grinding, electrolytic machining, chemical milling, ultrasonic machining, electron-beam machining, plasma-arc cutting. Most of these methods develop low mechanical forces and are useful for processing fragile of flimsy workpieces also. 60 ref. (G24)

74-G. Moving Rather Than Removing by Roll Forming. Engineering, v. 190, Oct. 21, 1960, p. 550.

A chipless machining process in which a hollow cylindrical tube is placed over a mandrel and squeezed by a number of rapidly pulsating dies, the mantle profile being reproduced in the inside diameter of the tube. (G11)

75-G. The Dollar Sense of Using Leaded Steel. Gerald X. Diamond. Metal Removing, Nov. 1960, p. 15-18.

Machinability of alloy steels (30-35 Rockwell C) improved by the addition of 0.15-0.43% Pb. Increased cutting speeds, improved finishes and extended tool life with no adverse effects on mechanical properties of steel are attributed to the Pb addition. (G17k, 2-60; AY, Pb)

76-G. (French.) Possibilities of Local Heating in Bending Flats and Shapes. A. Heydacker. Pratique des Industries Mecaniques, v. 46, Aug. 1960, p. 200-205.

Expansion and contraction resulting from local heating and subsequent cooling of structural steel prior to bending operations. Examples, with sketches, of heating procedure and areas to be heated for bending sheet, plate, pipe, angle irons, U, T and I bars. (G6, F21b; ST, 4-57)

77-G. Chip Formation During the Turning Operation in the Presence of a Built-Up Nose. B. W. Shaffer. 3rd. U. S. National Congress of Applied Mechanics, Proceedings, 1958, p. 655-664.

Chip formation during turning, when some of the workpiece adheres to the base of the cutting tool forming a built-up nose, is analyzed as a plane strain problem of a perfectly plastic material. Expressions are also derived for the machining force and chip-thickness ratio. (G17a)

78-G. Disc Grinding the Right Way Saves Money. W. A. Fazioli. Mill & Factory, v. 67, Dec. 1960, p. 85-90.

Pressure, speed, angle and motion of the grinder and choice of lubricants. Abrasives and backup pads for effective disk grinding. Examples of tests performed on mild steel, stainless steel and aluminum samples. (G18; Al, Cn, SS)

79-G. Chipless Machining Goes Automatic. Ben C. Brosheer. American Machinist/Metalworking Manufacturing, v. 104, Nov. 14, 1960, p. 109-112.

Use of intraforming, a new chipless machining process in which rapidly pulsating forming dies squeeze the workpiece blank to the shape of the mandrel, to machine bore contours of starter motor clutch housings cold formed from 1018 steel blanks. (G23, T21b; ST)

80-G. Precision Forging Firm Develops Electrochemical Methods. American Machinist/Metalworking Manufacturing, v. 104, Nov. 14, 1960, p. 113.

Tungsten, Waspalloy and other very hard, tough and heat sensitive materials are drilled, trepanned and contour shaped electrolytically using new electrolytic equipment which maintains a high current density and forces a pressurized flow of electrolyte between the anode (work) and cathode (tool). (G24d; Co-b, W, SGB-q, SGB-r)

81-G. Forming of Magnesium Alloys. American Machinist/Metalworking Manufacturing, v. 104, Nov. 14, 1960, p. 145.

Hot forming of Mg alloys using a heat resistant drawing lubricant such as graphite. Data for forming characteristics of wrought Mg alloys. (G-general, 1-66; Mg-b)

82-G. Clearance for Cupping Dies. Ferenc J. Kuchta. American Machinist/Metalworking Manufacturing, v. 104, Nov. 14, 1960, p. 147.

Nomograph giving clearance to use with iron and steel, Cu, soft brass and Al sheets of various thicknesses. (G4c, W24n; Al, Cu-n, Fe, ST, 4-53)

83-G. (Translation-PERA.) The Effect of Cutting Heat on Turning Accuracy. I. G. Baskakov. Russian, Nov. 1959, p. 43-46.

Cutting tests on U7A and ST5 steels using ceramic, carbide and high speed tips, using the buried thermocouple method to measure cutter and workpiece temperatures. Effect of cutting speed, feed and depth on temperature deformation of the workpieces. (G17a, 2-61; ST)

84-G. Explosive Forming of Metal Plates. Australasian Manufacturer, v. 45, July 30, 1960, p. 36.

Explosive forming of 20 gage bright mild steel plate for the dome end of a pressure vessel using a mild steel die, pressure plate, vacuum pump and thin sheet metal cylinder. (G-general, NM-k34, T26q; CN, 4-53)

85-G. Cutting Fails With Chemicals. David Fishlock. Metalworking Production, v. 104, Nov. 30, 1960, p. 54-56.

Chemical milling of Cu, brass, phosphor bronze, beryllium copper, Ni, steels, Stalloy and Permalloy fails 0.010 in. or thicker using $FeCl_3$ solution as the etchant. (G24b; Co-b, Cu-b, Ni-b)

86-G. Hot Milling Superalloy Boosts Tool Life. Metalworking Production, v. 104, Nov. 30, 1960, p. 58-60.

Tool life tests on 4340 steel, Thermold J die steel and 17-7 PH and 17-4 Mo stainless steels at 950-1080° using carbide cutters to show the effectiveness of face milling at these temperatures. (G17b, 1-66; SGA-h, SS, TS)

87-G. How GMC Approached Cold Forming. F. Griffiths. Metalworking Production, v. 104, Nov. 30, 1960, p. 63-67.

Cold forming of steel billets to produce automobile engine components using a hydraulic press and a nearly closed die. (G-general, 1-67; ST, 4-52)

88-G. Electrochemical Machining at Economic Speeds. Metalworking Production, v. 104, Nov. 30, 1960, p. 68.

Contouring of hard tough metal forgings by an electrochemical machining process in which the work is positioned as the anode between conforming cathodes, electrolyte is pumped into the interelectrode spacings and a very heavy current is passed. (G24d; SGB-q, 4-51)

89-G. Machining in Miniature by Electron Beam. Machinery Lloyd (Overseas Edition), v. 32, Oct. 1960, p. 36-38.

Use of intense energy of a concentrated electron beam for drilling and milling metals or nonmetals. Design of drilling and milling machines. (G17, 1-52)

90-G. New Method Selected to Cut Tough Alloys. Metalworking, v. 16, Dec. 1960, p. 17.

Electrolytic maching of jet engine turbine blades made from heat resisting alloys such as S-816, Nimonic and Udimet 700. Blades are electroshaped to 0.003 in. tolerances in only 5-10 min. whereas this operation previously required 1-2 hr. by grinding. (G24d; Ni-b)

91-G. (Italian.) Practical Suggestions for Finish Machining of Rolling Mill Rolls. S. Sirio Leporatti. Macchine, v. 15, Sept. 1960, p. 795-805.

Grinding and superfinishing of rolls. Roll grinding machines and their characteristics; operating hints. Peripheral speeds of grinding wheel and roll, traverse speed, grinding wheel specifications, lubricants and coolants for various grades of ground finishes. Principal surface defects resulting from improper grinding practice and ways to avoid them. Superfinishing equipment. (G18k, G17, 1-52, W23k)

92-G. Why We Chose Roll Forming. Fred J. Emmons. Metalworking, v. 16, Dec. 1960, p. 72-73.

Fabrication of brake formed, cold rolled steel sheet for furnace casings. Casings are formed from sheet stock cut to the required size. The edges are roll formed. Roll formed lock strips in a variety of patterns are used to assemble the panels. Jigs and screws are almost completely eliminated. (G11; ST, 4-53)

93-G. (German.) Difficulties in Punching Thick and Hard Steel Sheets. G. Oehler. Werkstattstechnik, v. 50, Nov. 1960, p. 582-586.

Evaluation of proper cutting gap and analysis of deposits on punchers to eliminate defects such as crack formation in the steel sheet and stamping tool and incomplete punching. 14 ref. (G2j; ST, 4-53)

94-G. (German.) Threading With Automatic Lathes. H. Jager. Werkstattstechnik, v. 50, Nov. 1960, p. 600-608.

Processes and machinery for automatic threading by drilling, cutting and milling and by rolling. Selection of process and tool. Comparison of surface quality of rolled and cut threads. (G17f, G12, 1-52)

95-G. (French.) Electro-Erosion Machining. H. Robert. Societe Royale Belge des Ingenieurs et des Industriels, Revue, Sept-Oct. 1960, p. 420-434.

Theory of spark cutting. Design and operation of equipment and manufacture of Cu electrodes for electro-erosion cutting. Machining of hard metal cutting and forming tools; miscellaneous applications. (G24a; SGB-q)

96-G. Why Wait? Ceramics Are Practical Now. D. H. Joyce. Carbide Engineering, v. 12, Dec. 1960, p. 12-15.

Improvement in tool wear by use of ceramic tools instead of carbide in operations such as turning, facing and boring of cast iron , hardened and mild steels; improved finish and higher operating speed. (G17, T6n; CI, ST, NM-a34, 17-57)

97-G. Problems in Production. A. Incardona and H. H. Poett. Carbide Engineering, v. 12, Dec. 1960, p. 22-23, 25.

Tabular guide to machining operations for using throwaway carbides on various ferrous and nonferrous alloys; recommended speeds and feeds, depending upon type of cut, workpiece material and machine horsepower and rigidity. (G17, T6n; 4-69)

98-G. Screw Machine Work on Aluminum III and IV. M. Bryan Baker. American Machinist/Metalworking Manufacturing, v. 104, Dec. 12, 1960, p. 133-134.

Data sheets are presented for possible defects and corrective measures in drilling and counterboring including drill breakage and chipping of cutting edge; variation in chilled hole depth and size; hole eccentricity; roughness; poor finish and lack of tolerance maintenance. (G17; Al)

99-G. High-Velocity Metalworking Processes Based on the Sudden Release of Electrical Energy. H. J. Wagner and F. W. Boulger. Defense Metals Information Center, Battelle Memorial Institute, DMIC Memo. 70, Oct. 27, 1960, 13 p. (Available as PB 161220 from U. S. Office of Technical Services, Washington 25, D. C.)

Machining and forming methods in which a high-amplitude, short-duration current pulse is used to create an underwater shock wave, either by causing a spark to jump across a submerged spark gap or by exploding a submerged filament wire in the vicinity of the workpiece. In a third method, the current pulse produces a rapidly changing magnetic field in a coil. 27 ref. (G24a, G-general; NM-k34)

100-G. A Hot Tapper for Cold Headed Parts. Automatic Machining, v. 22, Dec. 1960, p. 45-46.

4000 pieces of cold headed steel nut blanks are tapped per hour by a modified four-spindle lead screw tapping machine with a 3.6 sec. cycle time. (G17f, T7f; ST)

101-G. Hot Turning Superalloy. Metalworking Production, v. 104, Nov. 23, 1960, p. 85-90.

Orthogonal turning tests performed at 73-1200° F. on tubes of 4340 and AM350 steel, Thermold J alloy and 17-7 pH and 17-4 Mo stainless steel to determine tool life, mechanical properties and surface finish of the workpiece and efficiency of metal removal. (G17a, Q-general; SS, ST, 4-60)

102-G. (English.) Correlation Among Experimental Values Obtained in Various Formability Tests. Shinji Fukui, Kiyota Yoshida and Kunio Abe. Institute of Physical and Chemical Research (Japan), Scientific Papers, v. 54, June 1960, p. 199-205.

Press forming tests on cold rolled mild steel sheets to correlate data for the limiting drawing ratio, limiting bulge depth and stretch-flangeability as indications of formability. (G4d, Q23q; CN, 4-53)

103-G. Don't Overlook Explosive Forming, It's Now Applied to Common Metals. Machine and Tool Blue Book, v. 55, Dec. 1960, p. 95-96.

Explosive forming of Ni and 20 Cb steel thrust chamber tubes to close tolerances. Application of process to Rene 41, Ti, stainless steel and Al alloys. (G-general; NM-k34, Al-b, Ni, SS, ST, Ti, 4-60)

104-G. New Electroshaping Process Machines Toughest Alloys. Machine and Tool Blue Book, v. 55, Dec. 1960, p. 106-111.

A new electrochemical shaping process machines hard, high-strength metals such as Waspalloy, W, Mo and stainless steel by passing direct current between the workpiece and an electrolyte causing surface atoms to dissolve into solution. (G24d; SGB-q, SGB-a, Mo, SS, W)

105-G. A Break-Through in Machining With Wide-Belt Coated Abrasives. Machine and Tool Blue Book, v. 55, Dec. 1960, p. 122-125.

Grinding of stainless steel strip in oil to exacting tolerances by an all-resin bonded cloth abrasive belt. (G18k, W25c; SS, 4-53)

106-G. Manipulation of Metals. Pt. 2. A. M. Cooper, A. A. Blanco, Melvin D. Verson and Hugo Moller. Metal Industry, v. 97, Nov. 11, 1960, p. 399-401.

Abstracts of papers presented at a conference at Brighton, England. Topics include basic features of the cold forging process; pressure economy in cold extrusion; the fluid-form process; tube-in-strip and associated products. (G-general, F22, 1-67)

107-G. Developments in Electrolytic Machining. Mechanical World and Engineering Record, v. 140, Dec. 1960, p. 501.

Single point grinding, carbide-tipped grinding, high-speed steel tool grinding and cavity sinking of tough materials using an electrolytic process. (G24d; SGB-a)

108-G. Tools and Methods for Drawing Sheet Metal. John Waller. Mechanical World and Engineering Record, v. 140, Dec. 1960, p. 514-519.

Methods for deep drawing, reverse drawing and necking down of Al, brass, Cu, steel, Sn and Zn sheets. Recommended values for drawing pressure and speed, blank size and amount of initial reduction. (G4; Al, Cu-b, ST, Sn, Zn)

109-G. (German.) Effect of MoS_2 on the Total Service Drilling Depth of Twist Drills. G. Polzin. Werkstatt und Betrieb, v. 93, Nov. 1960, p. 709-711.

Experimental drilling of 40 mm. thick plates of a steel containing 0.475-0.48% C, 0.18-0.22% Si, 0.51-0.65% Mo, 0.029-0.033% P and 0.015-0.020% S using alloy steel drills. Effect of drilling emulsions containing MoS_2 on the total depth achieved. (G17e, 18-73; Al, 4-53)

110-G. (Japanese.) Pressure Lubrication in Deep Drawing. Japan Society of Mechanical Engineers, Transactions, v. 26, Sept. 1960, p. 1290-1297.

Calculation of fluid pressure and control. Changes in pressure are related to deformation. (G4b)

111-G Belt Grinding... Assures Precision Gage of Strip. Tool and Manufacturing Engineer, v. 45, Dec. 1960, p. 79-80.

Stainless steel strip is produced to exacting tolerances required for space-age applications using abrasive belts resin-bonded with Al_2O_3 or silicon carbide abrasives. Tolerances of 0.00003 in. can be obtained. (G18, W25c; SS, 4-53)

112-G. Improving Reliability of Ground Parts by Avoiding Residual Stress. J. E. Price. Tool and Manufacturing Engineer, v. 45, Dec. 1960, p. 75-78.

To investigate the residual stress induced by grinding, specimens of Mn oil-hardening toolsteel are prepared to various levels of hardness. Stress is induced by grinding on a reciprocating table surface grinder. The amount and kind of stress is determined as a function of wheel grade, steel hardness and gut size by a deflection measurement technique. (G18, 3-66; TS, Mn)

113-G. Chemical Milling of Honeycomb Core Blanket. R. G. McCue. Tool and Manufacturing Engineer, v. 45, Dec. 1960, p. 60.

Chemical milling of honeycomb core composed of Rene 41, Ni alloy, hot work die steel and Ti alloy to fit contoured facing sheets. A plaster cast is made of the facing sheet surface, then a negative cast is formed from this and cured. The honeycomb core is pressed into the plaster cast which is then washed away from the exposed cell walls. (G24b; Co-b, Ni-b, Ti, TS, 4-57)

114-G. Unit Shear-Forms Big Cylinders From Small Preformed Blanks. Iron Age, v. 186, Dec. 29, 1960, p. 54-55.

Steel, stainless steel, aluminum or brass components for the Minuteman missile are cold extruded to desired wall thickness, mechanical properties and dimensional tolerance by a "Floturn" process using a single or dual-roller horizontal shear-forming machine at pressure of 70,000 lb. (G5, T24e; Al, Cu-b, SS, ST)

115-G. (Dutch.) Lead in Free-Cutting Steels. B. L. ten Horn and R. A. Schurmann. Metaalbewerking, v. 26, Oct. 13, 1960, p. 139-146.

Machining of steels containing 0.2-0.3% S and approximately 0.2% Pb and, for comparison, of steels without Pb. Correlation cutting speed, cutting depth, cutting force and Pb content. Favorable effect of Pb on the service life of cutting tools. 5 ref. (G17; ST, Pb)

116-G. The Machining of Steel. F. C. Lea and Eric N. Simons. Edgar Allen News, v. 39, Dec. 1960, p. 269-270.

Design and operation of a planer and lathe for roughing and finishing operations on steel. (G17, W25; ST)

117-G. Manipulation of Metals. Metal Industry, v. 97, Nov. 18, 1960, p. 419-421.

Techniques for forming metal by extrusion, explosive forming, precision and cold forging, rolling and sheet forming processes. (G-general)

118-G. Machining the Unmachinable. F. J. McGee. Tool and Manufacturing Engineer, v. 45, Oct. 1960, p. 79-82.

Pure tungsten, considered unmachinable except by grinding, is cut by SiC cutoff wheels and WC tools. Blanking and shearing of the metal at 500-700° F. (G17, G2; W-a)

119-G. Hot Roll Spinning Controls Wall Thickness. P. C. Sun. Tool and Manufacturing Engineer, v. 45, Oct. 1960, p. 93-94.

Diameter of Al shell is reduced while wall thickness is increased by hot roll spinning under conditions of high spindle speeds, controlled temperature and rapid transverse tool movement. (G13; Al, 4-59)

120-G. (German.) Explosion Working of Metals. R. M. Cavanaugh. Technische Mitteilungen, v. 53, Oct. 1960, p. 427-434.

Detonation characteristics of EL-506-A explosive material (pentaeritrol tetranitrate and binder), and application to metal processing including hardening of Hadfield's steel; compression of powders (graphite, MgO, Al_2O_3, TiC, WC, Ti, Nb, Fe, Ni, Cu); shaping of metals with water or air as buffer between die and explosive material; and metal to metal plating (e.g. stainless steel on ordinary steel plate). (G-general, H-general; NM-k34)

121-G. Cold Extrusion of Ferrous and Nonferrous Metals. R. Tilsley and F. Howard. Machinery (London), v. 97, Dec. 7, 1960, p. 1286-1293.

Extrusion of Al, Zn, Cu, Mg, Be, Mo, Sn, Pb, EC-60 steel, low carbon and toolsteel and nodular cast iron using high carbon, high Zr-Cr toolsteel punch and die. Yield stress and tensile stress of extruded material. 8 ref. (G5; Al, Be, Cu, CN, CI, Mo, Pb, Sn, TS, Zn)

122-G. Cold Forming of Steels. F. Griffiths. Machinery (London), v. 97, Dec. 7, 1960, p. 1315-1321.

Processes, requirements and economics of operations necessary to cold form steel. Production of pellets, solid and hollow billets and preforms. (G-general, 1-67; ST)

123-G. BeO at National. Ceramic Age, v. 76, Dec. 1960, p. 25-26.

Accurate and dust free methods of machining BeO, metal-ceramic combinations and high-purity Hf, Al and Th oxide shapes after fusion and ultrasonic cleaning. (G17, L10f; Al, Be, Hf, Th, 14-68)

124-G. Design Techniques for Metal Spinning. J. F. Whittingham. Design Engineering, v. 7, Jan. 1961, p. 25-27.

Forming of symmetrical metal shapes from disks of rolled sheet metal composed of Al, Cu and Ni alloys, low alloy and stainless steels, Ta, Mg, Mo and Ti. (G13; Al-b, AY, Cu-b, Mg, Mo, Ni-b, SS, Ta, Ti, 4-53)

125-G. Longer Machining Time. Metal Removing, v. 5, Dec. 1960, p. 7-9.

Bronze castings are poured with excess metal, with the excess, containing most of the defects, being machined

away. This procedure results in fewer rejects than attempting to produce a perfect casting directly. (G17; Cu-b, 5)

126-G. Belt Grinding Development Scores Major Breakthrough in Stainless Steel Production. C. C. Porter. Grits and Grinds, v. 11, Oct. 1960, p. 11-15.

Grinding of cold rolled stainless strip to remove high crown and improve surface finish with vertical grinders using resin bonded belts with Al oxide or Si carbide as the cutting medium. Surface profile and thickness are measured by X-ray gage. (G18; SS, 4-53)

127-G. Electrochemistry Machines A 286. Warner W. King. American Machinist/ Metalworking Manufacturing, v. 104, Dec. 26, 1960, p. 61-62.

A cavity-making machine operating on the electrolytic process in which electrodes are used as tools and there is a continuous electrolytic flow is used to machine turbofan blades made integrally with the buckets of the machine and composed of A 286 superalloy. (G24d, T7h; SGA-h)

128-G. How to Machine Steels Hardened to 50 Rc. American Machinist/ Metalworking Manufacturing, v. 104, Dec. 26, 1960, p. 64.

Machinability of superalloys 4340 and Vasco Jet 1000 hardned to Rockwell 50. Recommendations for cutting and tool geometry. (G17k; SGA-h)

129-G. Roll-Forming Stainless Ceilings. American Machinist/ Metalworking Manufacturing, v. 104, Dec. 26, 1960, p. 66-67.

Mass production system for the manufacture of structural shapes used in assembling 800,000 sq. ft. of luminous ceiling. Roll forming, cutting, piercing and polishing methods. (G11, F22h, L10b; SS, 4-57)

130-G. Keyslotting Tool for Extra Large Castings. Chris J. Toonen. Machinery, v. 67, Jan. 1961, p. 140.

Design of a circular keyseating cutter rotated by a drilling-machine spindle and used to cut keyways in large 1020 steel castings. (G17c; ST, 5)

131-G. (Japanese.) Transitional Phenomena in Metal Cutting. Japan Society of Mechanical Engineers, Transactions, v. 26, Sept. 1960, p. 1216-1222.

Development of an equation to represent the transition of friction angle between the chip and the tool face at the beginning of cutting. Equations relate friction angle to cutting forces, cutting ratio and contact length of chip. (G17)

132-G. Forming of Magnesium Alloys. Metalworking Production, v. 104, Dec. 14, 1960, p. 75.

Hot forming of wrought Mg alloys at 360-650° F. using a heat resistant drawing lubricant such as graphite. Graphs are given to show minimum metal thickness and minimum vertical corner radius as a function of depth of draw. Tables give minimum radii for 90° bend in tubing and forming characteristics of wrought Mg alloys. (G-general, 1-66; Mg-b)

133-G. Impact Extrusion Added to B & P Services. Magnesium Products, Nov. 1960, p. 3.

Extrusions of 2011, 2024 and 7075 Al alloys, Mg alloys, carbon steel, oxygen-free Cu, brass alloys and Ti at Brooks & Perkins, Inc. Advantages of the process. (G5; Al-b, Mg-b, CN, Cu, Cu-n, Ti)

134-G. Chemical Milling. C. Conner Shepherd. Paper from "American Electroplaters' Society, Technical Proceedings", 1960, p. 51-54.

Review of applications, etchants and maskants. Although the process was initially restricted to Al it is now successfully applied to Mg, steel, Ti and Mo. Materials once considered impossible to mill in acid solutions, such as the 300,000 psi. low alloy steels, can now be successfully processed by chemical milling. 4 ref. (G24b)

135-G. Practical and Economic Problems of Machining Cavities by Spark-Erosion. W. Ullman and T. G. Traube. Metal Treatment and Drop Forging, v. 27, Dec. 1960, p. 493-501.

Requirements for machining molds and dies. Examples of applications. (G24a)

136-G. Hot Machining. Which Heat Source Is Best? Metalworking Production, v. 104, Dec. 7, 1960, p. 84-87.

High-frequency induction heating is satisfactory for controlling and maintaining heat but is limited in the extent of concentration. Radio-frequency resistance heating can localize and control heat without many of the disadvantages of induction, flame or arc heating. (G17)

137-G. Hot Dimpling With Electronic Temperature Control. Metalworking Production, v. 104, Dec. 7, 1960, p. 88-89.

Dies are electrically heated with the temperature being controlled by a built-in thermocouple. The dimple cannot be completed until the metal has been heated to the correct temperature to insure the desired ductile state. (G3)

138-G. CO_2 Coolant Makes Stainless Steel Behave. E. C. Hall. Metalworking Production, v. 104, Dec. 7, 1960, p. 91-93.

Use of CO_2 as a coolant in routing and milling operations on a high and ultra high tensile steels particularly those in the 86-120 ton range. The only heat not extracted by the CO_2 remains in the chips. (G17; NM-h, SS)

139-G. What Electrochemical Machining Can Do. David Fishlock. Metalworking Production, v. 104, Dec. 7, 1960, p. 94-98.

The four primary applications are superfinishing, deburring, grinding and contouring. Examples, applications and limitations of the removal of metal by electrolytic dissolution. (G24d)

140-G. Electrochemical Machining--What It Can Do. David Fishlock. Metalworking Production, v. 104, Dec. 21, 1960, p. 53-58.

Electrolytic contouring and gravity sinking of superalloys, nimonics, tungsten and Mo. Economic rates of cut have now been attained. (G24d; Ni-b, W, Mo)

141-G. Hot Machining. Pt. 4. Metallurgical Effect of Hot Machining. Metalworking Production, v. 104, Dec. 21, p. 60-63.

Tests on 4340 steel, Thermold J, 17-7 Mo and 17-7 PH stainless steels. No detectable change is observed in microstructure, but tempering, which varies with the material and duration of heating occurs when the tempering temperature is exceeded. Surface finish is as good as, or better, at elevated temperatures than at room temperature, although some surface oxidation takes place at the higher temperatures. (G17; SS)

142-G. Cold Heating and Cold Extrusion of Wire. J. C. McMurray. Wire and Wire Products, v. 35, Dec. 1960, p. 1649-1652.

Forward and backward extrusion and upsetting of mild steel wire to produce rivets, slugs, bolts and screws, using strain gages to measure tooling loads and working pressures. Lubrication is by mineral oil, sulphur and phosphate coatings. (G10, G5)

143-G. Are You Losing on Diamond Dressing? Christopher H. Hill, Sr. Grinding and Finishing, v. 6, Dec. 1960, p. 19-21.

Criteria for selection of diameter and process parameters for achieving maximum wear in dressings and truing grinding wheels, including turning, adjustment to proper drag angle and proper use of coolants. Rules for proper lapping procedure, including choice of abrasive grain, lap, speed and pressure. (G18; NM-k37)

144-G. Using Full Grinding Power Increases Belt Efficiency. H. L. Weisbecker. Grinding and Finishing, v. 6, Dec. 1960, p. 22-25.

A planned method for increasing the horsepower used on an abrasive belt grinder as the belt wears. Application in grinding stainless steel and Ti sheet to demonstrate increases in belt efficiency and rate of production. (G18, W25c; SS, Ti, 4-53)

145-G. What Are the Grinding Characteristics of Tool Steels? John A. Mueller. Grinding and Finishing, v. 6, Dec. 1960, p. 30-32.

Summary of the machinability of high speed, cold work, shock resisting, hot work, water hardening and low alloy toolsteels in terms of ease of metal removal, finishing and form generation and resistance to checking and cracking. Optimum grinding conditions for each type, including speed, feed, grinding fluid, size and shape of the material ground and size and type

of the grinding wheel. (G18, 17-52; TS)

146-G. While Carbide Tool Use Increased, Tool Room Grinding Cost Decreased. Grinding and Finishing, v. 6, Dec. 1960, p. 40-41.

Use of electrolytic methods for grinding carbide tools to decrease wear on the grinding equipment and allow complete processing in one operation on one machine. (G24, T6n; 6-69)

147-G. Machining Thermal-Resistant High-Strength Materials. Pt. 2. Western Machinery and Steel World, v. 51, Dec. 1960, p. 32-35.

Operation and design of a surface grinder and a skin mill converted to electrolytic machining and electrical spark discharge cutting of stainless steel honeycomb care used in aircraft structures. Testing of the machines to determine the maximum removal rates and current requirements. (G24, T24; SS, 4-57)

148-G. (Czech.) Flame Cutting of Low Carbon Self-Hardening Steels. J. Maly, V. Janosikova and K. Mazanec. Zvaracsky Sbornik, v. 9, Mar. 1960, p. 325-344.

Low alloy openhearth steel containing Ni, Mo and Cr is cut with a neutral oxy-acetylene flame. Effect of cutting on structure, composition and microstress is studied by micrographs, spectrography and back-reflection X-ray diagrams. 14 ref. (G22g; CN-g)

149-G. (Russian.) Improvements in Stamping of Automobile Parts and Deformability of Sheet Steel. V. M. Chirkin. Kuznechno-Shtampovachnoe Proizvodstvo, Mar. 1960, p. 8-10.

Prevention of stamping defects by selection of steel sheets of proper grain size, yield point, elongation, tensile strength and hardness. Results of tests on defect control with stamping of large numbers of automobile parts of steel of various mechanical properties. 4 ref. (G3, Q-general, T21; ST, 4-53)

150-G. British Developments in Explosive Forming. W. S. Hollis. Metalworking Production, v. 104, Nov. 9, 1960, p. 78-80.

Mechanical testing of explosively formed mild steel components to determine tensile strength, elongation and hardness. Methods of controlling direction and application of the impulsive force in explosive forming. (G-general, Q27a, Q23p, Q29n; NM-k34, CN)

151-G. Broaches Yield Tight Finishes. Iron Age, v. 187, Jan. 12, 1961, p. 65.

Strip broaching of wrist-pin bushing-assembly holes in forged steel connecting rods to tolerances of 0.0007 in., using broaches with a straight-line push of 4700 lb. (G17d, T21c; ST, 4-51)

152-G. (French.) Testing for Definition of Drawability. J. Pomey, A. Royez and P. Dhez. Memoires Scientifiques de la Revue de Metallurgie, v. 57, Oct. 1960, p. 741-754.

Use of simple tension, biaxial hydrostatic tension, compression and cupping tests to determine drawability of steel sheet for auto body parts, choice of test depending on the shape of the part. Test procedures and evaluation of results. (G4, 17-52, Q-general, T21a; ST, 4-53)

153-G. (German and French.) Finish Machining of Light Metals With Diamond-Tipped Tools. P. Frey. Aluminium Suisse, v. 10, Nov. 1960, p. 287-289.

Final turning or milling with diamond tools eliminating need for conventional final polishing operation. Work norms; types of diamond tools and work they perform, including decorative, on Al alloys. (G17a, G17b; Al-b, EG-a39, NM-k37, 17-57)

154-G. Pressure Economy--A Review of Extrusion Techniques. Melvin D. Verson. Wire Industry, v. 27, Nov. 1960, p. 1091-1095.

Cold extrusion of low carbon steel, boron steels and steel of the 4600, 5000, 5100 and 8600 series. Pressures of 180,000-400,000 psi. are obtained using a new lubricant consisting of a $Zn_3(PO_4)_2$ crystalline deposit coated with Zn stearate soap. (G5, 18-73; CN, ST, B)

155-G. (Russian.) Stamping of Large Elliptical Bottoms (Bilges). L. S. Amarian and B. L. Muravich. Kuznechno Shtampovochnoe Proizvodstvo, June 1960, p. 40.

Stamping large bottoms for tanks using a hydraulic press. Influence of the

diameter to thickness rates of the ellipsoid bottom on its strength at 800-900° C. Relationship between temperature and applied pressing force during the deformation. (G3, Q27a, T26q; ST)

156-G. (German.) Shaping Techniques for Large-Size Light Metal Forgings in the USA. E. Kursatz. Industrie-Anzeiger, v. 82, Nov. 22, 1960, p. 1615-1622.

Production of high precision aircraft parts up to 1360 kg. on 7200-50,000 ton presses by one and multistep forging. Chemical composition and mechanical properties of Al forging alloys. Processing of forgings by machining and deep etching. (G17c, M20q; Al, 4-51)

157-G. (Russian.) Using Explosive Energy for Metalworking. V. H. Kononenko. Kuznechno Shtampovochnoe Proizvodstvo, July 1960, p. 1-4.

Use of explosive energy from gaseous, liquid and powdered mixtures for shearing, stamping, pressing, forging, bending and piercing heavy metal blocks and slabs. Methods of controlling the supply of explosives to the combustion chambers or cylinders. (G-general, NM-k34; 4-52)

158-G. (Russian.) Stamping of Connecting Rods for Automobiles. H. S. Zaykovsky, M. I. Dytynenko and I. A. Fomenko. Kuznechno Shtampovochnoe Proizvodstvo, July 1960, p. 15-17.

Continuous production of connecting rods from 45 steel blanks by heating, reducing on a roll-forging machine and stamping on a crankshaft press. (G3, F22, T21b; ST)

159-G. (Russian.) Effect of Ultrasonic Vibrations on the Maching of Heat Resistant Alloys. A. A. Voronin. Stanki i Instrument, Nov. 1960, p. 15-17.

Application of ultrasonic vibration during surface grinding and cutting of U8A and R18 steels and Ei437B, EB60S2K and EB60SMIK alloys to reduce cutting temperature and eliminate roughness and cracking on the surface. (G24c; ST, SGA-h)

160-G. Spline and Thread Rolling. John Arnold. Wire Industry, v. 27, Dec. 1960, p. 1205-1208.

Production of steel precision threads and splines requiring no further finishing at 20° C. by cold working under compressive forces. Material is forced to flow upward within the die space to form the upper portion of the teeth. (G12, 1-67; ST)

161-G. Processing and Painting Aluminum Siding. Louis Hirsch. Industrial Finishing, v. 37, Jan. 1961, p. 22-24, 26.

Pretreatment, priming, enameling, baking and roll forming of coiled Al strip to produce siding, window channels, starter strips and inside corners. (G11, L26n; Al, 4-53)

162-G. Improving Diamond Wheel Performance in Electrolytic Machining. Tool and Manufacturing Engineer, v. 46, Jan. 1961, p. 80-82.

Selection and maintenance of diamond wheels for electrolytic maching, a process in which a low-voltage current passes through a conductive fluid flowing between the workpiece and the wheel. Diamond particles act as insulators and spacers and do not actually cut metal. (G24d, W25c)

163-G. Turning Hardened Tool Steels With Ceramic Tools. Fenton L. Bagley, Jr. Tool and Manufacturing Engineer, Jan. 1961, p. 99-101.

Use of tools designed with large negative rakes to cut Mn toolsteel and other extremely hard materials at high speeds. This geometry minimizes initial breakdown, strengthens cutting edge and improves tool life. (G17a, T6n; TS)

164-G. Improving Tap Life. Tool and Manufacturing Engineer, v. 46, Jan. 1961, p. 117-118.

Relationships between chip load and chamfer angle and between tool life and thread height are calculated for high speed steel taps cutting high strength alloys such as Rene 41, S-816, 4340 steel and Ti. (G17f, T6r; Co-b, ST, Ti, SGB-a)

165-G. New Ways of Cutting Metals. D. Fishlock. New Scientist, v. 8, Dec. 8, 1960, p. 1535-1537.

Shaping of modern high-duty alloys composed of Al, Cu and W by etching with chemical fluids. Different machining processes are done also by electrolysis, spark erosion, controlled explosive forming, spark forming by a focused electron beam and plasma arc torch cutting at a temperature of 17,000° C. (G24; Al-b, Cu-b, W-b)

166-G. (Russian.) Surface Quality of Parts Produced by Flow Turning. V. G. Kononenko. Kuznechno-Shtampovochnoe Proizvodstvo, Feb. 1960, p. 11-13.

Surface quality as affected by lubrication, composition of tool and material, rate of the tool feed, thickness of product, hardness of the tool and process parameters. (G17a)

167-G. The Impact Methods of Extrusion. Claude E. Pearson and Redvers N. Parkins. Chapter from "Extrusions of Metals", 2nd Edition. John Wiley & Sons, Inc., New York, N. Y., 1960, p. 297-318.

Preparation of cold blanks for high pressure, high velocity, explosive impact extrusion of metal tubing without rupture. Method is largely employed in extruding soft Al, Zn and Mg. (G5; Al, Mg, Zn)

168-G. Cold Extrusion of Small Symmetrical and Asymmetrical Components. O. May. Machinery, v. 97, Dec. 14, 1960, p. 1375-1380.

Mathematical determination of extrusion parameters for forward or backward extrusion processes in which the material flow is simultaneously at right angles to the tool axis and also parallel or at some other angle to it. (G5)

169-G. Cutting and Coolant Oils. Australasian Manufacturer, v. 45, Nov. 19, 1960, p. 60-61, 64-65.

Viscosity of cutting oils for machining brass, bronzes and high tensile steels. Use and effect of extreme pressure additives such as sulphur and sulphur compounds, phosphorus compounds and chlorinated hydrocarbons. (G17, 18-73; Cu-b, ST)

170-G. Sulphur Aids Copper Machining. E. E. Frisk. Iron Age, v. 187, Jan. 25, 1961, p. 74-75.

Mechanical and physical properties of Cu alloys containing 0.3% fine, high-purity sulphur. Sulphide particles dispersed through the Cu matrix produce short chips that give good machinability. (G17k, Q-general, P-general; Cu-b, S)

171-G. How CSF Produces Quality Turbine Blades. M. Novak. Canadian Metalworking, v. 23, Dec. 1960, p. 43-45.

Casting, shot blasting, heat treatment and flame cutting of steel turbine blades with variations between gage and turbine blade checked at 200 points to maintain 1/16 in. tolerance. (G22g, L10c, J-general, T7h; ST, 5)

172-G. Jet Engine Hot Parts Cleaned by Peening. Canadian Metalworking, v. 23, Dec. 1960, p. 46-47.

Chemical cleaning of jet turbine blades by glass bead blasting to increase fatigue life 20-75% and obtain an improved surface finish which simplifies defect detection. The layer of cold worked metal produced at the surface of the blades is in a state of residual compression which affects the tensile stress, thus retarding fatigue cracking. (G23n, T7h, T24b)

173-G. The Electroshaping Process. Charles L. Faust. Modern Machine Shop, v. 33, Jan. 1961, p. 122-127.

Electrochemical machining of high-temperature, high-strength alloys by a new process in which metal workpiece and another conductor are submerged in a chemical solution connected to a d-c. source. (G24d; SGA-h, SGB-a)

174-G. Sawing by Electro-Erosion. Metalworking Production, v. 104, Dec. 28, 1960, p. 57-59.

Design of electro-erosion sawing machines using a rotating disk as the electrode and cutting element. Machines are used for cutting bars and sections of high tensile alloy steels, stainless steels, heat resisting and magnetic alloys. (G24a; SGA-h, SGA-n, SGB-a, AY, SS)

175-G. 30 Ft.-Bed Press Blanks Transformer Core Plates. Metalworking Production, v. 104, Dec. 28, 1960, p. 60-61.

Cutting and piercing transformer core-plates on a specially designed press. (G17, G2j; SGA-n)

176-G. Breakthrough in Mold-Making Electro-Erosion. Frank Jacques and Joseph Schmidt. Modern Plastics, v. 38, Dec. 1960, p. 109-114, 196-197.

Electrical discharge machining of mold cavities of high precision in steel hardened to Rockwell 60. Relationship between current and frequency of erosion arc. Rate of material removal and surface finish. (G16, G24a; ST)

177-G. Spark Erosion Machining of Mold Cavities. Kenneth Birch. SPE Journal, v. 16, Dec. 1960, p. 1311-1312.

Methods in diemaking using brass electrodes having a wear ratio of 3:1 for machining square, rectangular, triangular, half round and oddly shaped die steel or carbide cavities. (G24a; TS, 6-69)

178-G. Higher Quality, Half the Cost of Lathe Work. Grinding and Finishing, v. 7, Jan. 1961, p. 15-17.

Requisite conditions for use of grinding instead of turning. Case study provides data for locating break point between the two processes. (G18, G17a)

179-G. Fittings Are Hot Formed From Seamless Tubing. Steel, v. 148, Jan. 23, 1961, p. 56-58.

Bends from 45-180° are formed in cut lengths of seamless steel tubing on a forming mandrel to produce welding fittings with closely controlled size and uniform wall thickness. Heavy duty lathes level and face ends in preparation for welding. (G6, 1-66; ST, 4-60)

180-G. (Dutch.) Spark Machining of Forging Dies and Stamping Punches. Thomas G. Traube. Metaalbewerking, v. 26, Nov. 11, 1960, p. 187-193.

Dependence of the spark length on the electrode and workpiece composition and the applied voltage. Importance of the rigidity in the apparatus-electrode system for the precision of work. Manufacture of Cu electrodes by forging, extrusion, casting, metal spraying and sintering. (G24a, W22a, W24p; ST)

181-G. Computer Controlled Oxygen-Cutting Machine. Welding and Metal Fabrication, v. 29, Jan. 1961, p. 22.

Automated oxygen-cutting used in profiling steel plate for ship construction. Tape controlled heads cut two plates at once, each up to 40 ft. long by 12 ft. wide and up to 3 in. thick. (G22g, T22g; ST, 4-53)

182-G. (German.) Experiences With L-D Steel in Wire Production. Erwin Fogy and Ottokar Kramer. Berg- und Huttenmannische Monatshefte, v. 105, Nov. 1960, p. 261-268.

Comparison of mechanical properties and resulting drawing behavior number of necessary intermediate annealing operations, cross section reduction, drawing rate and die wear in wire drawing of L-D, openhearth and basic Bessemer steel. (G4, 17-52, Q-general, 2-64; ST)

183-G. Tape Slashes Hole Costs on Structurals. Steel, v. 148, Feb. 6, 1961, p. 76.

Drilling structural members composed of high strength, low alloy heat treated steel using a tape controlled, beam and column machine. (G17e, 18-74; SGB-s, AY)

184-G. Explosives in Metal Working. R. E. Leyman. Machinery Lloyd (Overseas Edition), v. 32, Nov. 19, 1960, p. 41-44.

Underwater forming of sheet Al and steel with high explosives. Shock hardening of metals not suitable for rolling, especially austenitic manganese steel. Discussion of metallurgical effects. Advantages and disadvantages of these methods. (G-general, NM-k34; Al, SS, 4-53)

185-G. New Approaches to Machining. Wm. Pentland, W. L. Carr and R. L. Vaughn. Aircraft Production, v. 22, Dec. 1960, p. 456-463.

Machining of various steel alloys, especially 4340 steel, at elevated temperatures, at low temperatures with subzero coolants and at ultra-high speeds. Effects of these techniques on tool life, mechanical properties of the products, rate of metal removal and machinability. (G17, 1-66, 1-67; AY)

186-G. Explosive Forming. W. S. Hollis. Aircraft Production, v. 22, Dec. 1960, p. 446-451.

Observation on FV. 520 steel, N75 steel and Ti alloy steel to determine stress/strain, stress/time and strain/time relationships, as well as tensile characteristics of test pieces subjected to explosive forming. 8 ref. (G-general, NM-k34, Q25; AY, ST, Ti)

187-G. (Czech.) Anisotropy of Deep Drawing Sheet. S. A. Valijev. Strojirenstvi, v. 10, Nov. 1960, p. 842-846.

Cylindric cups are deep drawn from steel sheet, brass sheet, Al sheet and steel strip. Variation of wall thickness caused by anisotropy of the starting material. 6 ref. (G4b, 3-72; Al, Cu-n, ST, 4-53)

188-G. Extrusion of Hard Alloys. A. B. Graham. Metal Industry, v. 97, Dec. 30, 1960, p. 535-538.

A new method of producing extruded products using less unit pressure and a single stroke operation as compared to the old method of using steadily increasing pressure and repeated blows. Reference is also made to coating of metal cylinders with another metal by extruding both the cylinder and the coating. (G5; SGB-q)

189-G. Mechanics of Explosive Forming. Metalworking Production, v. 104, Nov. 16, 1960, p. 75-78.

Relative absence of springback and work hardening during explosive forming is explained in terms of the uniformity of applied stress. (G-general, NM-k34)

190-G. (English.) Plastic Flow of Chips in Steel Cutting. Keiji Okushima and Katsundo Hitomi. Bulletin of JSME, v. 3, Nov. 1960, p. 556-560.

Effect of rake angle, cut depth and cutting angle on chip structure, cutting ratio, thickness ratio and orientation angle are interpreted in terms of a flow region. (G17; ST)

191-G. Forming Techniques for Titanium Alloys. J. Pody. Metal Industry, v. 98, Jan. 6, 1961, p. 3-6.

Hand binding, brake pressing, furnace heating followed by power pressing on a cold tool and electric resistance heating with subsequent brake pressing are outlined as methods for hot and cold forming of 318A and 011 Ti alloys. Data are given for effect of heat treatment on mechanical properties. (G-general, Q-general, 2-64; Ti-b)

192-G. Plasma Flame Cutting of Mild Steel Seen as Competitive With Oxy-Fuel Process. Herman C. Phelps. Welding Engineer, v. 45, Dec. 1960, p. 33-36.

Flame cutting carbon and stainless steel, Al, Cu and its alloys, W, Mo and other difficult to cut materials, using a plasma torch which produces a high-velocity jet through arc heating of gas. The heated gas expands as it leaves the torch nozzle, achieving velocities of thousands of feet per sec. (G22g; Al, CN, Cu-b, Mo, SS, W)

193-G. Machine Tools: The Importance of Climb Milling. J. H. Meehan. Machine and Tool Blue Book, v. 55, Jan. 1961, p. 81-83.

Comparison of conventional and climb milling as to need for deburring, tendency of cutter to hold work down and rotation of cutter and its effect during cutting of castings with a hard scale. (G17b)

194-G. Tracer Machining Beryllium. Lincoln S. Magor. Modern Machine Shop, v. 33, Feb. 1961, p. 130-133.

Tracer turning of Be using hydraulic tracer attachments for use with engine lathes and vertical turret lathes. (G17a; Be)

195-G. Electrical Discharge Machining Cuts Die Production Costs. Modern Machine Shop, v. 33, Feb. 1961, p. 144, 146.

Electrical discharge machining is used to produce slots in precision piercing dies composed of high-speed steel. (G24a, T6r; TS-m)

196-G. (German.) Cold Extrusion Die With Hydraulically Controlled Back Pressure on Both Sides. G. Oehler. Werkstatt und Betrieb, v. 93, Dec. 1960, p. 782.

Design and operation of a die which provides uniform material flow during cold extrusion of nonferrous metals and steel in varying cross sections. (G5, W24n; ST, EG-a38)

197-G. Chipless Machining--What It Is and What It Is Not. Charles H. Wick. Chapter 1 from "Chipless Machining". Industrial Press, New York, 1960, p. 1-9.

Brief cost analysis and description of chipless cold working processes applicable to steel. (G-general, 1-67; ST)

198-G. Metallurgical Considerations of Plastic Deformation. Charles H. Wick. Chapter 2 from "Chipless Machining". Industrial Press, New York, 1960, p. 10-33.

Simplified metallurgical description relating to the cold plastic forming of steel by various chipless production processes. Data are given for stress-strain relationships, crystalline structure of metals and effects of alloying elements in steel and cold working on yield strength. 22 ref. (G-general, 1-67, Q24, Q25n, Q23b, M27; ST)

199-G. Cold-Heading. Charles H. Wick. Chapter 3 from "Chipless Machining". Industrial Press, New York, 1960, p. 34-71.

Description of cold heading, a process for manufacturing bolts, screws and rivets in which metal is gathered in certain sections along lengths of wire or rod stock by causing the metal to plastically flow between dies without preheating. 10 ref. (G10, 1-67, T7f)

200-G. Thread-Rolling. Charles H. Wick. Chapter 4 from "Chipless Machining". Industrial Press, New York, 1960, p. 74-113.

Economical method for production of close-tolerance fasteners in which a cylindrical blank is rotated between dies with the reverse contour of the thread form specified on reciprocating, hand-fed or planetary machines. Production rates and design information are given for rolling of carbon and stainless steels. 10 ref. (G12, T7f; CN, SS)

201-G. Rolling of Serrations, Splines and Gears. Charles H. Wick. Chapter 5 from "Chipless Machining". Industrial Press, New York, 1960, p. 115-144.

Advantages and applications of two new cold working processes for manufacturing toothed parts, the Roto-flow process in which workpieces are held between centers and rolled to a full depth in a single pass of a pair of traversing, rack-type forming tools and the Grab process in which a pair of identical, opposed, planetary rollers repeatedly and simultaneously contact a rotating cylindrical blank. 7 ref. (G-general, 1-67, T7a)

202-G. Cold Extrusion of Steel. Charles H. Wick. Chapter 9 from "Chipless Machining". Industrial Press, New York, 1960, p. 257-278.

Development, advantages, limitations and applications of cold extrusion, a process performed at low enough temperatures so that metal never reaches the recrystallization temperatures. Effect of process of the physical properties. 16 ref. (G5; ST)

203-G. Selecting Materials and Designing Parts for Cold Extrusion. Charles H. Wick. Chapter 10 from "Chipless Machining". Industrial Press, New York, 1960, p. 279-293.

Work hardening, structural tensile and physical properties of steels as they affect cold extrusion. Design of parts. Comparison of cold extrusion processes with stamping and drawing. (G5, Q23a, Q27a, P-general; ST)

204-G. Applications of Cold Extrusion. Charles H. Wick. Chapter 11 from "Chipless Machining". Industrial Press, New York, 1960, p. 294-330.

Applications of cold extrusion to production of cartridge cases, shells, rocket heads, other ordnance equipment and automotive components. (G5, T2, T21)

205-G. Production of Slugs and Secondary Operations. Charles H. Wick. Chapter 12 from "Chipless Machining". Industrial Press, New York, 1960, p. 331-346.

Blanking, sawing, cutting-off, shearing and cold heading as cold extrusion processes for producing steel slugs. Description of secondary operations including ironing, machining and annealing. Economic considerations. (G5; ST)

206-G. Phosphate Coating and Lubricating for Cold Extrusion. Charles H. Wick. Chapter 13 from "Chipless Machining". Industrial Press, New York, 1960, p. 347-366.

Use of zinc phosphate coatings as lubricants during cold extrusion of steel. Vapor and alkali degreasing, pickling and rinsing of slugs prior to coating. Comparison with Cu or Pb coatings. (G5, 18-73, L14b; ST, Zn)

207-G. Explosive and Other High-Energy-Rate Forming Methods. Charles H. Wick. Chapter 16 from "Chipless Machining". Industrial Press, New York, 1960, p. 435-485.

Explosive, shock wave and gas pressure forming methods as applied in aircraft and missile industry on high-temperature, high-strength materials. Data are given for critical impact velocity and formability and work hardening capacity of materials. Tooling for explosive forming. (G-general, NM-k34; SGA-h, SGB-a)

208-G. Quenched Arc Process Cuts Honeycomb Foil at High Rate. Machinery Lloyd (Overseas Edition), v. 32, Dec. 3, 1960, p. 36-37.

Electro-band machine utilizes quenched arc for cutting Al, Zr, Ti and stainless steel honeycomb and other thin, difficult to support materials. (G22h; Al, SS, Ti, Zr, 4-57)

209-G. Phosphating Aids Cold Extrusion. R. F. Drysdale. Mass Production, v. 36, Nov. 1960, p. 86-90.

Use of phosphate coatings for lubricating carbon and alloy steel blanks during deep drawing, cold shaping and cold extrusion operations. (G5, G4b, G17c, 1-67, 18-73)

210-G. H-11 Ultra-High Strength Steel Finds "New Look" in Supersonic B-70 Bomber. Nat Wood. Western Metalworking, v. 19, Jan. 1961, p. 19-22.

Fabrication of structural aircraft components from H-11 toolsteel (5% Cr), with description of machining, Tig welding and heat treatment operations. (G-general, K1d, J-general, T24a; TS)

211-G. Accuracy of Milled Surfaces. Pt. 1. Effect of Cutter Diameter, Number of Teeth, Runout and Feed. Metal Cuttings, v. 9, Jan. 1961, p. 2-11.

Influence of tool geometry and cutting variables on the tooth path cusp height, surface accuracy and surface profile in conventional and climb milling of mild steel. (G17b, CN)

212-G. Blank and Forming Can Lids and Drum Ends. John Waller. Australian Machinery and Production Engineering, v. 13, Dec. 1960, p. 29-31.

Blanking and forming steel plate and strip with a single press stroke using a compound tool consisting of forming punch, die and rubber pad. (G2h, G-general; ST, 4-53)

213-G. Forming Techniques for Titanium Alloys. J. Pody. Metal Industry, v. 98, Jan. 13, 1961, p. 27-28.

Cold forming, stretch forming, blast descaling and chemical cleaning of Ex. 011 and 318A Ti alloy. Flatness requirements for sheet materials. (G-general, 1-67, L10c, L12; Ti-b)

214-G. Electro-Machining Beryllium. Metalworking Production, v. 105, Jan. 25, 1961, p. 56.

Electrical discharge machining of Be by a process in which the work is the anode and a spark is created between it and the cathode, the latter being a low-density tungsten electrode infiltrated with Ag. Trepanning techniques as a means of salvaging Be as solids rather than chips. (G24a, G19r; Be)

215-G. Pot Broaching Produces External Forms. James R. Cypher. Metalworking Production, v. 105, Jan. 25, 1961, p. 59-62.

Cast iron clutch plates for automatic transmissions are machined by pot broaching, a technique using a heavy steel shell (pot) fitted with broaching tools that cut on the periphery of the part and complete irregular surfaces such as gear teeth in one stroke. (G17d, T21b; CI)

216-G. Quenched Arc...the Latest Way to Cut Honeycomb. Metalworking Production, v. 105, Jan. 18, 1961, p. 65-66.

Cutting of stainless steel, Ti or Al honeycomb by a quenched arc which is generated by a band electrode and suppressed by sprayed coolant. (G22h; Al, SS, Ti, 4-57)

217-G. Reversing of Heat-Treat Cycle Trims Machining Costs. W. J. Lavigne. Iron Age, v. 187, Feb. 9, 1961, p. 114-116.

Manufacture of gun components in the yield-strength range 160,000-190,000 psi. from forgings and castings of 240 Bhn by a cycle in which machining comes first and heat treatment later. An immersion heat treatment reduces distortion while maintaining the as-machined surfaces in their original condition. (G17, J-general, T2m; SGB-a, 4-51, 5)

218-G. New Methods Pace Tool Design. Iron Age, v. 187, Feb. 9, 1961, p. 118-119.

Techniques for machining with positive angles, single pass machining and duplex, face and straddle milling of stainless steel and other work hardenable metals. (G17; SS)

219-G. (Russian.) Precise and Flashless Stamping. I. F. Holovnev. Kuznechno-Shtampovochnoe Proizvodstvo, Apr. 1960, p. 23-24.

Hot stamping of conical and cylindrical steel gears for cars and farm machinery by using a crankshaft press.

Methods of preventing decarbonization of the gear surface. 11 ref. (G3, 1-66, T7a; ST)

220-G. Accuracy, Economy Stressed in Filtermaking Method. Steel, v. 148, Feb. 13, 1961, p. 119.

Steel, Cu, brass, Al, cloth, felt and paper are produced in pleated form by a close tolerance process, using a machine that forms materials into corrugated shapes by folding rather than drawing. (G6; Al, Cu-b, ST)

221-G. Flame Gouging Is Fast and Cheap. Engineer and Foundryman, v. 26, Nov. 1960, p. 46-47.

Description of flame gouging, a flame machining process depending on specially designed nozzles which deliver relatively large oxygen flows at low velocities. Process is used to cut U-grooves in steel plates, forgings and castings and to remove surface defects and defective welds. (G22g; ST, 4-51, 4-53, 5, 7-51)

222-G. Grinding Wide Stainless Strip. A. J. Taylor. Production, v. 47, Feb. 1961, p. 67.

Stainless strip is ground to controlled thickness variations of less than 0.0005 in. on a line having two grinding units with coated abrasive belts running in oil. (G18; SS, 4-53)

223-G. Machining Thermal-Resistant High-Strength Materials. Western Machinery and Steel World, Jan. 1961, p. 34-37.

New development in the electrical discharge machining of stainless steel honeycomb core, Ti and Rene 41 for aircraft components. Described are a step-cutting core with slipper-shoe electrodes, a skate unit to adapt the slipper electrode for milling and a unit for machining holes in sandwich materials. (G22h; Co-b, SS, Ti, SGB-a, 4-57)

224-G. Intricate Thin-Gage Stampings Made Without Dies. E. Altholz. Machinery, v. 67, Feb. 1961, p. 93-96.

Etching or chemical milling of photochemically treated surfaces of nickel-silver, Al, Al alloy, Fe, high and medium carbon steel and alloy steel to produce small thin gage parts with tolerances held to ± 0.0005 in. (G24b; Cu-b, Al-b, Fe-b, ST, 4-53)

225-G. Oldsmobile Turns to Aluminum for Rockette V-8. R. H. Spiotta. Machinery, v. 67, Feb. 1961, p. 98-103.

Milling, drilling and boring of 356-T5 Al permanent mold castings with carbide tools on a 400 ft. production line to produce engine cylinder heads. Flaw testing with compressed air and sealing with sodium silicate in cases of porosity or air leakage. (G17, S13b, T21b; Al-b, 5-63)

226-G. Forming Stainless Steel Percolators at 4000 a Day. P. J. Kircher. Machinery, v. 67, Feb. 1961, p. 116-121.

Drawing and forming operations on type 302 stainless steel blanks at 9000 psi. pressure on a hydroform press using castor oil lubrication, with annealing at 1950° F. in an ammonia atmosphere between drawings. Fabrication by brazing with Eutec no. 157 wire and embossing on a pneumatic drop press. (G4, T10a; SS)

227-G. Die-Sinker Generates Forms Without a Mold. L. W. Collins. Machinery, v. 67, Feb. 1961, p. 122-125.

Machining of Al, brass and steel on a universal pantograph die sinker to produce dies and mold cores for investment casting. Application of the metal cores with wax cores and patterns in producing intricate metal parts. (G16, E15; Al, Cu-b, ST, 17-57)

228-G. Cold-Hobbing of Hot-Working Steels. W. Haufe. Machinery (London), v. 98, Jan. 11, 1961, p. 70-77.

Comparison of various hot working steels which can be cold hobbed to determine resistance to forming as a function of hobbing depth, susceptibility to heat cracking and hardness occurring during heat treatment. Cold hobbing methods for producing pressure die casting dies, hot brass stamping dies, forging and coining dies. (G17b, 1-67, T6r; ST, 17-57)

229-G. Phosphate-Coating and Lubricating of Steel for Cold Extrusion. D. James. Machinery (London), v. 98, Jan. 11, 1961, p. 84-98.

Development of a lubrication system based on phosphate coatings impregnated with various lubricants. Comparison of Mn/Fe phosphate, Fe phosphate, Zn/Fe phosphate and Zn phosphate as phosphatizing solutions and sulphonated tallow and sodium stearate as lubricating agents. (G5, 18-73)

230-G. (Pamphlet.) Machining Characteristics of High Strength Thermal Resistant Materials. Pt. 2. Machining Characteristics of Molybdenum-0.5% Titanium Alloy. L. J. Nowikowski. Metcut Research Assoc., Inc. (Air Material Command, U. S. A. F.) May 1960, 70 p. (Available as PB 161775, U. S. Office of Technical Services, Washington 25, D. C.) $2.

Evaluation for turning, face milling, drilling, reaming and tapping operations. Graphs compiled from the machining tests show relationships between tool life, cutting speed, feed, tool geometry, tool material and cutting fluids. Effect of machining variables on unit power, coefficient of friction and tool forces. (G17; Mo-b, Ti)

231-G. (Pamphlet.) Survey of the Broaching Process. B. Hanna and C. E. Eppinger. University of Denver (AMC Aeronautical Systems Center, U. S. A. F.) Jan. 1960, 122 p. (Available as PB 161776, Office of Technical Services, Washington 25, D. C.) $2.75.

Methods of extending broaching to high temperature alloys. Data on broach cutting and tool life, materials and surfaces, economic and design factors. Additional information on cutting tooth geometry and gullet design as possible partial remedies to the heat friction problem. (G17a; SGA-h)

232-G. (Book.) Chipless Machining. Charles H. Wick. 502 p. 1960. Industrial Press, 93 Worth St., New York 13, N. Y. $10.

Methods of cold forming ferrous metal to finished shapes without producing chips. Description of processes, equipment design, tooling and applications, the latter including heading, rolling, spinning, swaging, extruding and high-energy-rate forming. (G-general, 1-67)

233-G. (Book.) Machining Characteristics of High Strength Thermal Resistant Materials. 180 p. 1960. AMC Aeronautical Systems Center, U. S. A. F. (Available from Wright Aeronautical Div., Curtiss-Wright Corp., Wood-Ridge, N. J.)

Machining characteristics in turning, milling, drilling and tapping of martensitic low alloy steel, hot worked die steel, austenitic stainless steel, martensitic stainless steel, precipitation hardening stainless steel, Ni base and Co base, high temperature alloys and Ti. Relationships between tool life, cutting speed, feed, tool geometry, tool materials and cutting fluids. Effect of grinding condition on wheel wear. Influence of grinding and milling variables on workpiece distortion and residual stresses. (G17; AY, Co-b, SS, Ti, TS)

234-G. (Translation-PERA.) The Use of Spark-Erosion Machining in the Manufacture of Carbide Dies. A. N. Kamorkin. Russian, Nov. 1959, p. 48-52.

Factors in the selection of machining conditions in terms of shape and dimension of profile to be machined, required accuracy and surface finish and the selection of electrode and working fluids for manufacturing blanking dies. (G24a, T6r; 6-69)

235-G. Metal Cutting Forces. Automatic Machining, v. 22, Feb. 1961, p. 39-43.

Effect of tool geometry on cutting forces and tool speed-life. Factors influencing production rate, cutting power, surface finish, tool wear and tool corrosion. Tool wear as influenced by type of chip formed during cutting. (G17)

236-G. Cross Drilling, Straddle Milling. Automatic Machining, v. 22, Feb. 1961, p. 44-45.

Machining of tapered 303 stainless steel parts in one cycle, using an automatic machine equipped with cross-drilling and milling attachments. Secondary roughing out and finishing operations are avoided. (G17e, G17b; SS)

237-G. Centerless Grinding. Automatic Machining, v. 22, Feb. 1961, p. 69.

Form and through-feed grinding of soft metals and carbide materials on a conventional surface grinder equipped with a centerless grinding fixture. (G18h)

238-G. Electro-Chemical Machining. Machinery (London), v. 98, Jan. 25, 1961, p. 218-221.

Electrolytic machining of Ni alloy airfoil surfaces of turbine blades, tungsten carbide and a W-Mo alloy by a new process in which the tool (cathode) is placed approximately 0.003 in. from the work and a special electrolyte is pumped through the space at high speeds. Current densities up to 1500 amp. per sq. in. may be applied. (G24d, T7h; Ni-b, W-b, Mo)

239-G. Cold Deforming. H. J. Merchant. Metal Treatment and Drop Forging, v. 28, Jan. 1961, p. 14-18.

Review of cold deforming processes such as cold heading, extrusion, impact extrusion, drawing, coining, embossing and cold forging. Advantages of material utilization efficiency, material improvement, dimensional tolerances and production efficiency are compared with conventional forging. Disadvantages and product design restrictions. (G-general, 1-67)

240-G. (German.) Use of Electroerosion in Industry. H. Rossa. Elektrie, v. 14, Nov. 1960, p. 407-410.

Machining of tools, machine parts, rolls and dies of hardened and alloyed steel, cast iron and Al by electro-erosion at local temperatures of up to 10,000° C. (G24a, W25; Al, CI, ST, SGB-q)

241-G. (German.) Production of Small Metal Parts by Spark Erosion. Werner Wendrich. Feinwerktechnik, v. 64, Dec. 1960, p. 427-430.

Method and apparatus for production of small Cu parts for microwave tubes by spark erosion in a nonconductive solution of benzine with additions of methyl-alcohol. Measurements of crater diameter, working gap and roughness depth as influenced by capacity and voltage. (G24a, T1; Cu)

242-G. Make It for Less and Better... From Tubing. Tooling & Production, v. 26, Feb. 1961, p. 52-56.

Application of stamping processes to production of ball flex-joint, air spring piston and shell from Al and welded steel tubing. (G3; Al, ST, 4-60)

243-G. (German.) Machines for Strip, Profile and Tube Processing. Draht, v. 11, Dec. 1960, p. 761-763.

Automatic and semi-automatic machines for rolling sectional steel into rings, fine and very fine grinding of cold rolled strip, working sheet into structural shapes, bending and stamping parts from steel strip and bending and cutting steel tubes. (G-general, 1-52, 17-51; ST, 4-53, 4-60)

244-G. (German.) Spark Erosion, Ultrasonic and Electrolytic Machines for Tool Production. Draht, v. 11, Dec. 1960, p. 775-779.

Design of machines for spark machining of forging and drawing dies, electrolytic grinding of hard metals and steels and for ultrasonic drilling and welding of thin sheets, foils or wires composed of Al, Cu, brass, Au, Ni, Zr or steel. (G24, K-general, 1-52, 17-51; SGA-j)

245-G. Drawing Aluminum Cans From Precoated Strip. Automation, v. 8, Feb. 1961, p. 79-81.

Production of Al cans by a draw and redraw process on an automated can line consisting of rotary redraw press, combination trimmer and flanger and rotary curling machine. (G4; Al, 4-53, 8)

246-G. Pressure-Forming Ups Reliability of Welded Rocket Cases. G. K. Schmitz and J. E. Benawa. Space Aeronautics, v. 35, Feb. 1961, p. 83-84, 90, 92, 94, 96.

Production of welded solid propellant rocket cases composed of steel using pressure forming to reduce discontinuity stresses in the weld transition zone and to reduce ignition boss bending stress. Weld mismatch and other contour distortions as they affect maximum stresses. Strain at proportional limits as a function of strain-pressure slope. (G14, K-general, T2p; ST)

247-G. Quantity Production of Laminations for Transformer Cores. Machinery (London), v. 98, Feb. 1, 1961, p. 250-252.

Cold rolled, grain oriented, coiled steel strip is pierced and cropped on a fully automatic installation with an overall length of 60 ft. (G2j; ST, 4-53)

248-G. Metal Shaping Process. Metal Removing, v. 5, Jan. 1961, p. 10-12.

Description of a new electrochemical metal-shaping process which removes metal at rates of 0.05-0.1 in. per min. The process is noiseless and because there is no pressure on the workpiece, eliminates deburring costs. (G24d)

249-G. Single Point Threading. Metal Removing, v. 5, Jan. 1961, p. 13.

4130 steel forgings heat treated to 180,000-250,000 psi. tensile strength are threaded with a triangular insert tool using throw-away inserts in place of brazed tips. (G17f; ST, 4-51)

250-G. Influence of Cold Working Carbon Steels on Their Machinability. E. Bodart and L. Czaplicki. Microtechnic, v. 14, Dec. 1960, p. 255-257.

Determination of the increase of tensile strength due to cold working. Machinability of 0.30 carbon steel is improved during cold working by drawing. (G17k, Q27a, 3-68; CN)

251-G. Electro-Chemical Machining. Machinery (London), v. 98, Jan. 18, 1961, p. 161-162.

Development of a new electroforming technique in which speed is increased by circulating a special electrolyte through a space 0.002-0.003 in. between the component to be shaped, which forms the anode, and the electrode. Method is applied to machining of aerofoil surfaces. (G24d)

252-G. Electroshaping. Metal Industry, v. 98, Jan. 27, 1961, p. 63-65, 71.

Applications of electroshaping for cutting, electrolytic broaching, drilling and electrolytic trepanning of difficult-to-machine metals such as W, Mo, Waspalloy, 700 Udimet, pearlitic and austenitic stainless steels, Nimonic, A-286 alloy and V-57 alloy. (G24d; SGA-h, Mo, Ni-b, W)

253-G. Automatic Abrasive Cut-Off Halves Screw Machine Costs. Richard L. McKee. Grinding and Finishing, v. 7, Feb. 1961, p. 11-12.

Production of 52100 steel and hardenable stainless steel aircraft roller bearing blanks by cutting, tumble deburring and centerless grinding operations performed on an abrasive cutoff machine. (G18h, T24b; SS)

254-G. Why Surface Grinding Is Replacing Cutter-Type Machining. Arthur M. Mattison. Grinding and Finishing, v. 7, Feb. 1961, p. 24-27.

Advantages of surface grinding are illustrated through cost comparisons obtained from machining of cast Meehanite hopper tables, cast iron roll housings and Meehanite chain block. (G18k; CI)

255-G. Propane Flame Cuts Steel Quickly. Petro and Chem Engineer, v. 33, Feb. 1961, p. E-16.

Cutting five foot thick slabs using a newly designed gas gun with nozzles which stabilize the flame and inhibit flashback. (G22g; ST, 4-52)

256-G. Boeing Flowspins the Superalloys. Steel, v. 148, Feb. 20, 1961, p. 62-64.

Flowspinning of X2219, Vascojet 1000, 4340 steel, 321 stainless steel and X200 alloys using tooling consisting of a roller, spin block and special tailstock adapter or follower. (G13; SGA-h)

257-G. Electron Beam Welder Cuts Metal. Steel, v. 148, Feb. 20, 1961, p. 68.

Cutting of stainless steel, Nimonic and carbon steel with an electron beam generated by a conventional Zeiss welder. Application of electron beam processing to spot alloying and spot bleeding. (G17; CN, Ni-b, SS)

258-G. (German-French.) The "Arcair" Process. G. Doneux and Otto Frey. Zeitschrift fur Schweisstechnik (Journal de la Soudure), v. 51, Jan. 10, 1961, p. 2-12.

Surface erosion to produce deep grooves, cutting and boring of carbon steel, stainless steel, heat resistant austenitic 14% Mn steel and nonferrous alloys by arc melting of metal using a graphite electrode with simultaneous removal of melted metal by compressed air. (G22h; CN, SS, EG-a38)

259-G. (German.) Thermal Processing by Electron Beams. Hellmut Droscha. Metall-Reinigung + Vorbehandlung, v. 10, Jan. 1961, p. 4-6.

High-precision small dimensional machining, welding, cutting, drilling and milling of metallic materials including alloy steels and high-melting metals

(W, Mo, Ta) and nonmetals such as glass and ceramics, by electron beams of high energy density. Examples of application: milling of spinning die and metal evaporated ceramic plate; butt welding of 15 mm. thick X12 CrNi 18-8 steel plate and butt welding of thick walled Zr tubes for reactor fuel elements. (G24; AY, Mo, Ta, W, NM-k)

260-G. Columbium Curbs Wrinkling in Forming Stainless Strip. C. T. Evans, Jr. Iron Age, v. 187, Feb. 23, 1961, p. 96-97.

Addition of Cb to 430 stainless steel to prevent formation of ridges on the surface during stretch forming. (G9; SS, Cb, AD-g40)

261-G. Automatic Spinning Solves Tough Forging Problems. Steel Horizons, v. 23, no. 1, 1961, p. 14-15.

Automatic spinning of high strength stainless steels and other alloys simplifies operation, eliminates inside machining and combines mass production with low unit cost. The process is applicable to a variety of missile, industrial and consumer products. (G13; SS, SGB-a)

262-G. (English.) Study on Wear in Shearing Process by Means of Irradiated Tools. Toshio Sata, Kunio Abe and Kiyoshi Nakajima. Scientific Papers of the Institute of Physical and Chemical Research (Japan), v. 54, Sept. 1960, p. 307-312.

Study of tool wear on high speed steel punches and dies during shearing of low-carbon steel, stainless steel and Si steel in dry or lubricated states. (G2, 18-73; CN-g, SS)

263-G. Revolution in Structural Fabrication. American Machinist/Metalworking Manufacturing, v. 105, Feb. 6, 1961, p. 89.

Use of drilling and reaming under numerical positioning control, automated welding and conveyorized painting in the construction industry. (G17, K-general, L26n, 18-74; SGB-s)

264-G. Screw Machine Work on Aluminum VII, VIII. M. Bryan Baker. American Machinist/Metalworking Manufacturing, v. 105, Feb. 6, 1961, p. 109, 111.

Causes and corrective measures for problems of damaged chasers, rough threads, tapered threads and pitch variation during threading and of work and tool edge breakage, chatter and poor finish during skiving. (G17a, G17f; Al)

265-G. The Development of Production Processes for Use With Titanium Sheet. A. T. Carse and W. T. Ardis. Welding and Metal Fabrication, v. 29, Feb. 1961, p. 50-56.

Blank preparation, die blanking, hot, cold, stretch and wheel forming, drilling and hot dimpling procedures for production of aircraft components. (G-general, T24)

266-G. Fluid-Form Hydraulic Forming Attachment for a Power Press. H. Moller. Machinery (London), v. 98, Jan. 4, 1961, p. 34-37.

Drawing of Numonic 75, 18-8 stainless steel, car body steel and Mg-Si-Al base alloy to form deep intricate components using a fluid form hydraulic forming attachment. The pressure for blank holding and forming is exerted by a plunger mounted on the drawing slide through a quantity of hydraulic fluid. (G4d, 1-52; Al-b, Ni-b, SS)

267-G. High-Energy Processes Shape Space-Age Parts. C. W. Gipe. SAE Journal, v. 69, Mar. 1961, p. 44-45.

Shaping of SAE 30321 stainless steel, 5086 Al alloy, AM355 stainless steel and 6Al-4V-Ti alloy by electric arc, high-energy impact and explosive forming. Little or no machining is necessary for finishing. Applications. (G-general, NM-k34; Al-b, SS, Ti-b)

268-G. New Machining Methods Needed for Heavier Space-Age Metals. Ken Sparling. SAE Journal, v. 69, Mar. 1961, p. 74-76.

Machining of Ti, Mo, Be, Ta, W, L-605 Co alloy, R-235 Ni alloy, A-286 alloy, H-11 toolsteel, 17-4 Mo steel and Thermold-J by electric spark discharge, electron beam machining, electrolytic grinding, ultrahigh speed machining, chemical milling and thermal machining. High precision finish is obtained in all cases. (G24; SGA-h, Mo, Ni-b, SS, Ta, Ti, TS)

269-G. Can Hot Machining Techniques Keep Pace With New Alloys. Iron Age, v. 187, Mar. 2, 1961, p. 98-100.

Results of machinability tests on low-alloy martensitic and semi-austenitic precipitation hardening stainless and hot work die steels in the hardness range 350-600 Bhn. Hot machining methods used include turning, face milling and drilling. (G17, 1-66; SS, TS)

270-G. Electropolishing Moves Into the Machine Shop. Electroplating and Metal Finishing, v. 14, Feb. 1961, p. 57, 59.

Development of a new high speed electrochemical machining process using very high current densities and a new fast plating process in which special electrolytes are pumped at high pressures through a perforated anode. (G24d, L17)

271-G. Experiences in the Commercial Production and Application of Cold Extruded Components. R. E. Okell. Machinery (London), v. 97, Dec. 28, 1960, p. 1457-1460.

Selection and design of suitable parts for cold extrusion. Determination of the various pressing stages and tooling required. Preparatory treatments for billets such as annealing and phosphate coating. (G5)

272-G. Tooling for Cold Steel Extrusion. Melvin D. Verson. Metalworking Production, v. 105, Feb. 1, 1961, p. 49-53.

Cold extrusion of low carbon steel (C = 0.008-0.3%) with AISI, M2, M3 or M4 type toolsteels. Improvements in physical properties, ultimate strength and elongation are attributed to the process. Tables show composition and optimum heat treatment temperatures for the various toolsteels. (G5, Q-general; CN-g)

273-G. Making Metal Bellows Is a Precision Job. Metalworking Production, v. 105, Feb. 1, 1961, p. 57-58.

Production of stainless steel, brass, phosphor bronze, Ti or Ni alloy bellows by hydraulic forming, in which metal is forced to flow uniformly around collapsible dies by internal and end pressure. (G-general, 1-70; Cu-b, Ni-b, SS, Ti)

274-G. Producing Aluminum Alloy Pistons. Cy La Tour. Modern Machine Shop, v. 33, Mar. 1961, p. 100-103.

Description of drilling, boring and inspection operations used in manufacturing strong, lightweight pistons from No 2018 F, 100% virgin Ni base Al alloy. (G17, T21b; Ni-b, Al)

275-G. High-Production Gun Drilling. Carl Christen. Tool and Manufacturing Engineer, v. 46, Feb. 1961, p. 83-84.

Use of gun drilling to machine the cam-follower holes in the cylinder heads for two diesel engine models. Castings are alloyed gray cast iron, 163-207 Bhn. (G17e, CI)

276-G. Wet-Belt Grinding Combines Accuracy, Speed. O. Mark de Michele. Tool and Manufacturing Engineer, v. 46, Feb. 1961, p. 111-112.

Grinding metal from a steel tube at a rate of almost 2 lb. a min. generates enough heat to stress and expand a workpiece unless the heat is removed. The large area of a belt offers an ample surface for heat transfer; floods of coolant carry it away. Result is that heavy removal rates can be maintained without loss of accuracy. (G18; ST)

277-G. Special Shop Machines Subway Liners. Clifford P. Farr. Canadian Metalworking, v. 24, Feb. 1961, p. 23-25.

Sand casting, milling, machining and bolting of curved gray iron segments to form subway liners. (G17b, E11, K13p; CI-n)

278-G. Better Machining From New Free-Cutting Steel. Australasian Manufacturer, v. 45, Aug. 6, 1960, p. 32-34.

New Pb bearing free-cutting Australian steel gives improved performance on all machining operations and increased tool life. 0.15-0.35% Pb exists as a fine dispersion of soft, submicroscopic particles in liquid or solid Fe. Steel also contains 0.10-0.17% C, 1.10-1.40% Mn, 0.05% P and 0.20-0.30% S. (G17, W25; ST, Pb, 17-57)

279-G. Spark Machining. Australasian Manufacturer, v. 45, Dec. 10, 1960, p. 87-90.

Spark machining of soft or hardened die steel and WC by a process which removes metal from workpiece with highly energized electric sparks delivered from an electrode, the shape of which matches the form required in the workpiece. (G24a; TS, W, 14-68)

280-G. Explosive Forming of Metal. W. S. Hollis. Machinery Lloyd (Overseas Edition), v. 33, Jan. 7, 1961, p. 45-47.

Production of hollow ware and tubular components from sheets of difficult to form materials. (G-general, NM-k34)

281-G. (Japanese.) Ultrasonic Processing. Yoshitaka Tani and Jiroh Miyajima. Ohm, v. 47, Nov. 1960, p. 44-47.

Ferrite, Ge, toolsteel, silicon, steatite and jewel stones are machined with ultrasonic cutters composed of Cu, mild steel, silver steel, stainless steel, brass or super hard alloys. Data are given for cutting velocity and surface roughness. (G17, 1-74; Ge, Si, TS)

282-G. How to Get the Most Out of Metalcutting. Jens L. Wennberg. Tool and Manufacturing Engineer, v. 46, Mar. 1961, p. 81-84.

Equations showing relationships between optimum cutting speed, optimum tool life and cast per piece are used to determine these variables during milling and turning. (G17)

283-G. Putting Plasma Jets to Work. R. L. Hockman. Tool and Manufacturing Engineer, v. 46, Mar. 1961, p. 85-89.

Applications of plasma-arc torches in metal cutting, plating and welding operations. Torch design and specifications. (G22h, K6, L29n)

284-G. Turning With Throwaway Inserts--Speeds and Feeds for Carbides. Tool and Manufacturing Engineer, v. 46, Mar. 1961, p. 99-100.

Data are given for turning carbon, alloy and stainless steels, cast iron, Al, Mg, Ti alloys, brass, Ni alloys and nonmetallics. (G17a; Al, AY, CI, Cu-b, CN, Mg, Ni-b, SS, Ti-b)

285-G. The Machining of Steel. F. C. Lea and Eric N. Simons. Edgar Allen News, v. 40, Jan. 1961, p. 15-17.

Method of setting up parts for rough and finish planings and of overcoming effects of internal stresses released during planing. Detailed description of design and operation of shapers. (G17c; ST)

286-G. Problems of Machining Space-Age Metals. L. A. Hauser and M. C. Metzger. Metal Progress, v. 79, Mar. 1961, p. 97-101.

As hardness increases, machining super-alloys and ultra-high-strength steels becomes progressively more difficult. This article offers suggestions on machining alloys with hardness in some instances over C-50. (G17, AY, Ni-b, Co-b, TS, SS, SGA-h)

287-G. Forming Corrugations to Close Tolerances. Arthur Morefield. Metal Progress, v. 79, Mar. 1961, p. 132-134.

Featuring a clamping and folding method of forming instead of the conventional drawing and bending, a new machine makes pleats one at a time. When compared to brake forming, tolerances that can be maintained are about five or six times closer and forming is four times as fast. (G6)

288-G. Electrochemical Machining of Metals. Aircraft Engineering, v. 33, Feb. 1961, p. 46-47.

Electrochemical machining of compressor or turbine blades composed of pearlitic and austenitic stainless steels, S-816, Waspalloy, Udimet 700, Nimonic alloy, A-286, V-57, W and Mo by a process in which there is no physical contact between tool and workpiece so that thin sections can be produced free from burs. (G24d, T7h; SGB-a, SGA-b)

289-G. Broaching Specified for Savings. J. Haydock. Metalworking, v. 17, Mar. 1961, p. 9-11.

Broaching forged rifle parts of 8620 steel to produce smooth surfaces that are square and parallel. (G17d; ST)

290-G. Electrochemical Machining. Aircraft Production, v. 23, Feb. 1961, p. 68-72.

Stainless steel turbine and compressor blades are electroshaped by a process which uses a rapidly circulating electrolyte to induce a high amperage to pass between cathode tool and anode workpiece. Dislodged surface atoms are attracted into dissolving electrolyte. (G24d, T7h; SS)

291-G. Controlled Belt-Grinding. Pt. 2. H. J. Pearson. Aircraft Production, v. 23, Feb. 1961, p. 42-46.

Grinding of turbine blades composed of Al and Ni alloys and heat resisting materials such as stainless steels and Ti by an abrasive belt machining technique. (G18, T7h; Al-b, Ni-b, SS, Ti, 17-57)

292-G. Economics of Cutting Processes. J. Cherry. Production Engineer, v. 40, Feb. 1961, p. 122-131.

Comparison of automatically controlled and manually controlled machining for various combinations of 1020, 1030, 1040, 1050 and 1060 steels with Stellite, tungsten carbide or H. S. S. 5% Co tool materials. 5 ref. (G17; ST)

293-G. (French.) Means for Increasing the Fatigue Resistance of Welded Naval Structures. H. de Leiris. Association Technique, Bulletin, 1960, p. 441-456.

Series of tests with von Arx 3B pistol as a high-speed, high-impact hammer on welded steel specimens to determine the value of hammer-treating welded structures in order to eliminate stresses in the welded seam and increase its fatigue resistance. 5 ref. (G23, Q7; ST, 7-51)

294-G. Cold Steel Impacting. Thomas A. Dickinson. Production, v. 47, Mar. 1961, p. 61-63.

An extrusion process involving the forming of unheated 4130 steel slugs in ambient temperature dies. Products are closed-end tubes and tubes with flanges requiring no machining to meet tolerances and having surface finishes to 8 micro-in. (G5; ST)

295-G. Super Precision Machining and Checking. Production, v. 47, Mar. 1961, p. 64-67.

Machining, grinding, gaging and cleaning methods used in manufacture of precision ball bearings. Measurement of radial play, geometric irregularities, waviness and starting torque of assembled bearings. (G17, G18, T7d)

296-G. The Real Reason for Superfinishing. J. B. Pond. Machine and Tool Blue Book, v. 56, Mar. 1961, p. 102-107.

Controlled finishing of metal surfaces by application under light pressure of an abrasive stick that is reciprocated at low speed on a revolving workpiece. Neither the microstructure nor the microscopic surface of the metal is altered. (G19q)

297-G. Titanium Sheet Forming. A. T. Carse and W. T. Ardis. Metal Industry, v. 98, Feb. 17, 1961, p. 131-132.

Hot forming and wheel forming of 22 gage ICI. 130 Ti alloy sheet. Blanks for hot forming are heated to 430° C. and the formed parts are subsequently stress relieved at 500° C. (G-general; Ti-b)

298-G. Titanium Sheet Forming. A. T. Carse and W. T. Ardis. Metal Industry, v. 98, Feb. 10, 1961, p. 103-107.

Forming of ICI. 317, ICI. 130, 318A, Ex. 011, Ti. 75A and RC. 55 Ti alloys. Brake and rubber forming tests show that, at 20° C., ICI. 130 Ti alloy forms satisfactorily, RC. 55 Ti alloy forms without fracture but requires heating to overcome springback and Ti. 75A fractures when formed. (G-general; Ti-b)

299-G. Production of Bolt-Head Trimming Dies by Intraforming. Machinery (London), v. 98, Feb. 22, 1961, p. 435-437.

Cylindrical hollow blanks of steel, Zr, Inconel, Hastelloy, Cu alloy and Al alloy are internally formed on a machine with pulsating dies which squeeze the work and cause the bore to conform to the cross-sectional shape of a mandrel. (G-general; Al-b, Cu-b, Ni-b, ST, Zr)

300-G. High Velocity Forming of Tungsten for Structural Applications. Machinery (London), v. 98, Feb. 22, 1961, p. 438.

Extrusion and forging of W at high speed to obtain extensive grain refinement and therefore improve ductility and hardness. (G-general; W)

301-G. (German.) Patterns for Flame Cutting With Magnetic Roller Control. H. Wyrich. Mitteilungen der BEFA, Nov. 1960, p. 6-7.

Automatic control of distance of burner, cutting rate, angle between burner and workpiece and cutting contour is achieved with patterns and magnet rollers during flame cutting. Emphasis on construction and use of steel patterns. (G22g)

302-G. Electrolytic Grinding Slashes Tool Finishing Cost. Metalworking Production, v. 105, Feb. 15, 1961, p. 65.

Machining of tough, hard or heat resistant materials such as brazed carbide-tipped steel blades with an electrolytic grinder to obtain continuous, single-pass machining and high stock removal rate. (G18, T6n; ST)

303-G. The Machining of Steel. F. C. Lea and Eric N. Simons. Edgar Allen News, v. 40, Feb. 1961, p. 38-39.

Discussion of optimum clearance and rake angle to use with single edge cutting tools on lathes, planers and boring machines. (G17; ST)

304-G. (Italian.) Grinding and Turning of Rolls Rotating About Roller Bearings. Macchine, v. 15, Nov. 1960, p. 1007-1014.

Rolls used in the manufacture of 0.002-0.003 mm. thick foil are ground or machined to perfect roundness while rotating about their service bearings to compensate for unroundness of bearing components. (G17, G18, W23k)

305-G. (Italian.) Machinability of Case Hardening Pb Alloyed Steels. Ezio Massa. Macchine, v. 15, Nov. 1960, p. 1025-1026.

Increase of machinability by addition of Pb. Unfavorable effect of ferrite and cementite. (G17k, 2-60; AY, Pb)

306-G. (Russian.) Vibration Tests With Welded Plates. Z. K. Lesnyak. Svarochnoe Proizvodstvo, Nov. 1960, p. 11-15.

Stress distribution in parts welded or cut from solid sheets of metal is studied with brittle varnish. Determination of stress concentration coefficient. Fatigue strength of various types of welds tested under vibrating loads. 5 ref. (G25; 7-51)

307-G. Cryogenic Sizing. C. H. Jung. Indian & Eastern Engineer, v. 102, Nov. 1960, p. 615-617.

Removing distortion from aircraft parts made of PH 17-7 and PH 1507 Mo stainless steel by a process based on constraining parts to desired configurations during a momentary pliable phase created by heat treatment. A heat treated part is cooled to slightly above 200° F. and forced into a sizing die prewarmed to 200° F. Part and die are cooled to -110° F. Process tolerances. (G23, 1-63, T24; SS)

308-G. Electroshaping Combines Forming and Finishing in One Operation. Industrial Finishing, v. 13, Feb. 1961, p. 30-31.

Outline of a new electroshaping process in which a workpiece is held in a special jig near electrodes which exactly reproduce the contours required for the finished article. Electrolyte is circulated rapidly to permit use of high current densities. (G24d)

309-G. Converted Milling Machine Makes Short Work of 3-D Cam Grooves. J. E. Laibach. Machinery, v. 67, Mar. 1961, p. 112-113.

Milling of 440 stainless steel bar stock on a three dimensional profiler milling machine followed by induction hardening, stress relieving and vapor blasting to produce aircraft drag chute release cam shaft. (G17b, 1-52, T24; SS)

310-G. Multiple Press Bending Speeds Tubular-Frame Production. Machinery, v. 67, Mar. 1961, p. 131-133.

Combined bending and coining of steel tubing on bending press with multiple groove dies to produce tubular steel frames. (G6, G3n; ST, 4-60)

311-G. Probing the Ultrasonic Cutting Process. Lucjan Kops. Metalworking Production, v. 105, Feb. 8, 1961, p. 51-57.

Influence of the abrasive slurry, vibration amplitude, balancing system and length wear and shape factor of the tool on metal removal rate of the transducer-amplitude transformer-tool system or ultrasonic machining process. (G24c)

312-G. (German-French.) Deep Drawing of Aluminum. John W. Lengbridge. Aluminium Suisse, v. 11, Jan. 1960, p. 19-33.

Study of material flow by a system of radial lines and parallel circles engraved on the blank. Advisable deformation degrees for each of several deep drawing steps. Formation of cracks and folds. (G4b; Al)

313-G. Hints on Turning Beryllium. Metalworking Production, v. 105, Feb. 22, 1961, p. 56.

Techniques and equipment used in turning or threading Be metal with carbide-tipped single-point tools. (G17a, G17f; Be)

314-G. Aluminum in Stainless Alloy Improves Machinability. Iron Age, v. 187, Mar. 16, 1961, p. 118-119.

Development of a new free-machining stainless containing 0.7% Al addition in place of sulphur eliminates reduced corrosion resistance and splitting which

occur with sulphur additions. (G17k, R-general; SS, Al)

315-G. (German.) Short-Time Testing of Machinability of Free-Cutting Steel by the Balance Weight Feed Method. Heinz Becker. Stahl und Eisen, v. 81, Jan. 1961, p. 46-50.

Machining of cold drawn 9 S 20 steel, 9 SMn 23 steel and 9 SMnPb 23 steel on a lathe using a weight as feeding force. Obtained feeding speed is taken as a measure of machinability. Automatic measurement of feeding distance and revolutions per second. Influencing factors such as toolwear and friction. Comparison with long time tests. (G17k, 1-54; ST, SGA-k)

316-G. Short-Run Blanking by the Rubber-Die Process. E. J. Hills. Product Engineering, Design Work Sheets, 14th Series, 1961, p. 63-65.

Sheet metal parts made economically by rubber die blanking. Limitations on complexity, dimensions and tolerances of blanks. (G2h; 4-53)

317-G. Eight Ways to Design Economy Into Malleable Iron Castings. Herbert L. Kee. Product Engineering, Design Work Sheets, 14th Series, 1961, p. 122-123.

Sizing, coining, punching, straightening, staking, bending or roll forming of malleable Fe castings for economical production of parts. (G-general; CI-s, 5)

318-G. Spiroid Gearing. Pt. 3. Materials, Mounting Details, Lubrication. Woodrow D. Nelson. Machine Design, v. 33, Mar. 16, 1961, p. 165-169.

Production of spiroid gears and pinions from soft and hardened steels and steels in combination with brass, bronze, nylon and Al by hobbing and thread milling. Design considerations for material selection, optimum heat treatment parameters, tolerances, mounting and backlash adjustments and resolution of tooth loads. (G17g, T7a; ST, Cu-b, Al-b, NM-d31, 7-59, 17-51, 17-57)

319-G. How to Avoid Common Shortcomings in Machining. Steel, v. 148, Mar. 20, 1961, p. 96-99.

Effect of tool composition and shape, cutting speeds and feeds, machine rigidity and other factors on metal removal rates. Suggestions for improving machining efficiency. (G17)

320-G. (Japanese.) Chemical Machining. Pt. 8. Machining of Aluminum (No. 8), Roughness of Machined Surface Produced by HCl Solution. Toshikazu Sato and Kazuo Kodaira. Government Industrial Research Institute, Reports, Nagoya, v. 10, Jan. 1961, p. 1-7.

Evaluation of HCl as a working solution in machining Al. Effect of various machining conditions such as temperature and HCl concentration on the surface roughness. 5 ref. (G24b; Al)

321-G. Precision Tapping With EDM. S. A. Hoffman. American Machinist/Metalworking Manufacturing, v. 105, Mar. 6, 1961, p. 72-73.

Electrical discharge machining is used to cut threaded holes in tungsten carbide and hardened steel punch and die parts. Precision tapping is obtained primarily by lead screw control of electrode advance. (G24a, T6n; TS, W, 14-68)

322-G. Hydraulics Aid Precision Holding. Karl Grimm and Rodney Schultz. American Machinist/Metalworking Manufacturing, v. 105, Mar. 6, 1961, p. 76-77.

Finish turning of small tubular beryllium copper cylinders. Precision workholding is accomplished with a hydraulically expanded mandrel filled with a light grease or heavy oil. It exerts even pressure throughout the bore of the beryllium copper workpiece which it supports and drives. (G17a; Cu-b, Be, 4-60)

323-G. Spark Forming Works on Stainless. American Machinist/Metalworking Manufacturing, v. 105, Mar. 6, 1961, p. 80.

Flat blanks or tubes of Al, Ti, stainless steel, mild steel, high-strength steel, Cb, Be-Cu alloy and epoxy are shaped into dies by electrospark forming under water. A high-voltage spark creates a shock wave which forms the workpieces. (G24a; Al, Cb, Cu-b, CN, SS, Ti)

324-G. Explosive Forming of Missile Components. L. C. Stuckenbruck and C. H. Martine. Machinery (London), v. 98, Mar. 1, 1961, p. 486-490.

Explosive forming of Cu, Ni, Ta, Zr, Co, Al alloys, Mo alloys and stainless steels in dies of Kirksite, plastic,

concrete, epoxy resin and fiberglass. (G-general, NM-k34, T24e; Al-b, Co, Cu, Mo, Ni, SS, Ta, Zr)

325-G. Rohr Puts Electroforming on the Line. Steel, v. 148, Mar. 27, 1961, p. 168-169.

Stainless steel tubing 2 1/2 in. O. D. is expanded to 3 1/4 in. by an underwater process in which electrical energy moves as a shock wave through the water to force into an Al die. (G24a; SS)

326-G. High Speed Cutting Betters Nonferrous Finish, Output. Steel, v. 148, Mar. 27, 1961, p. 184-185.

Data are given for cutter speed, chip load, feed speed and choice of coolant for high speed machining of Al and other nonferrous metals. (G17; Al, EG-a38)

327-G. Explosive Forming: Where Does It Go From Here? Edward Howard. Western Metalworking, v. 19, Mar. 1961, p. 39-41.

Applications of high energy forming processes to production of Al, Ni and steel rocket and missile components. (G-general, NM-k34, T24e; Al, Ni, ST, 17-57)

328-G. (Russian.) Stamping of Bevel Gears. A. D. Matveev, A. R. Krause and M. Yu. Salman. Kuznechno Shtampovochnoe Proizvodstvo, Jan. 1960, p. 14-17.

Stamping, heat treating and machining of toothed steel bevel gears using a 1000 ton crankshaft punch press. (G3, T7a; ST)

329-G. High-Energy-Rate Forming of Close-Tolerance Parts. Aircraft Production, v. 23, Mar. 1961, p. 80-86.

Complex forgings and extrusions of refractory metals and superalloys are produced by the Dynapak process accurately in which the required forming pressures are obtained by gas pressure. (G-general, F22, F24; EG-d37, SGA-h)

330-G. Electroshaping. Aircraft Production, v. 23, Mar. 1961, p. 88-96.

Electrochemical machining of difficult to machine aircraft materials by a new process in which an electrolyte is used to pass a high-amperage current between a profiled cathode tool and an anode workpiece, the surface of which is electrolytically dissolved. (G24d, T24)

331-G. (German.) Explosive Forming of Metals. R. M. Cavanaugh. Technische Mitteilungen, v. 53, Oct. 1960, p. 427-434.

Review of explosive forming techniques of metal compacts, metal powders and graphite powder. Applications in shaping, welding metal-to-metal plating and production of laminated materials. Comparison of mechanical properties of explosive formed and cold rolled steel. Reaction mechanisms. (G-general, NM-k34)

332-G. (English.) Research on Single Grain Cutting. Yukio Tanaka and Muneo Hitomi. Kansai University, Technology Reports, Sept. 1960, p. 49-62.

Experimental results obtained during single grain cutting of model grains are used to determine the effect of the contact angle between work and grain on the cutting mechanism. 7 ref. (G17)

333-G. Space Age Material Requires Abrasive Cut-Off. Grinding and Finishing, v. 7, Mar. 1961, p. 47.

Cutting of high-temperature steels and alloy rounds with diameters up to 22 in. on an abrasive cut-off machine. Determination of cutting time and the ratio of wheel wear to material wear. (G17; SS, SGA-h)

334-G. Why Not Broach It? Joseph A. Psenka. Cutting Tool Engineering, v. 3, Mar. 1961, p. 8-15.

Advantages and limitations of internal and external broaching processes. Comparison of steels, cast iron, brass, bronze, Al and Mg as to broachability. Applications to splined holes, flat surfaces, irregularly shaped holes, gears and shells. (G17d)

335-G. (Italian.) Machining of Metals. Tommaso Bruzzone. Ingegneria Meccanica, v. 11, Dec. 1960, p. 7-13.

Investigation of the correlation between cutting depth, feed, cutting speed and tool life for turning, milling and drilling operations. (G17)

336-G. (French.) Machinability of Gray Iron Castings. A. de Sy, E. Bodart, J. Van Eeghem and L. Czaplicki. Fonderie Belge, v. 30, Dec. 1960, p. 313-325.

Testing of gray cast iron bars to determine the relationship between machinability and Brinell hardness.

Possibilities for improving machinability by alloying with Cu or, to a lesser extent, with Ni. 6 ref. (G17k, Q29; CI-n, 5)

337-G. Further Studies of Iron-Oxygen Combustion in Gas Cutting. A. A. Wells. British Welding Journal, v. 8, Mar. 1961, p. 79-85.

Effect of preheating steel plates before gas cutting on ease of maintaining an ignition temperature at the top face of the cut. Greatest oxygen efficiency is obtained when the cut width times the cutting speed is equal to or less than 4-5 times the thermal diffusivity of the cut material. 11 ref. (G22g; ST)

338-G. Oxygen Cutting. A. A. Wells. British Welding Journal, v. 8, Mar. 1961, p. 86-92.

Gas cutting of Cu, Al, Ni, Pb, Mg, Zn, V, Ti, Armco iron and steels using oxygen, acetylene and fluorine gas. Influence of oxygen purity on the consumption of gas in cutting and on cutting speeds is explained by the boundary layer mechanism. (G22g; Al, Cu, Fe-a, Mg, Ni, Pb, Ti, V, Zn)

339-G. Fast Cutting With Carbon Dioxide Coolant. L. L. Arundel. Engineering, v. 191, Feb. 17, 1961, p. 266-267.

Machining of S96 high tensile steel and Cr-Ni-Ti alloy on a turret lathe using liquid CO_2 as a coolant enables cutting speed and feed to be greatly increased using proper tool geometry. (G17, 18-73; ST)

340-G. (German.) Boring of Cast Iron With Hard Metal Spiral Drills - An Approved Novel Technique. H. Drees and A. Jentsch. Maschinenbau, v. 9, Dec. 1960, p. 362-365.

Measurements of lifetime of hard metal spiral drills in boring GG 18 gray cast iron. Methods of drill production, regrinding and mounting; selection of drilling machines. (G17e, W25p, 1-52; CI)

341-G. A Comparison of Lubricants and Coatings for Cold Extruding Titanium. Alvin M. Sabroff and Paul D. Frost. ASLE (American Society of Lubrication Engineers) Transactions, v. 3, Apr. 1960, p. 61-68.

Graphite, Mo and other experimental and commercial surface coatings and lubricants are investigated as part of an over-all program on cold extrusion of solid and hollow Ti shapes. 3 ref. (G5, 18-73; Ti)

342-G. (German.) Force and Deformation Characteristics in Chipless Shaping of Uranium. I. L. Perlin, I. D. Nikitin, V. A. Fedorcenko, A. D. Nikulin and N. G. Resetnikov. Kernenergie, v. 3, Dec. 1960, p. 1217-1224.

Investigation of force and deformation characteristics in rolling, pressing, drawing and forging of uranium sheet, tube, rods and shapes. Measurement of deformability as influenced by temperature (400-1000° C.) and of pressing force as influenced by reduction and temperature (250-800° C.) (G-general, Q23q; U)

343-G. Magnetic Forming. D. H. Birdsall, F. C. Ford, R. E. Riley and H. P. Furth. American Machinist/Metalworking Manufacturing, v. 105, Mar. 20, 1961, p. 117-121.

Principles and applications of magnetic forming, a new development in high-energy metalworking. Hard bronzes, stainless steel, Cu and Al flat parts and tubes are shaped by a magnetic hammer using unidirectional or oscillating magnetic field pulse of 560,000 psi. 16 ref. (G-general; ST, Cu, Al)

344-G. Ultrasonics Ups Grinding Efficiency. James Peacock. American Machinist/Metalworking Manufacturing, v. 105, Mar. 20, 1961, p. 124-125.

Application of a toolhead attachment to the grinding wheel adding ultrasonic vibrations to the surface grinding of brass, 304 stainless steel, Al and Mg. Reduction of wheel wear, prevention of loading and improvement of metal surface finish is attributed to the addition of the vibrations. (G18k, 1-74; SS, Al, Mg, Cu-n)

345-G. Flame Cutting for the Small Shop. Clement F. Brown. American Machinist/Metalworking Manufacturing, v. 105, Mar. 20, 1961, p. 128-130.

Flame-cutting of heavy and irregular shaped mild steel bar stock using O_2 and acetylene gases, using general purpose equipment such as hand cutting torches, portable line-cutting machines, cam-guided shape-cutting machines and beam-type machines. (G22g; CN, 4-55, 4-57)

346-G. Licking EDM Electrode Distortion. Dean T. Wall and Daniel Strack. American Machinist/Metalworking Manufacturing, v. 105, Mar. 20, 1961, p. 142-144.

Prevention of electrode distortion during electrical-discharge machining of narrow, deep slots in a neutron chopper rotor having center and intermediate cores of natural U and a K-Monel outer ring. A suction pump draws coolant past the brass (65% Cu, 35% Zn) electrode during the machining and flushes away gas and heated metal particle. (G24a, 1-52; U, Ni-b)

347-G. Capacitor Discharge Forms Metals. Roy J. Bruun. Electronics, Jan. 20, 1961, p. 30.

Shock wave created by under water discharge of capacitor used for explosive shaping of hard-to-work metals, such as Ti. Development of super conductive bearings, motors and switches for use in the electrospark process. (G24a; Ti)

348-G. Formation of Continuous Chips in Metal Cutting. W. B. Rice. Engineering Journal, v. 44, Feb. 1961, p. 41-45.

Orthogonal cutting of 26ST Al workpiece is investigated utilizing high-speed photography. Mechanisms of ribbon-like and segmented continuous chip formation. Explanation of chip curling and of cratering wear of cutting tool. 6 ref. (G17; Al-b)

349-G. (Japanese.) Machining Performance of Ceramic Tools. Pt. 6. Effects of Tool-Tip Chamfering on Ultra High-Speed Cutting of Steel and Cast Iron. Kunio Yamada, Noboru Nakayama, Hiroshi Kajihara, Seisuke Sakai and Hisao Mii. Government Industrial Research Institute, Nagoya, Reports, v. 10, Feb. 1961, p. 63-75.

Tool wear and cratering and surface roughness, deformation and burring of specimens as a function of tool geometry and cutting speed. Data are given for cutting resistance of surfaces to various degrees of chamfering for various cutting depths. 5 ref. (G17, T6n; ST, CI, NM-a34, 17-57)

350-G. High Energy Forming to Gain Popularity. Steel, v. 148, Apr. 3, 1961, p. 82-85.

Survey of high-speed forming methods including explosive forming, forming with expanding gases, sheet drawing with liquid nitrogen, pneumatic-mechanical extrusion and forging, electrospark forming and bulging and magnetic forming. Application to Ti and Ti alloys; alloy, stainless, austenitic and Mo steels, Al alloys, Haynes alloy 25, Zr, W, Cb alloy and a diffusion of UO_2 in Ni. Effect of forming rate on green strength and green density of compacted powder metals. (G-general, H14; NM-k34)

351-G. Stretch Press Ages Sheet, Probe Tells How Much. Steel, v. 148, Apr. 3, 1961, p. 88.

Use of an eddy current probe during stretch aging of 17-7 PH stainless steel to determine elongation and ultimate tensile strength. Mechanical properties are read directly from the eddy current meter during the process, eliminating a majority of tensile tests. (G9, Q-general, S13h; SS-e)

352-G. Copper--Some of Its Uses. Engineer and Foundryman, v. 26, Dec. 1960, p. 26-28.

Survey of forming and bending techniques and soldering and brazing fabrication of Cu, brass and gunmetal. Applications in compression fittings, valves, sockets and pipe. (G-general, G6, K8, T26; Cu-b, 17-57)

353-G. Free-Machining Sulphur Copper. Production, v. 47, Apr. 1961, p. 64-65.

Application and machinability ratings are given with data for composition, tensile and yield strength, elongation, Rockwell hardness "B" and thermal and electrical conductivity of sulphur, Te and leaded Cu. (G17k, A-general, P-general, Q-general; Cu-b, S, Te, Pb, 17-57)

354-G. Versatile Tooling in Manufacturing Industrial Air Moving Equipment. Production, v. 47, Apr. 1961, p. 72-75.

Fabrication of variable pitch propeller and fan blades from Al sand castings by cutting, drilling, forming and welding methods. Magnaflux testing of the casting for production flaws. (G-general, W13e; Al-b, 5-60)

355-G. "Impossible" Stampings--Thousands Per Hour. Vearl A. Williams. Production, v. 47, Apr. 1961, p. 76-79.

Intricate parts composed of Cu and Ni-Ag alloy are stamped, formed and bent in one operation by a slide-type

machine incorporating multiple tooling. (G3; Cu-b)

356-G. Machining Honeycomb Faster. Production, v. 47, Apr. 1961, p. 82.

Large diameter carbide ring cutters using K92 Kennametal as abrasive are used to machine 17-7 and 15-7 stainless steel foils welded into honeycomb structures. After machining, the panels are brazed between thin sheet metal facings to form heat resistant panels for airplanes and missiles. (G17, K8, T24a; SS, 7-59, 17-57)

357-G. Chipless Machining. Charles H. Wick. Machine and Tool Blue Book, v. 56, Apr. 1961, p. 128-130.

Cold forming of parts with intricate shapes from hot rolled steel bar stock, subsequent machining being greatly reduced or not required. Improvement in tensile, yield and shear strength, fatigue resistance and hardness is attributed to the process. (G-general, 1-67; ST)

358-G. Explosive Metalworking. Metal Industry, v. 98, Feb. 24, 1961, p. 149-150.

Explosive hardening, welding, forging and forming of metals, using stand-off or contact charges, with the pressure from deflagrating and detonating explosives being used to distort the metal into the desired shape. Application of the methods to production of rocket nozzles, fuel tanks, railway tanker heads and other products from powder metals and alloys of Ti, Co, Cu, Mg, Al and Fe. (G-general, K-general, N7e; NM-k34, 17-57)

359-G. Application of Shear Spinning to the Fabrication of Solid-Propellant Rocket Cases. Lewis E. Zwissler. Paper from "High-Strength Steels for the Missile Industry". American Society for Metals, Novelty, Ohio, 1961, p. 201-231.

Manufacturing experience in shear-spinning large-diameter thin cylindrical shells and semi-elliptical head domes. Fabrication of a large-diameter chamber, manufactured of AMS 6434 alloy, for operation at stress levels of 210,000 psi. minimum yield strength. (G13, T2p; ST)

360-G. Large Solid-Propellant Rocket Case Fabrication by Deep Drawing. W. J. Ruprecht. Paper from "High-Strength Steels for the Missile Industry". American Society for Metals, Novelty, Ohio, 1961, p. 232-253.

Physical phenomena involved in forming metals by press drawing. Operations in forming large, solid-propellant rocket motor case halves by deep drawing. (G4b, T2p)

361-G. Tool Materials for the Cold Extrusion Process. A. W. F. Comley. Sheet Metal Industries, v. 38, Mar. 1961, p. 190-207.

Selection of toolsteels suitable for use as punches and dies for cold extrusion of steel. Review of heat treatment methods and defects and their prevention. Comparison with tungsten carbide tools. (G5; TS, 17-57)

362-G. Tape-Control Supercedes Chemical Milling. Metalworking Production, v. 105, Mar. 15, 1961, p. 72.

Sheet Mg skins for the engine struts of a missile are machined in a waffle pattern by a tape-controlled skin miller. (G17b, 1-52, T24a; Mg)

363-G. Techniques of Ultrasonic Machining. Aaron L. Roses. Tool and Manufacturing Engineer, v. 46, Apr. 1961, p. 71-75.

Review of development, operation, principles and applications of ultrasonic machining. Data are presented for abrasive grain size, cutting rates and factors affecting tool design and material selection for machining ultrahard metals, ceramics and intermetallic compounds. 5 ref. (G24c, 10-54; SGB-q)

364-G. Stressing for Reliability--Coining Increases Component Life. Austin Phillips. Tool and Manufacturing Engineer, v. 46, Apr. 1961, p. 87-88.

A coining technique for reducing metal fatigue in aircraft and missile components by setting up internal stress conditions and forming a groove of compressive stress adjacent to areas of tension. (G3n, G25, T24a)

365-G. Selecting Machinable Metals to Extend Tool Life. William Pentland. Tool and Manufacturing Engineer, v. 46, Apr. 1961, p. 89-90.

Analysis on cutting forces, power, tool life, temperature, surface finish

and mechanics and geometry of chip formation as factors affecting machinability of ferrous and nonferrous metals. Machinability ratings are given for different materials and data given for hardness factors affecting ferrous metals. (G17k)

366-G. New Tension-Controlled Blank Holder Combines Stretch and Draw Forming. Western Machinery and Steel World, v. 52, Mar. 1961, p. 45.

Sheets of Al, stainless steel, Ti and Rene 41 are stretch-formed by hydraulic cylinders in conventional press. Prestretching the sheet makes it conform accurately to the die surface. (G9; Al, Co-b, SS, Ti)

367-G. (Spanish.) Modern Techniques of Metal Forming Without Machining. F. Hrazdil. Ingenieria Industria, v. 27, Oct. 1960, p. 140-143, 145, 154.

Techniques for cold extrusion of steel, rolling of low-carbon steel screws and thin-walled tubes and punching of thin steel and nonferrous metal plates. (G5, F26s, F22k; ST, EG-a38)

368-G. (Spanish.) Die Stamping by Explosives. Ingenieria Industria, v. 27, Oct. 1960, p. 193-194.

Underwater explosive forming of Ni alloys, stainless steel and Ti to produce aircraft components. (G3, NM-k34; Ni-b, SS, Ti)

369-G. Explosive Forming. R. Gorcey, J. Glyman and E. Green. Machine Design, v. 33, Apr. 13, 1961, p. 188, 190.

Design considerations for high energy fabrication of hard-to-form materials and shapes. Application of explosive forming to 2024 and 6061 Al alloys, AZ31B Mg alloy, 4130 and 4340 steels; Vascojet 1000; 17-4PH, 17-7PH, 15-7MO, AM355 and 20CB stainless; Rene 41, Hastalloy X, Inconel X, HS21 Co alloy, 6Al-4V and B120VCA Ti alloys; Mo alloys and Teflon and Kel-Fusing plastic using deflagration or detonating explosives. (G17k; SGA-h, EG-a39, EG-d37, NM-d, NM-k38, ST, Ni-b, Ti-b, Mo-b, Co-b, Al-b, Mg-b)

370-G. Cold Heading. Automatic Machining, v. 22, Apr. 1961, p. 59-62.

Production of nuts, bolts and screws from wire using a cold heading machine with carbide or high-speed steel tooling. Shoulder length tolerances are held to ±0.005 in. and the tolerance of the shaft concentricity to the headed section is 0.0015 in. (G10, T7f; 4-61)

371-G. A Review of Bending Methods for Stainless Steel Tubing. C. T. Olofson. Defense Metals Information Center, Battelle Memorial Institute, DMIC Report 150, Mar. 2, 1961, 55 p. (Available as PB 151109 from U. S. Office of Technical Services, Washington 25, D. C.)

Ram, roll, press, compression and draw bending of 321 and 347 stainless steel tubing using bending, wiper, pressure and clamp dies and special mandrels. Physical properties of tubing. Minimum bending radii. (G6; SS, 4-60)

372-G. Contour Machining Beryllium. American Machinist/Metalworking Manufacturing, v. 105, Jan. 9, 1961, p. 69-70.

Turning, boring and gun drilling operations in solid Be billets for making throat nozzles for a Mach 10 wind tunnel with high surface finishes and 0.0002 in. tolerances. (G17; Be)

373-G. Screw Machine Work on Aluminum. Pt. 5. M. Bryan Baker. American Machinist/Metalworking Manufacturing, v. 105, Jan. 9, 1961, p. 91-93.

Various types of trouble encountered in cutting-off, tapping and threading operations on Al alloys in various wrought conditions are given in chart form, with possible causes and corrections. (G17a; Al-b)

374-G. Set-Up for Fine Boring Compressor Casings. Machinery (London), v. 98, Mar. 22, 1961, p. 654-656.

A double ended fine boring machine fitted with a special indexing and work holding fixture is used for rough and finish boring and front and back chamfering on holes in cast iron compressor casings. (G17d, 1-52, W13f; CI, 17-57)

375-G. Turning Operations on Titanium Billets. Machinery (London), v. 98, Mar. 22, 1961, p. 663-665.

A battery of seven 32 in. lathes is used to turn rough commercially pure Ti and Ti alloy billets to size. Recommended angles and nose radii for carbide, cast nonferrous alloy and high-speed steel tools for turning the billets. (G17a; Ti-b)

376-G. Cold Heading Stainless Steels and High Temperature Alloys. S. E. Tyson and J. W. Keegan. Machinery (London), v. 98, Mar. 22, 1961, p. 666-674.

Representative cold heading stainless steels and heat resisting alloys normally employed for the production of fasteners are reviewed in terms of chemical composition, mechanical properties and heading qualities. Survey of wire production and cold and warm heading operations. (G10, Q-general, T7f; SS, SGA-h, 17-57)

377-G. (German.) Testing Cuttability of Sheets With a Radioactive Tool. R. Neider. Kerntechnik, v. 3, Jan. 1961, p. 15-19.

Gamma-radiation measurements are used to assess cuttability of transformer and dynamo sheet cut with a radioactive tool. (G17k, 1-59; SGA-n)

378-G. Introduction to Chemical Milling. Materials in Design Engineering, v. 53, Apr. 1961, p. 128-132.

Recommendations for solution agitation, template size, thickness tolerances and surface areas to use in chemical milling. Methods of increasing uniformity of metal removal. (G24b)

379-G. Ultrasonics for Metal Cutting. George C. Brown and James N. Behm. Tool and Manufacturing Engineer, v. 46, Mar. 15, 1961, p. 57-60.

Applications of ultrasonic energy to conventional turning, milling and grinding operations. (G17, G18, 1-74)

380-G. Broaching for Maximum Production at Minimum Cost. W. H. Sutton. Tool and Manufacturing Engineer, v. 46, Mar. 15, 1961, p. 61-63.

Slotting of a circular A 5120 cam to tolerances of 0.001 in. on a continuous horizontal machine capable of producing 13,000 pieces per day. (G17d)

381-G. (German.) Grinding and Cleaning of Zinc, Pressure Die Castings and Light Metals. Thomas H. Curti. Metall-Reinigung + Vorbehandlung, v. 10, Feb. 1961, p. 19-20.

Grinding by sharp grinding media (SiC) at high speed with simultaneous cooling to avoid smearing or self-ignition. Cleaning of small castings in drums, using a 20% NaOH and 25% chromic acid containing pickling solution with subsequent rinsing, degreasing and drying. (G18, L12; Zn, 5-61)

382-G. (German.) Explosion Working of Superhard Metals. Metall-Reinigung + Vorbehandlung, v. 10, Feb. 1961, p. 22-23.

High-pressure die working by explosion of TNT (Trinitrotoluol), nitroglycerine, tritonal, zyclonite, dynamite, etc., of complicated parts of high-alloyed Cr and Ni steel, Al, Ti, Zr and their alloys using water for pressure transmission. (G-general, NM-k34; Al, SS, Ti, Zr)

383-G. Developments in the Forming of Aluminum Sheet. G. W. Eldridge. Metallurgia, v. 63, Feb. 1961, p. 71-77.

Progressive methods in forming Al and Al alloys by metal spinning, deep-drawing, pressing, high-energy forming and stretch forming. With heat treatable alloys, successful forming operations are conducted after solution treatment and before final precipitation hardening treatment is applied. 26 ref. (G-general; Al, 4-53)

384-G. Review of Some Unconventional Methods of Machining. Francis W. Boulger. Machinery, v. 67, Apr. 1961, p. 140-146.

Principles of electric discharge machining. Electrolytic grinding, electrolytic machining, chemical milling, ultrasonic machining, electron beam machining and plasma arc cutting. Application of these processes for machining refractory metals. High strength and heat resistant alloys, cemented carbides, ceramics and other materials. (G17, G22, G24)

385-G. Ultrasonics Creates a Major Innovation in Surface Grinding. Harold W. Bredin. Machinery, v. 67, Apr. 1961, p. 150-152.

Ultrasonic vibrations applied to cutting surface of grinding wheel through water base coolant prevent metal part build-up. Ultrasonics reduce wheel wear, need for dressing, frictional force and heat of grinding. (G18, 1-74)

386-G. Work Handling Time Cut by Setting up for Reciprocal Milling. A. A. Heckmann. Machinery, v. 67, Apr. 1961, p. 154-156.

Examples of reciprocal milling setups operating singly or in combination with index or progressive milling setups to machine components. (G17b)

387-G. (French.) Hot Drawing of Wire With Glass Lubrication. Louis Labataille. Revue Technique Luxembourgeoise, v. 52, Oct-Dec. 1960, p. 203-210.

Hot drawing of wire and tubes from billets of steel, ductile iron, refractory and nonferrous alloys. Process of glass lubrication. Properties of the tubes and wire produced. (G4, 1-66, 18-73; Fe, ST, EG-d37, EG-a38)

388-G. Machining Molybdenum. Australasian Manufacturer, v. 45, Mar. 4, 1961, p. 58-64.

Machining sintered and recrystallized Mo, Mo-W alloys and Mo-Ti alloys with high-speed steel and sintered carbide tools. Measurement of effect of cutting speed on tool life and effect of rake angle on tool force. Application of electro-erosion machining, chemical milling, electropolishing and photo etching. (G17, G24; Mo-b, Ti, W, 6-72)

389-G. Electroshaping of Metals. Machinery Lloyd (Overseas Edition), v. 33, Mar. 4, 1961, p. 39-40.

Forming of turbine blades by electroshaping produces a product having no stress problems, greatly reduced distortion allowances, good contour and high precision. (G24d, T7h)

390-G. Electrolytic Machining Speeds Metal Shaping. Chemical Engineering, v. 68, Mar. 20, 1961, p. 90-92.

Electrolytic machining of Nimonic, Udimet 700, Waspalloy and S-816 Co alloy. The rate of metal removal is influenced by the electric current and the flow rate of the electrolyte. Applications. (G24d; Co-b, Ni-b, SGA-h)

391-G. Free Machining Steel. E. Usui and M. C. Shaw. American Society of Mechanical Engineers, Transactions, Paper no. 61-Prod-4, 1961, 10 p.

Effect of tool speed, feed rate, chip tool contact length and chip thickness on shear, stress, cutting force, surface finish and tool life during machining of resulphurized, leaded and nonleaded hot rolled steels. (G17; ST)

392-G. (Czech.) Chip Formation Examined by Motion Pictures Taken During Machining. B. Vlach and J. Kozel. Strojirenstvi, v. 11, Jan. 1961, p. 47-49.

Steel and cast iron are machined at cutting velocity of 25-50 m. per min., cutting depth of 0.35-0.9 mm. and cutting angle of 7-18°. Chip formation is studied by motion pictures taken at a frequency of 2000-4000 exposures per sec. (G17; CI, ST)

393-G. Grinding Experts Challenge Tradition. Steel, v. 148, Apr. 24, 1961, p. 132-134.

Substitution of abrasive grinding for milling operations in heavy metal removal results in higher metal removal rates and lower material, fixture and wheel costs. (G18)

394-G. Tricks of the Trade Pay Off in Machining Stainless. G. J. Stevens. Iron Age, v. 187, Apr. 20, 1961, p. 140-142.

Solutions for problems of chip control, drill design and grinding, web thinning, tearing and burring encountered when machining stainless steel. (G17; SS)

395-G. (Japanese.) Correlation Between the Directionality Detected by Means of the Harbert Pendulum and the Earing in Deep Drawing of Aluminum Sheet. Ikeno Takashi, Zaima Shigeo and Shibata Kizo. Light Metals, v. 11, Jan. 1961, p. 20-23.

Directionality and earing phenomena in cold worked and annealed 25Al specimens as detected by Harbert pendulum testing is compared to data obtained with the Knoop indenter. 3 ref. (G4b, 3-72, 9-71; Al-b)

396-G. Machining 6Al, 4V Titanium. Metal Progress, v. 79, Apr. 1961, p. 96B.

Tool material, tool geometry, feed and cutting speeds for turning, milling, drilling and tapping. (G17; Ti-b, Al, V)

397-G. Trends in Aerospace Manufacturing. W. D. Nelson, J. A. Scott and R. H. Gassner. Metal Progress, v. 79, Apr. 1961, p. 106.

While new forming and shaping methods such as chemical milling, electromachining and grinding, subzero and thermal machining are used primarily in the aerospace field at present, they could spark a revolution in the manufacture of conventional items. Outline of the fabrication problems which remain to be solved in the fabrication of missiles, rockets and aircraft. (G24, G18, L-general, K-general, T24, T2p)

398-G. Single-Pass "J" Grooving in Heavy Plate With an Oxy-Fuel Gas Flame. C. B. Milton. Welding Journal, v. 40, Apr. 1961, p. 331-338.

Equipment, speed, gas flow and nozzle positioning for grooving steel plate. Examples of application. (G22g; ST, 4-53)

399-G. (English.) Critical Conditions of Wrinkling in Deep Drawing of Sheet Metals. Nozomu Kawai. Japan Society of Mechanical Engineers, Bulletin, v. 4, Feb. 1961, p. 169-175.

Clarification of mechanisms for preventing wrinkling in sheet metal after deep drawing. Formulas are developed for the prediction of wrinkling conditions when a blank-holder is not used. 9 ref. (G4b; 4-53)

400-G. (English.) Critical Condition of Wrinkling in Deep Drawing of Sheet Metals. Pt. 2. Nozomu Kawai. Japan Society of Mechanical Engineers, Bulletin, v. 4, Feb. 1961, p. 175-182.

Report on critical conditions of wrinkling in sheet metal after deep drawing where a blank-holder is used. By deducing the specific wave amplitude of wrinkles and including it in the equilibrium equation of moments, a formula predicting critical blank-holding pressure is obtained. 3 ref. (G4b; 4-53)

401-G. (English.) Critical Conditions of Wrinkling in Deep Drawing of Sheet Metals. Pt. 3. Nozomu Kawai. Japan Society of Mechanical Engineers, Bulletin, v. 4, Feb. 1961, p. 182-192.

Verification of a formula for predicting critical blank-holding pressure in the deep drawing of sheet metal to obtain minimal wrinkling. 6 ref. (G4b; 4-53)

402-G. New Coil Processing Lines Customize Sheet. Nat Wood. Western Metalworking, v. 19, Apr. 1961, p. 44-45.

Design and operation of a flying press and slitter line for cutting, slitting, flattening, regaging and edge conditioning of Al, stainless steel and carbon steel coil to form cut-to-size sheet, slit coils and blanks. (G2, 1-52; Al-b, ST, 4-53)

403-G. Behavior of Abrasive Grains in the Grinding Process. Hideo Tsuwa. Osaka University, Technology Reports, v. 10, Oct. 1960, p. 733-743.

Microphotographic examination of cutting edge shape, spacing, breakage and wear of abrasive grains during grinding of toolsteel of Rockwell 62 C. hardness. Relation of grain behavior to chip formation and other phenomena of the grinding process. 11 ref. (G18; TS)

404-G. Multi-Head Flame Cutter Clips Cost. Metalworking Production, v. 105, Mar. 29, 1961, p. 54-55.

Flame cutting of steel plate 1/4 to 5/8 in. thick by a multi-head electronic cutting machine increases output four times. (G22g; ST, 4-53)

405-G. Honing of Heading and Upsetting Dies. Gerhard Haasis. Wire World International, v. 3, Feb. 1961, p. 21-24.

Horizontal honing of carbide and toolsteel dies with electrolytically bonded diamond tools. Considerable increase in die life is attributed to the relatively fine surface finishes achieved. (G19n, T6r; TS, 14-68)

406-G. (French.) Fabrication of Pieces by Extrusion and Drawing. Jan Mailliard. Ingenieurs de l'Automobile, v. 35, Feb. 1961, p. 79-87.

Extrusion characteristics and workability of Pb, Zn, Sn, Cu and Al alloys and steels. Data are given for extrusion and drawing effects on mechanical and surface properties. (G4, G5, 17-52, Q-general; Pb-b, Sn-b, Zn-b, Cu-b, Al-b, ST)

407-G. Drilling and Reaming Beryllium. Metalworking Production, v. 105, Apr. 5, 1961, p. 52-53.

Deep hole and gun drilling of Be using carbide tipped or solid carbide tools to increase tool life and decrease the tendency of Be to seize the tool. (G17e; Be)

408-G. High-Speed Machining of Nonferrous Metals for Low Cost Production. Charles R. Onsrud. Production Equipment, v. 36, Apr. 1961, p. 4-5.

Smaller chips and reduced contact between tool and chip lengthen tool life in high speed machining of Al. (G17; Al)

409-G. You Can Reduce Your Grinding Costs. W. W. Mawry. Grits and Grinds, v. 52, Mar. 1961, p. 3-7.

Surface grinding of gray iron, ductile iron, high-speed steel, Meehanite and

high-carbon steel using Alundum 213 as an abrasive. (G18k; Fe, ST)

410-G. Fresh Approach in Machining Takes Aim on Hard Steels. R. H. Eshelman. Iron Age, v. 187, Apr. 27, 1961, p. 101-108.

Data are given for feed, cutting depth and speed, choice of cutting fluid and choice of cutting tool when machining materials above 300 Brinell hardness. (G17; ST, SGB-q)

411-G. Chemically Milled Structures. George H. Fox, Jr., and Hugh H. Muller. Machine Design, v. 33, Apr. 27, 1961, p. 126-134.

Advantages, limitations and design recommendations for chemical milling of Al, Mg, Fe, Ni and Ti alloys. Effect of chemical milling on the compression, tension and shear properties of these materials. (G24b; Al-b, Fe-b, Mg-b, Ni-b, Ti-b)

412-G. Centerless Grinding of Bolts Including Shoulders. Grinding and Finishing, v. 7, Apr. 1961, p. 30.

Grinding of carbonized 1040-steel engine bolts to required tolerances and finishes using a centerless grinder with a vibratory hopper. (G18h, T7f; ST, 17-57)

413-G. Recommendations and Precautions for Fabrication of 5% Cr Ultra-High-Strength Steel. Pt. 2. J. C. Hamaker, Jr., and W. Scott Lightner. Western Machinery and Steel World, v. 52, Apr. 1961, p. 46-50.

Machining and heat treating of 5 Cr MoV steel. Diffused Ni-Cd plating, silicone-Al painting, hot dip aluminizing, chromizing and nitriding impart corrosion and oxidation resistance. Tests showed excellent room and low temperature fatigue, impact and transverse properties, deep air hardenability, freedom from retained austenite and ability to be baked to 1000° F. Vasco Jet 1000 steel is used as a cutting tool 13 ref. (G17, J-general, Q-general; ST, SGB-a)

414-G. Abrasive Belt Grinding Aids Production of Tensile Specimens. Western Machinery and Steel World, v. 52, Apr. 1961, p. 54-55.

A cam controlled grinding machine produces specimens of any configuration from sheet, plate, extrusion or bar stock containing materials in both annealed and heat treated conditions. Materials include Al, stainless steel, Rene 41, Ti and H-11. Al oxide belts are used for all metals except Ti which requires a silicon carbide belt. (G18; Al, Ni-b, SS, Ti)

415-G. Hogging--a Job Shop Specialty. Gilbert C. Close. Modern Machine Shop, v. 33, May 1961, p. 116-121.

Effect of tool pressure and accuracy and work deflection when hogging Monel, titanium and stainless steel. (G17; Ni-b, SS, Ti)

416-G. High-Speed Machining. Modern Machine Shop, v. 33, May 1961, p. 122-125.

The life of tools used in high-speed machining of Al is affected by the time of contact between the chip and tool and by spraying coolant on the cutting tool. (G17)

417-G. Faster Machining Stainless Developed by Universal-Cyclops. Modern Machine Shop, v. 33, May 1961, p. 140-142.

Data given for composition, machinability, weldability and corrosion resistance of Uniloy 303 MA free machining stainless steel. (G17k, K9s, R-general; SS, SGA-k)

418-G. High Speed Machining Triggers Output of Nonferrous Parts. Iron Age, v. 187, May 4, 1961, p. 94-95.

Data for relationship between chip load and feed speed. Factors which prevent welding of chips to the cutter. Use of coolants. (G17; EG-a38)

419-G. (Dutch.) Chip Formation in Machining. J. J. P. Baart and P. C. Schot. Metaalbewerking, v. 26, Mar. 2, 1961, p. 358-361.

Determination of the direction in which the chip tends to move away from the work in turning operations. Dependence of the direction of chip removal on cutting tool profile, nose radius and cutting depth. 7 ref. (G17a)

420-G. (Rumanian.) Machining Parameters for Commercial Carbon Steels. M. P. Popov, I. Mitrica and E. Deciu. Studii si Cercetari de Mecanica Aplicata, v. 11, May 1960, p. 1-13.

Economical cutting speeds for OL 38, 42, 50, 60 and 70 steels are computed from a constant depending on the material used, the cutting depth, the linear feed and two exponents characterizing the mechanical properties. 6 ref. (G17; CN)

421-G. (Dutch.) Manufacture of Screws, Bolts and Nuts. Pt. 2. J. H. Meulman. Metaalbewerking, v. 26, Feb. 16, 1961, p. 330-333.

Upsetting of steel bolt heads and of flat, round and fillister head screws with thread rolling in a flat-die machine. Production of nuts by cold and hot forging methods. (G10p, G12, F22, T7f; ST, 17-57)

422-G. (Dutch.) Various Kinds of Plastic Deformation. Pt. 1. P. Landberg. Metaalbewerking, v. 26, Feb. 16, 1961, p. 319-330.

Investigation of deformation processes occurring during metalworking with attention to deep drawing. Force-depth diagrams are constructed and analysis is made of elastic and plastic flow mechanisms. (G4b, Q24)

423-G. "Fluid-Form" Interesting Process for Forming Sheet Metal Components. Australasian Manufacturer, v. 45, Feb. 25, 1961, p. 44-48.

Blanks are given an irregular shape through plastic forming in a simple tool with a cavity corresponding to the shape of the finished part and using a flexible punch which also acts as a blankholder. (G-general; 4-53)

424-G. Threading Goes Massive. Rupert LeGrand. American Machinist/Metalworking Manufacturing, v. 105, Apr. 17, 1961, p. 124-125.

Temperature-resistant steel, gear steel, Refractalloy and high-Ni steels can be thread rolled if spindle deflection is controlled. Application to worm threads, studs, long bars with helical splines. (G12; ST)

425-G. Accuracy of Milled Surfaces. Metal Cuttings, v. 9, Apr. 1961, p. 2-10.

Effect of end mill deflection during machining of Rene 41 and H-11 steel is investigated by special instrumentation to measure tool deflection and surface accuracy. (G17; Ni-b, ST)

426-G. (Italian.) Mechanical Working by Spark Erosion. Gianni Zucchetto. Macchine, v. 16, Jan. 1961, p. 17-23.

Principle of spark erosion process by electrical impulse. Application to conductor and semiconductor materials, metals, tempered steel and sintered parts. (G24a)

427-G. (French.) Improvement of Machinability by Treating the Liquid Melt With a Nitrogen Blast. Georges Blanc and Nicolas Volianik. Fonderie, v. 180, Jan. 1961, p. 3-10.

Treatment of melts of varying composition with a nitrogen blast through a graphite nozzle. Comparison of machinability of products from these melts with nontreated ones and those treated with ferrosilicon additions. (G17k, D11h)

428-G. An Experimental Investigation Into the Cold Extrusion of Steel. H. Ll. D. Pugh, M. T. Watkins and J. McKensie. Sheet Metal Industries, v. 38, Apr. 1961, p. 253-283.

Study of the extrusion pressure, the flow of metal during deformation and the mechanical properties of the product resulting from single stroke extrusion of simple axisymmetric rods, tubes and cans. Effect of process factors such as reduction, tool geometry, lubrication, ram speed and of the chemical composition of the steel, slug geometry and slug preparation. 33 ref. (G5, Q-general, 3-68; ST, 4-58)

429-G. Sheet Metal Data Sheet, Manufacture of Tin Boxes. Pt. 4. J. W. Langton. Sheet Metal Industries, v. 38, Apr. 1961, p. 305-306.

Data is compiled for the basic forming and soldering or welding operations in fabricating noncircular sheet steel containers with side seam. (G-general, K-general, W12c; ST, 4-53, 8-62)

430-G. Spark-Erosion Machining. Light Metals, v. 24, Apr. 1961, p. 108-109.

Hard metals, Nimonic alloys and intractable materials such as Stellite, tungsten-carbide and magnet steel are machined by a spark erosion installation consisting of machine, spark generator and dielectric filter. (G24a; Co-b, Ni-b, SGB-q)

431-G. Explosive Forming. Light Metals, v. 24, Apr. 1961, p. 115-116.

Forming of Ti, Mn and Al alloys and complex steels into simple or complex shapes by the instantaneous transmission of water or air by impulse waves generated by detonation of an explosive charge. (G-general, NM-k34; Al-b, Mn-b, ST, Ti-b)

432-G. Cold Extrusion of Ferrous and Nonferrous Materials. R. Tilsley and F. Howard. Production Engineer, v. 40, Mar. 1961, p. 176-196.

Cold extrusion of metal by backward extrusion, forward extrusion or a combination with other pressworking operations. Components produced can be circular or noncircular sections. The ferrous or nonferrous materials are caused to flow axially into a shape and size governed by the tooling. 13 ref. (G5)

433-G. Spline and Thread Rolling. John Arnold. Production Engineer, v. 40, Mar. 1961, p. 207-215.

Roto-Flo process of metal displacement for the mass production of metal parts. Spline and thread rolling are used as finishing operations with no subsequent cutting operations. Process maintains its original accuracy at high production rates because rolling dies are subjected to very little friction wear. (G12)

434-G. The Process of Explosive Forming of Metal. W. S. Hollis. Production Engineer, v. 40, Mar. 1961, p. 216-225.

Sheet specimens of FV 520, N 75 and Ti alloys are explosively formed using H_2O or air as the shock transmitting medium. Explosive forming dies are constructed of shock sustaining materials (Kirksite, Kayemalloy, mild steel and epoxy resin). (G-general, NM-k34; ST, Ti-b)

435-G. The Machining of Steel. F. C. Lea and Eric H. Simons. Edgar Allen News, v. 40, Apr. 1961, p. 80-81.

Design of tools for boring, turning, facing, planing and shaping steel. (G17; ST)

436-G. Fabricating in Titanium? Cut Costs by Sawing Contoured Parts From Slabs. Norman Phillips. Machine and Tool Bluebook, v. 56, May 1961, p. 100-104.

Complicated contoured parts from slabs of Ti are cut by a modified band sawing machine that is equipped with carbide tipped saws, flow coolant and features increased feeding pressure. (G17h; Ti)

437-G. A Review of Advantages of High Speed Machining of Light Metals. Light Metal Age, v. 19, Apr. 1961, p. 9.

Question and answer review covering the meaning of high-speed machining, tool life, chip welding onto the cutter and usage of coolant. (G17)

438-G. Cold Extrusion of Titanium. Light Metal Age, v. 19, Apr. 1961, p. 12.

Hexagonal cups are backward extruded in a single operation from solid round AMS 4902 Ti barstock, then are finish machined and threaded on a screw machine to produce a no. 10 hexagonal nut. Production cost savings on material and labor. (G5; Ti)

439-G. Electromagnetic Metal Forming--High Energy Exerts Shaping Force. A. P. Langlois. Tool and Manufacturing Engineer, v. 46, May 1961, p. 105-108.

Permanent deformations are produced in Al tubing and Cu rod by powerful magnetic flux lines. Electromagnetic metal forming exerts high pressure on conductive metals causing their elastic limits to be exceeded. (G-general; Al, Cu, 4-55, 4-60)

440-G. Stampings for the Space Age... by Explosive Forming. G. C. Throner and I. Lieberman. Tool and Manufacturing Engineer, v. 46, May 1961, p. 123-126.

High-strength steels (Tricent, Vascojet-1000, AMS-6434), Unitemp M-252 alloy, AISI 6434 steel, AISI 4340 steel, 6Al-4V Ti alloy, Mg, Al and Al alloys are explosively formed, forged and trued. Explosive compaction is done on powdered ZrO_2, Ta, W, Mo, tungsten carbide with binder, Ta carbide, Be and other refractory metals. (G-general, NM-k34)

441-G. Milling High-Strength Alloys. Tool and Manufacturing Engineer, v. 46, May 1961, p. 127-128.

Data from the machining of space vehicle components are to develop speed-and-feed charts for face milling, side milling, slotting and end milling. Data

are given for martensitic low-alloy steel, hot work die steel, austenitic stainless steel, martensitic stainless steel, Ni-base and Co-base high-temperature alloys and Ti. (G17b; AY, Co-b, Ni-b, SS, Ti, TS)

442-G. (Japanese.) The Life of Grinding Wheels. Hideichi Makino, Shozo Suzuki and Hosei Noguchi. Journal of Mechanical Laboratory (Japan), v. 15, Jan. 1961, p. 1-9.

Cylindrical grinding tests on S45C carbon steel of Rc. 40 hardness using a WA54 LMV grinding wheel on a universal grinder with emulsion cooling. Effect of machine rigidity on grinding action and subsequent wheel wear. (G18g; CN)

443-G. Tool Life Versus Machine Capacity. A. Incardona and H. H. Poett. Production, v. 47, May 1961, p. 54-55.

Machining of free-cutting steels, carbon steels, alloy steels, stainless steels, cast iron, Al, Mg, Ti alloy, brass, bronze, Monel and Inconel with disposable carbide tools to produce experimental missile parts. Measurements to determine effect of cutting speed, feed rate, depth of cut and lubrication on tool life. (G17, T24e; Al, Cu-b, Mg, Ni-b, ST, Ti-b)

444-G. High Speed Machining. Production, v. 47, May 1961, p. 64.

High-speed machining of Al using boring mill, knee mill, duplex mill and air turbine spindle with carbide tools. Data for effect of cutting speed and feed rate on tool life and chip load. (G17; Al)

445-G. Flame-Straightening Restores Fire Distorted Steel. Welding Engineer, v. 46, May 1961, p. 80, 82.

Structural steel members distorted as much as 3 ft. laterally have been flame straightened in place using an oxy-acetylene heating torch and a hydraulic jack. (G22g; ST, 4-57)

446-G. Improvement of Fatigue Life of Aircraft Components by Coining. A. Phillips. American Society of Mechanical Engineers, Paper no. 61-AV-35, 1961, 5 p.

Improvement of service life in structural aircraft components is achieved by coining a process which produces compressive residual stress adjacent to holes, slots or notched edges in a structural member. (G3n, Q7b, T24)

447-G. Explosive Metal Forming Comes of Age. G. C. Throner. American Society of Mechanical Engineers, Paper no. 61-AV-37, 1961, 7 p.

Discussion of advances in explosive cutting, piercing and swaging processes and high-energy compaction to fabrication of large, solid-fuel rocket engine components. (G-general, NM-k34, T24b)

448-G. (Dutch.) Manufacture of Screws, Bolts and Nuts. J. H. Meulman. Metaalbewerking, v. 26, Feb. 2, 1961, p. 301-303.

Cold upsetting of steel screw and bolt heads. Examination of macrostructure during various stages of deformation. (G10p, M28k, T7f; ST, 17-57)

449-G. Advanced Fabrication Techniques. R. Garcey, J. Glyman and E. Green. American Society of Mechanical Engineers, Paper no. 61-AV-13,1961, 19 p.

Advantages, applications and economics of filament winding, explosive forming and furnace brazing techniques used in fabricating missile components. (G-general, NM-k34, K8j, T24e)

450-G. New Ways of Cutting Metal. David Fishlock. South African Mining and Engineering Journal, v. 72, Mar. 17, 1961, p. 605, 607, 609.

Review of chemical, electrical and explosive methods for cutting and shaping alloys of Fe, Al, Mg, Ti, Cu, Zr and Mo including chemical milling, electromachining, electro-erosion, spark erosion, explosive forming and spark forming. (G-general, G24; Fe-b, Al-b, Mg-b, Ti-b, Cu-b, Zr-b, Mo-b, NM-k34, 17-57)

451-G. Copper-Base Extrusions. Precision Metal Molding, v. 19, May 1961, p. 35-39.

Data given for machinability rating, surface finish, corrosion resistance, thermal and electrical conductivity of Cu-base extrusions. (G17k, P15g, P11h, R-general; Cu, 4-58)

452-G. Machining AM350, Solution Treated and Aged to Bhn 444. Metal Progress, v. 79, May 1961, p. 96B.

Tabulated data on turning, milling, drilling and tapping. (G17; ST)

453-G. Fabrication Studies on Columbium Alloy Sheet. Andrew F. Frabold and Steven Bank. Metal Progress, v. 79, May 1961, p. 103-107.

Preliminary tests indicate that D-31 sheet (10% Mo, 10% Ti) has relatively good formability; its machining characteristics are similar to austenitic stainless steel. The alloy has fair bendability but its weldability leaves much to be desired. The material can be sheared cold; it can be dimpled at 500° F. but not at room temperature. (G-general, G17k, K9s, Q23q; Cb-b, 4-53)

454-G. (German.) Evaluation of Characteristic Data for Crank Presses and Drawing Presses With Over 200 Tons Pressing Power. Wolfgang Sibbe and Max Lang. Fertigungstechnik und Betrieb, v. 11, Feb. 1961, p. 90-95.

Time analysis for various forming operations in pressing steel sheet for auto parts by crank and drawing presses. (G4d, 1-52; ST, 4-53)

455-G. Quiet Revolution in Metalworking. H. Dale Long. Industrial Research, v. 3, Apr-May 1961, p. 59-65.

Machining and forming methods used in fabricating superhard alloys for aircraft and missile components, automotive parts and appliances including hot and cold machining, explosive forming and electrolytic machining methods. Application of numerical control to precision drilling, grinding and boring operations and use of harder and more heat resistant cutting tools at higher speeds. (G-general, G17, G24, T-general, 3-67; SGB-q, NM-k34, 17-57)

456-G. Metalworking. Pt. 1. Machining. OTS Selective Bibliography SB-460, 24 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.10.

Bibliography lists research reports of the Army, Navy, Air Force, Atomic Energy Commission and other government agencies as well as foreign technical literature on unconventional machining methods, shop practices, automation and controls, welding, soldering and brazing. (G17, K-general)

457-G. Chatter Patterns Formed on the Surface of Thin Cylindrical Tubes During Machining. R. N. Arnold. Journal of Mechanical Engineering Science, v. 3, Mar. 1961, p. 7-14.

Effect of self-induced and forced vibrations during machining on recurring surface patterns on specimen steel tubes. Measurement of chatter vibration mode, frequency and amplitude as a function of cutting depth, speed and force, tube geometry, density, Poission's ratio and Young's modulus. (G17; ST, 4-60)

458-G. Chipless Machining. Pt. 1. Clifford P. Farr. Canadian Metalworking, v. 24, May 1961, p. 46-47.

Review of the metallurgical aspects of cold working metals, particularly steel. Analysis of resistance to deformation measured in terms of strength, plasticity, ductility, malleability, elasticity and stress-strain relations. (G-general, Q23q, Q-general, 1-67, 10-54; ST)

459-G. (Translation.) Increasing the Effectiveness of Honing. N. I. Goraetskii. Machines and Tooling, v. 31, Nov. 1960, p. 13-15. (Translated from Stanki i Instrument, Nov. 1960.)

An increase in working area, specific pressures and hardness of honing stones improves the effectiveness of honing gray iron and steel. 5 ref. (G19; CI-n, ST)

460-G. (Translation.) Effect of the Built-Up Edge on a Cutter on the Surface Quality of Aluminum Alloys. V. B. Livshits. Machines and Tooling, v. 31, Nov. 1960, p. 29-31. (Translated from Stanki i Instrument, Nov. 1960.)

Effect of thermal conductivity of Al alloy on the active edge formation on a cutter. 3 ref. (G17; Al-b)

461-G. Cold Forming of Steels. Australasian Manufacturer, v. 46, Apr. 8, 1961, p. 44-46, 48-51.

Forming of steel components in closed dies similar to those used for hot forging. Advantages of hydraulic presses. Production of pellets, billets and preforms. (G-general, 1-67; ST)

462-G. Developments in Metal Spinning. Metal Industry, v. 98, Apr. 28, 1961, p. 335.

Spinning of Al black iron and carbon steel components by an electrohydraulic spinning lathe. (G13; Al, CI-s, CN)

463-G. Typical Machining Operations on Aluminium Cylinder Heads. Machinery (London), v. 98, May 3, 1961, p. 1000-1005.

Machining of gravity die cast Al cylder heads on a line which performs milling, drilling and boring operations. (G17, T21b; Al, 5-61, 17-57)

464-G. Step-by-Step Controls Pay Off in Machining Hi-Temp Alloys. Iron Age, v. 187, May 18, 1961, p. 142-143.

Stainless steel, hot work die steel and heat resistant alloys are machined, milled and tested. Hardness, tolerance, thickness and taper determined. (G17; SS, TS, SGA-h)

465-G. High-Impact Metal Forming, 1957-1960. A. A. Beltran. Lockheed Aircraft Corp. U. S. Office of Technical Services, PB 171379, July 1960, 37 p. $1.

List of references relating to explosive forming, hydrospark forming, electro-discharge machining, impact extruding and the firing of bolts into metals. (G-general)

466-G. HE Spark-Forming Moves Into Production. Metalworking Production, v. 105, May 3, 1961, p. 49-50.

High energy electrospark process is applied to instantaneous formation of Al, stainless and high strength steel, Ti, Cb and Be-Cu missile and automotive parts, using a high voltage, underwater discharge to force the metal into the die. (G24a, T21, T24e; Al, Cu-b, Cb, ST, Ti, 17-57)

467-G. Tap and Deburr in One Operation. Metalworking Production, v. 105, May 3, 1961, p. 65.

Removal of burrs from tapped holes in materials such as Al, cast iron, steel, brass, Cu and plastics, as the tap is withdrawn using attachments to the tap shank, including a chamfering bit, bit body, compression spring and collar. (G17f; Al, CI, ST, Cu-b, NM-d37)

468-G. Maskants for Chemical Milling. Henry M. Deutsch. Materials in Design Engineering, v. 53, May 1961, p. 128-130, 241.

Comparison of elastomeric and plastic maskants as to chemical and heat resistance. Methods of applying maskants. Choice of maskant for Al alloys, ferrous metals, Ti and Mg. (G24b; Al-b, Fe-b, Mg, Ti)

469-G. (German.) Importance of Flow Spinning. Herbert Jacob. Fertigungstechnik und Betrieb, v. 11, Mar. 1961, p. 188-190.

Principles and technological parameters for production of small and medium-size symmetric metal and alloy parts by continuous spinning. Tool design and mode of operation for forming a X 10 CrNiMoTi 18 10 steel. (G13; ST)

470-G. (German.) Deformation in Sheet Working. Pt. 2. G. Oehler. Fertigungstechnik und Betrieb, v. 11, Mar. 1961, p. 190-193.

Methods for evaluating deformation mechanisms by marking sheet surface with reference figures (circles and coordinates). Experimental evaluation of deep drawing force and of favorable blank forms for drawing. (G4b, G25, Q24; 4-53)

471-G. (German.) Sheet Cutting With Zinc Alloy Tools. Fritz Keller. Fertigungstechnik und Betrieb, v. 11, Mar. 1961, p. 197-200.

Use of steel mandrel and cast or rolled Zn alloy cutting plate (3.5-4.5% Al, 2.5-3.75% Cu, 0-1.25% Mg, bal. Zn) in cutting or punching of brass, Al-Cu-Mg alloy and steel sheet. Design, physical and mechanical properties and lifetime of cutting tools. (G2, T6n; Zn-b, 17-57, Al-b, Cu-n, ST, 4-53)

472-G. How to Design Rolled Worms. Metalworking Production, v. 105, Apr. 26, 1961, p. 51-56.

Factors affecting design of roll threaded worms including pressure angle, root and corner crest radii, die edges, blank design, thread blank chamfers and material selection, in particular, EN8, 12 and 362 steels. (G12; ST)

473-G. Small Hole Gun Drilling of Superalloys. D. A. Stewart. Society of Automotive Engineers, Paper no. 340K, 1961, 3 p.

Superalloys U-500, U-700 and DCM are drilled horizontally on a milling machine. Data are given for cutting speed, feed rate and gun geometry. (G17e; SGA-h)

474-G. Shearforming 7075 Aluminum. C. E. Howle and Frank Jacobs. Society of Automotive Engineers, Paper no. 340B, 1961, 5 p.

Mechanical properties of 7075 Al alloy as affected by shearforming. Data are presented to illustrate this effect. Use of equipment. 4 ref. (G11; Al-b)

475-G. Applications of the Plasma Arc in Fabrication. R. L. O'Brien. Society of Automotive Engineers, Paper no. 340H, 1961, 6 p.

Use of plasma arc process in cutting, plating and weld surfacing nonferrous metals, stainless steel, carbon steel and high-strength alloys such as RENE 41 and Hastelloy B. (G22h, L29, K6; CN, SS, SGB-a, EG-a38)

476-G. Distortion and Residual Surface Stress in Grinding and Milling of High Strength Steels. L. J. Nowikowski, John Maranchik, Jr. and Michael Field. Society of Automotive Engineers, Paper no. 340L, 1961, 9 p.

Residual stress and resulting distortion is reduced by controlling the machining and grinding conditions. Data are given for determining the nature and magnitude of stresses which produce distortion. (G17b, G18, 9-74; ST, SGB-a)

477-G. Hot Machining of High Temperature Alloys Can Increase Production. Jens L. Wennberg, Clarence L. Mehl and E. J. Krabacher. Society of Automotive Engineers, Paper no. 340J, 1961, 9 p.

High-strength thermal resistant materials and refractory alloys are heated at the time of machining to obtain maximum tool life. Data show effect of elevated temperature on the workpiece. (G17, 1-66; SGA-h)

478-G. (German.) Production of Small Drawing Parts in Plate-Guided Follow-On Tools. Heinz Kuckenberg. Werkstatt und Betrieb, v. 94, Mar. 1961, p. 159-161.

Design of tools and operational sequences for deep drawing of small parts of Ni, Al-plated soft steel and special deep drawing steel sheet without use of multiple-die presses. (G4, W24n, 1-52; Ni-b, ST, 4-53)

479-G. (Translation.) Effect of Ultrasonic Vibrations in Machining Creep Resistant Alloys. A. A. Voronin and A. I. Markov. Machine and Tooling, v. 31, Nov. 1960, p. 15-18. (Translated from Stanki i Instrument, Nov. 1960.)

Effect of high-frequency vibration on metal chip plastic deformation, tool wear, friction, fatigue, cutting force and surface finish during turning, cutting and grinding of high-speed steels, cemented carbides and Ti alloys. (G17, 1-74; TS-m, Ti-b, 6-69)

480-G. (English.) Buckling Limits of Tool Dimensions in Cupping Operation. Matsuo Miyagawa. Tokyo Metropolitan University, Faculty of Technology, Memoirs, Sept. 1959, 14 p.

Effect of the relation between relative thickness ratio and drawing ratio on the wrinkling limits during cupping of killed steel, 70-30 brass, soft and half hard Al, annealed Cu and soft steel. 23 ref. (G4c; Al, CN, Cu-n)

481-G. Fundamentals of Drawability of Sheet Steel. J. W. Frame, R. L. Whiteley and D. J. Blickwede. Paper from "Porcelain Enamel Institute Forum, Proceedings". v. 22. Porcelain Enamel Institute, Inc., Washington 6, D. C., 1960, p. 18-24.

Discussion of punch stretching and die drawing operations involved in deep drawing of sheet steel. Some measure of the drawability of steel can be determined from its elongation and anisotropy. (G4, 17-52; ST, 4-53)

482-G. Properties and Control of Drawing Compounds for Deep Drawing. A. Fucinari and W. J. Wojtowicz. Paper from "Porcelain Enamel Institute Forum, Proceedings". v. 22. Porcelain Enamel Institute, Inc., Washington 6, D. C., 1960, p. 26-30.

Oil, emulsion or dry film lubrication of cold rolled steel, stainless steel, galvanized Fe, enameling Fe, Al or terne plate before deep drawing. (G4b, 18-73; Al, Fe, SS)

483-G. Hot Ingot Milling Machine. Engineer, v. 21, Apr. 28, 1961, p. 719-720.

Hot milling of steel ingots to remove superficial defects such as cracks, cold laps, inclusions, oxides and other impurities. (G17b, 1-66; ST, 5-59)

484-G. Titanium Formed 98% Faster With Hot Dies. Steel, v. 148, May 22, 1961, p. 121.

Hot die forming of 8% Mn, Ti alloy channel rings. Die used is AISI H-13 hot work toolsteel heat treated to Rockwell C-49. (G-general, 1-66; Ti-b)

485-G. A New Test Method for Determination of Spinnability of Metals. Richard L.

Kegg. Journal of Engineering for Industry (ASME, Transactions), Series B, May 1961, p. 119-124.

Measurement of the effect of tensile area reduction on spinnability and of tensile elongation on maximum spinning strain during the spinning of Al alloys, stainless steels, cast iron, Cu and steels on ellipsoidal mandrels. (G13; Al-b, CI, Cu, ST)

486-G. On the Mechanics of Shear Spinning. Serope Kalpakcioglu. Journal of Engineering for Industry (ASME, Transactions), Series B, May 1961, p. 125-130.

Measurement of stress-strain rate, specific energy, tangential force, hardness distribution and metal flow pattern during the shear spinning of Cu, Al alloys, stainless steel and steel on conical mandrels. (G13; Al-b, Cu, ST)

487-G. Machinability of Nodular Cast Irons. Pt. 1. Tool Forces and Flank Adhesion. I. Ham, K. Hitomi and G. L. Thuering. Journal of Engineering for Industry (ASME, Transactions), Series B, May 1961, p. 142-154.

Testing of three nodular cast iron grades (60, 80 and 100) to determine the cutting and feed forces required to machine the materials and the performance of several grades of carbide and oxide cutting tools and to investigate the flank adhesion phenomenon. (G17k; CI-r)

488-G. Free Machining Steel. Pt. 1. Tool-Life Characteristics of Resulfurized Steel. M. C. Shaw, N. H. Cook and P. A. Smith. Journal of Engineering for Industry (ASME, Transactions), Series B, May 1961, p. 163-174.

Testing five steels with sulphur content of 0.33-0.37% to determine effect of cutting speed, cutting fluid, sulphur content and cold working on tool life and tool wear during machining with carbide tools and high-speed steel tools. (G17; ST, SGA-k)

489-G. Free Machining Steel. Pt. 2. Tool-Life Characteristics of Leaded Steel. M. C. Shaw, P. A. Smith and N. H. Cook. Journal of Engineering for Industry (ASME, Transactions), Series B, May 1961, p. 175-180.

Measurement of high-speed steel tool life with relation to cutting speed, feed, cutting fluid and cold working during the machining of hot rolled, leaded and non-leaded steels. (G17; ST)

490-G. Free Machining Steel. Pt. 3. Cutting Forces; Surface Finish and Chip Formation. M. C. Shaw, E. Usui and P. A. Smith. Journal of Engineering for Industry (ASME, Transactions), Series B, May 1961, p. 181-193.

Testing of low-carbon steels, leaded steels and resulphurized steels during machining with high-speed steel tools to determine effect of lubrication with MnS, water, air, Pb, graphite, Al_2O_3, molybdenum disulphide and mineral oil on friction force and to determine effect of cutting speed and cutting feed on cutting force, surface temperature and chip temperature. (G17; ST)

491-G. An Experimental Investigation of the Electrolytic Grinding Process. Reno R. Cole. Journal of Engineering for Industry (ASME, Transactions), Series B, May 1961, p. 194-201.

Measurement of effect of electrolyte flow, electrolyte concentration, grinding pressure and current density on metal removal rate during the grinding of hot rolled carbon steel with a phosphor bronze diamond wheel using a water solution of potassium nitrate for an electrolyte. Calculation of Faraday current efficiency. (G18, G24d; CN)

492-G. Explosives in Metal Working. R. E. Leyman. Australian Machinery and Production Engineering, v. 14, Mar. 1961, p. 21-23.

Advantages and disadvantages of explosive forming for sheet steel and Al. Shock hardening of metals. (G-general, NM-k34; Al, ST, 4-53)

493-G. Tube Grinding and Finishing Operations. John E. Hyler. Australian Machinery and Production Engineering, v. 14, Mar. 1961, p. 28-29.

Description of an internal tube grinding and polishing machine and an abrasive-belt centerless grinder for external operations. (G18, L-general, 1-52; 4-60)

494-G. "Chipless" Tapping: The Cold Forming of Internal Threads. Andrew E. Rylander. Western Machinery and Steel World, v. 52, May 1961, p. 46-47.

Review of process for cold forming internal threads on drill tools by metal displacement. Tabular data on tap drill size selection. (G-general, 1-67, W25p)

495-G. Machining Stainless Steel: Tricks of the Trade for Single and Multiple-Spindle Automatics. Western Machinery and Steel World, v. 52, May 1961, p. 64-65.

Drilling, tapping and grinding procedures for the efficient production machining of stainless steel with single and multiple-spindle automatics. (G17, G18, 1-53; SS)

496-G. Electro-Chemical Machining of Refractory Alloys. W. B. Stephenson, Jr. Modern Machine Shop, v. 34, June 1961, p. 102-109.

Rapid rate of stock removal is achieved in electrochemical machining of blade and bucket airfoils composed of M-252 superalloy. Successful machining is dependent on accurate temperature control of solution. (G24d, T24; SGA-h)

497-G. Machining Missile Parts to Tolerances of 25 Millionths. Gilbert C. Close. Modern Machine Shop, v. 34, June 1961, p. 118-122.

Al and Mg components are machined to close tolerances in controlled air atmosphere of a specially designed cleanroom. (G17, T24e; Al, Mg, 17-57)

498-G. Drilling Close Tolerance High Finish Holes. C. B. Weidner. Modern Machine Shop, v. 34, June 1961, p. 136-139.

Technique for drilling Al tube sheet assemblies to intricate specifications and high-quality finishes while preserving tool life. (G17e; Al, 4-53, 4-60)

499-G. How Shot Peening Improves Solid Shafts. Power Drive Engineering, v. 3, Apr-May 1961, p. 16.

Combination of shot peening and heat treating improves torsional rigidity and fatigue life of solid steel shafts used as automobile rear axles and motor shafts. Comparison with hollow shafts. (G23n, T21c; ST)

500-G. Evaluation of Numerically Controlled Machining of Forging Dies. A. H. Swift. Wyman-Gordon Co. U. S. Office of Technical Services, PB 171378, Sept. 1960, 71 p. $2.

Superior finish, consistent repeatability and greater accuracy are displayed by numerically controlled machining of forging dies, as contrasted to conventional machining methods. (G17, W24n, 18-74)

501-G. Explosive Forming. James P. Orr. SAE (Society of Automotive Engineers) Journal, v. 69, June 1961, p. 57-59.

High-temperature explosive forming of Mo, Ti and other refractory metal at 1200° F. using concrete, kirksite or ductile iron dies. (G-general; EG-d37, Mo, Ti, NM-k34, 17-57)

502-G. Natural Gas Hot Knife Precision Cuts Steel. Arthur Q. Smith. Industrial Gas, v. 39, May 1961, p. 3-4.

Natural gas torch cuts through over 2 ft. of steel. Material is preheated to its kindling temperature and then rapidly oxidized by means of an oxygen stream issuing from the torch. (G22g, 1-52; ST)

503-G. Precision Profile Grinding of Split Die Blocks. Oscar Loeffler. American Machinist/Metalworking Manufacturing, v. 105, May 15, 1961, p. 134-136.

Photographic reduction technique applied in profile grinding of split die blocks, lathe and screw-machine tools using a modified Deckel FP 1 universal punch-milling machine with a combination of optical system (microscope, camera) and pantograph. (G17b, G18m, T6n)

504-G. How Energy-Rate Replaces Force in Exotic Processes. William M. Stocker, Jr. American Machinist/Metalworking Manufacturing, v. 105, May 15, 1961, p. 139-140.

Review of the principles involved in traditional metalworking processes which depend upon mechanical energy or force and the new high-energy-rate processes which depend upon the rate of energy release. These new high-energy-rate processes improve metalworking and manufacturing capabilities by using electrical techniques and magnetic forces. (G-general, 10-54; NM-k34, 17-57)

505-G. The "Secret" of Volkswagen. Anderson Ashburn. American Machinist/Metalworking Manufacturing, v. 105, May 15, 1961, p. 141-145.

Rapid production of Volkswagen automobiles accomplished by a new manufacturing operation which includes circular production lines, highly-automated press lines with integrated welding

stations, transfer lines to machine Mg crankcases and a foundry for shell molding of cylinders and die casting Mg, Al and Zn. (G-general, E-general, K-general, T24, 18-67; Al-b, Mg-b, Zn-b, 17-57)

506-G. Four-Slide Forming--Picked for High Speed, Low Cost. John J. Pascale. Metalworking, v. 17, May 1961, p. 71-73.

Al clad steel strip electron-tube plates are produced by a four-slide forming machine that embosses, outlines, forms and stitches in one operation. (G-general, G3p, 1-52, T1j; ST, Al, 4-53, 17-57)

507-G. Cold-Forming the Stainless Steels. W. L. Keene. Metalworking, v. 17, May 1961, p. 74-77.

Selection of methods and equipment for fabrication of the 200, 300 and 400 series stainless steels. Consideration of drop hammer, bulge, stretch and "Guerin" or trapped rubber forming processes. (G-general, 1-67, W24; SS)

508-G. Metalforming Using Explosive Charges. G. G. M. Carr-Harris. Technical Information, National Research Council, Ottawa, Canada, TIS Report no. 74, Mar. 1961, 11 p.

Review of the literature covering explosive forming principles, methods, materials and applications. A selected bibliography includes cupping, forging, shearing, stamping, press forming, welding and hardening of Mn alloy steel, stainless steel, Al, Ti and superalloys with references to powder metal compacting. (G-general, 10-54, 11-65; ST, Al, Ti, SGA-h, NM-k34, 17-57)

509-G. Corrugating Machine for Super Alloys. Sheet Metal Industries, v. 38, May 1961, p. 334, 348.

Corrugation of heat and thermal stress resistant Ni and Co base alloys for aircraft applications using a combined clamp and vacuum chuck to hold the flat sheet material against the die located between closing tables. (G11, 1-52, T24; SGA-h, Ni, Co, 17-57)

510-G. Cold Extrusion of Small Symmetrical and Asymmetrical Components. O. May. Sheet Metal Industries, v. 38, May 1961, p. 335-340, 348.

Cold extrusion of steel and Al alloy sheets using a slow flow press having a ram speed that is much slower than that of the equivalent eccentric press. The accuracy and precision of the extrusions are determined as functions of flow phenomena such as flow resistance, cross-sectional area of flow, flow speed and speed of deformation. (G5, 1-52; Al-b, ST, 4-53)

511-G. Anisotropy as an Asset for Good Drawability. R. L. Whiteley, D. E. Wise and D. J. Blickwede. Sheet Metal Industries, v. 38, May 1961, p. 349-353, 358.

Correlation between the drawing capacity and plastic anisotropy of killed steel, rimmed steel, 430 and 301 stainless steel, 2S and 52S Al alloys, Cu, 35/65 brass and mild steel as determined by measuring the strain ratio. (G4, 3-68, 3-72, 17-52; ST, Al-b, Cu-b)

512-G. Fabricating Stainless-Steel Bellows. Sheet Metal Industries, v. 38, May 1961, p. 354-355.

Production of bellows from stainless steel or Monel metal sheet by cutting, rolling, seam welding with an argon arc welding machine, polishing and grinding with heat treatment before and after forming for retention of ductility. The finished product is hydraulically inspected. (G-general, J1a, K3p; SS-e, Ni-b, 4-53)

513-G. Splines Hobbed on Six Spindle Automatic. Steel, v. 148, May 29, 1961, p. 73.

Secondary spline hobbing operation for wringer rolls is incorporated into the primary setup on a multiple spindle automatic bar machine by means of a special attachment. Total machining time is cut from 73 sec. to 27.9 sec. (G17b, 1-52)

514-G. Tooling Up a Stainless Balloon. H. M. Edwards and W. P. McGregor. Metalworking Production, v. 105, May 17, 1961, p. 75-77.

Fabrication of fuel tanks of 10 ft. diameter from stainless steel with a skin thickness up to 0.04 in. for use at high internal pressure in the Atlas missile. Tooling operations involve trimming of external and internal skin assemblies, rolling, butt welding, spot welding, roll-spot welding and external

bracketry welding. (G-general, K-general, T24e; SS, 17-57)

515-G. Flute Milling by Tracer Control. Metalworking Production, v. 105, May 17, 1961, p. 78-79.

A hydraulic copying device, located on the Wyssbrod "V" flute miller in place of the usual change wheels, is used for cutting spiral flutes of high-speed steel. The device provides for milling flutes on taper or other form tools and all settings for helix angles are obtained by adjusting the movable milling head. (G17b, T7n, 1-52; TS-m)

516-G. Grinding Wheels in the Foundry Industry. S. M. Gray. British Foundryman, v. 54, May 1961, p. 239-243.

Reinforced resinoid grinding wheels are used to grind malleable iron castings before or after foundry annealing and to remove remnants of risers from castings. Control and arrangement of abrasive grits, binder and pores or air spaces regulate the grinding action of the tool. (G18, W25c, 17-57; CI-s)

517-G. Understanding the Four-Slide Process. C. J. Labonack. Machine and Tool Blue Book, v. 56, June 1961, p. 102-111.

Review of forming operations on a four-slide machine involving separate tool blocks for each bend or form needed. Survey of tooling equipment for piercing, blanking, coining, flattening and similar operations on flat stock. Application to production of small parts from 1010 steel. (G1, 1-52; ST, 4-53)

518-G. What's So Different About High Speed Machining? Machine and Tool Blue Book, v. 56, June 1961, p. 112-115.

Evaluation of high-speed machining in terms of improvement of finish and increased production rates on ferrous and nonferrous metals. Effect of rate of metal removal, heat generation and other cutting variables in tool life. (G17, 3-67)

519-G. Ultrasonic Machining. L. C. Miller. Machine and Tool Blue Book, v. 56, June 1961, p. 117-119.

Ultrasonic machining used for cutting extremely hard and difficult materials such as sapphire, quartz, glass, tungsten carbide, Ge, Si and ferrite. Discussion of principles and technology of the process. (G24c)

520-G. Laminated Plastics Cut Short-Run Die Costs. Robert F. Gieger. Machine and Tool Blue Book, v. 56, June 1961, p. 120-122.

Laminated plastic dies are used for high-pressure rubber pad forming of intricate Al parts for aircraft with good preservation of the high-mill finish on the workpiece. (G14a, T24a, W24n; Al, NM-d, 17-57)

521-G. New Finishing Technique Improves an Established Tool's Performance. Colin Sharp. Machine and Tool Blue Book, v. 56, June 1961, p. 123-125.

Steel metal slitting saws are cold finished by a grinding process, Superfinishing, which results in smooth, hard surfaces with increased stability. (G18, T6n; ST, 17-57)

522-G. This Tooling Permits Deep Box Forming on a Press Brake. Morton J. Schultz. Machine and Tool Blue Book, v. 56, June 1961, p. 146-147.

Al and steel sheet is formed into deep boxes on a press brake using an adapter which accepts standard "V" dies and punches, eliminating the need for special tools and setups. (G4d; Al, ST, 4-53)

523-G. Chipless Machining--Pneumatic-Mechanical Process. Charles H. Wick. Machine and Tool Blue Book, v. 56, June 1961, p. 149-151.

Carbon, alloy and stainless steels, Al alloys, Cu, Ti and refractory metals are formed by a high-velocity process using compressed nitrogen at 2000 psi. pressure in Dynapak machines. Smooth surface finishes and improved microstructure result from grain refinement and uniform dispersal of carbides in the workpiece. (G-general, 1-70; ST, Al-b, Cu, Ti, EG-d37)

524-G. Free-Machining Aluminium. Pt. 21. Aluminium in Practice. Aluminium Courier, no. 53, Mar. 1961, p. 21-22.

Al-5.5% Cu alloy containing small amounts of Pb and Bi produces small chips rather than swarf when machined and, therefore, can be machined at high speeds. Owing to the high thermal conductivity of the alloy, heat is rapidly carried away from the tool edge, thus decreasing tool wear. (G17; Al-b, Cu)

525-G. High-Speed Machining of Non-ferrous Metal Parts. Machinery, v. 67, May 1961, p. 167-168.

Design data for machining with cutter speeds of 5000-10,000 surface ft. per min. with attention to variation of chip load with speed rate, use of coolants and influence of high speeds on tool life and on heat production. (G17, 3-67; EG-a38)

526-G. The Fluid-Form Process. Hugo Moller. Production Engineer, v. 40, May 1961, p. 325-335.

Forming of irregular shapes from sheets of low-carbon steel, 18-8 stainless steel, Nimonic or Al with fluid-form process using metal or plastic dies and a hydraulic press to eliminate springback. (G-general, 1-70; Al, CN, Ni-b, SS)

527-G. Cutting Honeycomb With Quenched Arc. Australasian Manufacturer, v. 46, Apr. 15, 1961, p. 37-38, 42.

Cutting of honeycomb composed of stainless steel, Ti, Al and Zr at rates up to 200 sq. in. per min. with quenched arc band saw machines using hydraulic operated feed tables. (G22h; Al, SS, Ti, Zr)

528-G. Titanium Usage Increases B & P Experienced in Forming and Assembly. Magnesium Products, May 1961, p. 4-8.

Formation of components for missiles and rockets, cryogenic pressure vessels and storage tanks for cryogenic fuels by hot deep drawing and hot forming 6% Al 4% V Ti alloy, 7% Al 4% Mo Ti alloy, 5% Al 2.5% Sn Ti alloy, 13% V 11% Cr 3% Al Ti alloy and A-110 AT Ti alloys. (G4b, G-general, 1-66, T24e, T26; Ti-b)

529-G. Surface Grinder Replaces Shaper. William W. Wilson. Grinding and Finishing, v. 7, May 1961, p. 47.

Grip block teeth for tensile testing machines are surface ground using a wide vitrified Al_2O_3 wheel. Oxidation, warpage and tooth breakage are eliminated. (G18k)

530-G. Loading Buildup--Stopped. Grinding and Finishing, v. 7, May 1961, p. 52-53.

Design of a new ultrasonic attachment which reduces loading build-up during surface grinding. Results include less wheel dressing, extended wheel life, increased finish and greater productivity. (G18k, 1-74)

531-G. Some Aspects of Marine Engine Building Practice. A. W. Astrop. Machinery (London), v. 98, May 17, 1961, p. 1127-1132.

Facing, shaving, hobbing, boring, milling and grinding operations performed on cast iron and forged steel in the production of gears, blocks, bearings and rods for diesel engines. (G-general, W11j; CI, ST, 17-57)

532-G. Flame Cutting as a Production Tool. Australian Machinery and Production Engineering, v. 14, Apr. 1961, p. 21-23, 25, 27, 29.

Oxy-acetylene flame is used to cut steel plates, structural sections and heavy forgings. Fabrication of metals with oxy-acetylene using hand-cutting blowpipes and flame profiling machines. High-quality cuts are made with great accuracy and speed. (G22g; ST, 4-51, 4-53, 4-57)

533-G. Machining the Astro-Metal--Pure Beryllium. Laurence W. Collins, Jr. Machinery, v. 67, June 1961, p. 93-97.

Machining techniques for Be, taking into account the need for salvaging chips and preventing oxidation. Mechanical properties of Be. Physical properties as compared with those of other common structural metals. (G17; Be)

534-G. Different-Sized Parts Lapped in Multiple Quantities. Harry C. Gunetti. Machinery, v. 67, June 1961, p. 113-117.

Finishing of Nitralloy, carbon steel, tungsten carbide, stainless steel and Stellite components within tolerances of 0.000005 in. in flatness using a semi-automatic lapping machine. (G19p; CN, Co-b, SS, 14-68)

535-G. Double-Disc Grinding Proves Boon to Instrument Making. Machinery, v. 67, June 1961, p. 138-139.

Gear-box housings for missile computers are face-ground from Al plates on a horizontal-spindle disc grinder. (G18, T24e; Al, 4-53)

536-G. (Dutch.) Cold Forming. J. L. Remmerswaal. Metaalbewerking, v. 26, Mar. 16, 1961, p. 370-372.

Effect of shape and design of iron and steel castings on the force needed in embossing with attention to dimensional precision as a function of thickness. Consideration of rolling as a finishing operation on castings. (G-general, 1-67; Fe-b, 5)

537-G. Grind Away Cutting Costs. Leo P. Tarasov and Richard H. Merritt. American Machinist/Metalworking Manufacturing, v. 105, May 29, 1961, p. 58-59.

Abrasive machining removes up to 1/4 in. of metal with a grinder, reduces setting-up and machining time and costs. Comparative analysis of machining costs for a gray iron motor base and a face plate machined by a cutting tool and an abrasive wheel. (G18, G17, 1-52; CI-n)

538-G. Giant Saw Cuts Giant Scrap. Irving Epstein. American Machinist/Metalworking Manufacturing, v. 105, May 29, 1961, p. 70-71.

Manganese bronze ship propellers weighing 14-30 ton. are cut into scrap by a 15 ft. high bandsaw constructed of standard structural members and set in a concrete pit 3 ft. deep within 1 ft. of railroad tracks. Work is mounted on a wheeled carriage running on the tracks. (G17h, 1-52, T22h; Cu-s, Mn, 17-57)

539-G. Machined and Finished Die-Castings. Metal Industry, v. 98, May 19, 1961, p. 391-393.

Description of machining and finishing operations for die castings of Zn and Al alloys. Drilling, broaching, polishing, plating, assembling and painting techniques. (G17, L17, L26n; Al-b, Zn-b, 5-61)

540-G. Off-Beat Fine Boring. Charles L. Whitaker. Metalworking Production, v. 105, May 24, 1961, p. 69, 71, 73.

Unusual application of fine boring machines to machine 370 lb. forged steel connecting rods for large-diameter thin-walled bearings and gun drilling operations. (G17d; ST)

541-G. How Explosives Form Space Age Parts. Steel, v. 148, June 5, 1961, p. 86-88.

Common steels, stainless steels, Ti, Al, Tricent, Vascojet 1000, AMS 6434, Unitemp M-252 and Mg are cut, swaged, flattened, pierced, contoured and clad. Zinc oxide, Ta, W, Mo, tungsten carbide, tantalum carbide and Be powders are compacted. (G-general, NM-k34)

542-G. (Book.) The Machining of Steel. 2nd Edition. F. C. Lea and Eric N. Simons. 1960. 208 p. Odhams Press Ltd., Long Acre, London, England. $5.50.

Turning, planning, shaping, milling, drilling, broaching, reaming, sawing, indexing and electrospark cutting with reference to cutting tools, coolants, speeds and feeds. Special treatment of austenitic manganese steel. (G17; ST)

543-G. Strain Strengthening of Type 304 Stainless Steel. Walter Hammer, Jr., Leonard Stemann and E. E. Weismantel. ASTM Preprint no. 83, 1961, 9 p.

Tensile cold straining procedures produce high-strength austenite bar materials. Compressive yield strength, tensile properties and hardness determined. (G-general, 1-67; SS)

544-G. (Dutch.) High-Velocity Deformation. P. J. M. Boes. Metaalbewerking, v. 26, Nov. 24, 1960, p. 214-216.

Extrusion of stainless and heat resistant steels, Ti and sintered Ni by a device making use of the sudden pressure increase of an enclosed gas. Explosive forming of 2-15.9 mm. thick steel sheet using a device where the explosive wave is produced by an electrical discharge of 40 x 10^{-6} sec. duration. (G-general, NM-k34; SS, SGA-h, Ni, Ti)

545-G. Explosive Metalworking. Charles C. Simons. Light Metal Age, v. 19, Feb. 1961, p. 4-8.

Principles, effect on material properties and applications of explosive forming. Explosive compaction of metal powders, explosive welding, applications of explosive techniques including surface hardening, cutting, forging and punching. (G-general, NM-k34, 17-57)

546-G. Machining by Spark Erosion. Australian Mechanical Engineering, v. 48, Mar. 6, 1961, p. 37-39.

Tough metals, including stellite, tungsten-carbide and magnet steel that are difficult to cut by conventional methods are machined by a closely controlled spark discharge which removes the metal by microexplosive dissolution. Three types of spark erosion machines are

discussed as to design and application. (G24a; Co-b, ST, SGA-n, W, 14-68)

547-G. (English.) A New Method of Hot Deep Drawing of Sheet Metals. Matsuo Miyagawa. Tokyo Metropolitan University, Faculty of Technology (Japan), Memoirs, no. 10, 1960, 10 p.

A high drawing rate during hot deep drawing of 52S, 24S and 3S Al alloys, soft brass and steel is obtained by preheating of the blank flanges and simultaneous cooling of the wall of the drawn cup. 11 ref. (G4b; Al-b, Cu-n, ST, 4-53)

548-G. Residual Stresses in Metal Cutting. L. V. Colwell. Chapter 17 from "Handbook of Mechanical Wear". University of Michigan Press, Ann Arbor, Mich., 1961, p. 403-442.

Influence of temperature, pressure, strain rate, strains, friction and other environmental conditions on metal cutting. Review of information regarding machining and grinding as causes of surface damage. Experimental evidence relating residual stresses to metal cutting processes. Thermal and mechanical mechanisms involved in creating residual stresses. 37 ref. (G17, 2-61, 3-74, 3-68, Q25h)

549-G. Abrasive Machining in the Space Age. B. R. McDonnell, Sr. Grinding and Finishing, v. 7, June 1961, p. 32-35.

Roughing, heat treating and finishing operations involved in abrasive machining of 52100 steel bar stock to produce a hydraulic sleeve and slider unit for a missile control system. (G17, T24e; ST)

550-G. How Grinding Replaced Planing. W. C. Simcox. Griding and Finishing, v. 7, June 1961, p. 43.

Surface grinding of hot rolled carbon steel plates for molds to remove scale and distortion. Improved parallelism and finish and reduced machining time result (G18k; CN, 4-53)

551-G. Cold Extrusions Forge Ahead. Iron Age, v. 187, June 15, 1961, p. 103-105.

Raw steel bars are cold forged into hollow shafts or solid form extrusions with varied heads and shafts. Tooling, degreasing, pickling, phosphating, lubrication and cropping operations. (G5; ST)

552-G. Five Steps to Optimum Machining. Steel, v. 148, June 12. 1961, p. 146.

Recommendations aimed at stepping up the productivity of numerically controlled machine tools. (G17)

553-G. (French.) Ultrasound Machining. Pratique des Industries Mecaniques, v. 47, Mar. 19, 1961, p. 57-62.

Cutting method in which the tool is vibrated at a frequency of 20-25 kcps. in an emulsion containing abrasives such as carbides of B, Si or Al in water. The method is applied to machining ferrites, Ge, graphite, hard metals, brass, 12% Cr-steel and toolsteel. (G24c; ST, Ge, Cu-n, SGB-q)

554-G. The Mecatorn Process of Metal-Spinning. Machinery (London), v. 98, May 31, 1961, p. 1248-1250.

Application of the metal spinning process to the production of a bulkhead penetrant seal ring from an 18 in. diameter blank of Monel. (G13; Ni-b)

555-G. Study of Forces Acting on a Turning Tool. E. Bickel. Microtechnic, v. 15, Apr. 1961, p. 39-43.

Investigation of forces affecting chip formation and wearing phenomena of turning tools including effects of relief face wear. Calculation of relief face force. 7 ref. (G17, Q9, T6n)

556-G. Measurement and Significance of Radial Forces in the Cutting Action of Twist Drills. G. Spur and G. Pahlitzsch. Microtechnic, v. 15, Apr. 1961, p. 47-59.

Cutting force components of torque, drill thrust and radial forces as functional factors in the cutting action of twist drill tools on alloy steels and cast iron. 9 ref. (G17e, T6n, 17-57; AY, CI)

557-G. (German.) Wire Bending. C. Hamann. Draht, v. 12, Apr. 1961, p. 155-160.

Design and operation of wire bending machines for production of single and double bend steel wire in manufacture of wire nets and heavy steel springs. (G6, 1-52; 4-61)

558-G. (French.) Spark-Machined Surfaces. A. T. Kravetz and T. Nicholas. Machine Moderne, v. 55, May 1961, p. 62-64.

Investigation of roughness and microstructure of the surface area of machined parts as influenced by machining energy, frequency of impulses and current density. Examination of spark-machined carbon steel with 0.42-0.49% C, toolsteel with 0.50-0.84% C, 0.15-0.8% Mn, 0.15-0.35% Si and 0-0.8% Cr and gray cast iron with 3.4-3.6% C. (G24a; CN)

559-G. (Book.) Grinding Stresses--Cause, Effect and Control. 1961. 81 p. Grinding Wheel Institute, 2130 Keith Bldg., Cleveland 15, Ohio.

Collection of papers on the effect of grinding parameters on residual stresses induced in steels of varying degrees of hardness. Stress relief by heat treatment and mechanical techniques. Effect of residual stress on fatigue strength. (G18, Q25h; ST)

560-G. Residual Grinding Stresses. M. W. Gormly. Paper from "Grinding Stresses--Cause, Effect and Control". Grinding Wheel Institute, Cleveland 15, 1961, p. 7-21.

Summary of research on grinding stresses as affected by depth of cut, metal hardness, wheel and work speed and wheel grade. Methods of stress relief. Effect of stress on fatigue strength of metals. 30 ref. (G18, Q25h)

561-G. Select Grinding Wheels to Produce Minimum Stresses. J. A. Mueller. Paper from "Grinding Stresses--Cause, Effect and Control". Grinding Wheel Institute, Cleveland 15, 1961, p. 23-26.

Relationships between grinding ratio and wheel grade are used to determine wheel efficiency during grinding of A2746T, 3145 and A4142 steels. (G18; ST)

562-G. Improving Reliability of Ground Parts by Avoiding Residual Stress. James E. Price. Paper from "Grinding Stresses--Cause, Effect and Control". Grinding Wheel Institute, Cleveland 15, 1961, p. 27-30.

Specimens of Mn oil-hardening toolsteel are test ground on a reciprocating table surface grinder to investigate the induced residual stress. Amount and kind of stress is determined by a deflection measurement. (G18k, Q25h; TS, Mn)

563-G. Residual Stresses Produced by Up Grinding and Down Grinding. John A. Mueller. Paper from "Grinding Stresses--Cause, Effect and Control". Grinding Wheel Institute, Cleveland 15, 1961, p. 31-34.

Results of grinding tests run on high-carbon, high-chromium 52100 steel and toolsteel hardened to Rc 62. In one instance work moves in the same direction as the wheel while in the other the wheel moves in the opposite direction to the work. 4 ref. (G18, Q25h; ST)

564-G. Successive Grinding Cuts--Do They Affect Residual Stresses? L. M. Kubsh. Paper from "Grinding Stresses--Cause, Effect and Control". Grinding Wheel Institute, Cleveland 15, 1961, p. 35-39.

Grinding process in relation to residual stresses in hardened ball bearing steel with emphasis on accumulation of stress with successive cuts and feasibility of removing this stress by gradually reducing the unit downfeed until sparkout occurs. (G18, Q25h; TS, SGA-c)

565-G. Effect of Work and Wheel Speeds on Surface Conditions. J. A. Plusch. Paper from "Grinding Stresses--Cause, Effect and Control". Grinding Wheel Institute, Cleveland 15, 1961, p. 41-42.

Surface grinding of annealed toolsteel as affected by work speeds from 10-60 ft. per min. and wheel speeds of 6000-3000 surface ft. per min. (G18k; TS)

566-G. Residual Grinding Stresses Can Be Minimized. M. W. Gormly. Paper from "Grinding Stresses--Cause, Effect and Control". Grinding Wheel Institute, Cleveland 15, 1961, p. 43-46.

Samples of annealed Mn oil-hardening toolsteel and hardened 52100 bearing steel are test ground to determine effects of unit downfeed, metal removal rate and depth of cut on residual grinding stress. (G18, Q25h; TS, Mn)

567-G. Relief of Residual Grinding Stresses. R. O. Lane. Paper from "Grinding Stresses--Cause, Effect and Control". Grinding Wheel Institute, Cleveland 15, 1961, p. 47-51.

Evaluation of abrasive tumbling, low-temperature salt bath annealing, aging, lapping, electrolytic etching and chemical treatments as means for relieving grinding stresses. 4 ref. (G23, J1a, Q25h, G18)

568-G. (German.) Electrolytic Machining of Hard Metals. K. E. Schwartz. Industrie-Anzeiger (Berichtsheft zum 10. Aachener

Werkzeugmaschinen-Kolloquium), no. 80, Oct. 4, 1960, p. 1357-1360.

Review of reaction mechanisms, machinery and technology for electrolytic grinding of hard metals using grinding wheels of gray cast iron, embedded SiC, carborundum or diamond particles and electrolytes of water glass or KNO_3 solution. Comparison of surface quality of conventionally and electrolytically ground hard metals. 9 ref. (G24d; SGB-q)

569-G. (Russian.) Titanium-Alloyed Automatic Steel. A-12. I. M. Pavlov, I. K. Suvorov and Yu. E. Fomenko. Chernaya Metallurgiya, Nov. 1960, p. 61-65.

Alloying of high-sulphur steel with 0.19% Ti to make the steel suitable for machining and rolling and to reduce the scale formation during working. Determination of the resistance to cutting by galvanometry. 6 ref. (G17k, Q23q, 2-60; ST, Ti)

570-G. Cold Impact Alters Grain Flow to Boost Socket Strength. Iron Age, v. 187, June 22, 1961, p. 130-131.

Cold impact extrusion process transforms slugs of medium carbon steel into socket wrenches. Mechanical properties are improved as the grain flow follows the punch contours. The impact action adds strength and toughness to every socket, especially at abrupt changes in cross section. (G5; CN)

571-G. Cold Extrusion of Steel. F. Howard, H. A. J. Dennison and N. Angus. Sheet Metal Industries, v. 38, June 1961, p. 403-425.

Review of cold extrusion of steel including backward and forward deformation. Calculation of load test forces. Heat treatment and lubrication of extruded billets and slugs. Component design and commercial application. 8 ref. (G5; ST)

572-G. Curtiss Wright Deep in Motor Case Technology. John F. Judge. Missiles and Rockets, v. 26, June 26, 1961, p. 24-25.

Fabrication processes for missile motor cases including operations to increase yield strength, ductility and toughness. Research on application of thin film technology in metals to motor cases. (G11, G13, Q-general, T24e; ST, 17-57)

573-G. Rapid Boring of Deep Holes. Ragnar Carlstedt. American Machinist/Metalworking Manufacturing, v. 105, June 12, 1961, p. 109-112.

Machining of 4130, 4340, 316 stainless, Inconel-X, Ti, Hastelloy, A-286 and 300 and 400 stainless steels at feed rates four to ten times faster than conventional gun drilling produces fine surface finishes while eliminating reaming or grinding of holes. Straightness and concentricity are held to close tolerances. (G17d; Ni-b, SS, Ti)

574-G. Turning Malleable Irons. Hans J. Heine. American Machinist/Metalworking Manufacturing, v. 105, June 12, 1961, p. 117-124.

Cutting conditions for turning four grades of malleables: 32510 ferritic, 48004, 60003 and 80002 pearlitic. Cutting speed, feed, depth of cut and tool life for K-6 carbide are determined for each grade of malleable and type of cut. (G17a; CI-s)

575-G. Plasma Arc—New Fabricating Tool. R. L. O'Brien. SAE Journal, v. 69, July 1961, p. 84-85.

Cutting of Al, Mg, Cu, stainless steel, high-strength alloys and carbon steel by a plasma arc, a highly constricted arc formed between a tungsten electrode and the workpiece. Applications in plating and weld surfacing. (G22h; Al, CN, Cu, Mg, SS, SGB-a)

576-G. (Japanese.) Shave-Turning. Pt. 3. Tool Life of High-Speed Steel. Masao Kubota, Minori Kanai and Yuhei Masuyama. Journal of Mechanical Laboratory (Japan), v. 15, Mar. 1961, p. 52-56.

Shave turning SDS7 stainless steel and S45C carbon steel using a high-speed cutting tool. Effect of cutting temperature, abrasiveness and strain hardening on the cutting tool life. (G17a; CN, SS)

577-G. (Japanese.) Shave-Turning. Pt. 2. Surface Roughness by Carbide Tools. Masao Kubota, Minori Kanai and Tamehiro Kotorii. Journal of Mechanical Laboratory (Japan), v. 15, Mar. 1961, p. 48-51.

Edge build-up and surface roughness forms when machining Al, brass and carbon and chromium-molybdenum steels with carbide cutting tools. Optimum cutting speeds for each metal. (G17a; Al, Cu-n, ST)

578-G. Fabrication Techniques for Aerospace Systems. W. H. Grierson. Materials

Engineering Quarterly, v. 1, May 1961, p. 3-14.

Hot, inert atmosphere or vacuum forming, spot welding, continuous seam welding, brazing and diffusion bonding of steel alloys, Mg-Li alloy, Cb, Mo and Ti. Design requirements of strength and tolerance are given to 2000° F. (G-general, 1-73, K-general, Cb, Mg-b, Mo, ST, Ti)

579-G. Rate Setting for Turret Lathe Work. John Wolf. Automatic Machining, v. 22, June 1961, p. 35-44.

Work standards in regard to speed and feed, setup, machine handling and load-unload times and cutting tool cast during machining of bronze, Fe, brass, Al and stainless steel. (G17; Al, Cu-b, Fe, SS)

580-G. In-Cycle Grooving I. D. and O. D. Examples on Multi-Spindle Machines. Automatic Machining, v. 22, June 1961, p. 50-53.

Description of two grooving techniques, one involving the rolling of an oil groove on the contoured outer diameter of 4140 cold finished steel and the other cutting groove on the internal diameter of 1035 steel forging. Both techniques are performed on multiple-spindle machines. (G17; ST)

581-G. Production Tripled--Scrap Reduced on Valve Bodies. Automatic Machining, v. 22, June 1961, p. 56.

Production of Al hydraulic valve bodies for missile applications using single-spindle and turret drilling machines to perform drilling and reaming operations. (G17e; Al)

582-G. 45 Motions: 40 Seconds--On a Bechler Swiss Automatic. Automatic Machining, v. 22, June 1961, p. 57-58.

Bars of leaded bronze are milled and tapped on the same automatic machine to eliminate secondary operations. Product, a valve needle, is practically burr-free. (G17b, G17f; Cu-s)

583-G. Aluminum Alloys for Deep Drawing. C. J. Smith. Metal Industry, v. 98, June 2, 1961, p. 431-435.

Survey of the mechanical properties of Al-Mg, Al-Mn, Al-Mg-Si and Al-Cu-Mg-Si alloys, and their application for pressing and deep drawing by the auto industry. Comparison of tensile strength, proof stress, ductility and bend value of annealed Al and Al alloys. (G4, Q23q, Q-general, 2-60, 2-64: Al-b, Mg, Mn, Si, Cu, 17-52)

584-G. Design and Characteristics of Press Tools. Australian Mechanical Engineering, v. 48, Apr. 5, 1961, p. 44-47.

Blanking, bending and forming, deep drawing and explosive forming operation as influencing choice, design and construction of tools and dies. (G-general, W24n, W25, 17-51)

585-G. How Stelco Uses Cold Heading Process. C. P. Farr. Canadian Metalworking, v. 24, June 1961, p. 30-32.

Cold heading production of small parts by an automatic screw machine. Advantages of cold working and close control of tolerances in terms of greater strength of product, economy of operation and speed of production. (G10, T7, 1-67)

586-G. Machining and Surface Finishing Extrusions. Frank Starzyk. Precision Metal Molding, v. 19, June 1961, p. 47-50.

Review of techniques and equipment used in various machining operations and in buffing, anodizing and painting of extruded Al shapes. (G17, L-general; Al-b, 4-58)

587-G. Cold Forging Blasts Barriers. R. H. Eshelman. Iron Age, v. 187, July 6, 1961, p. 69-71.

Cold extrusion of bearing cups, worm gears and stepped shafts using a press with a five-station transfer die and a built-in feed. (G5, T7)

588-G. Ceramic Bits Mill Hardened Steel. American Machinist/Metalworking Manufacturing, v. 105, June 26, 1961, p. 67-68.

Face milling of 4340 gun steel hardened to 380-400 Brinell using a milling cutter carrying ceramic throwaway inserts and a cutting speed of 375 sfm. A severe negative rake angle of 53° is required to take advantage of the compressive strength of the ceramic tool material. (G17b; ST)

589-G. Springback Is Still With Us. American Machinist/Metalworking Manufacturing, v. 105, June 26, 1961, p. 79.

Review of papers presented at the 1961 meeting of the American Society of Mechanical Engineers. Topics include occurrence of springback and residual

stress during explosive forming, fabrication of refractory metals, explosive forging, press forming of heavy Mg plate and machining of nodular cast iron. (G-general, NM-k34, G4d)

590-G. (German.) Boring, Milling and Welding by Electron Rays. H. Droscha. Technica, v. 10, Apr. 28, 1961, p. 597-599.

Review of reaction mechanism of electron beams with materials. Design of equipment and application in electron beam machining and boring of small boreholes in metals and nonmetallic materials such as glass and in precision welding of metals. (G24, K6)

591-G. Cut Dished Stainless Steel Heads With the Tungsten Arc Process. Welding Design & Fabrication, v. 33, Dec. 1960, p. 40-41.

Operating conditions and setup procedure for cutting curved stainless steel parts. (G22h; SS)

592-G. Aluminum Alloys for Deep Drawing. C. J. Smith. Metal Industry, v. 98, June 9, 1961, p. 451-453.

Control of composition, rolling slab quality, microstructure and the casting operation during the manufacture of Al alloy sheet to obtain improved drawability characteristics. 12 ref. (G4, 17-52; Al-b, 4-53)

593-G. Prestressed Steel Beams Replace Concrete. Welding Design & Fabricating, v. 34, Apr. 1961, p. 48-51.

Application of prestressing principles to a 200 x 30 ft. I-beam bridge. Advantages and tests. (G23q, T26p; ST, 4-57, 17-57)

594-G. Flame Cutting Tracers: Guides to Good Cutting. Welding Design & Fabricating, v. 34, Apr. 1961, p. 52, 54-55.

Survey of flame cutting machines and tracer devices including electric eyes. (G22g, 1-52, 1-59)

595-G. (German.) Methods for Influencing Machinability of Steels. G. Ostermann. Industrie-Anzeiger, no. 80, Oct. 1960, p. 1344-1346.

Review of factors influencing machinability of steels such as carbon steels, 16 MnCr 5 steel and 34 Cr 4 steel including alpha to gamma transition, carbon content, heat treatment, microstructure and hardenability and means of controlling machining tool wear. 6 ref. (G17k; ST)

596-G. Stretch-Draw Press-Forming--A Success With Advanced Materials. Space/Aeronautics, v. 35, June 1961, p. 70-74.

Analysis of radial stretch-forming and stretch-draw press forming of advanced aerospace materials using Rene 41 as an example. Prevention of biaxial tensile stresses and advantages of rubber as a female-die material. Advantages and disadvantages of cold work. (G9, G4d, T24e; Ni-b, 17-57)

597-G. More Production Through Modernization. Modern Machine Shop, v. 34, July 1961, p. 114-116, 118, 120, 122, 124, 126.

Review of machining techniques including boring and honing cast iron cylinder sleeves with dual spindle boring machine, stopping machine automatically when tool becomes dull, brazing stainless steel blades to A-286 alloy hub at 1950° F. to produce missile turbine rotor, boring and counterboring stub axles, facing and tapping Zn die castings and extruding billets of brazing alloy at 1000° F. to produce 1/32 in. brazing wire. (G-general, F24, K8, 1-52, 10-54)

598-G. Gas Powers Metalforming Giant. Iron Age, v. 187, June 29, 1961, p. 74-75.

Type 4130 steel, Cu and Cu compacts, W, Mo, Ti, Cb and Zr are formed into complex shapes by the Dynapak process on a vertical drop-forming machine, using nitrogen at 2000 psi. to fire the piston at 1500 psi. (G-general, 1-52, 3-67, 3-74; ST, Cu, W, Mo, Ti, Cb, Zr)

599-G. (French.) Explosive Forming in the Rocket Engine Industry. L. C. Stuckenbruck and C. H. Martinez. Machine Moderne, v. 55, Apr. 1961, p. 9-13.

Explosive forming of rocket engine components from sheets of Al, Cu, Ni, Ta, Zr, Cb, superalloys, Rene 41, Ti and stainless steel. (G-general, T24e; NM-k34, 17-57, Al, Cu, Ni, Ta, Zr, Cb, Ti, SS, SGA-b)

600-G. Spacer Lapping to Millionths. Gene Gleason and George C. Bowen. Grinding and Finishing, v. 7, July 1961, p. 35.

Precision lapping of Ti and Be for electronic components to thousandths of an inch tolerances. (G19p, T1, 17-55, Ti, Be, 17-57)

601-G. Giant Radar Reflector Die Casting Used in Explosive Forming. Western Metalworking, v. 19, June 1961, p. 33.

Large Al radar reflectors are explosively formed using a 35-ton ductile Fe die casting. Contour and dimensions in the mirror's parabolic shape are maintained to within 0.001 or 0.002 in. tolerances. (G-general, NM-k34, X15q)

602-G. Skin Mill Shaves Costs Over Etching Patterns. Western Metalworking, v. 19, June 1961, p. 40.

Bomarc missile ramjet engine struts made of Mg sheet are carved in a waffle pattern to decrease weight of part without loss of structural strength on an automatic dual cutter skin mill controlled by magnetic tape. (G17, 1-52, T24e; Mg, 4-53, 17-57)

603-G. Aluminum Alloys for Deep Drawing. C. J. Smith. Metal Industry, v. 98, June 23, 1961, p. 499-501.

Occurrence of stretcher strain markings on Al alloy pressings. Methods for controlling this defect including salt bath annealing and grain size and Mg content control. 4 ref. (G4, 2-54, 2-60, 2-64; Al-b, Mg, 17-52)

604-G. The Hot-Machining of Metals. R. C. Brewer. Engineers' Digest, v. 22, June 1961, p. 83-87.

Review of high-temperature machining including effect on tool life and consideration of shear forces, stress and angles. Furnace, flame, electric arc, induction, radio frequency and plasma-arc heating methods. 11 ref. (G17, 1-66)

605-G. Diamond-Coated Bandsaws Cut Carbides. Metalworking Production, v. 105, June 7, 1961, p. 63.

Steel bandsaw blades coated with small natural diamonds are used to make contouring cuts in carbides, glass-reinforced plastics, ceramics, ferrite, cermets, Ge, W and other hard materials. Blade designs include a twist-coated wire, a serrated edge which improves cooling, a spaced edge blade and a continuous edge blade. (G17h, W24m, 17-52; NM-k37, 17-57, SGB-q)

606-G. Magnetic Forming. Metalworking Production, v. 105, June 7, 1961, p. 65-70.

Electromagnetic forming of small metal parts from bronze, steel, Cu, Al and stainless steel using a magnetic hammer. A one megaguss magnetic field is used to obtain a magnetic pressure of 560,000 psi. Parts produced include swaged aircraft parts, swaged tubes, flat pancake coils and expendable coils. (G-general, 1-69; Cu-b, Al, ST)

607-G. Flow Turning on Sub-Contract. K. W. Hards. Metalworking Production, v. 105, June 7, 1961, p. 71-73.

Flow turning is combined with ordinary spinning to produce components with varying wall thickness, using a template controlled through a hydraulic copying system. Cu, Al, mild steel and stainless steel are formed into hollow bodies by the process. (G13, G14; Cu, Al, ST)

608-G. Application of Ultrasonics to Grinding. Engineer, v. 211, June 23, 1961, p. 1050.

Method for surface grinding of hard and soft metals such as stainless and nitriding steel, brass, Al and Mg in which a transducer source of intense ultrasonic vibrations is placed in close proximity to the cutting surface of grinding wheel. Vibrations in the 20,000 c/s range are transmitted by a coolant to the wheel surface where loading and subsequent metal build-up is prevented. (G18, 1-74; ST, Cu-b, Al, Mg)

609-G. It's Precision Forming With a Bonus. Steel Horizons, v. 23, 1961, p. 22-23.

Machining of metal sheets into conical, contoured or cylindrical shapes by combined turning and forming in the Floturning process. Advantages of the process include savings in time and materials in the production of a seamless product with the mechanical properties of conventionally cold rolled steel. (G11; SS)

610-G. Machining High-Nickel Alloys. G. Fitzgerald-Lee. Mechanical World, v. 141, July 1961, p. 232-234.

Parameters for turning, drilling, reaming, planing and grinding of wrought and cast Ni and Ni-Cu alloys

and of high-nickel steel. Specifications for suitable high-speed tool-steel for machining these alloys. (G17; SS, Ni-b, Cu)

611-G. Chipless Machining. Pt. 3. Rolling--The Fastest Way to Cut Threads. C. F. Farr. Canadian Metalworking, v. 24, July 1961, p. 32-34.

Thread rolling of openhearth steels improves tensile and shear strength and fatigue life. Techniques and equipment. Advantages and limitations. (G12, 1-52, Q27a, Q2g, Q7b; ST-e)

612-G. Roll Making Modernised. Engineer, v. 211, June 30, 1961, p. 1086-1087.

Casting, roughing and finishing of steel and Fe in making rolling mill rolls, including parameters for melting, casting, annealing and machining. (G11, G19, 1-52, W23k; CN, CI-q, 17-57)

613-G. Finish Boring of Cast Iron Cylinder Sleeves. Engineer, v. 211, June 30, 1961, p. 1105-1106.

Rough and finish boring and honing of cylinder sleeves. Use of air-actuated collet pots to hold sleeves for finishing with eight-blade precision boring heal. (G17d, G19n, 1-52; CI)

614-G. Ultrasonics Boosts Grinding Efficiency. James Peacock. Metalworking Production, v. 105, June 28, 1961, p. 60.

Grinding of superalloys, brass, Al, stainless steel and Meehanite with coolant being ultrasonically vibrated to eliminate wheel loading. (G18, 1-74; SGA-h, SS, Cu-n, Al)

615-G. (Translation-Brutcher no. 5003.) Structure of the Hardened Layer Produced in Grinding. V. A. Landa. Metallovedenie i Termicheskaya Obrabotka Metallov, Dec. 1959, p. 12-18.

Previously abstracted from original. See item 51-G, 1960. (G18, Q29n; ST)

616-G. Backstand Idlers Enable Planers to Surface Grind. Bruce McDivitt. Australasian Manufacturer, v. 46, June 3, 1961, p. 54.

Grinding of large area cast iron tables and wallboard steel plates by a planer modified by the attachment of a backstand idler and motor driven serrated rubber contact wheel and abrasive belts. (G18k, 1-52; CI, ST)

617-G. Drilling and Reaming Beryllium. Australasian Manufacturer, v. 46, June 3, 1961, p. 60-62.

Techniques for conventional hole drilling, deep-hole drilling and gun drilling. Modification of geometry of solid carbide or carbide tipped tools. (G17e, T6n; Be)

618-G. Explosive Forming Processes. Charles H. Wick. Machine and Tool Bluebook, v. 56, July 1961, p. 121-123.

Description and application of various explosive processes. Advantages and disadvantages. Future trends. (G-general, NM-k34)

619-G. New Electrolytic Machining Process Shapes Parts in Minutes. Products Finishing, v. 25, July 1961, p. 66, 68.

Tough alloys are shaped by removing metal by passing d-c. between workpiece and electrolyte. Process is also used to sink die cavities and to drill round and irregularly shaped holes in alloys that cannot be penetrated by conventional drills. (G24d)

620-G. High Production Electro-Erosion. Metalworking Production, v. 105, June 21, 1961, p. 65-67.

Application to chamfering the ends of hardened steel springs in an automatic sequence, utilizing electromagnets for loading and unloading. Parameters of ending cycle. (G24a; ST)

621-G. (Russian.) Drawing Parts With Double Walls. M. N. Horbunov and Tan Yun-Si. Kuznechno-Shtampovochnoe Proizvodstvo, Jan. 1961, p. 5-8.

Drawing and flanging of Al double-walled pieces by circular dies at room temperature or with local preheating. Determination of critical reduction (deformation) degree as influenced by die shape and blank height. (G4, G6, Q24; Al)

622-G. (Russian.) Lubricant Viscosity and Its Effect on Drawing of Thin Steel Sheets. V. I. Konoplina. Kuznechno Shtampovochnoe Proizvodstvo, Jan. 1961, p. 8-9.

Viscosity and adhesion analyses of lubricants composed of gypsum, water, spindle oil, potassium soap, talcum and

other fillers in various proportions used in stamping of sheet steel cylindrical parts at an automobile works. Determination of lubricating efficiency by applied force necessary for a given deformation. (G3, G4, 18-73; ST, 4-53, NM-h)

623-G. (Russian.) Stamping Duraluminum Pistons. V. H. Makarov. Kuznechno-Shtampovochnoe Proizvodstvo, Jan. 1961, p. 47-48.

Technology for stamping pistons (diameter 120 mm., length 220 mm. and weight 7 kg.) from AK-4 Duraluminum in three continuous operations which enable reduction of the blank weight, eliminate necessity to cut away fins and result in better quality piston walls. (G3, T21b; Al-b)

624-G. Torch Cuts Off "Hot" Plates. J. W. Clark and C. H. Wodke. Iron Age, v. 187, July 13, 1961, p. 90-91.

Cutting of Zircaloy-2 diffuser plates located inside a highly-radioactive core vessel using plasma arc cutting equipment and a remote control manipulator. Process is carried out underwater to prevent damage from arc heat and molten spatter and control the spread of radioactive particles. (G22h, 1-52, 2-67; Zr-b, 4-53)

625-G. Metal-Cutting Analysis. Pt. 1. Re-Evaluation and New Method of Presentation of Theories. S. Kobayashi and E. G. Thomsen. American Society of Mechanical Engineers, Transactions (Journal of Engineering for Industry), Paper no. 61-Prod-1, 1961, 8 p.

The orthogonal metal-cutting process is re-analyzed and several existing theories are discussed. The principal factor for determining the steady-state configuration in metal-cutting is suggested as the condition which links shearing and friction processes to the phenomenon of chip-curl and the size of the area of tool-chip contact. Equilibrium conditions are presented in graphical form with emphasis on the relationship of energy of cutting to the cutting angle. 21 ref. (G17)

626-G. A Graphical Analysis of Regenerative Machine Tool Instability. J. P. Gurney and S. A. Tobias. American Society of Mechanical Engineers, Transactions (Journal of Engineering for Industry), Paper no. 61-Prod-5, 1961, 9 p.

A method for the investigation of regenerative machine tool chatter during cutting, drilling or spot facing based on the harmonic response locus of the machine tool structure which allows the determination of the stable and unstable cutting speed ranges. Effects of chip thickness, variation, penetration rate and mode interaction on the stability and chatter frequency. 8 ref. (G17)

627-G. Machining by Spark Erosion. Indian & Eastern Engineer, v. 103, Apr. 1961, p. 189-192.

Operation and applications of spark erosion machining. Description of spark erosion machines including the Seleromat A, the Seleromat B, the spark discharge generator and the Seleromic. (G24a, 1-52)

628-G. Flank Friction Studies With Carbide Tools Reveal Sublayer Plastic Flow. E. G. Thomsen, A. G. MacDonald and S. Kobayashi. American Society of Mechanical Engineers, Transactions (Journal of Engineering for Industry), Paper no. 61-Prod-3, 1961, 10 p.

Orthogonal cutting tests with artificial flank-wear lands are performed on 1112 steel, 4135 steel, 6061-T6 Al alloy and alpha brass. The condition for sublayer flow is predictable based on the state of plastic deformation and the stress-strain properties, from 100-1650° F. and varying strain rates. 12 ref. (G17, Q24, Q9, 2-61, 3-68; ST, Al-b, Cu-n)

629-G. (German.) Efficiency of Mechanical Stress Removal by Vibrators. H. Reinel. Maschinenbau Technik, v. 10, May 1961, p. 238-242.

Induction of residual stresses into ST 37 strip steel specimens by deposit welding with subsequent alternating bending of specimens at a constant number of revolutions per minute and constant amplitude to remove residual stresses. Measurement of elongation as an indication of residual stresses. 17 ref. (G23; ST, 4-53)

630-G. Pressing Aluminium. J. N. Lengbridge. Metal Industry, v. 99, July 7, 1961, p. 2-5.

Circular, elliptical and rectangular shaped shells are formed by pressing blanks. Evaluation of methods used and the numbers of draws necessary

to obtain a seamless, wrinkle-free shell having the same thickness as the original blank. (To be continued.) (G1; Al)

631-G. Explosive Forming by Electrical Discharge. Metal Industry, v. 99, July 7, 1961, p. 12.

Shaping of difficult metals such as Ti, W and stainless steel under water, using built-up electrical energy of 35,000 v. (G-general, NM-k34; Ti, W, SS)

632-G. Metal-Cutting Analysis. Pt. 2. New Parameters. S. Kobayashi and E. G. Thomsen. American Society of Mechanical Engineers, Transactions (Journal of Engineering for Industry), Paper no. 61-Prod-2, 1961, 9 p.

Orthogonal metal-cutting process is studied on alpha brass, SAE 1112 and 4135 steels, 6061-O, 6061-T6 and 2024-T4 Al alloys. A new angle relationship is developed from energy considerations. Use of effectiveness and machinability factor parameters in evaluating the machining process. 13 ref. (G17; Cu-n, ST, Al-b)

633-G. Planned Retooling Saves Payroll Dollars. Metalworking, v. 17, July 1961, p. 7-9.

Grinding, scaling, riveting and drilling with portable air tools and assembly with impactools in production of steel, stainless steel and Al tanks. (G18, G17e, K13n, 1-52, T26q; ST, SS, Al, 17-57)

634-G. Honing Selected for Ultra-Quality Bores. Metalworking, v. 17, July 1961, p. 15.

Honing 4140 and 4340 steel, 17-7 PH alloy, and Ti bores with aluminium oxide and silicon carbide stones in the production of compressible liquid springs, shock absorbers and actuators. Lapping brings surface finish to 0.5 micro-in. (G19n, G19p; AY, SS, Ti)

635-G. Shear Line Cuts Steel Drum Costs. Metalworking, v. 17, July 1961, p. 47.

Shearing, trimming, rolling, flattening, and squaring hot rolled, cold rolled and mild steel coil on automatic shear line to produce drums with a minimum of scrap loss. (G2, G-general; CN)

636-G. Dies You Can Make on a Bandsaw. Metalworking, v. 17, July 1961, p. 48-49.

Deep drawing and bulge forming stainless steel sheet and tubing with imcompressible polyurethane dies eliminates thinning and scuffing. (G4b, G14, W24n; SS, 4-53, 4-60)

637-G. Copper and Impact Extrusion. Copper, no. 12, Summer 1961, p. 18-21.

Methods of backward and forward extrusion of Cu and Cu alloys. Amount of deformation during extrusion and expected tool life. Slug preparation and lubrication method. (G5; Cu)

638-G. Tape Wound Titanium Scores. Iron Age, v. 188, July 20, 1961, p. 92-93.

Helically-interlocked tape winding is used to form pressure vessels for solid fuel rocket motor cases. The B120BCA Ti alloy tape is wound on a removable mandrel using a winding device which locks each turn with the preceding turn. (G-general, T26q; Ti-b, 4-53, 17-57)

639-G. Torch Burns Up Forming Costs. Iron Age, v. 188, July 20, 1961, p. 97.

A rotary torch cutting machine is used in place of a lathe and boring mill to remove the ends from steel cylinders for steam boiler drums. The unit utilizes divergent high-speed oxygen nozzles with oxy-propane cutting tips. (G22g, T26q; ST, 17-57)

640-G. Suction Pump Beats Electrode Distortion. Dean T. Wall and Daniel Strack. Metalworking Production, v. 105, July 5, 1961, p. 71-73.

Elimination of electrode distortion in electro-erosion machining of tapered slots by use of a suction pump which pulls out the gas and eroded metal particles by drawing the coolant around the electrodes. (G24a, 1-52)

641-G. Soviet Progress in Fluid Extrusion. Metalworking Production, v. 105, July 5, 1961, p. 79-81.

Influence of deformation and die inlet angle on extrusion pressure and effect of the fluid cold extrusion on mechanical properties of the product. Process incorporates fluid generated stress as a means of forcing the metal from the magazine through the opening in the die. (G5)

642-G. Aluminum Alloys for Deep Drawing. C. J. Smith. Metal Industry, v. 98, June 30, 1961, p. 517-519.

Methods of measuring and controlling grain size, earing phenomena, surface finish and gage in deep draw pressing of Al alloys. Effects of alloy composition, annealing and rolling conditions on grain size, earing and hardness. 13 ref. (G4b, M27c, Q29, 2-60, 2-64, 3-68, S14; Al-b, 9-71)

643-G. Drop Tank Production. Welding and Metal Fabrication, v. 29, July 1961, p. 274-282.

Rolling, stretch forming, spinning, drilling, argon arc and spot welding and bolting of mild steel sheet in the production of aircraft fuel-carrying drop tanks. (G-general, F23, K1d, K3n, T26q; CN, 4-53)

644-G. Tips on Machining Titanium. Clarence Mathewson and Frederick A. Janz. American Machinist/Metalworking Manufacturing, v. 105, July 10, 1961, p. 83-84.

Drilling, chamfering and tapping tests on as-rolled and heat treated Ti-6Al-4V alloy. Data on cutting speeds, feed rates, chip packing, drill geometry, chamfering and tapping procedures, chamfer diameters and tap sizes. (G17; Ti-b, Al, V)

645-G. Flat Within Tenths--By Milling. American Machinist/Metalworking Manufacturing, v. 105, July 10, 1961, p. 85.

Adjustable-rail miller for reducing scraping and machining time on Jigmil bedways incorporates an automatic cutter grinder for sharpening inserted-blade carbide cutters. Sequence of operations, milling accuracy and cutting speeds. (G17b, W25r)

646-G. Plastic Coat Shows Up Bearing Cage Stresses. American Machinist/Metalworking Manufacturing, v. 105, July 10, 1961, p. 88.

Photoelastic measurement of bearing cage stresses using a plastic surface coating on the bearing cage to reflect polarized light which is photographed through an analyzer filter. (G25)

647-G. Missile-Fuel Control Begins With Precise Machining. H. W. Bredin. Machinery, v. 67, July 1961, p. 78-85.

Machining with Carboloy inserts, lapping and finishing barstock, forgings and castings of 304 stainless steel, mild steel, brass, Al, U and cast iron to produce missile fuel valves with sealing and seating surfaces finished to 4 micro-in. Mass spectrometric leakage testing. (G17, S11c; SS, CN, Cu-n, Al, U, CI, 4-55, 4-51, 5)

648-G. Metal-Forming With Electromagnetics. Machinery, v. 67, July 1961, p. 86-91.

Swaging, blanking, forming, embossing and drawing stainless steel and Al sheet and tubing with electromagnetic Cu work coils to produce wrinkle-free parts. (G-general, F25, T1g; SS, Al, 4-53, 4-60)

649-G. 5-Axis Tape Control Profiling Under at Douglas. C. O. Herb. Machinery, v. 67, July 1961, p. 108-113.

Use of tape-controlled equipment in profile milling of 7079 Al alloy billets, barstock and forgings to produce aircraft parts with tolerances of 0.005 in. (G17b, 18-74, T24; Al-b, 4-51, 4-52, 4-55)

650-G. Novel Milling Chuck Cuts Cost of the B70. L. W. Collins. Machinery, v. 67, July 1961, p. 114-118.

Brazing and milling 17-4 PH stainless steel honeycomb and extrusions supported in a slip grip fixture which takes the place of the usual milling vise to produce smooth and high-temperature resistant aircraft panels. (G17b, K8, T24a, W25b; SS, 7-59, 4-58, 17-57)

651-G. Some Aspects of Fundamental Research in Metal Cutting and Its Application. A. Allen. Australasian Engineer, May 1961, p. 56-59.

Review of metal cutting studies including tool geometry, mechanics of cutting and economics of cutting. Formulas are given for calculating cutting forces, energy consumption and tool and cutting costs. 4 ref. (G17)

652-G. Machining and Machinability. C. A. Gladman. Australasian Engineer, May 1961, p. 60-65.

Pure and applied machining research and the mechanism of chip formation. Description of a machinability test conducted on a steel

billet. Relationship of tool life and cutting speed for CS114 hot rolled steel. (G17, G17k, A9, 1-54; ST)

653-G. Now--Flame Cutting With N/C. American Machinist/Metalworking Manufacturing, v. 105, July 24, 1961, p. 85.

Completely automatic flame cutting including cutting torch control, flame ignition and gas supply with a punched-tape numerical control system. (G22g, 18-74)

654-G. Shear-Forming Pointed Nose Cones. John B. Siegrist. American Machinist/Metalworking Manufacturing, v. 105, July 24, 1961, p. 90-91.

Production of 6061-C Al alloy closed-end missile nose cones by increasing the contact area between the nose of the mandrel and the inner surface of the blank before shear-forming begins. (G11, T24e; Al-b)

655-G. Faster Precision Hole Boring. Raymond Hoss. American Machinist/Metalworking Manufacturing, v. 105, July 24, 1961, p. 92-94.

Increase of efficiency and accuracy of hole sizes and locations with preset tools and direct dial positioning. Plant layout and sequence of operations. (G17d, 1-52, 18-74)

656-G. Abrasive Belt Grinding Projects Golf Irons. Nat Wood. Western Metalworking, v. 19, July 1961, p. 34-35.

Grinding and polishing operations on milled iron forgings; intermediate and final finish grinds. (G18, T10d; Fe-b, 4-51, 17-57)

657-G. Chipless Machining--High Energy Spark Forming. Charles H. Wick. Machine and Tool Blue Book, v. 56, Aug. 1961, p. 127-129.

Basic principles and applications in beading, bulging, expanding and sizing hollow shapes, punching and piercing and forming cup shapes, channels and panels. Parts up to 10 in. in diameter by 3/32 in. thick have been formed and it is planned to produce missile sections 10 ft. or more in diameter and at least 1 in. thick. (G24a)

658-G. Grinding Wheel Loading Minimized by Ultrasonics. Machine and Tool Blue Book, v. 56, Aug. 1961, p. 116-117.

An attachment mounted on a surface grinder ultrasonically prevents loading build-up on the grinding wheel. A transducer transmits vibrations to the head set close to the wheel's periphery. A liquid coolant passes through the head and sprays onto the wheel, where a force field is set up that prevents loading. (G18, 1-52, 1-74)

659-G. Template Solves Tricky Drilling Job. Welding Design & Fabrication, v. 34, July 1961, p. 58-59.

Use of a 96 in. diameter circular steel template as a guide for vertical positioning of a 14 ft. diameter spherical electronic equipment housing during drilling of large-diameter, close-tolerance holes in the spherical weldment of 1 in. thick H480 armor plate. (G17e, 1-52; 4-53, 7-51)

660-G. Chemical Milling. C. H. Rose. Watervliet Arsenal. U. S. Office of Technical Services, PB 171112, Dec. 1960, 21 p. $.75.

Techniques to apply chemical milling accurately and precisely enough to produce highly complex shapes, nonsymmetrical patterns, intricately stiffened structures and tapered skin. Breakthrough in the field is attributed to new organic coatings and tapes resistant to different types of solution, compounded or modified etching solutions that give uniform etching rates without destroying the physical or chemical properties of a metal and electronic measuring and control equipment. (G24b)

661-G. Cutting Super Alloys. Max J. Kuderko. Cutting Tool Engineering, v. 13, Aug. 1961, p. 8-11.

Performance of abrasion-resistant carbides for cutting abrasive and hard alloys including Tantung "G", Co high-speed steel and Stellite and performance of ceramics on work hardening alloys including Inconel X, Udimet 500 and Hastelloy X. (G17, T6n; SGA-h, TS, Co-b, Ni-b)

662-G. Diamond Wheels for High Vanadium Steels. Pt. 2. Cutting Tool Engineering, v. 13, Aug. 1961, p. 12-14.

Effect of workpiece size and diamond grit size on efficiency in

grinding steels with diamond wheels. (G18, W25c; AY, V)

663-G. Proper Sharpening Means Longer Tool Life. Pt. 4. William H. McNeilly. Cutting Tool Engineering, v. 13, Aug. 1961, p. 15, 18.

Sharpening internal, surface and round broaches to maintain specified design to minimize power usage and enhance tool preformance. (G18, T6n)

664-G. Nonstop Broach Speeds Hinge Production. Steel, v. 149, July 31, 1961, p. 59.

Automatic fixture clamping, broaching, unclamping, unloading and chip disposal in production of door hinges by chain broaching process. (G17d, 18-74)

665-G. (German-French.) Chemical Machining of Aluminum. E. Herrmann. Aluminium Suisse, v. 11, May 1961, p. 91-101.

Parts for machining are degreased and the surface oxide films are removed in an alkaline solution. Portions of the part where no metal is removed are covered with a plastic material in the liquid state. Machining is by immersion in a 10% NaOH solution or in diluted HCl. (G24b; Al)

666-G. Machining Magnesium Race Car Wheels. Ted Halibrand. Modern Machine Shop, v. 34, Aug. 1961, p. 94-95.

Use of a lathe tracing attachment which permits speeds of 625 rpm., feeds of 0.018-0.024 in. and cuts from 1/16-1/8 in. and assures constant speed and feed rate thereby eliminating fire hazards during machining. (G17, 1-52, T21c; Mg)

667-G. The Machining of Steel. Pt. 4. Milling Practice. F. C. Lea. Edgar Allen News, v. 40, July 1961, p. 154-155.

Review of equipment and techniques used in milling of steel. Design and use of negative rake cutters for high speed milling and of cutters for roughing and finishing. Method of "climb milling", a process in which the work is fed in the same direction as the cutter rotation. (G17b, T6n, 17-51; ST)

668-G. Production and Application of Cold-Extruded Components. Australasian Manufacturer, v. 46, July 1, 1961, p. 84-91.

Method of cold extruding components of various sizes and shapes from steel billets. Composition of steels suitable for cold extrusion and preparation of billets for extruding by annealing or coating treatments. Design, composition and mechanical properties of the punch and die. (G5, F21, W24; ST, 4-52)

669-G. Machinability of Nodular Cast Irons. Pt. 2. Effect of Cutting Conditions on Flank Adhesion. K. Hitomi and G. L. Thuering. American Society of Mechanical Engineers (Journal of Engineering for Industry), Transactions, Paper no. 61-SA-7, 1961, 7 p.

The influence of feed rate, rake angle, clearance angle and cutting fluids on flank adhesion in nodular irons of varying hardness is investigated using carbide and oxide tools. (G17k; CI-r)

670-G. Plasma-Torch Cutting. James A. Browning and George A. Klasson. Mechanical Engineering, v. 83, Aug. 1961, p. 43-46.

Procedures and applications of arc-plasma cutting of mild and stainless steel, Al, cast iron, Cu, brass and Ni. Wall and gas-whirl stabilization and transferred-arc techniques are discussed, giving data on cutting speeds, cutting speeds, current and gas flow relationships. 12 ref. (G22h; CN, SS, CI-b, Cu, Ni)

671-G. Explosive Forming Procedure Nears Production Stage at Martin. Missiles and Rockets, v. 9, Aug. 7, 1961, p. 24-25.

Use of explosive forming to reduce welding footage in the manufacture of torus tanks. A 15 x 8 ft. gore section of an elliptical dome explosively formed in 5086 Al alloy. (G-general, T26; Al-b, NM-k34, 17-57)

672-G. (Russian.) Force Determination During Stamping of Hot Rolled Iron. V. G. Alkov and L. D. Sokolov. Izvestiya VUZ--Chernaya Metallurgiya, Dec. 1960, p. 183-185.

Calculation of forces required to stamp hot bloom ingot as influenced by area of impression, metal plasticity and extent and rate of deformation. 4 ref. (G3, 1-54, 3-68; Fe, 4-52)

673-G. Turning Aluminum Alloys. Tool and Manufacturing Engineer, v. 47, Aug. 1961, p. 71-72.

Suggested speeds and feeds for turning wrought and cast Al alloys are given with machinability ratings. (G17; Al-b)

674-G. (German.) Technology of Spark Erosion (Spark Machining) and Its Application. H. J. Schulz. Elektrowarme, v. 19, June 1961, p. 210-216.

Review of reaction mechanism, machinery and technology of spark erosion (machining) in production of complex Cu, brass and steel shapes such as drawing, forging, cutting and pressing dies. (G24a, T6r, 1-52; Cu-b, ST, 17-57)

675-G. (German.) Material Processing by Electron Beams. H. Schluge. Elektrowarme, v. 19, June 1961, p. 217-226.

Reaction mechanism and design and operation of equipment for electron-beam machining including drilling, cutting and milling of profiles in metals and nonmetals and for precision welding of steel and for welding nonferrous metals such as Zircaloy and Cu to steel. (G24, K6, 1-52; ST, Cu, Zr)

676-G. How to Increase Tool Life When Machining Gray Iron. Charles F. Walton. Tooling & Production, v. 27, Aug. 1961, p. 25-28.

Influence of microstructure on tool life; machinability of ferrite, coarse pearlite, fine pearlite and acicular matrix structure; recommended cutting speeds and feeds. (G17, N8, Q9n, 1-52, 3-78; CI-n, 17-57)

677-G. (Book.) Theory of Metal Cutting. P. H. Black. 1961. 204 p. McGraw-Hill Book Co., Inc., 330 W. 42nd St., New York, N. Y. $7.50.

Structure and strength of metals, mechanics of metal cutting, basic principles of friction, lubrication and wear, cutting fluids, cutting tools, wear in metal cutting, tool life, grinding, three-dimensional cutting, unconventional methods of machining and economic considerations. (G17, G18, G22, G24, T6n; NM-h)

678-G. Jig Grinding--Versatility in the Die Shop. Pt. 1. Frederick C. Victory. Grinding and Finishing, v. 7, Aug. 1961, p. 22-25.

Principles and techniques for Jig grinding holes and contours in hardened steels and carbides. (To be continued.) (G18; ST, 14-68, SGB-q)

679-G. Tilt Grinder Head to Finish Taper. Aldo Olivero. Grinding and Finishing, v. 7, Aug. 1961, p. 33.

Production of an SAE 1010 steel automotive "C" washer with an ID of 4 in. and an OD of 5.62 in. and tapered one side from 0.250-0.062 in. using a tilted surface grinder. Wheel specification. (G18k, 1-52, T21c; CN)

680-G. Hot Welded Rail Grinding Takes Out Clickety-Clack. Grinding and Finishing, v. 7, Aug. 1961, p. 34-37.

One-quarter mile rail sections are produced by fusing smaller sections under pressure and welding. Welds are ground at 650° F. to remove sheared upset from sides, top and bottom of the rail. (G18, 2-61, T23q; ST, 7-51)

681-G. How to Design for Explosive Forming. Vernon H. Monteil. Metal Progress, v. 80, Aug. 1961, p. 66-70.

The process is not a cure-all for forming difficulties but is a good supplemental technique that is useful in shaping difficult materials and large parts. (G-general; NM-k34, 17-51)

682-G. Ryan's Experience in Explosive Forming. Floyd A. Cox. Metal Progress, v. 80, Aug. 1961, p. 71-73.

Explosive forming can simplify fabrication of complex shapes and produce close tolerance parts. Some examples of what can be done with the new technique point out its potential to design engineers dealing with tough forming problems. (G-general; NM-k34)

683-G. Steel Parts Formed on High-Energy-Rate Machine. Ralph G. Monsees. Metal Progress, v. 80, Aug. 1961, p. 74-75.

High pressures applied at great speeds permit parts to be extruded or forged in one stroke to close tolerances and smooth surfaces. These characteristics open areas of application of high-energy machines to conventional metals such as resulphurized steels as well as those which are difficult to form. (G-general, F22; ST)

684-G. Explosive Forming With Combustible Gas Mixtures. John Miller and

Philip Kruse. Metal Progress, v. 80 Aug. 1961, p. 76-78.

Working with mixtures of hydrogen, oxygen and an inert gas, Boeing engineers are experimenting with a forming method which possesses the advantages of conventional explosive forming but eliminates some of its limitations. Forming pressures can be controlled more accurately and the combustible gas is, in effect, an ideally shaped charge since it is always in contact with the workpiece. (G-general; NM-k34)

685-G. Machining Udimet 500, Solution Treated and Aged to Bhn. 360. Metal Progress, v. 80, Aug. 1961, p. 96-B.

Tool materials and geometry, cutting fluids, feeds and speeds for turning, milling, drilling and tapping operations. (G17; Co-b)

686-G. Mechanisms of Boundary Lubrication. P. R. Lancaster and G. W. Rowe. American Society of Mechanical Engineers, Paper no. 61-LUBS-5, 1961, 8 p. $1.

Experimental study of lubrication during slow metal-drawing at room temperature under heavy loads using dies of high entry angle to minimize hydrodynamic contributions. Boundary lubrication of Cu, mild steel and stainless steel. 4 ref. (G4, 3-68, 18-73; Cu, CN, SS)

687-G. A Review of Metal Processing Literature--Metal Cutting Analysis. J. S. Campbell, S. Kobayashi, J. M. Galimberti, Robert S. Hahn and E. G. Thomsen. American Society of Mechanical Engineers, Paper no. 61-PROD-12, 1961, p. 1-5.

Mechanics of chip formation, tool wear, friction and workpiece temperature, vibration, nonconventional machining methods, machinability and tool life, tool dynamometers, electro and ultrasonic machining, residual stresses and worn tool forces. 68 ref. (G17, G24, 11-65)

688-G. A Review of Metal-Processing Literature--Metal Cutting Practices. J. R. Roubik, A. L. Pickrell, K. H. Moltrecht, R. L. Vaughan, J. A. Sweeney and E. J. Weller. American Society of Mechanical Engineers, Paper no. 61-PROD-12, 1961, p. 5-7.

Tool-machine control systems, health and safety precautions during machining of Be, nonmachining metal removal processes (chemical milling, ultrasonic machining, etc.) and machining conditions for superalloys, ultrastrength alloys, Zircaloy 2, graphite, Mg, Mo and U. 23 ref. (G17, G24, 11-65, A7; Be, SGA-h, SGB-a, Zr-b, Mg, Mo, U)

689-G. A Review of Metal-Processing Literature--Grinding. E. J. Krabacher, R. S. Hahn and J. L. Wennbert. American Society of Mechanical Engineers, Paper no. 61-PROD-12, 1961, p. 10-12.

Grinding wheel wear, vibrations and chatter, wheel properties and truing, accuracy and control and diamond grinding. 25 ref. (G18, W25c)

690-G. Milling of Reliefs on Extrusion Dies. Machine Production, v. 20, July 1961, p. 72.

Design and operation of a unit which utilizes a standard milling head and a two-dimensional tracer control system which is electromechanically controlled operating from a template and will follow any contour around a 360° path at a constant cutting speed regardless of direction. Geometry of the sensing stylus. (G17b, 1-52, W24n)

691-G. (Book.) Machining Characteristics of High Strength Thermal Resistance Materials. v. 4. AMC Technical Report 60-7-532. May 1960. 180 p. Wright Aeronautical Div., Curtiss-Wright Corp. Wood-Ridge, N. J.

Machining characteristics in turning, milling, drilling, tapping and grinding of various steels, Ni-base and Co-base high temperature alloys and Ti alloys. Relationships between tool life, cutting speed, feed, tool geometry, tool material and cutting fluids. (G17, G18; ST, Ni-b, Co-b, Ti-b, SGA-h, SGB-a)

692-G. Shot-Peening Offers New Life to Critical Metal Parts. H. O. Fuchs. Iron Age, v. 188, Aug. 10, 1961, p. 67-70.

Fatigue strength of steel shaft, springs and gears, Be-Cu springs and Al alloy inducers as affected by shot peening. (G23n, Q7a, T7; ST, Cu-b, Be, Al-b)

693-G. Punched Tape Calls the Signals on Tough Tube-Bending Jobs. Iron Age, v. 188, Aug. 10, 1961, p. 72-73.

Tube bending for aircraft, missile and space vehicle applications using a precision bending machine controlled by punched tape. Bending patterns are easily changed and standard dies may be used. (G6, 1-52, T24; 4-60, 17-57)

694-G. Production Procedures at the Beacon Works of John Thompson Motor Pressings Ltd. Sheet Metal Industries, v. 38, July 1961, p. 482-487, 514.

Manufacture of heavy frames for railway passenger coaches and diesel trucks, mineral-wagon doors and other items for the railway and motor industries. Use of reversible die sets. Hot and cold forming and finishing operations by hot spray and rinsing or by an airless abrasive shot-cleaning plant. (To be continued.) (G-general, L-general, T21, T23; ST)

695-G. Pressure Economy. Melvin D. Verson. Sheet Metal Industries, v. 38, July 1961, p. 493-500, 514.

Presses and their design, lubrication systems and toolsteels used in "impact machining", cold extrusion basically carried to the point of eliminating finish machining, carbon and alloy steels. (G5, 18-73, W24g; CN, AY, TS, 17-57)

696-G. Machinability of OFHC Copper I, II. American Machinist/Metalworking Manufacturing, v. 105, Aug. 1961, p. 93-95.

Parameters for turning, forming, internal work, threading, centerless grinding and silver plating of Amsulf composed of 99.7% oxygen-free high-conductivity Cu and 0.30% sulphur. Production machinability is indicated at from 70-95% that of free-machining brass. (G17k; Cu-b, S)

697-G. Close-Tolerance Flame Cutting. J. C. Worthington and A. L. Cooper. American Machinist/Metalworking Manufacturing, v. 105, Aug. 1961, p. 85-88.

Elimination of machining by holding tolerances to 0 to 1/32 in. with an electronic line-tracing device, a low-pressure, injector-type torch and careful control of variables. Data are given for applications to mild steel shapes. (G22g, 1-52; CN, 4-53, 17-55)

698-G. A Million Severely, Multi-Formed Parts Without Rejects Result From Wire With Consistent Tensile. Wire and Wire Products, v. 36, June 1961, p. 763, 795.

Consistent tensile strength results in closer tolerances, fewer inspection rejects, less breakdown of equipment and improved corrosion resistance in the production of 430 stainless steel wire door hinges for home laundry equipment by four-slide forming, punch press flattening, drilling and tapping and passivating and burnishing. (Q-general, Q27a, T10c; SS, 4-61, 17-57)

699-G. (German.) High Intensity Electron Beams as a Thermic Tool. Heinrich Hora. Chemische Rundschau, v. 14, July 15, 1961, p. 393-394.

Review of electron beam high precision machining (cutting, erosion, milling, drilling) of metals and nonmetals (plastics, glass, quartz) under vacuum (10^{-4} Torr) and butt welding of metals including alloyed steels. Physical backgroung and applications. (G24, K6, 1-52, 1-73, 16-62; AY, NM-d, NM-f)

700-G. Belt Machines Hold Honeycomb Tolerances. Steel, v. 149, July 24, 1961, p. 88-89.

Conveyorized, wide belt grinders with 180G, 320G or 240G aluminum oxide or silicon carbide abrasives are used to finish stainless steel honeycomb panels maintaining tolerances within ±0.001 in. for use in the B-70 superbomber. (G18, T24, W25c; SS, 7-59, 17-55, 17-57)

701-G. Hot Machining. Jens L. Wennberg, C. L. Mehl and E. J. Krabacher. Aircraft Production, v. 23, July 1961, p. 246-252.

Methods of heating and hot machining high-strength heat resistant metals. Results of tests to determine effects of workpiece temperature on life of cutting tool, chip formation and metal removal rate. Prevention of thermal damage to the workpiece as dependent on heating method used. 5 ref. (G17, 1-66; SGA-h, SGB-a)

702-G. Cold-Point Drilling. Aircraft Production, v. 23, July 1961, p. 270-271.

Design and operation of a twist drill which incorporates a cooling system and which is used for cold point drilling of high-tensile materials. Testing of the drill by drilling a variety of materials to determine drilling time including bronze, Fe, stainless steel, Inconel, Monel, Nimonic 90 and other materials. (G17e, 1-67, W25p; Cu-n, Fe, SS, Ni-b)

703-G. How to Hot Hob Beryllium Copper. Islyn Thomas. Plastics Engineering, v. 38, July 1961, p. 101-103, 106, 108, 111, 174.

Techniques and equipment used in the production of molds, jigs and dies from Berylco 275C casting alloy by hot hobbing from 1100-2000° F. Importance of hob design. Melting and pouring, finishing, heat treating and plating operations. Physical properties of the alloy. (G17b, 1-66, 1-52, J-general, L-general, P-general; Cu-b, Be)

704-G. What's Your Abrasive Machining I. Q. ? Leo P. Tarasov and Richard H. Merritt. Grits and Grinds, v. 52, June 1961, p. 3-7, 10.

Results of an investigation into all aspects of heavy stock removal machining of flat work, solid hardened steel bars, stainless steel slab and other metals by abrasive tools. (G18, A9m, W25c; ST)

705-G. Fabricating and Machining Practices for the All Beta Titanium Alloy (Ti-13V-11Cr-3Al). C. T. Olofson and F. W. Boulger. Defense Metals Information Center, Battelle Memorial Institute, DMIC Memo. 121, Aug. 3, 1961, 7 p.

Review of heat treating, descaling, forming, spinning, dimpling, stretch forming, bending and machining operations. Tabulation of machining conditions for drilling, tapping and turning the alloy after solution treating and aging to 45 Rockwell C. Comparative formability of weldable Ti-alloy sheet metals. 10 ref. (G-general, G17, 2-65, Q23q; Ti-b, V, Cr, Al)

706-G. (German.) Investigation of Deep-Drawability of Sheets. Standardized Testing by Engelhardt and Gross Technique. Achim Rickert and Horst Gross. Fertigungstechnik und Betrieb, v. 11, June 1961, p. 384-388.

Equipment, shape of specimens, sampling and testing techniques and evaluation of testing data for the testing of steel, Cu alloy and Al and Al alloy sheets. (G4, 17-52, 1-53; ST, Al-b, Cu-b)

707-G. (Translation-Brutcher no. 5050.) Basic Oxygen (L-D) Steel in Wire Manufacture. W. Fogy and O. Kramer. Berg-und Huttenmannische Monatshefte, v. 105, Nov. 1960, p. 261-268.

Previously abstracted. See item 182-G, 1961. (G4, 17-52, Q-general; ST)

708-G. Modern Equipment, Better Work Flow Gain 20% to 300%. R. R. Moran. Production, v. 48, Aug. 1961, p. 64-69.

Layout and operation of an automotive plant for cold heading and machining operations in the production of steering gear parts, bolts and valve push rods. Techniques and equipment used in wire drawing, cutting, straightening, welding, threading, rolling, notching, cold heading and other processes. (G10, 1-67, G17, F-general, K-general, T21c; ST)

709-G. The Mechanics of Chip-Formation. R. D. Harris, S. N. Agrawal and B. H. Amstead. Machinery (London), v. 99, July 26, 1961, p. 193-198.

Use of a high-speed camera to study mechanics of chip formation, deformation, cracking and strain harding of hot and cold rolled steel, brass and Al. (G17, 1-53; ST, Cu-n, Al)

710-G. Production Advantages of Today's Modern Surface Grinding. John E. Hyler. Production Equipment, v. 37, Aug. 1961, p. 6, 8.

Techniques and equipment for heavy surface grinding of toolsteels, nonferrous metals and ceramics. (G18k, 1-52; TS, EG-a38, 6-70)

711-G. Automatic Grinding Saves Time, Men and Money. John W. Lane. Modern Castings, v. 40, Aug. 1961, p. 40-41.

Grinding of gate and riser ends of malleable iron pipe fittings with an automatic machine having a revolving turntable and a vertical grinding wheel. (G18, 1-52, T6a, W19g; CI)

712-G. Ceramics Do the Job When Used Properly. Benjamin E. Storrs. Tooling & Production, v. 27, July 1961, p. 30-33.

Machining cast iron, steel, Monel and other alloys using ceramic tools. Feed rates and types of cut are limited by the low transfer rupture strength. The heat resistance of the ceramic edge allows high speed machining without dulling the tool. Four case histories of machining utilizing ceramic tools. (G17, T6n; SGA-j, NM-f)

713-G. New Rotary Dresser Saves Grinding Dollars. Tooling & Production, v. 27, July 1961, p. 34.

Production of exhaust valves using a single unit to grind two spaced grooves and a chamfer on the foot. The grinding wheels are dressed in a single plunge by rotary diamond set form dressing wheels. Quality and uniformity of valves produced, diamond dressing tool costs, grinding tool life and labor costs. (G18h, T21b, 1-52)

714-G. Electrolytic Grinding Contributes to Customer Savings. Tooling & Production, v. 27, July 1961, p. 43.

Roughing carbide cutoff and grooving tools by electrolytic grinding with subsequent hand grinding to commercial tolerances. (G18, T6n, 1-52)

715-G. Cavities Cut Electrochemically--On Automatic Transfer Machine. David Fishlock. Metalworking Production, v. 105, July 19, 1961, p. 51-55.

Electrochemical machining of Ge wafers into transistors by cutting aligned cavities on each side of the wafer to leave a 0.0005 in. web between the sides. Electrodeposition of Cd in each cavity. (G24d, L17, T1k, 1-52; Ge, Cd)

716-G. Machining the Jet and Space-Age Metals. Donald A. Reiner. Western Machinery and Steel World, v. 52, Aug. 1961, p. 28-30.

Classification, relative machinability, characteristics and basic reasons for difficulty in machining Fe, Ni and Co-base superalloys, stainless steels and refractory metals. (G17; Fe-b, Ni-b, Co-b, SGA-h, SS, EG-d37)

717-G. Diamond Wheels Cut Tool Grinding Costs. Steel, v. 149, Aug. 14, 1961, p. 134.

Grinding of high vanadium toolsteels to good tolerances using a synthetic diamond wheel. Comparison with aluminum oxide wheels as to wheel wear, speed and workpiece surface finish. (G17, W25c; TS, V, NM-k37)

718-G. Micro-Filing Gives Geometrical Accuracy. Metalworking Production, v. 105, July 26, 1961, p. 49.

Microfiling of hardened steel and other materials used in light engineering for pivots, bolts and shafts using a pivot polishing machine. Process achieves a high degree of geometrical accuracy and a surface finish of 2 microinches or finer. (G17j; ST)

719-G. Flame Cutting for the Small Shop. Clement F. Brown. Metalworking Production, v. 105, July 26, 1961, p. 57-58.

Flame cutting of steel plates with portable, cam-guided shape or beam-type machines. (G22g, 1-52; ST, 4-53)

720-G. Flexible Tooling for Continuous Broaching Makes Short Runs Practical. Laurence W. Collins, Jr. Machinery, v. 67, Aug. 1961, p. 90-94.

Production of blades and vanes for compressor rotors and stators, inlet guides, nozzle diaphragms and jet engine turbine wheels by continuous broaching of Al, 403 stainless steel, A-286 alloy, Ti, Hastelloy and other special metals. This surface machining process produces dovetail profiles on blades using a multiple stage fixture. (G17d, T7h; SS, Al, Ti, SGA-h, 17-57)

721-G. Tiny Precision Bearings Boost Guidance System Reliability. Ralph O. Wirtemburg. Machinery, v. 67, Aug. 1961, p. 111-118.

Production of antifriction ball bearings for aircraft and missiles guidance system by cold heading from

round 440-C stainless steel wire with subsequent centerless finish grinding. (G18h, G10, 1-67, T7d, T24e; SS, 17-57)

722-G. Efficient Form Tool Grinding. Frederick H. Hall. Automatic Machining, v. 22, Aug. 1961, p. 65-66.

Use of single spindle automatic screw machine for flat form grinding of high-speed steel and carbide tools for reduced production costs, operator fatigue and increased finish quality. Survey of related equipment including lenses, mirrors and lighting sources. (G18, T6n; TS-m, 14-68, 17-57)

723-G. Modern Cold Heading. Donald E. Wood and R. G. Friedman. Automatic Machining, v. 22, Aug. 1961, p. 67-70.

Cold heading of ferrous and nonferrous metals as applied to products normally produced on screw machine such as balls for bearing, pens or ball mills. Survey of related equipment including single and two-blow headers. (G10, 1-67)

724-G. Broaching Tackles New Jobs. Iron Age, v. 188, Aug. 24, 1961, p. 51.

Broaching of Zr alloy I beams of over 5 ft. length using a horizontal position machine, hydraulic clamping units and carbide-tipped cutters. Design of a broaching machine which combines internal and surface operations. (G17d; Zr, 4-57)

725-G. Cryogenic Forming: New Process Stretches and Strengthens. Iron Age, v. 188, Aug. 24, 1961, p. 61-63.

Stretch forming of welded stainless steel spheres and cylinders at -320° F. using gaseous nitrogen resulting in improved room temperature strength even in the welded areas. (G9, 1-67; SS, 7-51)

726-G. (Italian.) Some Notes on Screw Thread Rolling. Lelio Orsini. Macchine, v. 16, July, 1961, p. 721-725.

Material selection and machine employment to suit applications. Technological and economic considerations. (G12, 1-52)

727-G. Forming at Austenitizing Temperatures for Distortion Control During Heat Treating. R. B. Cantley. Metals Engineering Quarterly, v. 1, Aug. 1961, p. 3-6.

Thin-gage sheet metal parts of martensitic stainless steels are simultaneously heat treated and formed at austenitic temperatures for distortion control using conventional furnaces, special salt baths and electrical resistance heating apparatus in combination with special and conventional presses. (G-general, J22; SS-c, 4-53)

728-G. Deformation of Metastable Austenite--An Interim Report on a New Process. C. F. Zackay, W. M. Justusson and D. J. Schmatz. Metal Progress, v. 80, Sept. 1961, p. 68-72, 126.

Mechanical properties of alloy steels strengthened by deformation in the metastable austenite "bay" of the T-T-T curve as affected in varying degrees by variations in grain size, tempering temperature, carbon content and other metallurgical factors. Application of the Ausforming process to H11 steel. (G-general, J22, N-general, Q-general, 2-59, 2-60, 3-68; AY)

729-G. Special Tooling, 3D Tracer Ease Contouring. Western Metalworking, v. 19, Aug. 1961, p. 40.

Three dimensional contouring and fabrication of Al, Ti, Mo, H-11 alloys and steel using a profiling unit capable of delivering from 23-1800 rpm. in 4 variables. (G17a, 1-52; Al, Mo, Ti, ST, TS)

730-G. How AC Spark Plug Machines Beryllium. Steel, v. 149, Aug. 28, 1961, p. 70-73.

Review of machining parameters used in turning, boring, threading, milling, grinding and deburring of Be to produce precision gyroscope parts. (G17, 10-54; Be)

731-G. (Russian.) Analysis of Seam Temperature During Hot Stamping. E. A. Sonkin. Kuznechno-Shtampovochnoe Proizvodstwo, Mar. 1961, p. 8-9.

Uniform distribution of metal within the dies as a function of the ratio between thickness and temperature of seam formed during hot die stamping of carbon steel. 4 ref. (G3, 1-66, Q25p; CN)

732-G. Chipless Machining--Electromagnetic Forming. Charles H. Wick. Machine and Tool Blue Book, v. 56, Sept. 1961, p. 139-140.

The design, operation and applications of high-energy rate machine to blank, emboss, draw and form parts from electrically conductive metal and to reduce tubes and swage fittings to tubing. Disadvantages of the process include cost of energy and limitations on size of machinable parts. (G24)

733-G. A Study of the Machinability of Gray Iron. A. De Sy and L. Van Eeghem. Foundry, v. 89, Sept. 1961, p. 78-81.

Measurements of tool life during turning with 18-4-1 high-speed steel cutting tools are used to predict the machinability of gray iron cylinders as a function of composition and mechanical properties. 4 ref. (G17k, Q-general, 2-60; CI-n)

734-G. Cold Upsetting and Cold Extrusion of Components on Transfer Cold Headers. B. Hatebur. Wire Industry, v. 28, Aug. 1961, p. 775, 778-779, 781.

Design and operation of split-die and solid-die double-blow cold headers and of transfer headers for boltblanking. Review of sequence of operations for producing a hexagon boltblank by the double-blow trimming method and by the double extrusion method. (G10, 1-66)

735-G. Photo-Template Profile Grinding. Oscar Loeffler. Metalworking Production, v. 105, Aug. 16, 1961, p. 57-60.

A photographic reduction (1:10) of template is used in conjunction with optical system for grinding setup to provide operator with an image of the contour projected onto the workpiece. Punch milling machine is used to make die block of high-carbon high-chrome steel, Rockwell 62C. (G18, 1-52; SS)

736-G. Electric Machining Builders Sight Market Breakthrough. K. W. Bennett. Iron Age, v. 188, Sept. 7, 1961, p. 72-73.

Production of tungsten rocket nozzles, Be and other metal parts by electrical discharge and electrolytic machining. Advantages and limitations of the processes. Production and consumption statistics. (G24a, G24d, A4p; W, Be)

737-G. (English.) Surface Finish Produced by Ceramic Tools. Keiji Okushima and Yoshiya Fujii. Bulletin of JSME (Japan Society of Mechanical Engineers), v. 4, no. 14, 1961, p. 365-374.

Effect of cutting conditions, tool geometry and flank wear on the roughness of surfaces produced by machining 0.44% carbon steel with ceramic or carbide tools. The two types are compared as they affect the appearance of the surface, the depth of the workhardened layer and the relationship between luster of the surface and the oxide film. 4 ref. (G17, S15b, 1-52; CN)

738-G. (English.) Pressure Lubricated Deep Drawing. Yasuo Kasuga, Norihiko Nozaki and Kazuyoshi Kondo. Bulletin of JSME (Japan Society of Mechanical Engineers), v. 4, no. 14, 1961, p. 394-405.

A method of fluid lubrication for the deep drawing of sheet metals is developed with experimental application to Al. The mechanism of pressure lubrication is investigated to improve drawing ratio. (G4b, 1-53, 3-74, 4-53, 18-73; Al)

739-G. Machining Die Cast Motor Housing for Floor Polishers. Machinery (London), v. 99, Aug. 2, 1961, p. 255-256.

Use of automatic boring machines to eliminate line reaming and improve accuracy and efficiency in roughing and finishing of Zn die castings (SAE Alloy 903, ASTM AG40A). (G17, E24j, 1-52, T10c; Zn, 5-61)

740-G. U.S. Gain Experience in Explosive Forming. James P. Orr. Metalworking Production, v. 105, July 1961, p. 50-53.

Review of tooling developments in the explosive forming process includes a description of concrete, ductile iron and epoxy resin forming dies. An application is given for the fabrication of hemispherical Al missile bulkbeads. Advantages and disadvantages of the process are summarized. (G-general, T24e; NM-k34, Al)

741-G. (German.) Drilling of Deep Bore-Holes by Ultrasonic Techniques. W. W. Metelkin. Maschinenbau, v. 10, June 1961, p. 250-252.

Equipment design and process variables for drilling deep holes in glass and quartz and for cutting quartz, Si, Ge and hard metals by ultrasonic methods using boron carbide as the grinding agent. (G24c; SGB-q, Ge, Si, NM-f)

742-G. Breakthrough in Cutoff. Horace Frommelt. Tooling & Production, v. 27, Sept. 1961, p. 39-41.

Use of a carbide throw-away insert tool for slugging and parting a 1045 steel bar. Economic considerations. (G17, T6n; ST)

743-G. More Production, Closer Tolerancing From a Trunnion Machine. A. J. McLaren. Tooling & Production, v. 27, Sept. 1961, p. 42-44.

Description and operation of a 10 station machine for close tolerance boring and facing of nodular iron and gray iron tractor cylinders. (G17d, 1-52, T21b; CI)

744-G. High Speed Machining Ready for New Horizons. Tooling & Production, v. 27, Sept. 1961, p. 58-60.

Tool life and heat transfer during high speed (5000-10,000 sfpm.) machining of Al barstock and die castings. (G17, P11k; Al, 4-55, 5-61)

745-G. The Use of High Speed Stereophotography in Explosive Metal Forming. Rolland Gallup and John Pearson. U.S. Naval Ordnance Test Station, China Lake, Calif., NAVWEPS Report 7738, July 21, 1961, 16 p.

Method for using medium and high speed stereophotography to obtain quantitative engineering data on the dynamics of explosive forming, specifically the time response of the material and deformation and movement of the metals as a function of time. Explosive free-forming of Al is used for illustrative purposes. 5 ref. (G-general, NM-k34; Al)

746-G. Special Welded Beam Is Lighter, Stronger. Welding Design & Fabrication, v. 34, Aug. 1961, p. 30-31.

Wide flange hot rolled ASTM A-7 steel beams are serrated in a punch press to produce a continuous S-shaped or zigzag cut. The section halves are then manually welded. The resulting beams are 40-45% deeper and thus about 50% stronger than the original beams. Comparison with equivalent long-span joists. (G2j, K-general; ST, 4-57, SGB-s)

747-G. Cutting Your Weld Grinding and Finishing Costs. W. G. Pinkstone. Welding Design & Fabrication, v. 34, Aug. 1961, p. 38-41, 44-48, 50-51.

Selection and identification of weld grinding wheels. Techniques for coated abrasives. (G18k, L10b, W25c; SS, 7-51)

748-G. Aluminum Foil and Plastics Give Improved Satellite Skin. Light Metal Age, v. 19, Aug. 1961, p. 17.

Chemical milling of perforations in an Al foil and plastic laminate to produce light weight, wrinkle resistant skins for balloon-type satellites. (G24b, T24; Al-b, NM-d, 4-56, 7-58, 17-57)

749-G. Building Minuteman's Shell. Ben Brosheer. American Machinist/Metalworking Manufacturing, v. 105, Aug. 21, 1961, p. 95-100.

Rough forging, machining, shear spinning, roll forming, Tig welding, stress relieving and bracket assembly operation parameters for fabrication of a low alloy modification of AISI 4340 steel containing approximately 0.50% Ni, 1.00% Cr and 1.00% Mo into first stage rocket engine cases. (G-general, F22, K1d, J1a, T24e; AY, 17-57)

750-G. Transfer Line for a L-o-n-g Run. Charles Emerson. American Machinist/Metalworking Manufacturing, v. 105, Aug. 21, 1961, p. 114-116.

Automated drilling, grinding and swaging operations on cold rolled Cd and Ni-plated C-1213 steel bar stock for producing agitator shafts for washing machines. (G17, G18, F25, 1-52, 18-74, T10c; ST, 8-62, 17-57)

751-G. How to Bend Tubing. R. M. Spencer. Modern Machine Shop, v. 34, Sept. 1961, p. 130-137.

Draw, compression and press bending of welded steel are described with types of mandrels for various applications. Parameters for calculating bend radii and distance between bends. (G6, 1-52; ST, 4-60, 7-51)

752-G. Cold-Forming Taps. F. T. Thorley and E. K. Chofman. Metalworking, v. 17, Aug. 1961, p. 9-11.

Cold forming taps are used to produce internal thread by actions similar to external thread rolling in stainless steel, sintered iron, precipitation-hardening stainless steels, electrolytic Cu, magnet iron as well as the softer metals. Stronger and smoother threads with longer life are attributed to the process. (G17f, T6r, 17-57; ST, Cu, Fe-b)

753-G. Lapping Makes 'Super-Stampings' Metalworking, v. 17, Aug. 1961, p. 47.

Stampings of cold rolled and 300 series stainless steel are lapped using suspensions of Al_2O_3 to obtain flatness

tolerances within 0.0002 in. and surface finish from 3-5 microin. (G19p; ST, 4-59)

754-G. Roll Forming Selected to Ease Titanium Shaping. Lawrence J. Mattek. Metalworking, v. 17, Aug. 1961, p. 50-51.

Room temperature roll forming of A-110-AT and 4Al-6VTi alloy sheet for shroud support-ring applications in aircraft. Effect of nonuniformity and overgaging on crack formation. Technological parameters of the process are discussed in terms of power requirements and production speed and springback and workability of the material. (G11, 1-67, 9-72, T24; Ti-b, 4-53, 17-57)

755-G. Take Guesswork Out of Forming. Iron Age, v. 188, Sept. 21, 1961, p. 93-95.

Standardized indices and equations give a method for predicting formability of sheet material. Forming processes include brake forming, dimpling, drop hammer beading, rubber press beading, sheet stretch, audroform, joggling, linear stretch, rubber stretch, rubber shrink, roll forming, spinning and deep drawing. (G-general, Q23q)

756-G. New Aluminium Alloy 'Machines Like Butter'. Steel, v. 149, Sept. 18, 1961, p. 110.

Drilling and milling tests on a new alloy with a composition similar to that of 355 and 356. An 8 in. long, 3/8 in. diameter hole can be drilled in the new alloy with a feed rate of 40 ipm. (G17, 2-60; Al-b, 17-52)

757-G. Single Point Thread Cutting Goes Automatic. Tool and Manufacturing Engineer, v. 47, Sept. 1961, p. 105-107.

Automatic thread cutting is essentially a faster version of standard thread cutting as a lathe. Because of the fast automatic cycle minimum time is spent in withdrawing the tool at the end of the cutting pass, returning the lathe carriage to the start of the subsequent cut and setting up each cut to the right depth. (G17f)

758-G. Tracer Permits Change in Gear Production. Steel, v. 149, Sept. 11, 1961, p. 116.

Contour machining of forged steel 120-lb. ring gear blanks using a double, hydraulic tracer attachment on a standard lathe. (G17g, 1-52; ST, 4-51)

759-G. Explosive Forming of Refractory Metals. Harry W. Highriter. Fansteel Metallurgy, Aug. 1961, p. 2-3.

Underwater explosive deformation tests on pure Mo and Cb and Ta alloys. Effect of deformation rate and forming temperature on properties including deformation behavior, weldability, ductility, embrittlement and elongation. Pretreatment processes include annealing, stress relieving and hot forming. (G-general, Q-general, 2-61, 3-67; EG-d37, Cb-b, Ta-b, Mo, NM-k34, 17-57)

760-G. (French.) Thermal Sawing. Mines et Metallurgie, Mar. 1961, p. 157-158.

Sawing of hardened or tempered carbon, chromium, nickel-chromium, manganese, chromium-vanadium and tungsten steels or stainless steels at a velocity of 1000-5000 m. per min. The heat produced by friction causes the material sawed to soften and oxidize thereby increasing the effectiveness of the operation. (G17h, 2-61; ST)

761-G. (Italian.) Cost Problem of Steel Part Components. R. Parigi. Il Nickel, no. 92, June 1961, p. 1-11.

Hardening, tempering, annealing, normalizing, stress relieving and machining of UNi 38NCD4, UNi 40NCD7, UNi 14/19 CN5 and 18 NCD 5 steel. Brinell hardness, tensile strength, elongation, workability and their applicability in mechanical industry. Practical and economical advantages of some carbon and stainless steels. (G-general, Q-general, 17-53, 17-57; CN, SS)

762-G. (Italian.) Manufacturing Stainless Steel Fastenings. Luigi Sarogni. Il Nickel, no. 92, June 1961, p. 14-18.

Cold forming, cutting, threading, pickling and passivation techniques are applied to 302, 303, 304, 305, 309, 310, 316 stainless steels for the fabrication of fastenings. Evaluation of mechanical properties. (G-general, L12g, Q-general, R10c, T7f; SS)

763-G. Electrolytic Grinding Scores Five Ways. David Fishlock. Metalworking Production, v. 105, Aug. 30, 1961, p. 73-76.

Production of carbide-tipped tools using an Agathon 125 SE tool grinder.

Advantages include cost reduction, faster grinding, longer diamond wheel life, thermal cracking elimination and consistent surface finish. (G24)

764-G. Cold Extruding for Faster Production. Clifford P. Farr. Canadian Metalworking, v. 24, Sept. 1961, p. 48-51.

Typical designs and applications for both backward and forward extrusion. Careful die design is necessary to achieve accurate steel parts. (G5; ST, 17-51, 17-57)

765-G. Explosive Metal Forming for Short Runs. Guy G. Goyer. Canadian Metalworking, v. 24, Sept. 1961, p. 58-60.

Review of process advantages and disadvantages. Advantages include lower die cost, fewer forming steps and accuracy. Several metal shapes are amenable only to forming by hydraulic process or explosives. (G-general; NM-k34)

766-G. (Italian.) Climb Milling and Down Milling. Giovanni Maestri. Macchine, v. 16, Aug. 1961, p. 781-785.

Comparison of procedures with regard to surface finish, cutter wear, cutting velocity, cutting angle, time factors and costs. (G17b)

767-G. (Italian.) Screw Taps. Macchine, v. 16, Aug. 1961, p. 801-811.

Application of hand and machine screw taps, for threading pipes and nuts with helical, straight and inclined grooves. Rake angle, cutting velocity and lubricants are tabulated for machining metals, alloys, steels, stainless steels and plastic material. (G17f, 1-52, 17-57)

768-G. Research Sheds New Light on Turning Malleable Irons. Hans J. Heine. Metalworking Production, v. 105, Aug. 23, 1961, p. 45-50.

Recommended feeds and speeds for turning pearlitic and ferritic malleable irons. Comparison of machining characteristics and determination of the best tool geometry and cutting conditions. (G17a, G17k; CI-s)

769-G. Androforming. American Machinist/Metalworking Manufacturing, v. 105, Sept. 4, 1961, p. 100-101.

Stretch forming of mild steel, stainless steel and Al-base alloy into a variety of compound contoured shapes, both concave and convex. The sheet is pulled between a set of dies, the contours of which can be adjusted to provide the desired curvature. Stretched more at the center than at the edges, the metal curls because of the tensile and compressive stresses set up on the surface by the bending. (G9, 1-52, G25; CN, SS, Al-b, 4-53)

770-G. Stretch Forming Below Zero. American Machinist/Metalworking Manufacturing, v. 105, Sept. 4, 1961, p. 103.

Stainless steel pressure vessels are cold worked at cryogenic temperature (-320° F.), restoring the strength of weld metal to that of the parent material by cooling with liquid N_2 in a cylindrical die and stretching with N_2 gas at high pressure. Nominal tensile strength of unstretched vessel is 102,000 psi.; of stretched vessel, 260,000 psi. (G9, 1-67, Q27a, T26q; SS, 7-51, EG-p)

771-G. Cutting ID and OD Threading Time 70%. E. L. Fester. American Machinist/Metalworking Manufacturing, v. 105, Sept. 4, 1961, p. 108.

Heat treated alloy steel shafts, ductile iron rotor shaft assemblies and large pipe flanges are threaded internally and externally by a lathe that, with its attachments, generates 8 tpi. 60° pipe thread in 16 automatic passes. (G17f, 1-52)

772-G. 4 Step to Integrated Production. Production, v. 48, Sept. 1961, p. 68-71.

Automated machining, cleaning and inspection of heavy gray iron castings for tractor rear axle housings on a line incorporating multiple drilling, boxing, reaming and tapping operations. (G17, T3r; Fe, ST, 17-57, 18-74)

773-G. An Electrode 'Sweeps' a Mold Cavity. Steel, v. 149, Sept. 25, 1961, p. 159.

By rotating a contoured blade of graphite through a rough machined cavity, 8 x 30 in., mold halves are machined by electrical discharge within close tolerances. (G24, 1-52)

774-G. Factors Affecting the Choice of Inserted Blade or Throw Away Tip Milling

Cutters. F. Gable. Machinery (London), v. 99, Aug. 23, 1961, p. 421-423.

Influence of chip load per tooth, length of cutting edge, shape of the tip and accuracy of a cutter fitted with a throw-away tip on the selection of mill cutters for roughing and finishing operations. (G17, T6n, 1-52)

775-G. Methods Employed for Machining Beryllium in an American Plant. Machinery (London), v. 99, Aug. 23, 1961, p. 442-443.

A gyro gimbal is trepanned by the electrodischarge process and a large ring is machined by a carbide-tipped trepanning tool on a vertical turret lathe. Effective cutting speeds and feed ranges are given. (G19r, T24e; Be)

776-G. Uses of Ultrasonic Energy. Pt. 4. Genrokuro Nishimura. Machine & Instruments, Aug. 1961, p. 31-33.

Review of the mechanism of ultrasonic machining and of the accuracy and surface finish of the machined part as they are affected by tool composition, frequency of tool use and regrinding and plastic deformation. (G24c)

777-G. Design Tips for Using Dowel Embossings. Federico Strasser. Machine Design, v. 33, Sept. 28, 1961, p. 135-136.

Dowel connections are made in mild steel sheet by embossing, using standard, tapered, oversize and stepped dies. Factors affecting allowable punch penetrations. (G3p, 1-52; CN, 4-53)

778-G. Some Unusual Operations on Parts for Nuclear-Powered Submarines. Machinery (London), v. 99, Sept. 6, 1961, p. 567-571.

Tracer-controlled equipment for the precision machining of Al, Ni, Cu-Ni alloys and other metals used in the fabrication of nuclear submarine components. Operations considered include parts contour planning, groove cutting, threading, honing, drilling and milling. (G-general, T22, 1-52)

779-G. Effect of High Temperature Prestraining on Retained Ductility of Steel. Kazuo Terazawa and Midori Otani. Osaka University, Technology Reports, v. 11, Mar. 1961, p. 99-119.

The influence of prestraining temperature in the range 20-600° C. and the amount of compressive or tensile prestrain on the retained ductility, fracture stress and flow stress curve for a killed mild steel. 17 ref. (Q5m, G23q, 1-66; CN)

780-G. Manual Lathe--With Automatic Control. Automatic Machining, v. 22, Sept. 1961, p. 39-40.

Pure Cu blanks for power tubes are machined by a manual lathe fitted with a lathe actuator and a chute type parts feeder. Production is increased and dimensional accuracy improved. Controlled, rather than hand, feed lengthens tool life. (G17, 1-52, 18-74; Cu)

781-G. Tooling Materials for Cold Headers. W. F. Pravel. Automatic Machining, v. 22, Sept. 1961, p. 55-58.

Tabulation of composition, heat treatment temperatures, Rockwell hardness values and wear resistance data for cold heading die steels, cold heading punch steels, steels for cutoff tools and steels for knockout pins. (G10, 1-67, Q-general, 17-57; ST)

782-G. Stainless Shapes Double Their Strength. Machine Design, v. 33, Sept. 14, 1961, p. 40, 42.

Application of Ardeforming to 301, 302 and 304 stainless steel. Vessels fabricated from Type 301 have been stretched 13% at -320° F. Tensile strength went from 102,000-260,000 psi. and yield strength approached 240,000 psi. (G9, 1-67, Q23b, Q27a, T26q; ST)

783-G. Chemicals Blank Precision Parts. John E. Hendricks. American Machinist/Metalworking Manufacturing, v. 105, Sept. 18, 1961, p. 126-129.

Blanking precision parts by a photomechanical technique which combines photography with chemical etching to produce burr-free parts to close tolerances. A multiple-exposure master negative is prepared, from which the designs of the parts to be blanked are transferred to stainless steel, brass, Cu or Al sheet and foil. (G2h, G24b, 1-52; SS, Cu-b, Al)

784-G. Hand-Held Tool Explosive-Forms Tubing. American Machinist/Metalworking Manufacturing, v. 105, Sept. 18, 1961, p. 129.

A hand-fired explosive expanding tool is used to expand the ends of tubular joints

to eliminate heavy couplings in aircraft fuel and hydraulic systems. The tube ends are then brazed. (G-general, K8, T24; NM-k34, 4-60)

785-G. Conveyorized Grinding Holds Close Honeycomb Tolerances. L. G. Brown. Space/Aeronautics, v. 36, Sept. 1961, p. 81, 83, 85.

Grinding of honeycomb cores and stainless sheet tolerances of ±0.001 in. Batch processing method in conjunction with conveyorized and pinch-roll grinders reduces grinding, handling and finishing operations. (G18, 1-52, 17-55; SS, 7-59)

786-G. Taking Heat Out of Solid Case-Making. John F. Judge. Missiles and Rockets, v. 9, Aug. 28, 1961, p. 32-35.

Application of cryogenic metalworking to solid-rocket motor case fabrication. 301 and 302 steel are used for stretch-forming without size limitation. Parameters are given for design of chamber and of equipment. (G9, 1-52, 1-66, T24e; SS)

787-G. From Art to Science in Grinding. Mauric Gormly, Robert G. Fisher and W. Kent Mathias. Grinding and Finishing, v. 7, Sept. 1961, p. 34-38.

Study of basic theories, wheel composition and machine design to develop closer tolerances. Dynamometer is used to obtain work force measurements on the workpiece. Effects of plastic deformation, friction and high temperature and pressure. (G18, 10-54, 17-55)

788-G. Jig Grinding--Versality in the Die Shop. Pt. 2. Contour Grinding. Frederick C. Victory. Grinding and Finishing, v. 7, Sept. 1961, p. 40-43.

Accurately locating and sizing holes, studs and contours in hardened production parts by horizontal-spindle contour grinding and wheel dressing. Parameters governing contour practices. (G18, 1-52)

789-G. Grinding High Strength Thermal Resistant Materials. Grinding and Finishing, v. 7, Sept. 1961, p. 44-46.

Abrasive machining of stainless steel and of Ni, Fe and Co-base alloys requiring variable spindle speed drive; automatic gaging, sizing, wheel dressing and balancing; increased spindle rigidity and "low stress" grinding. (G-general, 1-52; SGA-h, SGB-a, SS, Ni-b, Fe-b, Co-b)

790-G. (Russian.) Contact Friction Stresses in Pressing of Aluminum and Some of Its Alloys. Yu. P. Hlebov and R. A. Nikolaev. Tsvetnye Metally, Apr. 1961, p. 48-50.

Influence of reduction rate and temperature on resistance force developed during die forming. 6 ref. (G25, G4d, 2-61, 3-67; Al)

791-G. New Shear Line Cuts Sheet Fast, To Close Tolerances. Modern Metals, v. 17, Sept. 1961, p. 66-67.

Shearing Al sheet in a line which includes a hump table for taking up slack and a positive stop measuring system of precise measurement of length. Vibration at the cutting point is controlled to maintain accuracy. (G2, 1-52; Al, 4-53)

792-G. Determination of the Deep-Drawing Capacity of Aluminum and Its Alloys. Robert Chopin. Sheet Metal Industries, v. 38, Sept. 1961, p. 637-643.

Tests are made on several diameters and thicknesses of Al and by graphical analysis of the test results. Influence of metal thickness, die radius, drawing speed, temperature and choice of lubricant on drawing capacity. (G4; Al, 17-52, 17-57)

793-G. Quantitative Assessment of Deep Drawing and Stretch-Forming Qualities. Pt. 1. J. C. Wright. Sheet Metal Industries, v. 38, Sept. 1961, p. 649-658, 674.

Parameters and equipment for tests of general metallurgical quality, non-simulative quantitative tests and cupping tests used to evaluate drawability of sheet materials. 22 ref. (G4, 1-54; 4-53, 17-52)

794-G. Steel-Bonded Carbide Whittles Die Costs. Metalworking Production, v. 105, Sept. 13, 1961, p. 69.

Drawing of austentic stainless steel cups using a die fabricated from toolsteel and titanium carbide. Effect of composition and heat treatment on galling resistance and wear life of the die material. (G4c, Q9, W24n; SS-e, TS, 6-69, 17-57)

795-G. Ten Proven Applications of Modern Surface Grinding. John E. Hyler. Production Equipment, v. 37, Sept. 1961, p. 4, 6, 8.

Operating principles and equipment design are reviewed for level, index and contour grinding. Use of special horizontal and vertical grinders for fabricating steel and ceramics bushings, missile and aircraft nose cones and foundry components. (G18k, T7, T24, 1-52; ST, NM-f, 17-57)

796-G. Blasting Metals Into Shape. Lawrence Lessing. Fortune, v. 64, Sept. 1961, p. 127-131.

Use of controlled underwater explosion to shape metals utilized for rocket and missile components. Equipment, principles, operating stages and future applications including an explosive welding process. (G-general, K-general; NM-k34)

797-G. (French.) Operations in Thick-Sheet Mills. Y. Charet. Revue de Metallurgie, v. 58, June 1961, p. 507-511.

Trimming stage including end and side shearing of as-rolled sheet with technological parameters for uniform quality control. (G2g, 1-52)

798-G. (Russian.) Stamping of Truck Camshaft Journals. I. E. Hutkin. Kuznechno-Shtampovochnoe Proizvodstvo, Apr. 1961, p. 15-18.

Sequence of hot stamping operations includes induction heating of hollow blanks. Various designs are given for dies for economic and accurate stamping of journals. (G3, 1-69, 17-51, T21e)

799-G. (Russian.) Two-Step Cold Upsetting Machine for New Automatic Line. A. N. Hladkikh and N. I. Maslennikov. Kuznechno-Shtampovochnoe Proizvodstvo, Apr. 1961, p. 32-35.

Bolts with hexagonal heads are cold stamped by a machine with conveyor and ejector subassemblies. (G10p, 18-74, T7f)

800-G. (Russian.) Dies for Hole Piercing. A. H. Kokin. Kuznechno-Shtampovochnoe Proizvodstvo, Apr. 1961, p. 43-44.

Highly wear resistant dies are designed for simultaneous piercing of multiple holes in steel disks. Methods of cooling and lubrication. (G2j, W24n, 1-52, 17-51; ST)

801-G. How to Select Free-Machining Steel. T. M. Garvey. Metalworking, v. 17, Oct. 1961, p. 24-27.

Evaluation of machinability of representative free machining steels including B1100, C1100 and C1200 series, leaded and resulphurized, high and low phosphorous carbon steel bars; 4000 series alloy bar steels; 303 austenitic, 430 F ferritic and 416 martensitic stainless; and Fremax plate steels. Relation of S, Pb, P and N additives to machinability and effect on mechanical properties. (G17k, Q-general, 2-60; ST)

802-G. Ultra-Modern Feed Line--Key to Precision Blanking. F. W. Tortolano. Metalworking, v. 17, Oct. 1961, p. 72-73.

Drawing blanks for automobile components are stamped from steel strip at closer tolerances and increased production rates on a blanking press fed by an electrically controlled decoiling and feed line. (G3, T21c, 1-52; ST, 4-53, 17-57)

803-G. IBM Chooses EDM to Cut Today's Tough Metals. Metalworking, v. 17, Oct. 1961, p. 75.

Electrical discharge machining, using porous Cu or brass electrode and a dielectric stream for flusing particles from the spark gap, is applied to cutting case hardened high carbon, high chromium steels, tungsten carbide and 304 and 305 stainless steels. Printing wheels and card punch and powder compacting dies are cut to severe tolerances from materials hardened to 63 Rockwell C hardness. (G24a, T6r; SGB-q, ST, 6-69)

804-G. Cold, Silent "Explosion" Shapes Stainless Steel. Metalworking, v. 17, Oct. 1961, p. 77.

Explosive forming of pressure vessels and cylinders to design configuration from welded preforms using gas pressure at -320° F. by the Ardeforming process. Application to 301, 302 and 304 stainless steels, Ti and Al. The temperature deformation enhancing mechanical properties and eliminating the need for heat treatment. (G-general, 2-63, 3-67, 3-74, T26q; SS, 17-57)

805-G. (Japanese.) Shave-Turning. Pt. 2. Tool Life of Carbide Tools. Masao Kubota, Minori Kanai and Yuhei Masuyama. Journal of Mechanical Laboratory (Japan), v. 15, May 1961, p. 1-5.

Shave turning operations on 0.45% carbon steel and 18-8 stainless steel

are studied to determine performance of single, double and universal carbide tools and optimum rate of feed. (G17a; CN, SS)

806-G. (Japanese.) Shave-Turning. Pt. 5. Cutting Temperature. Masao Kubota, Minori Kanai, Masuo Kakishima and Hideyo Ito. Journal of Mechanical Laboratory (Japan), v. 15, May 1961, p. 6-11.

Chip-tool thermocouple measurement during shave-turning of 18-8 stainless steel with high-speed steel tools indicates that temperature is a function of angle of inclination, depth of cut, rate of feed and cutting speed. (G17)

807-G. Automation Speeds Repair Work. Iron Age, v. 188, Oct. 5, 1961, p. 79.

Use of automatic turret lathes to produce replacement parts for earth-moving equipment from cast iron, cast steel, malleable iron and steel forgings. Feeds and speeds for materials are included in each work order for single-spindle checking machines. (G17, T4a, 18-72, 18-74; CI, ST, 4-51, 5)

808-G. Oscillating Stone Shapes Parts. Iron Age, v. 188, Oct. 5, 1961, p. 80-81.

Finishing to close tolerances by rotating small metal parts beneath an oscillating microstoning machine which corrects out-of-round conditions left by centerless grinding. A cycling principle achieves metal removal and final polishing. (G18h, G19n, 1-52, 1-63)

809-G. Factors Affecting the Drawability of Sheet Steel. R. L. Whiteley. Paper from "Regional Technical Meetings, 1960". American Iron and Steel Institute, New York 17, 1961, p. 11-27.

Principles of the deep drawing process as affected by depth of draw, character of the drawing operation and drawability of the sheet material. Effect of the material's ductility and anisotropy on drawability. 12 ref. (G4b, Q23, 3-72, 17-52; ST, 4-53)

810-G. (English.) The Behavior of Ceramic Tools in Turning Operations. G. Pahlitzsch and G. Kamiske. Werkstatt und Betrieb, v. 94, July 1961, p. 161-165.

Turning of 16 MnCr 5, unalloyed and free-cutting steels as it affects wear qualities of oxide ceramic tools with special reference to such operational parameters as cutting angle and frequency. (G17a, T6n, 1-52; ST)

811-G. (English.) Investigations of the Force and Physical Work Required for Punching Holes Into Thick Sheet Metals. Werner Eickhoff. Werkstatt und Betrieb, v. 94, July 1961, p. 171-179.

Determination of forces encountered by hole punching as a function of material strength, metal thickness, cutting clearance, punch diameter, impact speed and return forces. Testing conducted on St. 37, CK35 and CK45 steel sheet. 32 ref. (G2j, 1-53; ST, 4-53)

812-G. Air-Device Makes Four Bends in Resistor Leads at Once. Morton J. Schultz. Assembly & Fastener Engineering, v. 9, Oct. 1961, p. 36.

Fast and accurate bending of resistor leads using an air-powered device, adjustable to height and width specifications, which is usable with many sizes of resistors. A cam, adjustable to various wire thickness, guards against flattening of resistor leads at the time of compression. (G6, T1p, 1-52)

813-G. (Dutch.) Correct Choice of Electrode Materials for Spark Machining. H. J. Hovinga. Metaalbewerking, v. 26, Dec. 8, 1960, p. 231-235.

Machining of Cu, Al, ferrous materials, Ni, brass and Zn with electrodes of the same materials to find the most advantageous pairings (work metal/electrode metal) providing the least electrode wear and optimum electrical parameters. (G24a, T1f; Cu-b, Al, Fe-b, Zn, Ni, 17-52, 17-57)

814-G. Metallurgical Aspects of the Cold Extrusion of Steel. R. E. Okell. Metal Treatment and Drop Forging, v. 28, Aug. 1961, p. 309-316.

Plastic properties and deformation resistance required for extrusion of steel are considered for annealed billets. Behavior of steel during extrusion is related to reduction, tensile strength and Izod values. Effects of extrusion on carburizing, welding, cracking and surface rippling. (G5, Q23q, Q-general, 2-64; ST, 17-52)

815-G. (German.) Deep-Drawing of Rectangular Pieces. W. Dutschke. Werkstattstechnik, v. 51, Apr. 1961, p. 167-173.

Investigation of force, drawing ratio and model relations in the deep drawing of sheet steel specimens of various dimensions at varying drawing speeds. (G4b, G25; ST, 4-53)

816-G. The Fabrication of Stainless Steel. Pt. 1. J. B. Burk. Atlas Steel News, v. 15, Aug. 1961, p. 7-8.

Ferritic, martensitic and austenitic steels are compared on the basis of mechanical properties, corrosion resistance and machinability. (G17k, Q-general, R-general; SS)

817-G. "Buttercut" Tag Tied on Tellurium Grade Steel. Steel, v. 149, Oct. 9, 1961, p. 120.

Machining tests on a modified leaded grade steel with Te additions at speeds 3 1/2 times the normal rate and feed rate increased to 0.0035 in. per revolution indicate good machinability. (G17k, 17-52; ST, Te)

818-G. Steel Rule Dies Pare Costs on Short Stamping Runs. Steel, v. 149, Oct. 9, 1961, p. 132.

Steel rule material is cut, beveled at joints and contoured by hand-operated machine to design blanking and piercing dies which are virtually free from burrs. (G-general, W24n; ST)

819-G. Explosive Forming Scores at General Dynamics. Steel, v. 149, Oct. 9, 1961, p. 145.

Production of intricate parts for missile and space vehicles by explosive forming technique which accommodates parts up to 8 ft. in diameter and 6 ft. in length. (G-general, T24e; NM-k34)

820-G. Propeller Profiling Under Electronic Control. Metalworking Production, v. 105, Sept. 20, 1961, p. 67-69.

Shaping helicoidal pressure surfaces and copy-milling suction surface of propeller blades by tip to root or circumferential methods under automatic control. (G17, 1-52, 18-74, T24a)

821-G. Tips on Machining Titanium. Clarence Mathewson and Frederick A. Janz. Metalworking Production, v. 105, Sept. 20, 1961, p. 70-71.

Results of test drilling of as-rolled Ti alloy containing 6% Al and 4% V, following heat treatment at 1550° F. for 30 min. and hardening to Rockwell C 34. General machining techniques, drill geometry, chamfering and tapping. (G17, 1-53; Ti-b, Al, V, 4-53)

822-G. (German.) Experiences in Processing of Stainless Sheets of Austenitic Steels. E. Fr. Scheven. Werkstattstechnik, v. 51, Feb. 1961, p. 75-79.

Production of household goods from austenitic stainless 18-8 CrNi and CrMnNi steel by drawing and pressing with rubber mandrels, followed by free annealing and annealing to remove strain hardening and magnetic behavior. (G1, J1, J23, T10; SS-e)

823-G. (German.) Tool Design for Processing of Stainless Sheets of Ferritic Steels. H. Kiethe. Werkstattstechnik, v. 51, Feb. 1961, p. 79-82.

Cutting, punching, bending and folding operations on X 10 Cr 13, X 7 CrAl 13, X 8 Cr 17, X 8 CrTi 17, X 8 CrCb 17 and X 8 CrMoTi 17 steel sheet. (G6, G17, 1-52, 17-51; SS, 4-53)

824-G. Fundamentals of Drawability of Sheet Steel for Porcelain Enameling. J. W. Frame, R. L. Whiteley and D. J. Blickwede. Metal Products Manufacturing, v. 18, Oct. 1961, p. 65, 67, 69.

Operations by which flat sheet steel or coil is formed into useful shape prior to enameling include adjusting blank size, holding down pressures, use of lubrication and other techniques to make deep draws. (G4, 1-52, 17-52; ST, 4-53)

825-G. Chip Deformation and Surface Finish in Turning. M. Ehrenreich and Shimon Ilani. Microtecnic, v. 15, Aug. 1961, p. 129-132.

Investigation of chip deformation in turning 1045 SAE alloy with a round-nose cutting tool; comparison of the chip sections obtained with the theoretically expected forms. Effect of the feed/nose-radius ratio on surface finish of the workpiece. 5 ref. (G17, 1-52; ST)

826-G. The Effects of Vibrations on the Cutting of Metals. R. Weill. Microtecnic, v. 15, Aug. 1961, p. 133-139.

Measurement of wear in high-speed steel tools during the cutting of steel

samples. Effects on tool wear of vibrations and variations in cutting force. (G17, Q9p, 1-53; TS-m)

827-G. Economics of the Cutting-Off of Metals. J. L. Remmerswaal and M. J. C. Matthusen. Microtecnic, v. 15, Aug. 1961, p. 140-150.

Cutting of bar stock of stainless steel, toolsteel, carbon steel, cast iron, brass, bronze, Cu and Al and Mg alloys. Cutting-off processes considered include hack, band, circular and friction sawing and abrasive cutting with both automatic and nonautomatic machines. 4 ref. (G17h, 17-53, 18-74; SS, TS, CN, CI, Cu-b, Al-b, Mg-b, 4-55)

828-G. Automatic Profiling of Tube Ends. Engineer, v. 211, Apr. 7, 1961, p. 556-557.

Operating principles and equipment design for a flame-cutting machine which automatically profiles branch tube ends using center line and main structure angle information provided on drawings. Design considerations are given to simple and multiple profiling of tube ends for tubular structures and pipe systems. (G22g, 1-52; 4-60)

829-G. (Dutch.) Drill Points Applicable in the Drilling of Cast Iron. J. N. Klaver and J. G. Wessels. Metaalbwerking, v. 26, Jan. 19, 1961, p. 292-294.

Effect of the drill point profile on drilling speed and the tool life measured as a function of the number of holes and the total depth drilled in cast iron of approx. 200 Brinell hardness. Torsional momentum measured in drilling as a function of the point angle and the applied pressure. (G17e; CI)

830-G. Some Aspects of Explosive Forming. J. L. Remmerswaal and P. J. M. Boes. Microtechnic, v. 15, July 1961, p. 104-109.

Review of the methods of explosive forming according to the source of power. Report of experiments on the relationship between the minimum charge required for forming and plate thickness. Formulas are given for calculating the pressure, impulse and the energy density for these experiments. (G-general, 1-52, 1-53; NM-k34)

831-G. Hard Metals Form Soft Ones. Steel Horizons, v. 23, Fourth quarter 1961, p. 12-13.

Machining and tempering of high-alloy toolsteel to make dies for pressure die casting of various metals including Zn, Al, Mn and brass. (G-general, J-general, E13, 1-52; TS, Al, Cu-n, Mn, Zn)

832-G. (German.) Material Processing by Electron Beams of High Intensity. W. Scheffels. Draht, v. 12, Aug. 1961, p. 352-356.

Precision welding, drilling, cutting and milling of metals such as alloy steel including X 12 CrNi 18 8 steel, Zr, Ti, Al, Cu, W, Mo, Pt, Ge, Ta, Si, Cu-Ag, W-Fe and Cu-Al alloys; and nonmetals such as graphite, diamond, Al_2O_3, ceramics, glass and quartz by high-intensity electron beams. Review of reaction mechanisms; and design and application of equipment. (G24, K6, 1-52)

833-G. (Russian.) Intensification of the Drawing-Out Process of Austenitic Stainless Steels. V. P. Martynov. Kuznechno-Shtampovochnoe Proizvodstvo, May 1961, p. 11-12.

Increasing maximum coefficient for drawing out of steel (from 2.3-5.2) by selection of the correct temperature. 6 ref. (G4, 1-57, 2-61; SS-e)

834-G. Broaching on Dial-Type Machine Cuts Hole Finishing Costs. Metalworking Production, v. 105, Sept. 6, 1961, p. 77-78.

Strip broaching is applied in place of reaming in the processing of connecting rod gudgeon pin holes. Equipment and procedure designed to raise quality while lowering production costs and tool maintenance. (G17d, 1-52)

835-G. Duplex Grinders Have Flexibility Too. Metalworking Production, v. 105, Sept. 6, 1961, p. 79-80.

Increased flexibility in surface grinding achieved, giving cheaper tooling for a wider range of components. Automatic loading and work sizing equipment and processes. (G18k, 1-52)

836-G. One Tape Machine Replaces Five. Metalworking Production, v. 105, Sept. 6, 1961, p. 87-88.

Machining of Al sand castings and stainless steel, using a multiway tape-controlled machine (MT3-Burkhardt &

Weber) that functions as a vertical miller, six-spindle drill, turret lathe, borer and tapper. Operational examples cite cutting time factors. (G17, 1-52; SS, Al, 5-60)

837-G. Machining the Jet and Space-Age Metals. Donald A. Reiner and James M. Galimberti. Western Machinery and Steel World, v. 52, Sept. 1961, p. 74-77.

Machining variables including lead and rake angles, cutting fluid, honing, carbide grade, cut depth and feed and speed affecting machining of Fe, Ni and Co-base superalloys. Suggestions for achieving improved machining include tool care and workpiece handling recommendations. (G17, 1-52; Fe, Ni-b, Co-b, SGA-h)

838-G. Tape-Controlled Jig Boring of Fire-Control Computer Parts. Western Machinery and Steel World, v. 52, Sept. 1961, p. 82.

Tape-controlled jig borer utilized in the fabrication of bearing plates for naval fire-control computers. Numerical control (Fosmatic System) provides table and saddle locations, speed and feed rates and spindle depth and cycle control. (G17d, Ti, 1-52, 18-74)

839-G. Stub Broaching Cuts Shouldered Helical Gear. Metalworking Production, v. 105, Sept. 27, 1961, p. 68-69.

Cutting an internal helical gear for an automatic transmission unit from high-speed steel by broaches mounted on an indexing table controlled through microswitches. (G17d, 1-52; TS-m)

840-G. Tape Quarters Condenser Plate Drilling Time. Metalworking Production, v. 105, Sept. 27, 1961, p. 70-71.

Drilling, tapping and counter-boring 12,000 1 in. diameter holes in brass or steel condenser plates for nuclear power station equipment. Operations and capacity of bridge-type drilling machine. (G17, 1-52; ST, Cu-n)

841-G. Tungsten Arc Cuts Stainless 97% Faster. Welding Design & Fabrication, v. 34, Oct. 1961, p. 65.

Contoured holes in 8-in. stainless steel pipe are cut with standard tungsten arc equipment using a 35% H-65% Ar mixture for shielding. High amperages and voltages are used to speed the cutting with the high content boosting the temperature above 3000° F. A high flow rate for the protective gas cover is used to remove slag and metal from the cut. (G22h, 1-52, 3-67; SS, 4-60)

842-G. Austenitic Stainless Steel Tubing for Bourdon Elements. E. S. Hughes. Instrument Practice, v. 15, Sept. 1961, p. 1119-1123.

Fabrication of corrosion resistant Bourdon tubing by cold drawing hollows of austenitic stainless steel containing C, Mn, Si, S, P, Cr, Ni and Mo. Mechanical properties of the tubing including yield strength, as affected by wall thickness, and workhardening capacity. (G4, 1-67, Q-general, X12; SS-e, 4-60, 17-57)

843-G. (German.) Machining Tests on Drawn and Drawn and Normalized Rods of Openhearth Steel With Varying Carbon and Lead Content. Alexander Schepers and Ernst von Blumenstein. Stahl und Eisen, v. 81, Aug. 31, 1961, p. 1180-1182.

Machining of rod specimens of cold drawn normalized and as-drawn openhearth steel, containing 0.1-0.5% C, 0.15-0.35% Si, 0.45-0.75% Mn, 0.015-0.045% P, 0.015-0.035% S and 0.16-0.22% Pb at varying cutting rates. Machinability as influenced by composition and normalizing. (G17k, 2-60, 2-64; ST, 4-55)

844-G. (German.) Stresses and Forces in Deep Drawing Without Blank Holder Using Conical Rings. Galal S. A. Shawki. Zeitschrift fur Metallkunde, v. 52, Aug. 1961, p. 532-537.

Stress analysis and computation of maximum drawing force as influenced by friction and strain hardening of drawn metal. Comparison of results obtained from deep drawing of St.VIII c steel, Al 99.5 and Ms 63 brass sheets with theoretically derived data. (G4b, G25, Q-general, 3-66; ST, Al, Cu-n)

845-G. The Fabrication of Stainless Steel. Atlas Steel News, v. 15, Sept. 1961, p. 7-8.

Survey of turning speed and feed requirements and tool geometry for machining 300-400 series stainless steels. (G17, 1-52; SS)

846-G. Technological Explosion in Forming. C. L. Kobrin. Iron Age, v. 188, Oct. 12, 1961, p. 153-160.

A brief review of forming techniques, equipment and applications. The use of explosive, hydroelectric, magnetic, gas, contour and radial draw forming, cold and hot extrusion, shear spinning, electroforming, plasma-jet spraying, rolling under an atmosphere, ardeforming and ausforming in the production of aircraft, missile and other components from high strength and refractory metals. (G-general, T24, 1-52, 10-54)

847-G. Abrasives Slash Cutting Costs. Iron Age, v. 188, Oct. 12, 1961, p. 165-167.

The use of an abrasive wheel cutter in heavy-metal removal and machining operations as well as grinding and finishing. The design, wear rate and production rate of the cutter. (G17, 1-52)

848-G. Numerical-Control Costs Tumble. Iron Age, v. 188, Oct. 19, 1961, p. 138-139.

Drilling with a mass produced, automatic single-spindle machine eliminates positioning errors and the need for jigs. Design and speed of the machine are discussed in several applications. (G17e, 1-52)

849-G. Vibrations Shape Soviet Tools. Iron Age, v. 188, Oct. 19, 1961, p. 145.

Ultrasonic vibrations are used during grinding of carbon steel, toolsteel, carbide or Ti alloy cutters to improve crystal structure of the tool and thus increase tool life. Effects on residual stresses and surface smoothness. (G24c, Q25h, S15; CN, TS, Ti-b, 6-69)

850-G. Tool Making by Spark Erosion. P. J. C. Gough. International Plastics Engineering, v. 1, Sept. 1961, p. 399-403.

Production of forging dies, die casting dies, plastic molds and glass molds in toolsteel and Nimonic. (G24a, W19n, W22a, 1-52, 17-57)

851-G. Forming and Piercing on a Press Brake. J. A. Waller. Machinery Lloyd (Overseas Edition), v. 33, Sept. 30, 1961, p. 47-49.

Notching, slitting, punching and bending operations carried out on sheet steel 0.036 in. thick by tools of special design to reduce chance of distortion and cracking during heat treatment. (G1, G2, 1-52, 17-51; ST, 4-53)

852-G. (French.) Explosive Deformation. G. Greiner. Mines et Metallurgie, no. 3554, Sept. 1961, p. 483-485.

Metallurgical applications of explosives include the workhardening of Hadfield steel, causing lattice microdeformations without significant macrodeformation; the pressing of powder, applying a sudden pressure of 150 kilobars to produce a compact with high density and tensile strength; and the forming of sheet metal. (G-general, H14, Q23a, 1-52; ST, 4-53, 6-71, NM-k34)

853-G. (German.) Cutting by Electron Beams. W. Opitz and K. H. Steigerwald. Schweissen und Schneiden, v. 13, Sept. 1961, p. 432-436.

Development of a new electron beam cutting technique which combines electron deep welding and the pulse technique used in electron milling. Design and operation of electron beam cutting machine. Examples for electron beam cutting of sinter metal, "Widia", X 8 CrCb 17 and 18-8 CrNi steel, carbon steel, Ms 58 brass and hardened free-cutting steel. (G24; ST, Cu-n)

854-G. Tolerances in the Prefabrication of Ships. Carl-Erik Fredriksson. Engineer, v. 212, Sept. 29, 1961, p. 538-540.

Machining, welding and other prefabrication procedures performed on steel angle bars, flat irons and plate work are considered in terms of tolerances, shrinkage effect and assembly faults. (G17, K-general, T22g, 1-52, 17-55; ST)

855-G. (English.) Ultrasonic Electro-Spark Machining. Pt. 1. Genrokuro Nishimura. Machine & Instruments, Sept. 1961, p. 34-35.

Method for creating spark and mechanism for feeding the electrode. An R-C circuit produces spark in water, the electrode being fed manually. (G24, G14b)

856-G. Computer Puts Production Runs Into Orderly Machining Plan. Iron Age, v. 188, Oct. 26, 1961, p. 83-85.

Increased production of rollers machined from Krupp steel, a high Ni alloy, through use of saddle-type turret

lathe with special attachments and 2AB automatics. Scheduling techniques are computer-based. (G17, 1-52, 18-54; SS, Ni)

857-G. How Non-Chemical Explosions Shape Hard-To-Form Metals. Iron Age, v. 188, Oct. 26, 1961, p. 88-89.

Electro-hydraulic operating principles and procedures for capacitor-discharge plant equipment used to form, weld, bond and pierce ceramics and metals including Al, Ti, Be, Co and stainless steel. (G14b; SS, Al, Be, Co, Ti)

858-G. Solid Propellant Cases Produced by Ardeform Process. Modern Machine Shop, v. 34, Oct. 1961, p. 124-127.

Cold working of preform in cryogenic stretch-forming process improves strength and ductility of austenitic stainless steels. (G9, 1-67, Q23, T24e; SS-e)

859-G. Machining Small Gears to Precision Tolerances. Winifred M. Berg. Modern Machine Shop, v. 34, Oct. 1961, p. 134-141.

Technique and equipment enabling quality control of spur gears in mass production operation. Blanks of 303 stainless steel or 24ST aluminum are cut, drilled and finished in a series of carefully controlled operations. Al gears are anodized before hobbing. (G17, L19, 1-52; SS, Al)

860-G. (German.) The Electron Beam as a New Tool. W. Opitz. Werkstattstechnik, v. 51, Sept. 1961, p. 448-454.

Welding, milling, cutting and machining of nonmetals including synthetic rubies, Si and quartz and of metals including alloy steel, Cb, Mo, W and Ta. (G24, K6, 1-52; NM-e, ST, Cb, Mo, Ta, W)

861-G. "In Place" Roll Grinding. Ralph H. Bohlin. Grits and Grinds, v. 52, Aug. 1961, p. 10-11.

Redressing calender and other types of rolls made of cast iron and steel by a process carried out in the mill, using a portable roll grinder. Practical advantages and economic considerations. (G18k, W23k, 1-52, 18-71; ST, CI)

862-G. Elevator Plungers Machined by Centerless Belt Grinding. Carlton C. Porter. Grits and Grinds, v. 52, Aug. 1961, p. 12-13.

Descaled mild steel pipe up to 16 in. in diameter and 56 ft. in length is ground to specified roundness limits and finished with coated abrasive belts. (G18h, W25c, 1-52; CN, 4-60)

863-G. Grinding the Largest Cast Steel Rolls Ever Produced. E. T. Larson. Grits and Grinds, v. 52, Aug. 1961, p. 3-7.

Grinding rolls with diameters up to 72 in. using a roll grinder with a grinding wheel made of A301-HB12 Alundum, which offers good accuracy regardless of roll size. (G18, 1-52, 17-57; ST, 5)

864-G. (Japanese.) Study on Machinability of Free Machining Steels. Government Mechanical Laboratory (Japan), Report no. 43, 1961, 126 p.

Effect of Pb and S additives and use of carbon tetrachloride as a cutting fluid on tool friction, chip formation, cutting force, surface finish, temperature and tool life. (G17k, 2-60, 2-66; ST, SGA-k)

865-G. (English.) Machinability Study of Ceramic Tools. Pt. 7. Roughness of Machined Surface. Noboru Nakayama, Kunio Yamada, Hiroshi Kajihara, Seisuke Sakai and Hisao Mii. Government Industrial Institute Research (Nagoya), Report, v. 10, Aug. 1961, p. 457-466.

Effects of cutting speed, tool wear and chamfering of cutting edge on surface roughness of carbon steel (0.44%) machined by standard throw-away type ceramic tools. 5 ref. (G17k, 1-52; CN)

866-G. (English.) Chemical Machining. Pt. 9. Machining of Iron and Steel. Chemical Resistant Coating Film and Surface Treatment. Toshikazu Sato, Kazuo Kodaira and Hirosuke Yamazaki. Government Industrial Research Institute (Nagoya), Report, v. 10, Sept. 1961, p. 523-536.

Uniform etching at the interface between a carbon steel plate and a chemically resistant polymer coating film achieved by use of HNO_3. 10 ref. (G24b, 1-53, 17-57; CN)

867-G. How to Make a Larger Ultrasonic Grinding Tool. G. E. Wright. Ceramic Industry, v. 77, Oct. 1961, p. 75-76, 89.

Technological parameters for tooling developed to machine a pattern over an area of glass or ceramic larger than the recommended maximum. (G24c, 1-53)

868-G. Critical Threads Cut by EDM. Machine and Tool Blue Book, v. 56, Nov. 1961, p. 122-124.

Tapping and threading of 52-100 steel ball bearing races and a 17-4 PH stainless steel cylinder by electric discharge machining, utilizing hollow brass electrodes. (G17f, G24a, 1-52; Cu-n, SS, ST, 17-57)

869-G. Tungsten Can Be Machined! W. E. Montgomery. Machine and Tool Blue Book, v. 56, Nov. 1961, p. 137-139.

Study of tool geometry in cutting, boring, chamfering, turning, facing, drilling and grinding of sintered and hot pressed tungsten. Determination of speed, feed, depth of cut for roughing, semifinishing and finishing operations. (G17; W, 6-72)

870-G. A PE Special Report on Theoretical Formability. W. W. Wood, R. E. Goforth and R. A. Ford. Product Engineering, v. 32, Oct. 16, 1961, p. 71-83.

Design charts are used to predict sheet metal forming failures by splitting or buckling. Forming methods include brake forming, deep drawing and spinning, dimpling, rubber stretch and shrink flanges, joggling, linear stretch heel-in, sheet stretch and beading rubber press. Sheet materials include Al, Ti, Mg, Be, V, Cb, Mo, W and Ni alloys and superalloys. 7 ref. (G-general, G25, 17-52; Al, Be, Cb, Mg, Mo, Ni-b, Ti, V, W)

871-G. New Ways to Form Metals. R. J. Ward, Jr. Product Engineering, v. 32, Oct. 16, 1961, p. 106-107.

Electric discharge, magnetomotive and chemical explosive techniques are discussed with examples of industrial and aerospace applications including the fabrication of bulkheads larger than 200 in. in diameter. (G-general, G24, 10-54; NM-k34)

872-G. Automatic Tube Profiling. Welding and Metal Fabrication, v. 29, Oct. 1961, p. 403-405.

The design, accuracy, setting procedure and operation of an automatic oxygen-cutting machine for producing a profile on steel tubes and pipes required to fit on or saddle other tubes as in structural, chemical and petroleum applications. Use of the profiling machine eliminates many conventional steps in preparation. (G22, T26, T28, 1-52, 17-57; ST, 4-60)

873-G. Giant Band Saw Slices Die Blocks With Ease. Western Metalworking, v. 19, Oct. 1961, p. 29-30.

Forged steel billets and die blocks are cut at a rate of 2.4 sq. in. per min. by an automatic horizontal band saw incorporating two 4-in. band wheels and an oil coolant stream directed through the cut. (G17h, 1-52; ST, 4-51)

874-G. New Twist for Lathe--It Wraps Rocket Chambers. Western Metalworking, v. 19, Oct. 1961, p. 30.

Fabrication of high strength, lightweight, cylindrical chambers for rocket engines and pressure vessels by bonding helically wrapped, thin metal strips to a light weight metal shell. (G-general, T24f, 1-52)

875-G. Solid-Fuel Cases Tapped Hard for Polaris Rocket Engine. Laurence W. Collins, Jr. Machinery, v. 68, Sept. 1961, p. 87-92.

Drilling and tapping blind holes in closure flange of rocket case made of 300 M alloy steel heat treated and tempered to C 54-56 Rockwell hardness. (G17e, G17f, T24e; AY, 17-57, SGB-q)

876-G. Which Tools for Turning--Brazed, On-End, or Throw-Away? G. A. Manchester. Machinery, v. 68, Sept. 1961, p. 98-105.

Analysis of various interrelated factors influencing the selection of tools for turning under a wide range of conditions. Consideration of metal removal rate, downtime, grinding time, tool life, scrap loss, tool geometry, available equipment, part design, required finish, materials to be machined and other factors in terms of productivity and costs. (G17a, T6n; 7-52, 7-59, 17-57)

877-G. Reactor-Case Opener Doubles as Welder. P. L. Marjon. Machinery, v. 68, Sept. 1961, p. 106-110.

Special seal weld cutter for milling the welds on Type 304 stainless steel sealing rings of nuclear reactor pressure vessel. Device also serves as guide for welder during closure. (G17b, T26q, 1-52; SS, 7-51, 17-57)

878-G. Automated Tube Former Improves Washing Machine Production. Edward Damschroder. Machinery, v. 68, Sept. 1961, p. 111-113.

Automatic tube forming machine fabricates cold rolled steel tubes into support posts for washing machine baskets. (G-general, 1-52, T10c; ST, 4-60, 17-57)

879-G. Largest Vertical Dynapak Now in Pilot Phase. Machinery, v. 68, Sept. 1961, p. 133.

Pneumatically operated Dynapak unit is capable of forming a variety of metals and alloys with ram velocities as high as 2000 in. per sec. (G-general, 1-52, 1-71)

880-G. Machine Replaced--Production Increased 100%. Earl Paul. Machinery, v. 68, Sept. 1961, p. 138.

Tube end finishing machine chamfers Al tubing ranging from 3/8-1 in. OD. (G17; Al-b, 4-60)

881-G. Explosive Forming. Metal Treatment and Drop Forging, v. 28, Oct. 1961, p. 401-402.

Summary of process development and review of technological parameters and material deformation characteristics for shaping of complex metal parts and difficult-to-form metals by high energy rate processes. Comparison of a process depending on a combustible gas mixture to forming by detonation of high explosives, the former being more controllable while still producing high forming rates. (G-general; NM-k34)

882-G. Rational Removal of Chips. A. Fackelmeyer. Demag News, no. 160, 1961, p. 27-31.

Design and operating principles of a reciprocating barbed rod conveyor belt including a rod which pushes metal chips along the inside of the conveyor trough. (G17, W12r, 1-52)

883-G. Super-Lathe for Roll Turning. J. Binns. Iron and Steel Engineer, v. 38, Oct. 1961, p. 117-124.

Parameters of design to achieve structural rigidity in order to utilize full horsepower regardless of roll material or type of cutter and development of cutting theory to aid in the selection of ceramic cutters and the evaluation of machinability. (G17, 10-51, 17-51)

884-G. Single Point Threading With Carbide Tooling. Automatic Machinery, v. 22, Oct. 1961, p. 61-62.

Thread cutting with a semi-automatic threading machine incorporating a precision ground hardened Pb screw, a constantly-engaged bronze nut, an auxiliary hydraulic slide and carbide tips. Operating principles and equipment design for producing precise and varied threads. (G17f, W25, 1-52)

885-G. Wire for Cold Heading. S. E. Tyson and J. W. Keegan. Automatic Machining, v. 22, Oct. 1961, p. 71-74.

Stainless steel and heat resistant alloy wires are annealed, coated with a Cu plate and sized in a draw die prior to cold upset heading. Corrosion resistance and workhardening capacity are considered as they affect heading applications. Determination of wire diameter upset, head diameter and heading severity ratios. (G10p, 1-52, 1-67, Q23a, R-general; SS, SGA-h)

886-G. Milling 321 Stainless. A. Incardona and H. H. Poett. Cutting Tool Engineering, v. 13, Nov. 1961, p. 14-15.

Use of a milling cutter with indexable carbide inserts to cut 321 stainless steel billets at a metal removal rate of 24.2 cu. in. per min. Cutter is tested to determine tool life and metal removal rate and feed, cut depth, spindle and cutting speed increases. (G17b, T6n, 17-52; SS, 4-52)

887-G. Machining Complex Stainless Steel Sections. Machinery (London), v. 99, Oct. 18, 1961, p. 912-914.

Milling of airframe components from extrusions of simpler forms. Strength to weight ratio and dimensional accuracy. (G17b, T24a; SS, 4-58, 17-57)

888-G. Temperature Control in Titanium Processing. P. C. Barr. Metal Progress, v. 80, Nov. 1961, p. 71-74.

For processing, Ti should be heated only to the lowest possible forming temperature. Though protective atmospheres are not needed, room air should be kept from inside the furnace as much as possible. (G-general, J-general, 1-52, 2-61; Ti-b)

889-G. Metal Forming With Flexible Tools. Ir. H Hermans and F. H. R. F. Vermeulen. Metalworking Production, v. 105, Oct. 11, 1961, p 69-72.

A number of flexible tooling methods in which rubber or a liquid, or a combination of both, are used to apply the necessary pressure control for deep forming of conical, parabolic or similar shapes. Methods include forming with a free rubber pad, hydroforming and the waterbag process. (G14a)

890-G. (Book and Commentary.) Light Gage Cold-Formed Steel Design Manual. 3rd Edition. 1961. 175 p. American Iron and Steel Institute, 150 East 42nd St., New York 17, N.Y. $1.

Specifications for the design of light gage cold formed steel structurals from A245 and A303 carbon steel, A374 cold rolled steel and A375 hot rolled steel and A446-60T galvanized steel sheet. Information is given for determining the safe load capacities and deflections of sections made of any combination of sheet or strip steel. (G-general, 1-67, 11-62; ST, 4-53, 4-57)

891-G. Ceramic Tips Mill Hardened Steel. Metalworking Production, v. 105, Oct. 4, 1961, p. 54-55.

Milling of steel, hardened to 380-400 Brinell, using a vertical mill equipped with ceramic cutting tips. Comparison of milling efficiency and cost and surface finish for ceramic and carbide tips. (G17b, T6r; ST, NM-f40, 6-69, 7-59, 17-57)

892-G. Broaching Supercedes Reaming. J. M. Sharman. Metalworking Production, v. 105, Oct. 4, 1961, p. 56.

Broaching of Al aircraft parts using portable equipment, incorporating a broaching gun-ram, actuated by air pressure. (G17d, T24a; Al, 17-57)

893-G. Directionality in Sheet and Strip. T. Ll. Richards. Sheet Metal Industries, v. 38, Oct. 1961, p. 715-722.

Discussion of the causes of directionality in metals and its effects on elastic properties. Methods of either eliminating directionality or using it to improve the drawing quality of strip. 10 ref. (G4, 3-72; 4-53, 17-52)

894-G. The Selection and Forming of High-Strength Materials in Aircraft. Sheet Metal Industries, v. 38, Oct. 1961, p. 723-730.

Consideration of manufacturing problems and material characteristics in the design of aircraft, expecially as regards the use of Ti alloys. Topics include structural efficiency, dead weight, bend radius, fatigue, creep and weldability and elongation, springback and buckling during forming. 9 ref. (G-general, Q-general, T24a; Ti-b, SGB-a, 17-57)

895-G. Quantitative Assessment of Deep-Drawing and Stretch-Forming Qualities. Pt. 2. J. C. Wright. Sheet Metal Industries, v. 38, Oct. 1961, p. 731-741.

Review of methods and equipment for Swift and Erichsen cup-drawing, hole-expanding cup, conical cup forming, wedge drawing, bend and lubricant testing and measurement of strains imposed during forming. 18 ref. (G4, G9, 1-54, 17-52)

896-G. (German.) Flame Cutting Technology and Economics. H. G. Kunz. Technische Mitteilungen, v. 54, Aug. 1961, p. 294-298.

Manual and mechanical flame cutting of steel using oxygen of 99.3-99.7%. Review of reaction mechanisms, design of burners and automatic cutting machines, mode of operation and economics. (G22g, 10-54; ST)

897-G. (German.) Inert-Gas Shielded Arc Cutting. F. Walter. Technische Mitteilungen, v. 54, Aug. 1961, p. 298-305.

Mechanism and technology of manual and mechanical inert-gas shielded electric cutting of Al, Cu and austenitic steels. Survey of economics and fields of application. 10 ref. (G22h, 1-54; Al, Cu, SS-e)

898-G. Grinding Fluids. Pt. 1. What They Are. L. P. Tarasov. Tool and Manufacturing Engineer, v. 46, June 1961, p. 67-73.

Reduction of attritious wear, grain fracture and bond fracture of grinding wheel and removal of heat from grinding

wheel and from the work by using grinding oils, water base fluids or gases as lubricants or coolants. Basis for classification of grinding fluids is determined by function and type. (G18; NM-h, 17-57)

899-G. Grinding Fluids. Pt. 2. How They Affect Grinding Action. L. P. Tarasov. Tool and Manufacturing Engineer, v. 47, July 1961, p. 60-67.

Nature of work material as a factor in the selection of water-base or oil fluids for grinding. Quantitative data presented for steels, high-temperature alloys and Ti alloys. 7 ref. (G18, W25c; NM-h, 17-57)

900-G. Grinding Fluids. Pt. 3. Their Selection and Use. L. P. Tarasov. Tool and Manufacturing Engineer, v. 47, Aug. 1961, p. 57-63.

Factors affecting suitability of oils and water-base fluids for grinding operations. Consideration of stability, influence on wheel condition, ability to settle chips, corrosion prevention, residues left on equipment, affect on the operator. Review of flooding-mist and through-the-wheel methods of applying the fluid. 9 ref. (G18, ST, Ti-b, SGA-h, NM-h, 17-57)

SECTION H

POWDER METALLURGY

1-H. Isostatic Pressing Gains Favor. W. Derrick Johnston. Ceramic Age, v. 76, Nov. 1960, p. 14-18.

Hydrostatic compacting and forming of metals, clay, ceramics, plastics and carbides by an isostatic press. The material to be compacted is placed in a rubber die which is then sealed in a pressurized vessel and subjected to pressure through a water or petroleum-based fluid. (H14, 1-52)

2-H. Powdered Metal Products. Walter A. Olep. Wisconsin Engineer, v. 65, Oct. 1960, p. 14-15, 38, 42.

Production of Cu, Fe and Sn powders by atomization, reduction and electrolytic process. Particle size and distribution, density and purity of the powders. Pressing, sintering and finishing of powder metal parts. (H-general; Cu, Fe, Sn)

3-H. Nickel Strip Rolled From Powder. Steel, v. 147, Nov. 28, 1960, p. 84.

Production of high purity Ni strip by direct rolling of powder without intermediate rolling, annealing and pickling. (H14j; Ni, 4-53)

4-H. Metals Reinforced With Fibers. D. L. McDanels, R. W. Jech and J. W. Weeton. Metal Progress, v. 78, Dec. 1960, p. 118-121.

Experiments with composites made up of tungsten wires in a Cu matrix indicate that their strengths are directly proportional to the volume percentages and tensile strengths of the tungsten wires. If whiskers are used instead of wires, composites with tensile strengths of over 1,000,000 psi. may some day be available. (H17; Cu, W, 14-61)

5-H. Sintered Stainless Steel Powders. Pt. 1. R. L. Sands and J. F. Watkinson. Precision Metal Molding, v. 18, Dec. 1960, p. 41-42.

Sintering and compacting behavior of 304 L, 316 L, 347 L and 410 L stainless steel powder pressed at 30-50 tons per sq. in. and sintered at 2100° F. in dissociated ammonia. Effect of composition on particle size distribution, sintered and green density and mechanical strength. (H11, H14, H15, 2-60; SS)

6-H. The Vacuum Sintering of Tungsten Ingots. J. W. Pugh and L. H. Amra. Electrochemical Society, Journal, v. 107, Dec. 1960, p. 990-993.

Rate of densification at various temperatures, microstructure, hardness, fabricability and purity of tungsten ingots vacuum sintered at 1800-3100° C. for 0.25-8 hr. 4 ref. (H15, 1-73, H11k, 2-61, M27, Q29n; W)

7-H. (Japanese.) Elongated Single Domain Iron-Cobalt Magnet and Its Magnetic Properties. Toranosuke Kawaguchi, Mitsuru Nagakura, Tetsuro Yamaguchi, Isao Tanabe and Yoshinori Hosono. Japan Institute of Metals, Journal, v. 29, Sept. 1960, p. 585-588.

Electron micrography and magnetic measurement of powder specimen after heat treatment at 175-250° C. for 10-60 min. Effect of heat treatment, composition, oxidation and isotropic pressing on coercive force, remanence and demagnetization curve and average diameter and dimensional ratio of particles. 9 ref. (H11p 2-60, 2-64; Fe-b, Co-b, SGA-n)

8-H. (Rumanian.) Determining Degree of Sintering by Resistivity Measurements. Georgeta Dan, Aurelia Protopopescu and Olga Ivanciu. Studii si Cercetari de Metalurgie, v. 5, Mar. 1960, p. 343-364.

Electrolytic Fe with a particle size of 0.063 mm. and electrolytic Cu of 0.063-0.09 mm. are pressed under a force of 0.5-8 tons per sq. cm. and sintered at 100-1200° C. in a hydrogen atmosphere. Measurement of electrical resistivity, density and hardness. 11 ref. (H15, H14, P15g, P10a, Q29n; Cu-a, Fe-a)

9-H. Slip Casting: A Good Way to Shape Difficult Materials. L. M. Schifferli. Materials in Design Engineering, v. 51, Dec. 1960, p. 108-109.

Design considerations for engineering metals, refractory metals, refractory metal compounds, mixtures and nonmetallics. Thin-wall closed-end tubes or complex shapes having re-entry angles, now beyond the capabilities of even the most advanced powder metallurgy methods, are particularly suitable for slip casting. (H14)

10-H. (Russian.) Pressing and Rolling Titanium Powder Tubes. B. A. Borok, V. K. Havrilova, H. M. Karpman, E. A. Trifonov and E. B. Zadov. Tsvetnye Metally, Sept. 1960, p. 66-68.

Hydraulic pressing at 850-1060° C. and cold rolling of powdered Ti billets. Specification of dies and lubricants for prevention of adhesion during pressing. Optimal reduction degree for elimination of edge cracking. (H14, F26; Ti)

11-H. (Japanese.) Hot Pressing of TiC-Co Cermets. Masataka Sugiyama and Hisashi Suzuki. Japan Institute of Metals, Journal, v. 24, Oct. 1960, p. 618-622.

Mechanical properties, density and microstructure of powder compacts containing 20-60% Co, hot pressed at 1550-1750° C. and at pressures of 20-140 kg. per cm. sq. for 2-15 min. Investigation of relationship of hot pressing conditions to cermet's properties and applicability of sintering method. 4 ref. (H14h, M27, P10a, Q-general; Ti, 14-68, Co, 6-70)

12-H. (Japanese.) Hot Pressing of TiC Base Cermets. Masataka Suziyama and Hisashi Suzuki. Japan Institute of Metals, Journal, v. 24, Oct. 1960, p. 622-625.

Mechanical properties, density and microstructure of powder compacts containing 20-40% metal binders such as Ni, Nimonic 90, X-40 alloy, Fe and Ni-Cr-Mo alloy and 18-8 stainless steel. Specimens are hot pressed at 1550-1750° C. at pressures of 20-140 kg. per cm. sq. for 2-15 min. Effect of binder oxidation, carbon transfer from the graphite die used in pressing and other process variables on properties. 9 ref. (H14h, M27, P10a, Q-general; Ti, 14-68, Fe, Ni-b, SS, 6-70)

13-H. (German.) Gear Wheels of Sintered Materials. H. Endter. VDI Berichte, no. 46, 1960, p. 69-75.

Pressing by hydraulic and mechanical presses at 6-8 tons per cm^2 and sintering at 800-1300° C. of Fe, steel, brass and bronze gear wheels. Post-treatments such as machining, hardening, corrosion protection by oil soaking and surface oxidation by 350-550° C. water vapor treatment. Mechanical properties. (H14h, H15, T7a; Cu-b, Fe, ST, 17-57)

14-H. Purification Reactions of Tantalum During Vacuum Sintering. W. D. Klopp, D. J. Maykuth, H. R. Ogden and R. I. Jaffee. Metallurgical Society of AIME, Transactions, v. 218, Dec. 1960, p. 971-977.

Investigation of the purification by vacuum sintering of commercial-purity Ta powder at 2600-2860° C., mixtures of Ta oxide and Ta carbide at 1800 and 2200° C. and Ta bars containing 1% additions of O, N and C at 1800-2600° C. Analyses are made of the sintered mixtures to determine the extent of removal of O, N and C at each sintering condition. 11 ref. (H15, 1-73, C-general; Ta, C, O, N, 9-71)

15-H. Zn-ZnO Alloys for Dispersion Hardening. Horace Pops and J. F. Libsch. Metallurgical Society of AIME, Transactions, v. 218, Dec. 1960, p. 1131-1133.

Investigation of powder metallurgy production of Zn alloys with increased strength and high temperature stability by dispersion hardening. Physical and mechanical properties, with attention to deformation and recrystallization behavior, microhardness, macrohardness and fabricability are given as influenced by heat treatment, temperature and microstructure. 3 ref. (H-general, N7a, P-general, Q-general, 2-64; Zn-b)

16-H. Powder Metallurgy. Selective Bibliography 423, U. S. Office of Technical Services, Washington 25, D. C.

Bibliography covering Army, Navy, Air Force and AEC reports and translations on sintering, kinetics of oxidation of metal powders, inspection of sintering compounds, softening temperatures of Fe ores and sinters and effect of partial replacement of coke by gas in sintering machines. (H-general; 11-65)

17-H. A High Temperature Contact Device. Fansteel Metallurgy, Dec. 1960, p. 3.

Vacuum and inert gas sintering of metal bars at 2740° C. using a high temperature contact device to maintain electrical contact at the ends of the compacted bar. Device consists of a machined Mo body to which is riveted a Tantaloy (7.5% Ta, 92.5% W) strip and sliding contact made with a combined Cu strip and H_2O cooled Cu-base plate. (H15, T1; Mo, 17-57)

18-H. Hafnium Carbides. R. Kieffer, F. Benesovsky and K. Messmer. Metal Progress, v. 79, Jan. 1961, p. 196-198. (Digested from Metallwissenschaft und Technik, v. 13, Oct. 1959, p. 919-922.)

Production, solubility for other carbides, sintering and compaction, hardness, bend strength, cutting performance. (H-general, Q-general; Hf, 6-69)

19-H. (Japanese.) Sintering of Cermets of the TiC System. Shinnoku Saito. Ceramic Association of Japan, Journal, v. 68, Nov. 1960, p. 267-273.

Measurement of shrinkage modes and velocities as a function of sintering and heat treatment temperatures in 20% CO-80% TiC cermets. Optical and electron microscopy and rupture tests are used to study properties after flash sintering and cyclic heating at 400-1400° C. 15 ref. (H15, M-general, Q-general, 2-64; Ti, CO, 6-70, 14-68)

20-H. (German.) Properties and Use of S. A. P. Sinter Material. R. Akeret. Technica, v. 9, Nov. 1960, p. 1425-1427.

Production of S. A. P. (sintered Al product) powder by pulverization, or casting and subsequent grinding with stearin addition under oxidizing conditions. Fabrication of semifinished products by cold pressing of powder with sintering at 550-600° C. and extruding. Properties such as electric and thermal conductivity, mechanical properties (including workability) and microstructure. Use of S. A. P. material for piston reinforcement and for supersonic aircraft parts. (H-general, P-general, Q-general; Al-b, 7-62, 17-57)

21-H. (English.) Stress Infiltration of Two Phase Alloys. G. Matsumura. Planseeberichte fur Pulvermetallurgie, v. 8, Dec. 1960, p. 110-118.

Tensile test, X-ray diffraction and microstructure investigation of specimens, consisting of a 1200° C. sintered Fe-Cu (0-8% Cu) skeleton, soaked with Cu or Bi infiltrant, with subsequent freezing. Influence of stress infiltration on tensile strength. (H16e, M-general, Q27, 3-66; Fe-b, Cu, 6-71)

22-H. (English.) Attempt to Produce Synthetic Composite Alloys. D. E. Gucer. Planseeberichte fur Pulvermetallurgie, v. 8, Dec. 1960, p. 119-121.

Application of repeated pressing-sintering cycles to obtain bodies of nonwetting components (mixtures of soft low-melting metals such as Sn, Mg, Zn, Pb, Cd, Bi with 25% WC or TiC). Influence of compacting pressure, sintering temperature and sintering time. (H14, H15; Bi, Cd, Mg, Pb, Sn, Zn, W, Ti, 6-70)

23-H. Extruded Magnesium Pellets. R. S. Busk. Precision Metal Molding, v. 19, Jan. 1961, p. 35-38.

Extrusion of ZK60 pellets involves the atomizing of a stream of liquid alloy into spherical pellets of the desired size and the extrusion of the pellets into the desired shape. Pellets must be spherical to minimize surface area, must contain a minimum of fine dust and must have an average particle size between 100 and 400 microns. 7 ref. (H14k; Mg)

24-H. Sintered Stainless Steel Powders. Pt. 2. R. L. Sands and J. F. Watkinson. Precision Metal Molding, v. 19, Jan. 1961, p. 46-48.

The newer austenitic stainless steel powders such as 304L, 316L, 347L and 410L have adequate green strength and can give approximately 60,000 psi. tensile strength with 5% elongation. (H15; SS)

25-H. (German.) Production and Properties of Atomized 45% Silicon Stabilized Ferro-Silicon. K. Feldmann

and K. Frank. Schweissen und Schneiden, v. 12, Dec. 1960, p. 514-517.

Production of powder for electrode coatings by atomization of liquid electro furnace melted ferrosilicon by air or water vapor and subsequent water quenching. Examination of corrosion resistance by measuring gas formation of powder in water and KOH/NaOH mixtures at 20 and 70° C. Stabilization, grain size and shape, pressing and welding properties. (H10f, H11; Fe-b, Si)

26-H. (Japanese.) Vacuum-Sintering of TiC-Ni Cermets. Masataka Sugiyama and Hisashi Suzuki. Japan Institute of Metals, Journal, v. 24, Nov. 1960, p. 689-692.

Vacuum sintering of TiC-Ni cermets containing 20-65% Ni at 1330-1480° C. for obtaining information on sintering technique for TiC-base cermets. Under fixed conditions of ball-milling, properties such as the transverse rupture strength, Rockwell A hardness, density, microstructure and carbide grain size of the cermets are given as a function of metal binder content, pressing pressure and sintering conditions. 10 ref. (H15, 1-73, Q-general; Ti-b, Ni, 6-70, 14-68)

27-H. (Japanese.) Disintegration of Fe-Al Alloy. Harunobu Sawada, Akira Masuda, Yoriyosu Atobe and Toshimosa Aoki. Japan Institute of Metals, Journal, v. 24, Nov. 1960, p. 732-735.

The phenomenon of disintegration or self-pulverization of 50 Fe-50 Al alloy containing 0-2% carbon in open air and in water at 20-68° C. for various times is studied by microscopy and X-ray diffraction methods. Cracks leading to disintegration are observed to originate at Al_4C_3 grain boundaries with progressive growth and release of stress. In water immersed specimens, methane gas evolution, produced by Al_4C_3 reaction with water, plays a dominant role in the process. 8 ref. (H10; Fe-b, Al)

28-H. Powder Metallurgy. J. S. Jackson. Rugby Engineering Society, Proceedings, v. 50, 1959-1960, p. 16-40.

Review of powder production by mechanical, electrolytic, chemical and atomization methods and of compacting and sintering operations. Applicability for production of hard and refractory metals and semi-metals including W, Ta, Mo, carbides, Si nitrides and cobalt and for production of large numbers of components cheaply to high tolerances and associate reproducibility in the ordinary metals. Data are given for physical and mechanical properties, with T-T-T curves for some materials. (H-general, 10-54; EG-d, W, Ta, Mo, Co, 14-68)

29-H. (Russian.) Effect of Allotropic Transformation on the Sintering of Iron Powder Compacts. A. A. Shmykov and V. S. Saklinskii. Metallovedenie i Obrabotka Metallov, Dec. 1960, p. 26-36.

Selection of optimum sintering variables. Dilatometric study of changes in linear shrinkage and expansion coefficient during sintering within 500-1000° C. Improvements in mechanical properties, porosity and plasticity of sintered parts. (H15, N6p, P10; Fe, 6-72)

30-H. (Russian.) Activated Sintering Process for Iron Powder. P. A. Andrievskii and I. M. Fedorchenko. Metallovedenie i Obrabotka Metallov, Dec. 1960, p. 36-39.

Intensification of sintering process by using dry and moistured hydrogen, H_2 + HCl, Al_2O_3 + NH_4Cl or Al_2O_3 + NH_4F as a sintering medium. Favorable effect of H_2 + HCl on density, magnetic properties and microhardness of sintered parts. 10 ref. (H15, Q-general; Fe, 6-72)

31-H. Powder Metallurgy. Nature, v. 189, Feb. 4, 1961, p. 365-367.

Review of the history and techniques of powder metallurgy including mechanisms of the sintering process and methods of hydrostatics and isostatic pressing, slip casting, hot extrusion, rolling, explosive pressing, blow forging and dispersion hardening. (H-general)

32-H. New Powder Metallurgy Practices. J. Comstock. Australian Machinery and Production Engineering, v. 14, Jan. 1961, p. 28-29.

Slip casting of stainless steel or other corrosion resistant metals and alloys by a process in which metal particles are added to water and held in solution by an alkalied alginate to form slip. Slip is poured into dry porous molds where water is absorbed. Alginate gel holds

particles together in a transient bond. (H14; SS, 6-68)

33-H. (Translation-Brutcher no. 4883.) Hot Pressing of Chromium-Boride Powder and Some of Its As-Sintered Properties. V. S. Neshpor and P. S. Kislyi. Ogneupory, v. 24, May 1959, p. 231-236.

Conditions of sintering of Cr boride powder obtained by reaction of Cr oxide with boron carbide; also of various properties of sintered Cr boride powders and comparison of results with available literature data. (H14h; Cr, B, 14-68)

34-H. Powder Metallurgy Operations at Maytag. Walter Anderson, Wesley Bissett and P. R. Kalischer. Precision Metal Molding, v. 19, Mar. 1961, p. 43-46.

Discussion of mixing, compacting, sintering, sizing and inspection techniques used in manufacture of metal bushings. (H-general, T7d)

35-H. For Stronger, Tougher Metal-Powder Parts. Felix Giordano. Product Engineering, v. 32, Mar. 13, 1961, p. 78-79.

Application of sintered Fe powders with densities over 90% in metal-powder parts. Density, tensile strength, yield strength, elongation, dimensional tolerances and surface finish of carburized, hardened and nonheat-treated high-density parts. (H15, H11k; Fe)

36-H. Fabrication of U_3O_8--Aluminum Dispersion Fuel Elements by Extrusion. R. A. Noland, D. E. Walker and L. C. Hymes. Paper from "Materials in Nuclear Applications". STP no. 276, American Society for Testing Materials, Philadelphia, Pa., 1960, p. 336-344.

Hot coextrusion of Al canned uranium oxide-Al powder mixtures to produce dispersion type fuel elements. Effects of powder preparation, billet can composition, extrusion temperature and uranium oxide content of powder mixture. (H14k, T11g; Al, U)

37-H. (Translation.) Kinetics of the Sintering of Metal Powders. R. S. Mints. Russian Journal of Inorganic Chemistry, v. 5, Apr. 1960, p. 437-444.

Thermal testing of compacted Ni, Cu, Ti and Mo powder specimens during sintering by cyclic or isothermal heating. Design and operation of the vacuum dilatometer used to measure thermal contraction and expansion. Comparison of the specific gravity, hardness and microstructure of specimens processed by each method. 8 ref. (H15; Cu, Ni, Mo, Ti)

38-H. Equipment for Hot Rolling Strip in Vacuum. M. Hill, R. Holman and E. Kulinski. Paper from "Vacuum Technology Transactions". Pergamon Press, New York, 1959, p. 124-128.

Ti powder compacts are heated to 2000° F., rolled at 100 ft. per min. and then cooled while continuously under vacuum. Equipment used consists of entrance and exit chambers, furnace, rolling mill and pumping system. (H14j, 1-66, 1-73, W23; Ti)

39-H. (German.) Sinter Process and Suitable Sinter Materials for High Temperature Technology. Eberhard Meyer-Hartwig. Jahrbuch 1959 der WGL, v. 13, Oct. 1959, p. 390-394.

Sintering by exothermic reaction of hot and cold pressed mixtures of metals (Al powder) and ceramic materials (Al_2O_3, Cr_2O_3, B_2O_3, MgO) without external heating and with and without after pressing to produce cermets or pure ceramics. Reaction mechanisms. Applicability. (H15; Al, NM-f)

40-H. Fuel Elements for German Reactor. M. Becker. Nuclear Power, v. 6, Mar. 1961, p. 81-84.

Solvent extraction, co-reduction and powder metallurgy techniques for producing sinterable UO_2 and natural U. Fabrication methods, including extrusion, cladding and chamber argon-arc welding, for producing fuel elements and tubes from rods and billets. (H-general, F24, K1d, T11; U, 14-68, 17-57)

41-H. Powder Metallurgy. L. Harrison. Engineering Materials and Design Conference, Proceedings, Feb. 1960, p. p. S1-S12.

Application of powder metallurgy techniques in production of structural components, bearings, frictional materials, porous media, hard metals, magnets and special alloys. Design considerations for compacting and sintering techniques and equipment. (H-general)

42-H. Production and Utilization of Cobalt Powders. E. De Bie and P. Doyen. Cobalt, Mar. 1961, p. 22-32.

Review of powder metallurgy production methods; particle size and specific surface area analysis and industrial applications of Co powders. 16 ref. (H-general, H11; Co, 6, 17-57)

43-H. (Japanese.) Vacuum-Sintering of TiC-40Ni-Cr-Co Cermet. Masataka Sugiyama and Hisashi Suzuki. Japan Institute of Metals, Journal, v. 25, Jan. 1961, p. 4-8.

Some room temperature properties such as transverse-rupture strength, hardness, density, Curie temperature and microstructure of a TiC based cermet containing 40% Ni-Cr-Co (3:1:1 ratio) as a function of wet ball milling times to 200 hr., sintering temperature of 1270-1440° C. with times of 1 hr. and with Mo additions of up to 5% as a substitute for Co in the binder. 8 ref. (H-general, Q-general, M-general, 2-60, 2-61; Ti-b, Ni, Cr, Co, 6-70)

44-H. (Ukrainian.) Some Properties of Cu-Ni Sintered Briquets. V. V. Ogorodnikov, I. M. Fedorchenko and O. I. Raichenko. Dopovidi Akademii Nauk Ukrainskoi RSR, Dec. 1960, p. 1603-1606.

Comparative isothermal sintering experiments with pure Cu or Cu-Ni powder mixture or Cu-Ni alloy powders. Data are given for compression strength, porosity, shrinkage, electric conductivity and effect of Cu concentration. 6 ref. (H15, Q-general, P-general; Cu-b, Ni, 6-72)

45-H. Todays Five Trends in Powder Metallurgy. Donald Peckner. Materials in Design Engineering, v. 53, Apr. 1961, p. 111-115.

Survey of developments in production of pre-alloyed powders, coated powders, large parts, composite structures and magnetic alloys. (H-general)

46-H. The Fansteel Method--Tantalum--From the Ore to You. R. G. Christophersen. Corrosionomics, v. 6, Jan. 1961, p. 1-4.

Conversion of tantalite ore to Ta ingots by a method involving crystallization of tantalum raffinate into K_2TaF_7 and electrolysis of K_2TaF_7 to obtain Ta powder. The powder is pressed and sintered in controlled atmosphere furnaces. (H10b, H10c, H-general; Ta)

47-H. Quantum Mechanism of the Formation of Metallic Powders by Electrolysis at High Current Densities. A. Calusaru and I. Atanasiu. Revue Roumaine de Metallurgie, v. 5, Feb. 1960, p. 291-300.

Explanation of the phenomena at limit current. New theory on the mechanism of formation of metal powders and its confirmation by calculations based on the quantic transit scheme of electrons through the potential barrier between the levels in the metal and those in the solution. 5 ref. (H10b)

48-H. (Japanese.) Comparison of the Mechanism of Pore-Formation Between Fe-Cu and Cu-Sn of Sintered Bearing. Terushia Watanable. Government Industrial Research Institute, Nagoya, Reports, v. 10, Mar. 1961, p. 140-151.

Pore formation during sintering of self-lubricating bearings of 86.4% Fe-13.6% Cu and 90% Cu-10% Sn as caused by "Sn-off" or "Cu-off" cavity formation when the alloys are heated above the melting point of the lesser components. The lower melting point materials melt-off into the cavities, formed by expansion of the compact due to alloying of the materials, resulting in increased pore size. 8 ref. (H15, T7d; Fe-b, Cu-b, Sn, 6-71)

49-H. (Japanese.) Study on the ZrO_2-Ni Cermets. Pt. 1. Effects of Additive on Sintering. Shigeharu Naka, Etsuro Kato, Goro Nishiyama and Hideo Matumoto. Government Industrial Research Institute, Nagoya, Reports, v. 10, Mar. 1961, p. 199-205.

Effects of CoO and NiO additions on the oxide-metal wettability, mechanical strength, high temperature stability and sintering properties of ZrO_2-Ni cermets, containing CaO stabilized ZrO_2, sintered at 1450° C. 9 ref. (H15, P-general, Q-general; Ni-b, Zr-b, 6-70)

50-H. (German.) Sinter-Bronze Composite Bearings. J. Kubelik, E. Navara and V. Prochazka. Neue Hutte, v. 6, Feb. 1961, p. 115-118.

Production of specimens of Pb-Cu sinter-bronze (20-50% Pb) bearing alloy by water jet pulverizing of a liquid Pb-Cu alloy and subsequent sintering of powder at low pressure. Mechanical and fatigue testing of specimens with data given for properties as influenced by Pb content of the bronze. (H15, Q-general, 2-60; Cu-b, Pb, 6-72)

51-H. Make Better Use of Powder Metallurgy Parts. Precision Metal Molding, v. 19, Apr. 1961, p. 27-30.

Metal Powder Industries Federation seminar review covering such properties as self-lubrication, corrosion resistance, pressure tightness, density, hardness, tensile strength, ductility, surface finish and close dimensional tolerances. (H-general)

52-H. Composite Powders. Precision Metal Molding, v. 19, Apr. 1961, p. 54-55.

Production of composite powders by a process in which Ni or Co is precipitated by pressurized hydrogen on to the surface of powders of refractory carbides, silicides, nitrides, borides, oxides and metals. (H10c)

53-H. Powdered Metal Bullets. Robert A. Powell. Ordnance, v. 64, May-June 1960, p. 952-953.

Experiments show that the 7.62 mm. NATO ball bullet can be fabricated by powder metallurgy techniques from Fe powder compacts if their density is increased by Cu or Pb-Bi alloy admixtures. (H14, T2j; Fe)

54-H. The Effect of Porosity in Metal Powder Compacts on the Structure of the Sintered Material. Henry H. Hausner. Indian Institute of Metals, Transactions, v. 13, Dec. 1960, p. 351-373.

Relation of powder metal properties, particularly particle size and shape, and compacting and sintering variables to pore volume, number, orientation, gas content and distribution. Investigation of consequent porosity and densification process effects on compact microstructures, in particular, grain growth, grain boundary migration and grain structure. Data are given for structure and properties of Cu, Be, Zr, Mo and stainless steel powder compacts. 11 ref. (H-general, H11, M-general, N-general, 9-68; Cu-b, Be-b, Mo-b, Zr-b, ST)

55-H. Redesigning for Powder Parts. Richard B. Thompson. American Machinist/Metalworking Manufacturing, v. 105, Apr. 17, 1961, p. 113-115.

Pump thrust plates are made from 361 Gramix iron. Powder is compacted under 60,000 psi. pressure, sintered and steam treated. Density, tensile strength, yield and hardness determined. (H14, H15; Fe)

56-H. Spherical Powders of Metals and Alloys Developed by Union Carbide Corporation. Current Engineering Practice, v. 3, Feb. 1961, p. 39.

Report on spherical powders of Cu, Al, Ni, 316 stainless steel, W and Nichrome (particle size 20-150 microns) produced in an inert atmosphere to avoid defects. Applications and physical data are noted. (H-general; Al-b, Cu, Ni-b, SS, W)

57-H. Designing for Powder Metallurgy. T. L. Robinson. Precision Metal Molding, v. 19, May 1961, p. 56-59.

Tensile strength, elongation, compressive strength, Brinell hardness, porosity, specific gravity, density, coefficient of thermal expansion, electrical conductivity and particle hardness given for sprockets formed of sintered 4630A alloy steel or sintered medium Cu-Fe. (H15; AY, Fe-b, Cu)

58-H. (Pamphlet.) Designing for Pressed Brass and Nickel Silver Metal Powder Parts. 1960. 24 p. New Jersey Zinc Co., 160 Front St., New York 38, N. Y.

Advantages and limitations of nonferrous powder metallurgy. Materials, methods, design and cost. Properties and tolerances of powder parts. Applications of powder parts. (H-general; Cu-b)

59-H. Powder Metallurgy--A Survey. I. Jenkins. Metal Industry, v. 98, May 5, 1961, p. 351-354.

Metallographic examination of Cu, Ta, W, Ag, Pb, Be and C particles formed by electrolysis, atomization, thermal dissociation or reduction to determine particle size and distribution, particle shape, density, packing, molding and chemical properties. (H-general; Ag, Be, C, Cu, Pb, Ta, W)

60-H. New Powder-Metallurgy Process Makes Parts in Vacuum. R. H. Eshelman. Iron Age, v. 187, May 25, 1961, p. 101-103.

Production of nuclear reactor parts with high density and low porosity by vacuum pressing powder on sponge of Zr, W, Cb or Mo at high temperatures. Specifications are given for typical parts of Zircaloy-2 alloy. (H14h, 1-73; Cb, Mo, W, Zr)

61-H. Pressing and Sintering of Nickel Brasses. J. Wilcock and R. J. Woolfall. Metallurgia, v. 63, Apr. 1961, p. 167-173.

Optimum processing conditions for nickel brass components involve lithium stearate lubrication and compacting at 30 and 35 tons per sq.in. Torsional properties approaching those of rolled nickel brass strip are found with controlled additions of Fe and phosphorus. (H14, H15, 18-73; Cu-n, Ni)

62-H. (English.) Theory and Application in the History of Powder Metallurgy. W. Leszynski. Planseeberichte fur Pulvermetallurgie, v. 9, Apr. 1961, p. 14-20.

Development of powder metallurgical theory and technology from Pt sintering in the first half of the 19th century to present day production of hard metals from sintered carbides, of structure parts and magnetic materials and of cermets and high-temperature SAP (Al_2O_3-Al combination) material. (H-general)

63-H. (English.) Sintering Behavior of Loose Metal Powders. H. H. Hausner. Planseeberichte fur Pulvermetallurgie, v. 9, Apr. 1961, p. 26-32.

Sintering of spherical and irregular shaped 316 stainless steel powder under hydrogen at 1300° C. to investigate density of sintered mass as influenced by particle size, particle distribution and particle activity. 5 ref. (H15; SS, 6-68)

64-H. (English.) Swelling of an Iron Copper Compact During Sintering. G. Matsumura. Planseeberichte fur Pulvermetallurgie, v. 9, Apr. 1961, p. 33-35.

Twisted Fe wires of 1.2 mm. diameter are mounted in solid Fe-saturated Cu and heated at 1050° C. for up to 200 hr. Observation of Cu diffusion into Fe. Surface cracks caused by swelling of Fe. (H15, P10d, N1; Fe, Cu)

65-H. Explosive Compacting. Digest of "The Compacting of Metal Powders by Explosives". Paper no. 7 Read Before the Powder Metallurgy Joint Group of the British Iron and Steel Institute and the Institute of Metals, Dec. 16, 1960. W. T. Montgomery and H. Thomas. Metal Progress, v. 79, June 1961, p. 178.

Results are given for "W-Ti", Al, Cu and Fe powders. Apparent advantages of the method are for compacting shapes too large for available presses or made from powders requiring inordinately high pressures. (H14, NM-k34; Al, Cu, Fe, Ti)

66-H. Powder Metallurgy in Russia. Metal Industry, v. 98, May 26, 1961, p. 418-419.

Resume of the proceedings of the Fifth All-Union Conference on Powder Metallurgy. Topics include preparation of powder, sintering, compacting, mechanical and physical properties of powder metal parts and applications. (H-general)

67-H. Powder Metals Increase Profits. Design Engineering, v. 7, June 1961, p. 42-44.

Design parameters affecting powder metallurgical processes including size, shape, porosity and machinability of the part. Welding, peening and finishing techniques. (H-general)

68-H. Powder Metallurgy Slashes Cost of Armature. Materials in Design Engineering, v. 53, June 1961, p. 12.

A pressed bronze powder core is placed within a sintered steel outer ring and the two sintered together at 1450-1600° F. to produce an armature having alternating magnetic and nonmagnetic sections. Cost savings of 72% result from the elimination of machining and staking or peening operations. (H14, H15; Cu-s, ST)

69-H. (Russian.) Vibration Compression in Powder Metallurgy. V. I. Likhman, N. S. Gorbunov, I. T. Shatalova and P. A. Rebinder. Doklady Akademii Nauk SSSR, v. 134, May 1960, p. 1150-1152.

Compression of powders containing Ti-C, W-C and Co in a mechanical vibrator for a maximum time of 4-10 sec. with a frequency of 14,000 vibrations per min. increases density and uniformity and prevents cracking. (H14; Co, Ti, W, 14-68)

70-H. (German.) Surface Diffusion in Sintering of Nonpressed Powder. Karl Torkar and Hellfried Neuhold. Zeitschrift fur Metallkunde, v. 52, Apr. 1961, p. 209-215.

Ni-Cu powder mixtures of given particle size and a mixing ratio of Ni:Cu= 1:2 are sintered at varying times under a

hydrogen current from 800-1050° C. Density measurements and magnetic evaluation of the diffusion zones in the sintered bodies. Computation of diffusion factor and activation energy using the Arrhenius equation. (H15, N1; Cu, Ni)

71-H. (German.) Production and Stability of Aluminum Di-Boride. H. J. Becher. Zeitschrift fur Anorganische und Allgemeine Chemie, v. 308, Mar. 1961, p. 13-22.

Production of AlB_2 from Al and B powder by sintering under inert gas and vacuum at 800° C. Investigation of thermal stability by heating to 1450° C. Structure identification of obtained phases by X-ray diffraction. (H-general, M22g, P11; Al-b, B)

72-H. Half a Century of Modern Powder Metallurgy. Paul Schwarzkopf. Paper from "Powder Metallurgy". Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1961, p. 1-7.

Review of significant historical developments. (H-general, A2)

73-H. Theory of Solid State Sintering. G. C. Kuczynski. Paper from "Powder Metallurgy". Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1961, p. 11-30.

Limited to simplified models such as spheres to spheres (or wires) to plates. Experiments with such sample yield fairly reliable confirmation of the theory proposed. The first stage of sintering, characterized by formation of a neck between two particles, can be brought about by one or more of the following processes: viscous or plastic flow, evaporation and condensation and volume diffusion or surface diffusion. 17 ref. (H15)

74-H. The Role of Interparticle Contacts in Sintering. R. T. De Hoff, R. A. Rummel, F. N. Rhines and A. H. Long. Paper from "Powder Metallurgy". Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1961, p. 31-51.

The topological model of the sintering process leads to the conclusion that the rate of densification should be simply related to the genus, which is the difference between the number of interparticle contacts and the number of particles plus one. During first stage sintering it is found by experiment that the number of interparticle contacts may increase. Alteration of the specific genus by changing the number of particles in unit mass of the powder causes the rate of lineal contraction to vary inversely with the particle diameter. (H15)

75-H. Sintering of Wire Compacts. A. L. Pranatis and L. Seigle. Paper from "Powder Metallurgy". Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1961, p. 53-73.

Influence of the presence of grain boundaries on the rates of sintering of Ni, Cu and Fe wire-wound compacts. In Fe compacts sintered in the alpha range, surface diffusion appears predominant and no grain boundary effect is, therefore, expected or evident. On the other hand, sintering of Cu and Ni compacts at temperatures close to their respective melting points apparently occurs by volume diffusion but with varying grain boundary effects. 16 ref. (H15; Cu, Fe, Ni)

76-H. Sintering in the Presence of a Liquid Phase. F. Eisenkolb. Paper from "Powder Metallurgy". Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1961, p. 75-95.

Behavior of metallic and nonmetallic additions which melt in the sintering process when mixed with metal powders. Tests on alloyed and unalloyed Fe powders varying in grain sizes and in origin from different production processes. Powders of Cu alloys, sulphides and silicates delivering the required liquid phase at the sintering temperature applied were added to the Fe powders. Effects of these additions and of the sintering conditions on change in dimensions, porosity and mechanical properties. 12 ref. (H15; Cu, Fe)

77-H. On the Sintering of W-Ni-Cu Heavy Metal. Simo Makipirtti. Paper from "Powder Metallurgy". Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1961, p. 97-111.

Study of the phenomena which occur when a 90W-10(2Ni-Cu) powder mixture is sintered at high temperatures. On the basis of accurate shrinkage observations, it is noted that sintering obeys a new sintering equation which is valid over the entire sintering range for this mixture as well as for the investigated pure and multicomponent system in which the grain size of the powders is small. 16 ref. (H15; W-b, Cu, Ni)

78-H. The Nickel-Activated Sintering of Tungsten. J. H. Brophy, L. A. Shepard and J. Wulff. Paper from "Powder Metallurgy". Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1961, p. 113-135.

When fine W powders are coated with a uniform Ni layer of the order of atomic thickness, rapid densification occurs during sintering at unusually low temperatures. Theoretical and experimental considerations indicate that Ni-activated sintering of W takes place by the movement of W through or on a thin Ni carrier phase. 29 ref. (H15; W)

79-H. High Density Sintering of Metal Powder Compacts. Michel A. Eudier. Paper from "Powder Metallurgy". Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1961, p. 137-156.

Review of the different conventional ways of obtaining high density parts, high-temperature sintering, hot pressing, hot forging, rolling extruding and drawing. Other possibilities are discussed, especially the use of ultra-fine powders, special atmospheres on thin films and intermediate liquid phases created by small additions such as phosphorus which can be eliminated afterwards. 11 ref. (H14, H15)

80-H. Kinetics of Hot Pressing. J. D. McClelland. Paper from "Powder Metallurgy". Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1961, p. 157-171.

Hot pressing of powdered materials can be adequately described using a plastic flow theory proposed by Mackenzie and Shutleworth for sintering. The present derivation assumes that the principal driving force for the closing of pores is the applied hydrostatic pressure instead of the surface tension of the pores. This pressure term, when corrected for the density of the compact, can be substituted for the surface tension term in the original derivation. The resultant equations give the rate of densification of the material in terms of a yield point and viscosity. 9 ref. (H14h)

81-H. The Latest Developments of the S. A. P. Process. E. A. Bloch and H. Hug. Paper from "Powder Metallurgy". Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1961, p. 371-385.

For the practical manufacturing of S. A. P. semifinished products, a heavy oxide containing Al powder is used; its flakes are cold welded. Each powder particle already shows dispersion hardening. Sintering in the strict sense (i. e., shrinking and consolidation of the compact) does not take place in the case of S. A. P. However, the oxides undergo a transformation from 525-550° C. Electron micrographs of oxide replicas show that the oxide is embedded in the metal ground mass in the form of platelets of 100-500 A thickness. (H14, H15; Al)

82-H. Large Sintered Bodies and Parts. F. Emley. Paper from "Powder Metallurgy". Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1961, p. 389-401.

Various powder compaction processes are reviewed in regard to largest sizes of parts which are made commercially by each technique. The present status of processes for continuous compaction is presented along with a discussion of potential applications. (H14)

83-H. Hydrostatic Pressing of Powders. Charles E. Van Buren and Harold H. Hirsch. Paper from "Powder Metallurgy". Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1961, p. 403-441.

Particulate matter can be consolidated into shaped bodies by the application of pressure in a fluid by a flexible, nonporous membrane. Pressure can be applied slowly or rapidly, the charge can be deaired or not, and the powder may be made to load into the flexible membrane densely or loosely. These factors along with the effect of pressure, particle hardness, size distribution and granulations are investigated to establish their effects on the quality of the pressed bodies and subsequent processing. (H14, 1-70)

84-H. A Compaction Technique for Shaped Parts of Metal Powder Compositions. H. W. Highriter, Rinaldo Curcio and Leo Kaempf. Paper from "Powder Metallurgy". Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1961, p. 443-459.

A method of hydrostatic compacting metal powders in shaped flexible molds has been successfully employed in the production of heavy metal (W-Cu-Ni) parts but

is also applicable to materials which sinter without forming a liquid phase. (H14, 1-70; W-b, Cu, Ni)

85-H. Explosive Forming of Metal and Its Potential Application to Compacting Metal Powders. R. A. Cooley. Paper from "Powder Metallurgy". Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1961, p. 525-542.

Brief review of the procedures used. Observations made on changes in metals caused by explosive energy with respect to hardness, strength, elongation and springback. (H14, NM-k34)

86-H. Comments on Copper Strip Rolled From Chemically Produced Powders. Dennis K. Pickens. Paper from "Powder Metallurgy". Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1961, p. 543-552.

Commercial development of continuous rolling of strip from Cu powder. Powder characteristics are reviewed and comparative results of strip made from chemically produced powders as compared with strip from electrolytic powders. (H14; Cu, 6)

87-H. Continuous Hot Compaction of Metal Powders. P. E. Evans. Paper from "Powder Metallurgy". Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1961, p. 553-562.

Potentialities of hot rolling metal powders with results of experiments with Cu powders. The powder must be kept in motion while being heated. Since the apparatus did not permit rolling temperatures above 300° C., the hot rolled strip requires subsequent sintering. However, strip produced by rolling powder at 300° C. and subsequent sintering is stronger than cold rolled and sintered strip. 11 ref. (H14j, 1-66; Cu, 6)

88-H. Hot Extrusion of Metal Powders. P. Loewenstein, L. R. Aronin and A. L. Geary. Paper from "Powder Metallurgy". Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1961, p. 563-583.

Hot extrusion is a practical method of consolidating and shaping metal powders into long lengths of various cross sections. It generally yields superior physical properties and is at present used as the production method for a number of Al-base alloys. For other metals, however, hot extrusion is still in the laboratory stage. (H14k, 1-66; Al-b)

89-H. Lubricants for Powder Metallurgy Parts Manufacturing and Their Influence on Properties. Ernst Geijer and Roy S. Jamison. Paper from "Powder Metallurgy". Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1961, p. 585-610.

Prior to the briquetting of a metal powder part, a lubricant is usually mixed with the metal powder to minimize die wall friction. Analysis of variations obtained in mixed, pressed and sintered properties of a sponge Fe powder with and without graphite addition when mixed with varying amounts of different stearates and other solid lubricants. (H14, 18-73; Fe)

90-H. Shrinkage Compensation by Alloying. H. Silbereisen. Paper from "Powder Metallurgy". Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1061, p. 611-627.

There is an increase of volume if Cu is added to Fe powder. This phenomenon is investigated in a series of experiments. With the correct Cu addition it is possible to compensate the shrinkage so that there will be neither an increase nor a decrease in volume. With this method, the blueprint dimensions may, therefore, be used for die construction. The resulting compact will have, to a large extent, the required final dimensions. (H15, 9-67; Fe-b, Cu, AD-n32)

91-H. Recent Trends in European Metal Powder Parts Manufacture. Sven I. Hulthen. Paper from "Powder Metallurgy". Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1961, p. 631-643.

Efficient presses as well as continuous and semicontinuous furnaces for temperature up to 2375° F. have facilitated the manufacture of sintered parts with high physical standards. Much work has been devoted to the problem of manufacturing sintered parts with properties equal to those of ordinary forgings. (H-general, H15)

92-H. Titanium and Zirconium Powder Metallurgy. A.D. Schwope. Paper from

"Powder Metallurgy". Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1961, p. 731-746.

Powder metallurgy techniques for Ti and Zr follow classical methods and appear to be appropriate for production. The metals can be effectively strengthened by dispersions, particles or fibers and can be used as bases for alloy systems. Alloying elements which are alpha stabilizers are particularly useful since they usually have low melting temperatures and hence promote rapid sintering and homogenization. (H-general, N7a; Ti, Zr)

93-H. The Powder Metallurgy of Beryllium. Wallace W. Beaver and Harold F. Larson. Paper from "Powder Metallurgy". Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1961, p. 747-773.

Practically all processing methods applicable to powder metallurgy are useful in the consolidation of Be powder. Although vacuum hot pressing has many advantages for the production of large and short-run parts and the ability to cycle machine shot scrap directly back through the attritioning process makes it economic, other conventional powder metallurgy methods as well as specialized techniques can be used for making shapes closer to dimensions and to contour. 9 ref. (H-general; Be)

94-H. An Exploratory Investigation of Pre-Alloyed Powders of Aluminum. S. G. Roberts. Paper from "Powder Metallurgy". Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1961, p. 799-818.

Utilization of alloy powders instead of conventionally cast ingots in the production of wrought Al base alloys. Mechanical and metallurgical characteristics of laboratory scale extrusions made from atomized pre-alloyed powders. Alloys investigated are based on the common Al alloy systems and range in composition from current commercial alloys to highly alloyed materials in which the alloying additions are greatly in excess of the levels feasible with current commercial practices for wrought alloy production. 5 ref. (H14k; Al-b)

95-H. Powder Metallurgy Provides Friction Material Work Horse. Clyde S. Batchelor. Paper from "Powder Metallurgy". Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1961, p. 825-831.

Increased service requirements and broad new fields of application such as heavy duty truck brakes and aircraft brakes demand new physical shapes and advanced thinking. Fe-graphite combinations, cermetallics and certain austenitic compounds show considerable promise. Be with its low gravity, high modulus of elasticity, high specific heat and high conductivity has tremendous potential, particularly, for aircraft brakes. (H-general, Q-general, T-general; Be, Fe, SS, 17-57)

96-H. (Book.) Bibliography on Powder Metallurgy in Nuclear Engineering. (1956-1960). Henry H. Hausner and Helen C. Friedemann. 1961. 119 p. Metallwerk Plansee Aktiengesellschaft. Reutte/Tyrol, Austria. $2.

Collection of 643 selected references, most of them annotated. References are taken from reports, magazine and book literature and cover foreign as well as English language sources. (H-general)

97-H. (Pamphlet.) Production of Extrusion Billets of High Temperature Aircraft Alloys by Powder Metallurgy. M. W. Toaz, G. F. Davies and R. D. Johnson. AMC Aeronautical Systems Center, AMC TR-60-7-764, Manufacturing and Materials Technology Division, Wright-Patterson Air Force Base, Ohio, Dec. 1960, 111 p.

Out of several high-temperature superalloys for high performance aerospace vehicles, Rene 41 and PH-157 are best adapted for extrusion from powder metal billets by hydrostatic compaction. Density and mechanical properties of the powder metal extrusions are within 5% of those of wrought metal at room temperature. (H14k; Ni-b, SS)

98-H. Fiber-Metal Seals Allow High Temperature-Pressure Operation. Lars G. Soderholm. Design News, v. 16, June 19, 1961, p. 90-91.

Fabrication of high-temperature, high-pressure static seals using sintered and brazed skeletons of Mo and stainless steel fibers impregnated with melted In and Ag by compression under vacuum and in an argon atmosphere. Data are given for compression and recovery measurements, thermal cycling and

hydraulic leak tests at various temperatures to 1000° F. and pressure to 5000 psi. at varying impulse cycles. (H15, H17; Mo, SS, In, Ag)

99-H. Designing for Powder Metallurgy. T. L. Robinson. Precision Metal Molding, v. 19, June 1961, p. 24-26.

Design parameters for the composition, applications, corrosion resistance, accuracy, self-damping qualities, mechanical properties and tooth form of powder metal gears produced from Cu, nickel silver, brass, Fe and various steels. (H-general, T7a, 17-51; AY, Cu-b, CN, SS, 17-57)

100-H. Brass Gears and Cams Win 1961 Prize. Precision Metal Molding, v. 19, June 1961, p. 42-43.

Design considerations for dimensions, tolerances and mechanical properties of a fire alarm gear and cam assembly produced by powder metallurgy. (H-general, T7a, 17-51; Cu-n, 17-57)

101-H. How Design Affects Quality of Powdered Metal Parts. Iron Age, v. 187, July 6, 1961, p. 76-78.

Methods of designing powder metal parts so that no machining is required, sharp corners and thin walls are avoided and density is uniform. Parts should be shaped so that dies and punches can be strong. (H-general, 17-51)

102-H. Hot Pressing of Lead Spheres. F. E. Westermann and R. G. Carlson. Metallurgical Society of AIME, Transactions, v. 221, June 1961, p. 649-650.

Spherical antimonial Pb (47% Sb) alloy shot is pressed from 300-400° F. and 400-1500 lb. compressive load with dilatometric readings during compacting to test a rate equation for densification. Photo-macrographic examination is made of the compacted specimen. 4 ref. (H14h, H11k, M23b, 2-61, 3-74; Pb-b, Sb)

103-H. Powder Metallurgy. I. Jenkins. Metal Industry, v. 98, May 12, 1961, p. 375-377, 380.

Review of powder metallurgy processes with emphasis on pressing and sintering. Application in the area of high density components, magnetic processes, ferrous and nonferrous alloys, cemented carbides and porous and high-temperature materials. Future trends and research suggestions. (H-general)

104-H. Preparation of Tantalum and Niobium Metal Powders. Toyoji Ishiyama and Tadashi Kuroda. Electrochemical Society of Japan, Journal (Overseas Edition), v. 28, July-Aug. 1960, p. E143-E145.

Purity yield and yield efficiency data for the preparation of Ta and Cb metal powders by the Zeppelin and Kroll processes and the hydrogen-reduction process. Chlorination process flowsheet. (H10; Ta, Cb)

105-H. (French.) Stainless Steel Powder. Peintures, Pigments, Vernis, v. 37, Apr. 1961, 3 p.

Composition analyses and corrosion test on stainless steel powder containing a maximum of 0.12% C, 17-19% Cr, 0-2.5% Mo, 0-1.2% Cb, 0.8-3% Si and a maximum of 1% Mn. Description of their production from a melt by atomizing and simultaneous water quenching. 6 ref. (H10f, J26, R11; SS, C, Cr, Mo, Cb, Si, Mn, 6)

106-H. Powder Metallurgy. Machine Production, v. 20, June 1961, p. 17-19, 23.

Parameters are given for the molding, sintering and sizing of metal parts from various materials. Advantages include the use of unusual combinations of metals or of metals with nonmetals, applications to refractory metals and the fabrication of special products. (H-general)

107-H. Metal Powders--Boon for Industry? Erich Tetz. Canadian Metalworking, v. 24, July 1961, p. 21-22.

Advantages of metal powders in industrial applications. Summary of atomizing process which produces metal powder by subjecting molten metal to high pressure air blasting in the downward course of a huge funnel-like apparatus. (H10f; 6, 17-57)

108-H. All Industries Find Powder Uses. Donald Harvey. Canadian Metalworking, v. 24, July 1961, p. 23-24.

Production and use of sponge Fe powders and Fe alloy powders in powder metallurgy, the arc welding electrode industry and in cutting and

scarfing of stainless and alloy steel billets and other shapes. (H-general, W29h, F21e, G17; Fe, 6, 17-57, SS, AY)

109-H. What Is the Powder Metal Process? J. G. Parr. Canadian Metalworking, v. 24, July 1961, p. 25-26.

Review of methods for producing metal powders. Fabrication and interfacial diffusion. (H-general, N1h; 6)

110-H. How to Make Structural Parts From Powdered Metals. H. F. Johnson. Canadian Metalworking, v. 24, July 1961, p. 26-27.

Compressing, sintering and sizing operations to form low, medium and high density structural components. Advantages and limitations of the process. (H-general; ST, Fe, 6-72)

111-H. Redesign for Powder Parts. Richard B. Thompson. Metalworking Production, v. 105, June 28, 1961, p. 61-62.

Compacting and sintering Fe powder at 2000° F. in a controlled atmosphere for the production of pump thrust plates. Parts are self-lubricating, shock and wear resistant and have a dense, fine grained, pearlitic structure with a radial crushing strength of 37,000 psi. and tensile strength of 18,000 psi. (H15, Q-general; Fe, 6-72)

112-H. (Translation-Brutcher no. 4991.) Effect of Copper on Carbon Absorption in the Sintering of Iron-Copper (Powder) Alloys. V. K. Sorokin. Metallovedenie i Termicheskaya Obrabotka Metallov, Oct. 1959, p. 61-62.

Previously abstracted from original. See item 2-H, 1960. (H15, 2-60; Fe-b, Cu)

113-H. Preferred Design in Metal Sinterings. Metalworking Production, v. 105, July 5, 1961, p. 67-70.

Process design considerations including size, radial projections, length to diameter ratio, undercuts, re-entrant grooves and recesses, threads, bevels and tapers, holes in the direction of pressing and at right angles to the direction of pressing, variations in cross section, density, physical properties, tolerances and finishes. (H15, 17-51)

114-H. (Japanese.) The Grain Refining of Magnox by Powder Extrusion. Shigeyasu Koda and Shotaro Morozumi. Light Metals, v. 11, Mar. 1961, p. 125-130.

Comparative study of microstructure and mechanical properties of Magnox alloys (Mg-1% Al-0.015% Be), containing 0-40% Mg-0.6% Zr powder, produced by powder extrusion and of cast billet extrusions, both after annealing from 450-500° C. Data are given for tensile properties and corrosion resistance, recrystallization structures and grain size. 7 ref. (H14k, M27c, N5, Q-general, 2-64; Mg-b)

115-H. (Pamphlet.) Bibliography on Powder Metallurgy in Nuclear Engineering (1956-1960). Henry H. Hausner and Helen C. Friedemann. 1961. 119 p. Metallwerk Plansee Aktiengesellschaft, Reutte/Tyrol, Austria.

Annotated bibliography on research, properties, fabrication, production and application of powder metals with reference to nuclear engineering. Metals covered include Be, U, Zr, B, Al, Th, W, Cd, Si, Rh, Pu, Y, Hf, Ir, Fe, Pd, Pt, Cb, rare earths and their compounds and alloys. Principal processes noted are slip casting, bonding, sintering, isostatic pressing, coating, calcining, rolling, compacting, granulation and machining. 643 ref. (H-general, A-general, 10-54, 11-65)

116-H. Sintering Crystalline Solids. Pt. 1. Intermediate and Final State Diffusion Models. R. L. Coble. Journal of Applied Physics, v. 32, May 1961, p. 787-792.

Photomicrographs of pore and grain boundary structures in sintered powder compacts of Cu, Ag and various oxides for qualitative description of the densification phases. The explicit change in densification rate with discontinuous grain growth is predicted in terms of pore spacing and grain size. 12 ref. (H15, M27, N3, 2-59; Cu, Ag, 14-68, 17-56)

117-H. Blending Metal Powders. John J. Fischer. Precision Metal Molding, v. 19, July 1961. p. 36.

Principles of the process. Advantages of twin shell and double cone type blenders. Causes of segregation and overblending and preventive techniques. Effect of granulating powders before pressing. (H12, W26b)

118-H. Atomizing Shapes Future for Powdered Metals. Iron Age, v. 188, Aug. 10, 1961, p. 79-80.

Development of a process for atomizing pre-alloyed metal into powders having less surface oxide, higher green strength and a more desirable shape for molding into structural parts than products made by mixing primary powders. Application to stainless steel and Vasco 50 (50% Ni-Fe). (H10f, H11n; SS, Fe-b, Ni-b)

119-H. Particle Control Beefs Up Compacts. Arnold R. Poster. Steel, v. 149, Aug. 7, 1961, p. 66-69.

Green strength and density of powder compacts with emphasis on tungsten as affected by particle size and shape. (H11n, P10a; W, 6-71)

120-H. Designing With Powder Metallurgy to Improve Quality and Reduce Costs. Paul J. Failla. American Society of Mechanical Engineers, Paper no. 61-MD-16, 1961, 8 p. $1.

Design considerations in the manufacture of bronze, brass, Fe, Fe alloy and FeC mechanical components and oil-impregnated bearings. Commercial dimensional tolerances for plain cylindrical bearings, flange bearings and thrust washers. Friction of powders on die wall and punches. Mechanical limitations of tooling. (H-general, 17-51, Q9p, T7d; Cu-n, Cu-s, Fe)

121-H. Designing for Powder Metallurgy. T. L. Robinson. Precision Metal Molding, v. 19, Aug. 1961, p. 36-38.

Parameters for the design and application of powdered metal cams. Fabrication of density and yield in compression, data for several Fe, steel, stainless steel and Cu-base powdered metal compacts. (H14, 17-51; Fe, ST, Cu-b, 6-71, 17-57)

122-H. New Press Uses Water Pressure to Shape Powdered Metals. Iron Age, v. 188, Aug. 24, 1961, p. 72-73.

Production of boring bars, steel mill rolls and billets from carbides and powdered metals using a 100,000 ton capacity hydrostatic press actuated by 60 tons of water. (H14k, 1-70)

123-H. Carbon-Oxygen Relationship in Sintered Columbium. E. M. Grala and R. J. Van Thyne. Paper from "Columbium Metallurgy". v. 10. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1961, p. 139-145.

Little decrease in oxygen content occurs as a result of vacuum sintering Cb compacts at 2000° C. for 1 hr. at pressures below 1 micron. Carbon additions effectively aid in the removal of oxygen as carbon monoxide. The carbon composition of the sintered material is not increased unless the amount added is greater than the stoichiometric content required to form CO. Nitrogen content is unchanged by the 2000° C. treatment similar to low carbon, vacuum-sintered material. (H15, 1-73, N15; Cb)

124-H. Beryllium Processing by Powder Metallurgy. K. G. Wikle and V. C. Potter. Journal of Metals, v. 13, Aug. 1961, p. 537-544.

Description of the vacuum hot pressing process, including operational techniques required for high quality control and other techniques employed in powder processing and fabrication of hot pressed billets. (H-general; Be)

125-H. (Ukranian.) Sintering of Two-Phase Powder Systems. V. V. Skorokhod and I. M. Fedorchenko. Dopovidi Akademii Nauk Ukrainskoi RSR, Apr. 1961, p. 486-489.

Kinetics of the growth of interphase contacts in the powder systems Cu-W, Cu (5%Ni)-W, Cu(5%Ni)-ZrC and Cu-ZrC during sintering. Relationship between the wetting angle and the magnitude of interphase contacts is measured by electroconductivity. A theory of viscosity of block crystals is proposed. 10 ref. (H15, P13h; Cu-b, W, Ni, Zr, 14-68)

126-H. Density-Pressure Relationships in Powder Compaction. R. W. Heckel. Metallurgical Society of AIME, Transactions, v. 221, Aug. 1961, p. 671-675.

The rate of density increase with applied pressure for Fe, Cu, Ni, W and graphite powders is determined to be proportional to the volume fraction of pores for pressures exceeding a lower limit varying from 15,000 to 30,000 psi. depending on the powder. The relationship of the "At-pressure" and the "zero-pressure" powder compact density to the applied pressure is obtained from continuous measurements of punch movement during a single compaction operation.

4 ref. (H14, H11k, 3-74; Fe, Cu, Ni, W, NM-k36)

127-H. Don't Overlook Powdered-Metal Parts. Product Engineering (Design Digest Issue), v. 32, Sept. 4, 1961, p. 65-67.

Advantages and limitations of powder metal parts; basic principles of design with particular reference to Ni, brass and Ag. (H-general; Cu-n, Ag, Ni, 6-72)

128-H. Impregnation--Materials and Techniques. George J. Caudron. Product Engineering (Design Digest Issue), v. 32, Sept. 4, 1961, p. 167-168.

Success of the process depends upon infiltration of the pore and retention of material in the pore by capillary action. Commonly used impregnating materials are sodium silicates mixed with various fillers and polyester resins. The vacuum pressure technique delivers the greatest infiltration. (N16d; NM-d35, 17-57)

129-H. Sintered Insert Shaves Cost of Diecast Engine Flywheel. Henry Lefer. Precision Metal Molding, v. 19, Sept. 1961, p. 79.

Powder alloy used is 90% Fe-10% Cu. It is pressed at about 35-40 tons into a density of 63 gm. per cc., then is sintered in a reducing atmosphere. No sizing or coining is required. (H-general, E13; Fe-b, Cu, 7-59)

130-H. Designing for Powder Metallurgy. T. L. Robinson. Precision Metal Molding, v. 19, Sept. 1961, p. 80-83.

Materials and properties for nondisposable filters. Data on pore size, pressure drop, cleaning, machining and brittleness of filter materials with special reference to sintered bronze. (H-general, 17-51; Cu-s)

131-H. Small Stainless Steel Camera Components Produced by Powder Metallurgy. Machinery (London), v. 99, Aug. 16, 1961, p. 365.

Sintering and coining of stainless steel powders to form complicated shapes within close tolerances having necessary properties of corrosion resistance without further sealing or electroplating. (H15, H16a; SS)

132-H. (German.) Powder Metallurgy, a Complementary Subject to Ceramics. W. Jellinghaus. Berichte der Deutschen Keramischen Gesellschaft e.V., v. 38, June 1961, p. 253-257.

Powder metallurgy and ceramics are compared with reference to production of powders, production of compacts by pressing at room temperature and subsequent sintering at elevated temperatures, mechanism of sintering and surface treatments. 5 ref. (H-general; NM-f)

133-H. (Translation-Brutcher no. 5195.) Investigations Into the Sinterablity of Chromium-Nickel Austenitic Steels. F. Eisenkolb. Monatsberichte der Deutchen Akademie der Wissenschaften zu Berlin, v. 1, no. 7-10, 1959, p. 446-451.

Brief review of available German research data on the behavior in sintering of 0.05-0.20 C, 12-20 Cr, 8-20 Ni, 0.1-2.0 Si, 0-3 Mo steel powders. Ways of overcoming difficulties in sintering caused by slowed-down diffusion owing to presence of alloying elements in solid solution and of chromium oxide films on surface of particles. (H15; SS-e)

134-H. Vibratory Compacting. Metal Industry, v. 99, Sept. 1, 1961, p. 167-168.

Greater densities are obtained in compacting carbide with Ti or Co powder by combining vibration with pressure. (H14g, 1-54, 3-74)

135-H. (Russian.) Obtaining Plastic Tantalum From Electrolytic Powders. V. M. Amosov. Tsvetnye Metally, June 1961, p. 65-72.

Grinding, briquetting and vacuum sintering of high impurity electrolytic tantalum powder. Effect of C-O ratio and of Si on plasticity and porosity of Ta briquettes. 4 ref. (H15, 1-52; Ta, 6-73)

136-H. Hydrostatic Compaction of Consumable Electrode. Leonard S. Dorsett and Thomas M. Krebs. Paper from "Vacuum Metallurgy Conference, Transactions". Interscience Publishers, Inc., New York 1, 1961, p. 3-13.

A high pressure hydrostatic medium is used for compacting a column of fines within a flexible tube inside a pressure vessel. Application to Fe and Ti powder and sponge with subsequent vacuum sintering to produce consumable electrodes for vacuum melting. Effect of compaction on density and dimensional changes and of sintering on meltability of the electrodes. (H14, H15, 1-70, 1-73; Fe, Ti)

137-H. (Ukranian.) Influence of Variable Particle Sizes on Sintering of Two-Phase Powder Mixtures. V. V. Skorokhod and I. M. Fedorchenko. Dopovidi Akademii Nauk Ukrainskoi RSR, June 1961, p. 745-748.

Compressing and sintering of Cu and W powders with correlation of the effect of particle size on the electroconductivity and shrinkage of briquettes. 6 ref. (H15, P15g; Cu, W, 6-73, 9-67)

138-H. (Translation-ConBur.) Specific Surface of Titanium Sponge. L. V. Biryukova, L. L. Neroslavskaya and E. V. Mekhova. Journal of Applied Chemistry of the USSR, v. 33, Dec. 1960, p. 2761-2762.

Specific surface is determined as a function of compaction for sponge prepared by reduction of $TiCl_4$ with Mg and Na, electrolysis of $TiCl_4$ and electrolytic refining of Ti wastes. (H11j, 1-54, 2-60, C-general; Ti)

139-H. Hydrostatic Press. Machine Production, v. 20, Sept. 1961, p. 51.

A press which generates 50,000 psi. is used for compacting powder metals and carbides in rubber molds incased in perforated steel tubes. Application to the production of boring bars, billets, nuclear fuel, elements and consumable electrodes for arc melting. (H14g, 1-52, 17-51)

140-H. (Russian.) Influence of Small Additions of Nickel and Cobalt on Sintering of Iron Powder. R. A. Andrievskyj and I. M. Fedorchenko. Izvestiya Akademii Nauk SSSR--Metallurgiya i Toplivo, Mar. 1961, p. 50-54.

Changes in strength, density, porosity and shrinkage of sintered Fe powder briquets as effected by small additions of Ni and Co powder. 19 ref. (H15, 2-60; Fe, Ni, Co)

141-H. Metal-Bonded Graphite. Engineering Materials and Design, v. 4, Oct. 1961, p. 697-698.

Metal compacts containing Fe, Cu, Ni, W, Ce, Ca, Mg, Ba, Si, Co, Ag and Al are sintered with additions to improve wettability of graphite. Compressive strength is related to porosity and composition and electrical resistivity and wear data are given for anti-friction, electrical and refractory applications in the automotive industry. (H15, P15g, Q9, Q28, T21, 1-52, 3-71; NM-k36, 6-71)

142-H. (German.) Investigation of Concentration Changes in Binary Mixtures Nickel-Iron and Nickel-Copper in Sintering. Fritz Fraunberger and Volker Scheuning. Zeitschrift fur Metallkunde, v. 52, Aug. 1961, p. 547-550.

Sintering of pressed powder specimens of Ni (10-90%) and Fe (10-90%) and Ni and Cu (15% Cu) at temperatures from 500-1300° C. Investigation of concentration changes by inductive measurement of effective resistance influenced by sinter temperature and pressing force. (H15, P15g, 2-60, 2-61, 3-74; Ni, Cu, Fe, 6-71)

143-H. Designing for Powder Metallurgy. T. L. Robinson. Precision Metal Molding, v. 19, Oct. 1961, p. 69-70.

Design of ratchets and pawls to take advantage of wear resistance, hardenability and accuracy. (H-general, T7, 17-51; 6-71)

144-H. The Sintering of Tungsten and Molybdenum. Precision Metal Molding, v. 19, Oct. 1961, p. 88-89.

Effect of moisture content of the hydrogen atmosphere on nucleation and grain growth. (H15q; Mo, W)

145-H. (German.) Sinter Materials of Nickel or Nickel-Aluminide Containing Aluminumoxide. Werner Jellinghaus. Forschungsberichte des Landes Nordrhein-Westfalen, no. 1016, 1961, p. 1-33.

Compacts are produced by pressing of mixtures of Al_2O_3 with Ni, or NiAl alloy (50:50) and vacuum sintering at 1400-1500° C. with and without subsequent oxidation at 900-1100° C. in air. Investigation of deformability and stress-rupture strength and bending strength at elevated temperatures (800-900° C.) (H-general, Q3q, Q5g, Q23q, 1-52, 2-62; Ni, Ni-b, Al)

146-H. Fourth International Plansee Seminar (Held in Tyrol, Austria, on June 20-24, 1961). Werner Leszynsk. Journal of Metals, v. 13, Oct. 1961, p. 746-751.

General subject of "Powder Metallurgy in the Nuclear Age" includes sintering theory, two-component systems, dispersion strengthening, reactor fuel materials, properties of uranium carbides and oxides, uranium nitride, boride and Tn, Pu and Be and surveys of high-melting metals including W,

Ir, Mo, Ta, Cb and Ru and of pre-alloyed powders. (H-general, N7a, T11g, 11-63, 17-57; Be, Cb, Ir, Mo, Ta, Th, Pu, Ru, U, W)

147-H. Pressureless Compacting and Sintering of Metal Powders. H. H. Hausner. Journal of Metals, v. 13, Oct. 1961, p. 752-758.

Comparison with pressure compacting with reference to density, particle deformation and contact, diffusion, lattice defects, stress and other characteristics. Vibratory compacting and slip-casting processes. 11 ref. (H-general, H15, Q24m, 1-52, 10-54)

148-H. An Analysis of Powder Compaction Phenomena. R. W. Heckel. Metallurgical Society of AIME, Transactions, v. 221, Oct. 1961, p. 1001-1008.

The compaction of metal powders is analyzed through density-pressure curves as a three-stage process--die filling, individual particle motion and gross compact deformation. The densification occurring during each of these stages is evaluated quantitatively for specimens of Fe, Ni, Cu, W and 4630 steel. The amount of densification in the first and second stages is primarily a function of particle geometry. The densification taking place in the third stage is dependent mainly upon the material. 18 ref. (H14, H11, 3-73; Fe, Ni, Cu, W, ST)

149-H. Beryllides Boost Temperature Level. John Judge. Missiles and Rockets, v. 9, Nov. 6, 1961, p. 36-37.

Powder metallurgical production of $TaBe_{12}$, Ta_2B_{17}, $CbBe_{12}$, Cb_2Be_{17}, $ZrBe_{13}$ and Zr_2Be_{17} by cold and isostatic pressing, sintering, extrusion, slip casting, diamond grinding and flame spraying. Evaluation of oxidation resistance, specific gravity, modulus of rupture and tensile strength for beryllides used in missile components. (H14, H15, Q27, T24f; Be, Ta, Cb, Zr, 14-68, 17-57)

SECTION J

HEAT TREATMENT

1-J. Temperatures for Rapid Uniaxial Stress Relief of Heat-Resistant Alloys. Howard S. Avery. Welding Journal, v. 39, Nov. 1960, p. 509s-512s.

Hindered contraction testing of alloy steel to determine the temperature necessary to reduce residual stresses below a selected level. Effect of composition on stress in cast heat resistant alloy steel cooled under restraint from 2000° F. 6 ref. (J1a, Q25, 2-60; AY, SGA-h)

2-J. (Japanese.) Die Steel. Akira Takeuchi. Metals, v. 30, Sept. 1, 1960, p. 40-43.

Martempering, sub-zero treatment, surface hardening (atomalloy treatment) and hard Cr plating of die steel to increase hardness and toughness; protection against warping and aging; applications. (J26p, J28, L17, Q29n; TS)

3-J. Surface Treatment Extends Metal Life. B. M. Pearson. Machinery Lloyd (Overseas Edition), v. 32, Oct. 8, 1960, p. 41-43.

Methods for increasing wear resistance of steel and cast iron parts including surface deposition of metal diffusion coatings by oxides and carbides, hardness, induction hardening and nitriding. (J28, J2g, L15, Q9n; CI, ST)

4-J. (French.) Surface Treatment by "Sulphinuzation". R. Desbrandes. Metaux-Corrosion-Industries, v. 35, Oct. 1960, p. 353-378.

Sulphinuzed steels with lower friction resistance and improved abrasion resistance are produced by a cementation process in a molten bath of cyanide, sulphocyanide and alkaline sulphide salts at 550° C., with cooling in still air. (J28, Q9n, Q9p; ST)

5-J. Vacuum Bright Annealing in Elevated Furnaces. Wire Industry, v. 27, Oct. 1960, p. 985-987.

Annealing of wires of all gages and tubes with very narrow inner diameters in elevated annealing furnaces. (J23a, 1-73, W27; 4-60, 4-61)

6-J. Does Silicon Accelerate Decarburization? Peter Payson. Metal Progress, v. 78, Dec. 1960, p. 78-81.

Not in medium-carbon alloy steels, according to the author. Si actually promotes separation of ferrite from austenite on cooling and the excess ferrite at the surface of steels high in Si has been attributed erroneously to decarburization. Elements added for more hardenability (Cr and Mo, for example) will negate this effect. (J4a, J5, 2-60; AY, Si)

7-J. (German.) Heat Treatment and Hardening of Various Types of Cast Iron. Horst Hentze. Industrie-Anzeiger, v. 82, Nov. 15, 1960, p. 1579-1582.

Unalloyed and alloyed Fe, both with laminar graphite and SG cast iron are held at 320-620° C. for 0-15 hr. Residual stress, transformation temperature, growing tendency and dissolved carbon are determined as functions of compositon, heating temperature and time. 7 ref. (J-general, N-general; CI)

8-J. (Russian.) Thermomechanical Magnetic Treatment of Metals and Alloys. M. L. Bernshtein. Metallovedenie i Termicheskaya Obrabotka Metallov, Oct. 1960, p. 31-36.

Combination heat treatment for steels and technically pure Fe to improve tensile properties and plasticity. Method

consists of tensile loading after furnace heating of material with subsequent austenitization at 800-950° C. in a magnetic field, followed by water cooling and tempering. 8 ref. (J22, J29, Q23p, Q27a; ST, Fe-a)

9-J. (Russian.) Conveyor Type Quenching-Tempering Equipment. V. I. Filippov. Metallovedenie i Termicheskaya Obrabotka Metallov, Oct. 1960, p. 46-54.

Quenching and tempering of 1KH18N9T and KH25N20 steels using electric heat treating furnaces with automatic temperature regulation in a conveyorized line. (J26, J29, W27, 1-52; ST)

10-J. (Russian.) Heat Treatment of Forging Dies. I. N. Tavadze and E. K. Kovshikov. Metallovedenie i Termicheskaya Obrabotka Metallov, Oct. 1960, p. 54-57.

Oil quenching of forging die bodies with simultaneous tempering of the shanks to provide maximum hardness. Correlation of heat treatment parameters with grade of steel in the die. (J26, J29, Q29n, W22a; ST)

11-J. (Russian.) Normalizing and Sorbitizing of Rails Along the Whole Length at Dzerzhinsky Iron Works. P. T. Besedin, H. H. Oreshkin, A. A. Sorokin, P. M. Chepelev, A. F. Valilev, A. M. Karpunin and A. D. Kutsenko. Stal', Oct. 1960, p. 946-953.

Heat treatment of rails to increase mechanical properties at low temperatures and after aging. Testing of rails for flaking, plasticity and shock resistance. 5 ref. (J24, N8, Q-general, 2-63, T23q)

12-J. Quench Hardening of Aluminum. Takao Kino. Hiroshima University, Journal of Science, Series A, v. 24, July 1960, p. 85-96.

The increase of yield stress due to the quenching is investigated using Al polycrystalline wire 0.5 mm. in diameter. The main contribution of quenching vacancies to hardening is caused by the internal stress originated by the vacancy clusters dispersed in bulk. 11 ref. (J26; Al)

13-J. Open Coil Processes of Annealing and Gas Alloying. Engineer, v. 210, Oct. 7, 1960, p. 611-612.

Separations between individual wraps of cold rolled Sn or steel coils permit rapid heating and cooling during annealing. Carbon, nitrogen and other alloying elements that can be gasified during annealing are used to change the composition of the coil. (To be continued.) (J23; Sn, ST, 4-53)

14-J. (Ukrainian.) Softening of Steel During Electric Heating. V. N. Gridnev and Yu. Ya. Meshkov. Dopovidi Akademii Nauk Ukraino'koi RSR, Aug. 1960, p. 1081-1084.

Quench-hardened or cold deformed (33-80%) steel samples are exposed to cyclic electric heating in magnetic field at various temperature intervals. Effect on kinetics of internal stresses relaxation, magnetization changes, structure and mechanical properties. 8 ref. (J29, P-general, Q-general; ST)

15-J. (German.) Kinetics of Annealing of Martensite and of Retained Austenite Decomposition Determined by Hardness Measurements and Bend Tests on a 1.1% C Steel. Peter Fischer. Archiv fur das Eisenhuttenwesen, v. 31, Oct. 1960, p. 617-622.

Data for hardness, bending strength and angle and retained austenite content of unalloyed steel samples annealed at 160-400° C. are correlated with annealing time and temperature and activation energies for precipitation from martensite. (J23, N8, Q29, Q5, P13a, 2-61; CN)

16-J. A Basic Guide to Specifying Heat Treatment of Steels. Pt. 1. Heat Treatment Methods. Lester F. Spencer. Machine Design, v. 32, Dec. 8, 1960, p. 160-167.

Normalizing, annealing, quenching and tempering of carbon and alloy steels. Effect of heat treatment on mechanical, electrical and magnetic properties. (J-general, Q-general, P15, P16; AY, CN)

17-J. (Japanese.) Nitriding Treatment of High Speed Steel. Sadao Koshiba, Kazuo Taraka and Akeo Sumi. Japan Institute of Metals, Journal, v. 24, July 1960, p. 429-432.

Hardness distribution and depth of nitrided case, microstructure, toughness and cutting durability of high speed steels nitrided in liquid after heat treatment, at 450-600° C. for 30-60 min. dipping times. (J28k, Q-general; TS-m)

18-J. Induction Heating of Alloy Steel for Rolling. Roy H. Neer. Iron and Steel Engineer, v. 37, Oct. 1960, p. 117-120.

Induction heating of alloy steel billets minimize scale formation and decarburization. Design of the conveyorized system which discharges the billets at the mill. (J2g; AY, 4-52)

19-J. New Salt Bath Furnace at Convair Heat Treats Aluminum Alloy Sheet Parts. Industrial Heating, v. 27, Nov. 1960, p. 2350, 2512.

Heat treatment of Al alloy aircraft parts at 800-1200° F. using a salt bath furnace which holds a 22,000 lb. bath of $NaNO_3$. (J-general, T24, W27m, 1-52; Al-b, 4-53)

20-J. Alumina Lined Hump-Type Atmosphere Furnace Bright Brazes and Heat Treats Stainless Steel. Industrial Heating, v. 27, Nov. 1960, p. 2380, 2382.

Bright annealing, bright brazing and atmosphere quenching of fabricated stainless steel dies using an electric hydrogen-controlled atmosphere furnace. (J23a, J26, K8, W27n; SS)

21-J. Vacuum and Controlled Atmosphere Heat Treatments Specialized at Metallurgical Consultants, Inc. Industrial Heating, v. 27, Nov. 1960, p. 2503-2504, 2506, 2508, 2510, 2512.

Brazing in all atmospheres, bright annealing, nitriding, vacuum outgassing, aging and atmosphere quenching of aircraft, missile, atomic and electronic components. (J-general, 1-73, T1, T24)

22-J. Continuous Annealing Furnace. Iron & Steel, v. 33, Nov. 1960, p. 547.

Steel forgings and stampings are cycle annealed and normalized in a five-zone furnace with conveyorized charging and discharging. (J23, J24, W27, 1-52; ST, 4-51, 4-59)

23-J. (Spanish.) Notes on Nitriding and Data on the Use of Type F-124 Chromium-Molybdenum Alloy as a Nitriding Steel. Pt. 1. Enrique Garcia. Tecnica Metalurgica, v. 16, May-June 1960, p. 111-124.

Effect of nitriding on performance and life of steel automotive and aircraft components, turbine parts and machinery parts in general. Principles and mechanism of nitriding. Influence of composition of steel, structure of core and nitrided case and process variables (time, temperature and degree of dissociation of ammonia) on hardness and depth of nitrided layer. Changes produced by this nitrided layer in mechanical properties of steel. (J28k, 2-60, 2-61, Q-general, T21, T24; ST)

24-J. (Spanish.) Contribution to the Study of Spanish Casehardening Steels and the Direct Measurement of Case Depth. Pt. 1. P. G. Gomez and E. Asensi. Tecnica Metalurgica, v. 16, Jan-Feb. 1960, p. 1-45.

Casehardening and service behavior of aircraft engine components. Cementation process and theories of diffusion. Structures, case depths and hardness of a carbon steel, a Cr-Mo steel, two Cr-Ni steels and a Cr-Ni-Mo steel treated in cyanide bath and with "Caron" mixture, a solid casehardening agent composed of carbon and barium carbonate, at temperatures of 875-925° C. for periods of 1-8 hr. (J28, Q29n, T24b; CN, ST, Cr, Mo, Ni)

25-J. Vacuum Annealing. Mechanical World, v. 140, Nov. 1960, p. 450.

Vacuum annealing of Cu-wire using a bell furnace installation with a movable cylindrical casting and automatically controlled heating elements. (J23, 1-73, W27; Cu, 4-61)

26-J. (Italian.) Heat Treatment of Ductile Light Metals. Pt. 2. E. Hugony. Trattamenti Termici, v. 3, Sept-Oct. 1960, p. 3-12.

Duralumin, Avional and Ergal type alloys are exposed to stabilization annealing or heterogenization heat treatment causing coalescence of the precipitate Al_3Mg_2, subsequent to deformation. Effect of heating and cooling velocities in hardening on mechanical properties and corrosion resistance. (J21, J23, Q-general, 3-67; Al-b, EG-a39)

27-J. (Italian.) Hardening of Stamping Dies. Pt. 3. M. Tosci. Trattamenti Termici, v. 3, Sept-Oct. 1960, p. 15-24.

Die steels containing 0.90% carbon are hardened at 740-900° C. and water quenched with some samples being subsequently tempered for 2 hr. at 180-300° C. Effect of heat treatment temperatures on hardness, elasticity, toughness and microstructure. (J-general, M27, Q-genera; TS)

28-J. (German.) Surface Hardening Plant for Welded Crossing and Wing Rails. Horst Binnewies. Glasers Annalen, v. 84, Sept. 1960, p. 509-512.

Design and mode of operation of hardening plant. Preheating of steel rails in an oil furnace to 600° C., heating to hardening temperature (930° C.) by coal gas and oxygen burners and subsequent shower-quenching to obtain 350-400 Brinell surface hardness. (J-general, 18-67, T23q; ST, 7-51)

29-J. Heat Treating Electrical Steels. John J. Lawless. American Machinist/Metalworking Manufacturing, v. 104, Nov. 14, 1960, p. 128-129.

Heat treatment of high Ni and Si steels and magnetic ingot iron, with emphasis on control of contamination levels and cooling rate. (J-general; CI-a, ST, Ni, Si)

30-J. (Pamphlet.) Cold Rolled Carbon Spring Steel. Steel Products Manual, Nov. 1960, 34 p. American Iron and Steel Institute, 150 E. 42 St. New York 17, New York.

Manufacturing methods and heat treatments in production of cold rolled steel. Specifications for Rockwell hardness, dimensional tolerances, edges and finishes. (J-general, S22; CN, SGA-b)

31-J. (French.) Effect of Oxidation During Heat Treatment on the Machinability of Black Heart Malleable Iron. Journal d'Informations Techniques des Industries de la Fonderie, Oct. 1960, p. 10-11.

Hardness increase in small sections as caused by oxidation and the formation of cementite during malleablizing. (J23b, G17k, R1h; CI-s)

32-J. (German.) Residual Stresses in Iron Castings and Their Elimination by Annealing. Joseph Czikel, Harald Kochling and Joseph Sturm. Freiberger Forschungshefte, B 45, 1960, p. 21-52.

Stress-free annealing of a cast iron lathe frame at 300-450° C. and of plate-shaped iron castings at 450-600° C. Microstructure of stress-relieved castings. (J1a, J23, M27; CI, Fe, 5)

33-J. Heat Treatment of Cast Stainless Steels. Pt. 1. W. P. James. Precision Metal Molding, v. 18, Dec. 1960, p. 36, 38.

Effects of various heat treatments, including annealing, normalizing, hardening and tempering on mechanical and physical properties of investment cast steels with special attention to 410 steel as a representative of the martensitic group. (J-general, P-general, Q-general; SS, 5-62)

34-J. An Improved Die Surface. H. K. Barton, R. Pochard and M. Veilhan. Precision Metal Molding, v. 18, Dec. 1960, p. 31-33.

Application of the Lubri-Case process, a soft nitriding or second tempering carried out in a Cassel type salt bath at about 570° C., for producing dies with a slippery surface which is highly resistant to galling. (J28k, W19n)

35-J. (German.) Experimental Determination of Case Depth in Induction Hardening at a Frequency of 10 Kcs. H. Geissel. Elektro Warme, v. 18, Oct. 1960, p. 309-313.

Computation of power consumption and heating time to evaluate case thickness at given hardening temperature. Induction heating of CK45 steel specimens (20-80 mm. diameter) at 900-920° C. and subsequent shower quenching. Measurement of case depth by macrostructure examination. (J2g, Q29n, 1-54; AY)

36-J. Is Premature Die Failure Necessary. R. F. Spillett. Metalworking, v. 16, Dec. 1960, p. 69-70.

The greater percentage of die failure is caused by faulty heat treatment. Mistakes during austenitizing and quenching involve overheating or underheating, removing from quench too soon, quenching too cold and not tempering immediately, using the wrong quenching medium, non-uniform quenching, or insufficient volume of liquid quenching medium. (J-general; TS)

37-J. (Japanese.) Nitriding of Titanium. Akira Takamura. Japan Institute of Metals, Journal, v. 24, Sept. 1960, p. 565-569.

Kinetic study of the nitriding of Ti in a nitrogen stream at 850-900° C. Diffusion and reaction rates, case depth and hardness distribution as a function of nitrogen solubility and diffusion coefficients, time and temperature. 13 ref. (J28k, N-general, P13b, Q29; Ti)

38-J. Effect of Carbide Stringers on the Distortion of Die Steels During Heat Treatment. K. Sachs. Metal Treatment and Drop Forging, v. 27, Nov. 1960, p. 455-460.

Causes and mechanism of die steel distortion during heat treatment; influence of structure of steel with emphasis on part played by carbide stringers. Effect of temperature, heating rate and alloying additives. (J-general, 2-60, 2-61, 3-71; TS, 9-74)

39-J. Heat Treatment of Steel. Pt. 10. Liquid Heating Baths. E. Gregory and E. N. Simons. Edgar Allen News, v. 39, Nov. 1960, p. 251-252.

Use of liquid heating baths of molten pig Pb contained in cast iron, pressed steel or heat resisting alloy pots with solid or liquid covers to prevent oxidation of the molten Pb. Classification of salt baths and their use in heat treating steel. (J-general; ST)

40-J. Which Heat Treatment for AM350 and AM355? Materials in Design Engineering, v. 51, Dec. 1960, p. 110-112, 145.

These steels are deliverable in six conditions. By choosing the proper combination of treatments a wide range of mechanical properties can be obtained. (J-general; SS)

41-J. (Russian.) Protective Atmosphere for Heat Treatment of Stainless Steels, Heat Resistant Materials and Titanium. A. Ya. Ishchenko and V. I. Kolchinskii. Metallovedenie i Termicheskaya Obrabotka Metallov, Nov. 1960, p. 25-28.

Methods for drying and purifying of Ar and hydrogen. Use of halogenized protective atmosphere in place of vacuum for bright annealing, nitriding and soldering of heat resistant materials. (J-general, K7; SS, SGA-h, Ti)

42-J. (Russian.) Effect of Heat Treatment and Nitriding on the Magnetic Properties of Austenitic Steels. M. M. Belenkova, A. V. Kostenko, M. N. Mikheev, E. E. Stoinskaya, T. M. Pogrebetskaya and A. A. Yurgenson. Metallovedenie i Termicheskaya Obrabotka Metallov, Nov. 1960, p. 16-20.

Samples are heat treated at 1150-1070° C. with subsequent aging at 800° C. and nitriding at 600° C. for 55-75 hr. Structure and magnetic susceptibility and permeability are measured as a function of depth of the nitriding layer. Results of experiments show the possibility of controlling nitriding depth by an electromagnetic method. 5 ref. (J-general, J27d, J28k, P16; SS-e)

43-J. (Russian.) Heat Treatment of Manganese Cast Iron Crankshafts. D. A. Sveshnikov. Metallovedenie i Termicheskaya Obrabotka Metallov, Nov. 1960, p. 28-37.

Hardness, tensile strength, bend strength and elongation of crankshafts having a granular pearlitic structure which is produced by air quenching from 950° C. and tempering at 725° C. for 8 hr. with subsequent air cooling. (J26, J29, Q-general, T21b; CI, Mn)

44-J. (Italian.) Heat Treatment of SG Cast Iron. Fonderia, v. 9, Oct. 1960, p. 454-455.

Gray cast iron with 3.42-3.49% C, 1.87-2.98% Si, 0.32-0.34% Mn, 0.03% P, 0.01% S and 0.75-0.82% Ni, Ni alloyed and Ni-Mo alloyed iron are stress relief annealed at 1000-1250° F., treated for higher ductility at 1650° F., normalized, tempered at 1600-1700° F. and austempered, martempered or surface hardened to improve ductility and hardness. (J-general, Q29n, Q23p; CI, Fe, Mo, Ni)

45-J. How to Cut Tool and Die Costs. Pt. 3. Eliminating Heat-Treat Failure. J. S. Pendleton, Jr. Tool and Manufacturing Engineer, v. 45, Dec. 1960, p. 49-51.

Heat treat failures on steel tools are minimized by well planned fixturing in the furnace, correct atmospheres and controlled annealing and quenching methods. Effect of size change, soft spots, warpage and cracking on tool failure. (J-general, T6; ST)

46-J. The Heat Treatment of Steel. Edwin Gregory. Edgar Allen News, v. 39, Dec. 1960, p. 271-272.

Advantages of medium and high temperature salt baths for hardening of steel using rectification agents or cast iron chips to prevent contamination. Methods of melting and replenishing baths for use at 500-900° C. (J2j; ST)

47-J. Method of Heat Treating Silicon Steel. George W. Wiener. U. S. Patent, no. 2,965,526, Dec. 20, 1960.

Production of oriented Si steel strip to specified thickness and magnetic and electrical properties by annealing material containing small quantities of oxides, sulphides and nitrides at annealing temperatures as high as 1300° C. in a reducing atmosphere and using a high rate of

heating. 5 ref. (J23, F23, 1-67; ST, Si, 4-53)

48-J. (German.) Soft Nitriding and Carbonitriding in Precision Mechanical Engineering. F. W. Eysell. VDI Berichte, no. 46, 1960, p. 57-61.

Soft nitriding in salt bath at 570° C. and carbonitriding in cyanide and cyanate bath of steel and cast iron at 700-730° C. is discussed with reference to: dimensional changes and deformation of parts during carbonitriding; surface roughness and mechanical properties; formation and influence of diffusion in martensite zone and hardness testing. Applications. (J28k; CI, ST)

49-J. (Japanese.) Change of Brightness of Steel Parts During Bright Quenching Related to Deterioration of Quenching Oil by Thermal Decomposition. Masayashi Tagaya, Imao Tamura and Mitsugu Tanaka. Metal Finishing Society of Japan, Journal, v. 11, Nov. 1960, p. 629-632.

Nichrome and steel specimens heated at 900° C. are quenched cyclically in circulating mineral and fatty oils held at constant temperature of 30° C. in a nitrogen atmosphere. Decrease in brightness and increase in thermal polymerization is reported as a function of oil deterioration and specimen reaction with decomposition products as a result of oxidation and thermal decomposition. 4 ref. (J26; ST, Ni-b)

50-J. How to Select Proper Case Depth for Carburized and Hardened Gears. R. Pedersen and S. L. Rice. SAE Journal, v. 68, Nov. 1960, p. 34-38.

Testing of gears composed of 8600 and 8700 steel to determine case thickness and causes of pitting fatigue and case crushing. Subsurface shear strength is calculated for gear teeth and used to determine shear stress/shear strength ratios. (J28, T7a; ST)

51-J. (German.) Bright Annealing in Hood Furnaces Under High Vacuum. E. Schwarz. Draht, v. 11, Nov. 1960, p. 710-713.

Bright annealing of cold worked steel or Cu wire in mobile hood furnaces at temperatures over 350° C. with automatic temperature control. (J23a, 1-73; Cu, ST, 4-61)

52-J. Automatic Hardening and Tempering of Carbine Barrel Forgings. Iron and Steel, v. 33, Dec. 1960, p. 576-577, 581.

Effective dimensions, rating and operating temperatures of furnaces. (J26, J29, W27; 4-51)

53-J. New Process Ups Fatigue Strength of Steel. Western Metalworking, v. 18, Dec. 1960, p. 41-42.

Heat treating process for mild, stainless and alloy steels and cast irons based on immersion in a specially formulated molten salt bath operating at 1050° F. Process develops a tough, ductile, wear resistant surface and increases fatigue strength and resistance to corrosion. (J2j, Q7a, R-general; AY, CN, SS)

54-J. Spray Cooling Inside a Standard Bell Furnace. American Machinist/ Metalworking Manufacturing, v. 104, Dec. 26, 1960, p. 70-71.

Annealing of strip metal in an atmosphere of steam and natural gas using a bell furnace. Water is introduced during the cooling cycle and is turned to steam. Vaporization of the water extracts heat from within the bell and circulation of the resulting water vapor cools the work. Internal spray cooling boosts production by cutting the overall annealing cycle from 22 to 10 hr. (J23, W27; 4-53)

55-J. Reroller Adopts Vacuum Annealing. Machinery, v. 67, Jan. 1961, p. 143.

Production of stainless steel and high Ni strip and electrical resistance wire in a rerolling plant. A vacuum annealing system has been installed to produce purer products. (J23, F23; Ni, SS, 4-53, 4-61)

56-J. (Czech.) Precipitation Hardening of Low Carbon Steel. Mirko Klesnil and Premysl Rys. Hutnicke Listy, v. 15, Nov. 1960, p. 867-876.

A steel containing 0.05% C and 0.0042% N is held at 1000° C. for 1 hr. and cooled in a furnace for 24 hr. to develop a large grain. After heat treatment at 700° C. water quenching, the steel is aged at 23-128° C. and studied by microscopy to determine amount of precipitation. 18 ref. (J27, N7, M21; CN-g)

57-J. (German.) Development and Properties of Direct Case-Hardenable

Steels. Herbert Tauscher and Eberhard Stecher. Neue Hutte, v. 5, Oct. 1960, p. 596-607.

Development of case-hardenable steel by alloying with elements which improve hardenability (Mn, Mo, Cr, Si, Ni, B) and control grain size (Mo, Ti, W, V). Static and dynamic mechanical properties for 20 MoCr5 and K13NiCr14 steel after varying case-hardening operations. (J5, J28, M27c, Q-general; AY)

58-J. Computerized Control of a Continuous Annealing Line. Robert H. Smith. Paper presented at Pittsburgh Regional Technical Meeting, American Iron and Steel Institute, Nov. 16, 1960, 19 p.

Continuous annealing of Sn-plated steel strip in a line in which all process variables of the annealing cycle, including temperature, holding time and resultant metal hardness are controlled by digital computers. (J23, 18-74; ST, 4-53, 8-62, Si)

59-J. Continuous Annealing...Increases Production of Motor Laminations. Irwin Schumaier. Metal Treating, v. 11, Dec-Jan. 1961, p. 7-8, 43.

An automatic conveyorized heat processing machine is used to anneal stator and rotor laminations. (J23, W11q)

60-J. (German.) Investigation of Stress-Free Annealing for Stress Relief of Alloyed and Unalloyed Steels. M. Kroneis. Schweisstechnik, v. 14, Nov. 1960, p. 126-128.

Prestressed springs of alloyed and unalloyed steels are annealed at 300-700° C. and at varying annealing times. Elastic recovery is measured as an indicator of residual stress. (J1a; ST)

61-J. Effect of Carbide Stringers on the Distortion of Die Steels During Heat Treatment. K. Sachs. Metal Treatment and Drop Forging, v. 27, Dec. 1960, p. 487-492.

Causes and mechanism of distortion of die steels during heat treatment; influence of the structure of the steel and the role of carbide stringers. (J-general, N8r; TS, 9-74)

62-J. (German.) Short Time Malleablizing. Horst Kruger. Giesserei-Technik, v. 6, Oct. 1960, p. 312-313, 316.

Duplex melting of malleable iron (2.5% C; 1.4% Si; 0.5% Mn) for auto parts in 750 mm. diameter hot blast cupola and four ton line-frequency induction furnaces. Malleablizing (two-chamber system) by preheating at 350° C., annealing at 950° C. and cooling at a cooling rate. (J23b, E10; CI-s)

63-J. Influence of Alloying Elements on the First Stage of Tempering in High-Carbon Steels. H. W. King and S. G. Glover. Iron and Steel Institute, Journal, v. 196, Nov. 1960, p. 281-288.

Tempering of five 1% carbon steels containing Si, Mn, Ni, Cr, or Mo and 1.14% plain carbon steel at range 23-100° C. is studied by measurements of the change in electrical resistivity. Cr and Mo steels resistance decreases with tempering time at all temperatures. Resistance changes in Si, Ni and plain carbon steels exhibited a positive peak and Mn steel a point of inflection, at temperatures below 80° C. These various forms of resistance changes are associated with alpha-carbide in coherent form. 28 ref. (J29, N8r, P15g; CN-r)

64-J. Open Coil Process of Annealing and Gas Alloying. No. 2. Engineer, v. 210, Nov. 28, 1960, p. 650-651.

Control of the carbon and nitrogen level and the temper of steel through temperature-time and atmosphere regulation in open coil annealing. Gas alloying and decarburizing are applied producing "direct on" enameling steel and "Tu", "T-5" and "T-6" tinplate from one grade of steel. (J23, J2k, J4a; ST-d, Sn, 8-62)

65-J. (Czech.) Heat Treatment of Cast Iron in Gas-Tight Containers. Stanislav Drapal and Josef Rydlo. Slevarenstvi, v. 8, Nov. 1960, p. 379-383.

Black-heart iron of improved mechanical properties is obtained by malleablizing in gas-tight containers. Impact strength is measured as a function of testing temperature from -30 to 200° C. Fracture of castings malleablized in packing material is compared with that of castings heat treated by the new method. 9 ref. (J23b, Q6n, 2-61, Q26; CI-S)

66-J. New Carburizing Steels in German Automobiles. H. U. Meyer. Metal Progress, v. 79, Jan. 1961, p. 70-75.

Comprehensive research into the nature of case hardenability has led to the development of carburizing steels in which the major alloying element is Mo. These new steels have been successful to the point where they have replaced standard carburizing grades in German automobiles despite their higher cost. (J28g, J5, 2-60; AY, Mo)

67-J. Stress-Relieving Large Weldments by Radiant Heating. Tom Bishop. Metal Progress, v. 79, Jan. 1961, p. 124.

Halves of turbine castings, measuring about 21 x 17 x 18 ft., are stress-relieved after welding by 68 single phase radiant heating elements each of 7 1/2 kw. rating. (J29a, W11m, 7-51)

68-J. (English.) Difference Between Single Isothermal Annealing and Successive Isothermal Annealing Effects in Cold Worked Aluminum. Genjino Mima. Osaka University, Technology Report, v. 10, Mar. 1960, p. 489-503.

Recovery and recrystallization processes in Al specimens as a function of annealing time, temperature (100-550° C.) and cycle determined by room temperature measurements of internal friction and tensile properties and by metallographic analysis. Relation between softening phenomena and annealing temperature. 10 ref. (J23s, N4, N5, Q22, Q27; Al-a)

69-J. Low Temperature Annealing Stages of Irradiated Copper. Ryukiti R. Hasiguti. Japan Academy, Proceedings, v. 36, June 1960, p. 335-339.

Various low temperature stages of lattice defect annealing in Cu are interpreted in terms of the trapping of interstitial atoms by impurity atoms. (J23, 1-67; Cu)

70-J. A Basic Guide to Spectifying Surface Hardening of Steels. Pt. 1. Hardening Methods. L. F. Spencer. Machine Design, v. 33, Jan. 19, 1961, p. 148-154.

Study of two general classifications of surface-hardening procedures, those that involve a chemical reaction between the surface of the steel and an external medium and those that develop surface hardness by selective heating and quenching. (J28; ST)

71-J. Heat Treatment of Cast Stainless Steel. Pt. 2. W. P. James. Precision Metal Molding, v. 19, Jan. 1961, p. 39-41.

Effect of heat treating variables on 17-4PH stainless with special reference to investment castings. Ferrite formation; austenite retention; influence of Cu content on mechanical properties. (J-general; SS, 5-60)

72-J. Working the Exotic Alloys. Gilbert C. Close. Modern Machine Shop, v. 33, Jan. 1961, p. 116-121.

Review of production problems involved in heat treating, joining, grinding and chemical milling of high-temperature, high-strength alloys. (J-general, K-general, G17, G24b; SGA-h, SGB-a)

73-J. Specialized Heat-Treating Cuts Die Costs. Donald F. Griffin. Metalworking Production, v. 104, Dec. 28, 1960, p. 53-56.

Outline of a five stage heat and freeze cycle in a controlled atmosphere furnace which permits production of die steels according to application. Dies are used in thread rolling and cold forming. (J2k; TS)

74-J. Heat-Treating Electrical Steels. John J. Lawless, Jr. Metalworking Production, v. 105, Jan. 11, 1961, p. 56-58.

Heat treatment of high Ni, high Si steels for cores and shielding in protective and reactive atmospheres at up to 2050° F. taking into account the effect of alloy composition on the heat treatment procedure. (J2k; ST, SGA-n, Ni, Si)

75-J. (German.) Surface Hardenability as a Criterion for Case Hardening Steels. Hans Ulrich Meyer. Berg- und Huttenmannische Monatshefte, v. 105, Nov. 1960, p. 292-301.

Presentation of surface hardness curves for various German and American case hardened Mn, Cr, Ni and Mo alloyed steels. Calculation of hardenability by factors related to concentration of alloying elements. Assessment of steel quality in terms of surface hardenability. (J28; AY)

76-J. Some Experiments in Controlled Low Temperature Stress Relief. R. N. Parkins. British Welding Journal, v. 8, Jan. 1961, p. 24-29.

Controlled low-temperature stress relieving (Linde Process) is applied to welded mild steel pipes in which the transverse residual stresses are high. Subsequent stress corrosion tests and stress analyses are conducted to determine the residual stress. 10 ref. (J1a, R11s; CN, 4-60, 7-51)

77-J. (Russian.) Cooling Base of Thick-Walled Cylindrical Billets. Z. V. Kovalevskaya, P. I. Karandashov and V. P. Kachanov. Stal', Nov. 1960, p. 1038-1041.

Cooling rate of 38KhN4MF steel cylinders (120-200 mm. wall thickness) is studied using oil, water and air as quenching media at 900° C. Quenching parameters are developed for temperature drop in various sections of the billet. (J26; ST, 4-52)

78-J. High Temperature Carburizing. T. W. Ruffle. Metallurgia, v. 62, Nov. 1960, p. 183-186.

Discussion of equipment required and means of controlling the atmosphere when carburizing at temperatures up to 1000° C. Test runs are made to evaluate the possibility of elevated temperatures for carburizing bearing retainers. Tables show the influence of furnace dewpoint on the carbon content of the steel. (J28g, 1-66; ST)

79-J. Properties of Ni-Al Age Hardening Steel. J. B. Seabrook. Metal Progress, v. 79, Feb. 1961, p. 80-83.

Because the Ni-Al steels (usually used for nitrided parts) have interesting aging properties, they do not overage despite long times at high temperature, they have been the source of much speculation and research. In this article the author concludes that the 5% Ni, 2% Al steel is potentially useful for precision gears despite its moderate impact strength. (J27d, Q-general; AY)

80-J. Heat Treating and Sintering Stainless in an Atmosphere. Bernt A. Ruediger. Metal Progress, v. 79, Feb. 1961, p. 101-105.

Hydrogen and dissociated ammonia are often used for protective atmospheres when bright annealing or sintering stainless steel parts. This article discusses the characteristics of such atmospheres and describes the various types of furnaces and gas generators which can be used. (J2k, H15q; SS)

81-J. Vacuum Furnaces are Versatile. H. W. Westeren. Metal Progress, v. 79, Feb. 1961, p. 106-109.

For tricky heat treating applications, brazing stainless steel parts, for example, vacuum "atmospheres" can be very useful. This article details the characteristics and applications of vacuum heat treatments. (J2k, 1-73)

82-J. The Selection and Heat Treatment of Tool Steels. J. G. Ritchie. Australian Institute of Metals, Journal, v. 5, Nov. 1960, p. 264-276.

Properties important in toolsteel and their determination; classification of toolsteels based on hardenability, hot hardness and carbon content, toolsteel specifications, basic principles of heat treatment. 18 ref. (J-general; TS)

83-J. (Japanese.) Recent Advances in Case Hardening Techniques. Kiyokazu Ogawa. Metal Finishing Society of Japan, Journal, v. 11, Oct. 1960, p. 523-529.

Review of carburizing, nitriding, cementation, induction hardening, flame hardening, hardfacing and spark hardening methods for increasing hardness, wear resistance and corrosion resistance of steel machine parts. (J28, Q29n, R-general, T7; ST)

84-J. (Japanese.) Status of Liquid Carburizing. Atsuo Ohmori and Kihei Imaizumi. Metal Finishing Society of Japan, Journal, v. 11, Oct. 1960, p. 529-536.

Case hardening of alloy, carbon and stainless steels by carburizing in a NaCN bath, heating in either electric, gas or oil furnace, quenching, annealing and straightening. Regulation of the salt bath. Properties of the hardened case as influenced by C concentration. (J28g, J-general; AY, CN, SS)

85-J. (Japanese.) Gas Carburizing and Heat Treatments in a Protective Atmosphere. Shin Yuuki. Metal Finishing Society of Japan, Journal, v. 11, Oct. 1960, p. 537-544.

Description of gas carburizing in which steel is carburized in CO, H_2 and N_2 gas prepared from propane or natural gas. Surface carbon concentration is determined by dew point measurement. Enriching, diffusing and bright heat treatments are carried out in a similar gas. (J28g, J2k; ST)

86-J. (Japanese.) Flame and Induction Hardening. Kan-ichi Wariishi and Hachiroh Homma. Metal Finishing Society of Japan, Journal, v. 11, Oct. 1960, p. 545-550.

Flame or induction hardening of steel gears, followed by annealing, quenching and tempering to improve hardness and mechanical properties. (J2g, J2h, T7a; ST)

87-J. Increasing the Strength and Wear Resistance of Rails by Quenching in Oil. P. S. Plekhanov, T. Ya. Kravchenko and V. A. Koshkin. Paper from "Contemporary Problems of Metallurgy". Consultants Bureau, Inc., New York, 1960, p. 501-508.

Mechanical properties of carbon steel rails after sorbitization (oil quenching) treatments at 780-950° C. with subsequent tempering at 550-570° C. Data are given for fatigue, impact, rupture, wear, fracture and deformation resistance and elongation, Brinell hardness, resilence and microstructure. (J26, Q-general, T23q; CN)

88-J. (Translation-ConBur.) Effect of Heat Treatment on Decarbonization and Cracking of Steels Subjected to Hydrogen at Temperatures Between 500 and 600° C. and a Pressure of 800 kg/cm^2. Yu. I. Archakov, I. D. Grebeshkova and V. P. Teodorovich. Journal of Applied Chemistry of the USSR, v. 33, Jan. 1960, p. 86-90.

3 ref. (J4a, Q26q, 2-64; ST)

89-J. Effect of Carbide Stringers on the Distortion of Die Steels During Heat Treatment. K. Sachs. Metal Treatment and Drop Forging, v. 28, Jan. 1961, p. 31-36.

Causes and mechanism of distortion of die steels during heat treatment. Influence of the structure of the steel. Relation of carbide distribution to coefficient of linear expansion. (J-general, 9-74, P11g, 3-71; TS)

90-J. (French.) Isothermal Hardening and Its Applications. Metallurgie et la Construction Mecanique, v. 92, Dec. 1960, p. 1013-1015, 1017, 1019-1021.

Davenport and Bain methods of determining the isothermal transformation diagrams of steels. Applications in hardening, tempering and special thermal treatments. Description of furnace for salt-bath quenching. (J26, N-general; ST)

91-J. Heat Processing of Silicon Iron Alloys or Electrical Steels. Pt. 1. B. A. Ruediger. Industrial Heating, v. 28, Jan. 1961, p. 26-28, 30, 32, 34, 36.

Hot rolling, cold reduction, annealing, normalizing and stretching processes used in the production of grain oriented or nonoriented, fully or semiprocessed electrical steels. Effect of composition on electrical and magnetic properties. (J-general, F23, F29s, P15, P16, 2-60; Fe-b, Si, ST-f)

92-J. Automatic Production of Nonferrous Tubes With Modern Induction Heating and Extruding Facilities. L. M. Duryee. Industrial Heating, v. 28, Jan. 1961, p. 56-57.

Induction heating of large Cu, brass and cupro-nickel billets prior to extrusion to prevent scale formation. Description of heaters, conveyorized line and extrusion equipment. (J2g, F24; Cu-b, Ni, 4-52)

93-J. Bright Annealing Stainless Tubing in Twin Muffle Furnace. Industrial Heating, v. 28, Jan. 1961, p. 64-67.

Bright annealing of welded tubing in a controlled atmosphere furnace having muffles which completely enclose the work during the heating and cooling cycles. (J23a, J2k, W27; SS, 4-60)

94-J. (Spanish.) Nitriding and the Application of F-124 Cr-Mo Steel as Nitriding Steel. Enrique Garcia Sardinero. Tecnica Metalurgica, v. 16, Sept-Oct. 1960, p. 189-205.

Composition of specimens; hardness tests; surface structure; depth of nitrided layer. 35 ref. (J28k, Q29; AY)

95-J. Annealing of Cold-Reduced Sheet and Coil at the Steel Company at Wales Ltd. H. H. Ascough. Paper from "Production of Wide Steel Strip". Iron and Steel Institute, London, England. May 1960, p. 128-143.

Batch, open coil, roller hearth and single stack annealing of low carbon steel at 1610-1650° F. in atmospheres of DX, NX and HNX generator gas and ammonia. Influence of hot strip mill temperature variations, annealing time and temperature and cold reduction on ductility and microstructure. (J23, 2-61, 3-68; CN-g, 4-53)

96-J. Fast Heating Accomplishes Uniform Speroidizing of Heading Stock. John Tschopp. Blast Furnace and Steel Plant, v. 49, Feb. 1961, p. 184-185.

Spheroidization of pearlite in the structure of 1038, 1041 and low alloy steels, using a continuous pusher type furnace. (J23r; AY)

97-J. Stress-Relieving Fabricated Girders. Welding and Metal Fabrication, v. 29, Feb. 1961, p. 67-70.

Resistance heating of welded steel fabrications to 650° C. using a furnace having mats composed of ceramic beads threaded on Ni alloy resistance wire. Latter are linked together to provide a mat surface temperature of 1000° C. (J1a; ST, 4-57)

98-J. (Japanese.) The Gas Carburizing Capacity of Some Practical Case-Hardened Steels. Kingo Kiyonaga and Toshio Okuno. Japan Institute of Metals, Journal, v. 24, Nov. 1960, p. 727-731.

Specimens of S15 CK, SCM 22, SNC 22, SNCM 21 and SNCM 23 alloy steels are carburized in a batch furnace at 875-925° C., with measurement and calculation of the effect of dew point, carburizing temperature and holding time on the carbon distribution curve. The relation of surface carbon content, case depth and the diffusion coefficient of carbon are determined in terms of the carburizing conditions and composition of each steel. 8 ref. (J28g; AY)

99-J. Surface Hardening of Steel. Lester F. Spencer. Machine Design, v. 33, Feb. 2, 1961, p. 110-114.

Material selection factors related to surface hardening of steel, including data on average core and surface properties after various carburizing cycles. 9 ref. (J28; ST)

100-J. (Russian.) Structural Steels With Lower Hardenability. K. Z. Shepelyakovskii. Metallovedenie i Obrabotka Metallov, Dec. 1960, p. 8-15.

Induction melting, technology and resultant composition and mechanical properties of EI937, 55PP and 65PP structural steels of low hardenability. Gears (3-6 mm.) or small cross section parts of these steels can be successfully surface quenched subsequent to induction heating, eliminating carburizing operations. 9 ref. (J5, J26, D6, Q-general; ST, SGB-s)

101-J. Fluidized Beds: New Heat Treating Medium. Metalworking Production, v. 105, Feb. 1, 1961, p. 56.

Steel is heat treated at 100-1500° F. in a fluidized bed composed of a dense dispersion of highly turbulent refractory particles. Comparison of heat transfer rates in the fluidized bed to those in Pb and salt baths. Quenching rates for steel are compared in fluidized bed, H_2O, oil and air. (J-general, J26; ST)

102-J. Technical Control in Steel Foundries in North America. Clyde B. Jenni. Foundry Trade Journal, v. 110, Feb. 2, 1961, p. 133-144.

Survey of heat treatment, welding, inspection, quality control and other plant practices in the production of steel castings. 49 ref. (J-general, K-general, 18; ST, 5)

103-J. (Japanese.) Hot Bath Quenching at Low Temperature of Eutectoid Carbon Steel. Pt. 3. Length Changes in Hot Bath Quenching at Low Temperature and Aging at Room Temperature of Eutectoid Carbon Steel. Itsuro Tatsukawa. Japan Institute of Metals, Journal, v. 24, Dec. 1960, p. 782-785.

Expansion and microstructural charge in an 0.8% C steel as a result of hot bath quenching above and below the Ms temperature, tempering and annealing (250° C.), aging and cooling (0° C.) Relation to austenite stabilization and decomposition, martensite transformation and bainite reactions. 7 ref. (J26, J27, N8, P10d; CN)

104-J. Gaseous Decarburization of White Cast Irons. J. Burke, J. Bell and D. R. Bourne. Acta Metallurgica, v. 8, Dec. 1960, p. 864-870.

Decarburization of two white cast irons differing in microstructure is studied using a 20% carbon dioxide-80%

carbon monoxide atmosphere. Carbon loss and depth of decarburization at 1000 and 1050° C. are measured as a function of time. A mathematical analysis of decarburization is developed and from comparison with the experimental results it is concluded that the diffusion of carbon in austenite is the rate controlling process. 10 ref. (J4a, N1, N8, 3-67; CI-p)

105-J. The Heat Treatment of Steel. Edwin Gregory and Eric N. Simons. Edgar Allen News, v. 40, Jan. 1961, p. 9-10.

Hardening of flat disks and long tools of high speed steel by liquid heating baths. Description, output, rating, etc., of an electrode salt bath. (J27a; TS-m)

106-J. For Stronger Missile Cases... Decarburize! John M. Lynch. Metal Progress, v. 79, Mar. 1961, p. 78-81.

The trend to higher strength in sheet steels for rocket cases has been slowed by two drawbacks: the drop in toughness and the increased susceptibility toward notch sensitivity which goes along with these greater strengths. Surface decarburization is suggested as a means for toughening the sheet surfaces. (J4a; ST, AY)

107-J. (Russian.) Heating of Titanium Alloy Parts. G. S. Sakharov and N. G. Evlanov. Vestnik Mashinostroeniya, Dec. 1960, p. 41-43.

VT3-1 Ti-base alloy blades are heated at 850-1050° C. in an argon protective atmosphere in a muffle furnace. Metallographic study, microhardness measurements and mechanical tests show the efficiency of this atmosphere in preventing oxidation or nitrogen absorption. (J2k; Ti-b)

108-J. The Heat Treatment of Steel. Edwin Gregory and Eric N. Simons. Edgar Allen News, v. 40, Feb. 1961, p. 33.

Design and operation of a suspended pot-type salt bath furnace having its thermal efficiency increased by waste heat recuperator. Comparison of salt and Pb baths. (J2j, W27m; ST)

109-J. Effect of Carbide Stringers on the Distortion of Die Steels During Heat Treatment. K. Sachs. Metal Treatment, v. 28, Feb. 1961, p. 59-62.

Thermocouple measurements and X-ray examination to determine effect of temperature gradient, retained austenite, anisotropic dilation and carbide distribution on microstructure and distortion mechanism. (J-general, 9-74, M27; TS)

110-J. Precipitation Hardening of Low-Carbon Steel. Mirko Klesnil and Premysl Rys. Metal Treatment, v. 28, Feb. 1961, p. 63-73.

Examination by optical and electron microscopy of structural changes in a super-saturated solution of alpha iron during heat treating experiments at temperatures to 700° C. with low-carbon steel. Effect of hardening time and temperature on hardness, ferritic grain boundries and tensile strength. (J27, Q29n, Q27, M27; CN-g)

111-J. (Italian.) An Age-Hardenable Nitriding Steel. W. S. Mounce and A. J. Miller. Nickel, Aug. 1960, p. 14-16.

Nitriding characteristics, hardness and high-temperature properties of an alloy steel containing 5% Ni and 2% Al. (J5, J28k, N7a, Q29n, 2-62; AY, Ni, Al)

112-J. (French.) Nitriding of Mg at Elevated Temperatures. The Mg-NH_3 System. I. G. Murgulescu and D. Cismaru. Revue de Chimie, v. 5, Feb. 1960, p. 289-297.

Mg samples are nitrided in NH_3 at 490-600° C. for 0-500 min. Computation of the reaction velocity, using Arrhenius' law. Weight increases as a function of time. Structure tests. 11 ref. (J28k; Mg)

113-J. (French.) Heat Treatment of Cast Iron. Journal d'Informations Techniques des Industries de la Fonderie, Feb. 1961, p. 1-3.

Cast iron parts containing 3.17-3.65% C, 2.49-3.15% Si, 0.56-0.77% Mn, 0.06-0.12% S, 0.10-1.13% P, 0-0.22% Cr, 0-0.41% N and 0-0.13% Ti are heat treated at 820-900° C. for 15 min. to 1 hr. to reduce hardness for machining purposes. (J-general; CI)

114-J. (Pamphlet.) Heat Treatment. Paper from "Federated Aluminum Casting Alloys Handbook". American Smelting and Refining Co., New York, 1960, p. 8-11.

Effects of solution treatment aging and stress relief on mechanical properties, structure and dimensional stability of Al alloy castings. Optimum temperature and process parameters are specified for various alloys according to composition. (J-general, Q-general; Al-b, 5)

115-J. A Recent Solution to the Problem of Stress Relieving of Welds Under Site Conditions. R. B. L. Tindall. South African Mechanical Engineer, v. 10, Jan. 1961, p. 141-146.

Use of induction heating for stress relief of welded steel rotary furnace riding rings and stainless steel clad scrubber towers. (J1a, W18b; ST, 7-51)

116-J. Preheating and Stress-Relieving of Pipes and Vessels. P. J. Cooper. Welding and Metal Fabrication, v. 29, Mar. 1961, p. 95-100.

Preheating and stress-relieving of welded carbon steel and Cr alloy steel tubes and vessels using induction, inductive radiant or noninductive radiant heating. (J1a, T26; AY, CN)

117-J. (French.) Nitriding of Magnesium at Elevated Temperatures. I. G. Murgulescu and D. Cismaru. Revue de Chimie (Rumania), v. 5, Feb. 1960, p. 251-258.

Cleaned and polished Mg samples are nitrided in pure nitrogen for 4-168 hr. at 500° C. Reaction velocity as a function of temperature and time. 12 ref. (J28k; Mg)

118-J. The Decarburization of Steel Wire. Peter Fischer. Wire and Wire Products, v. 36, Mar. 1961, p. 336-339, 383-385.

Influence of rim-decarburization of spring steel on the machinability, hardness, elastic properties and fatigue bending behavior. (J4a, G17k, Q29, Q7, Q21; ST, 4-60)

119-J. New Die Hardening Method Reduces Distortion. Howard E. Jackson. Western Metalworking, v. 19, Mar. 1961, p. 45-46.

Development of a bright hardening process for die casting cores which minimizes distortion and results in bright, clean surfaces. Tool and stainless steels are hardened by heating in an electric bell-type furnace, cooling through the hardening cycle and tempering. (J2k; SS, TS)

120-J. Some Features of the Use of Molybdenum in Alloy Steels. Aciers Fins & Speciaux Francais, Dec. 1960, p. 21-26.

Effect of Mo as alloying element on the hardenability, temper brittleness and segregation of steels. (J5, Q26s, 2-60, 9-69; ST, Mo)

121-J. Heat Treating Rohr's Runway Stretchers. Thomas A. Dickinson. Metal Treating, v. 12, Feb-Mar. 1961, p. 15, 40.

Thrust reversers of A286 stainless steel are heat treated in a conventional box type furnace to improve ultimate tensile strength and yield strength. (J-general, T24b; SS, 17-57)

122-J. (Italian.) Heat Treatment of Light Alloys for Plastic Forming. Pt. 3. E. Hugony. Trattamenti Termici, v. 3, Nov-Dec. 1960, p. 19-26.

Heat control and optimum design of furnace charging facilities for heat treatment of Al-Cu-Mg alloys. 14 ref. (J-general; Al-b, Cu, Mg)

123-J. (Italian.) Dynamic Oil Method for Mechanizing Temper Quenching. Trattamenti Termici, v. 3, Nov-Dec. 1960, p. 36-42.

Comparison of a conventional oil quenching technique in water cooled oil vats with a dynamic method having forced oil circulation and heat exchange. Application to steel products. (J26; ST)

124-J. (Italian.) Stress Relieving in Weldable Heat Resistant Steels. Pietro Brozzo. Revista Italiana della Saldatura, v. 12, Sept-Oct. 1960, p. 209-221.

Stress relieving of heat resistant, weldable Cr and Cr-Mo 14CD3, 10CD910, X10CD5 and X15C13 steels investigated by torsion relaxation tests. Effect of degree of deformation, temperature and rate of rolling and chemical composition on stress relieving. 14 ref. (J1, G23, Q1c, 2-60, 2-61, 3-68; AY)

125-J. Heat Treating: Key to Production of Investment Castings. Edward M. Broad. Industrial Gas, v. 39, Mar. 1961, p. 10-13.

Mold making and curing techniques and investment casting of stainless, alloy, tool and regular steels and nonferrous

metals including Al alloys, brasses, bronzes and Be-Cu. Application of gas atmosphere generators and pit and horizontal muffle furnaces to carburizing, annealing, normalizing and hardening of the castings. (J-general, 1-52, E15; Al-a, Cu-b, ST)

126-J. Thermal Distortion in Steel Plates for a Proton Synchroton Magnet. R. J. Wakelin. Research Applied in Industry, v. 14, Mar. 1961, p. 100-106.

Warping difficulties in the annealing of 10 ft. wide steel plates for parts of a 7000 ton proton synchroton magnet as caused by residual stress systems existing in the plates after annealing. Calculations of transformation and thermal stress for achieving closer control of temperature and selection of optimum heating rates and equipment. 11 ref. (J23, Q25p, 9-74; ST, 4-53)

127-J. (French.) Preliminary Aging of Aluminum-Magnesium-Silicon Alloys. Martial Renouard and Roland Meillat. Memoires Scientifiques, v. 57, Dec. 1960, p. 930-942.

Influence of the time lapse between quenching and aging and the effect of a short preliminary aging treatment immediately after quenching on the mechanical resistance of drawn or rolled A-SG, A-SGM and A-GS Al-Mg-Si alloys. 6 ref. (J26, J27d, N7a; Al-b, Mg, Si)

128-J. Annealing in Hood Furnaces With Movable Annealing Hoods. Wire Industry, v. 28, Mar. 1961, p. 285-286.

Bright annealing of wire, strip, tube and sheet in an annealing furnace heated by gas or electricity having an annealing hood made from heat resistant nickel chromium stainless steel. An inert gas provides a nonoxidizing atmosphere within the hood. (J23a, J2k, 1-52)

129-J. Heat Processing Stainless Steels. B. A. Ruediger. Metal Treatment and Drop Forging, v. 28, Mar. 1961, p. 105-107.

Stainless steels are annealed, brazed, sintered and, in some cases, fully hardened without discoloration or oxidation by performing operations in a dry atmosphere of hydrogen, dissociated ammonia or vacuum at a controlled dewpoint. Recommendations are made for types of gas generating equipment and furnaces. (J2k; SS)

130-J. Effect of Carbide Stringers on the Distortion of Die Steels During Heat Treatment. K. Sachs. Metal Treatment and Drop Forging, v. 28, Mar. 1961, p. 115-119.

Comparison of distortion figures for quenched and martempered specimens specially designed to show the influence of carbide distribution. Effect of homogenizing treatments on the distortion behavior of forged bars. (J-general, 3-71; TS)

131-J. (Japanese.) Spheroidized Graphite Cast Iron. Takeomi Okumoto and Shiroh Iijima. Japan Society of Mechanical Engineers, Journal, v. 64, Jan. 1961, p. 25-34.

Data are given for composition, structure, mechanical properties, wear, corrosion, heat resistance and weldability of the cast iron. Discussion of hypothetical growth mechanisms during spheroidizing. (J23r, Q-general; CI-r)

132-J. (Translation-Brutcher no. 4657.) Quenching of Carbon Steel Tools in Fused Salts. B. G. Gol'dshtein and A. I. Vinograd. Metallovedenie i Termicheskaya Obrabotka Metallov, July 1959, p. 45-49.

Details of a stepped-quenching practice for carbon-steel tools up to 100 mm. diameter in vigorously stirred salt baths at 110-125° C. containing a certain amount of water. Advantages are slow cooling through martensite range; complete elimination of quench cracking and distortion, minimum finishing work on heat treated tools and wider use of carbon toolsteels. (J26; CN)

133-J. (German.) Heat Transfer Parameters in Quenching. V. Paschkis. Harterei-Technische Mitteilungen, v. 15, Apr. 1960, p. 189-201.

Heat flow and heat transfer are measured during quenching of an Ag sphere of 50.8 mm. diameter from temperatures of 870° C. in varying amounts of water, oil and NaOH solutions (0-5% NaOH) at 16-85° C. Cooling curves; change of heat transfer during cooling. (J26, P11k; Ag)

134-J. (German.) Heat Treating by Induction Heating. W. Brunst. Harterei-Technische Mitteilungen, v. 15, Apr. 1961, p. 233-234.

Automatic induction hardening (heating to 620° C. and water quenching) of

unalloyed steel (0.35% C) coupling boxes using 10-station round table machine. Subsequent automatic hardness testing. (J2g; ST)

135-J. (German.) Chemical Reactions Between Furnace Atmosphere and Annealed Materials in Plant Annealing of Cold Worked Steel Under Protective Atmosphere. Theodor Schmidt and Joachim Wunning. Stahl und Eisen, v. 81, Mar. 16, 1961, p. 361-366.

Continuous concentration measurement is used to control the protective atmosphere during annealing of cold rolled, degreased Sn strip in a hood-type furnace and of low-Si transformer steel in a continuous furnace. Decarburization of deep drawing sheet in protective atmosphere as influenced by annealing temperature (700-920° C.). (J2k; Sn, ST, SGA-n)

136-J. Strengthening Mechanisms in Nickel-Base High-Temperature Alloys. C. H. Lund and D. C. Drennen. Defense Metals Information Center, Battelle Memorial Institute, DMIC 95, Apr. 4, 1961. (Available as PB 161245 from U. S. Office of Technical Services, Washington 25, D. C.)

A review of the various mechanisms from which Ni base superalloys derive their high-temperature strength. Discussed are solid-solution hardening, precipitation hardening and strengthening imparted by additions of B and Zr. Each strengthening mechanism is discussed briefly in terms of dislocation theory. Also a discussion of failure, heat treatment and related grain boundary behavior. 14 ref. (J27; Ni-b, SGA-h)

137-J. (French.) Modern Thermal Treatments. L. Villard. Metallurgie, v. 22, Mar. 4, 1961, p. 111-115.

Surface tempering, sulphide treatment and nitriding of carbon and Cr-Mo steels. 4 ref. (J29, J28k; ST, Cr, Mo)

138-J. Principles of the Fluid Bed. J. D. Stauffer and C. O. Pedersen. Metal Progress, v. 79, Apr. 1961, p. 78.

When a thick layer of small particles of refractory (silica sand, for example) is heated in a container and subjected to a blast of gas from the bottom, it will billow, boil and flow much like a fluid. This characteristic is the basis for the "fluid-bed" furnace, a new type of heating device which heats parts rapidly and cleanly. (J-general, B15q)

139-J. Heat Treating in the Fluid Bed Furnace. Charles Bennett and Charles Jung. Metal Progress, v. 79, Apr. 1961, p. 82.

Among other successful applications, the fluid bed furnace has been used in austenitizing intricate parts of alloy steel and for removing residual stresses from Al parts. (J-general, B15q)

140-J. Fluidized Bed Speeds Super Alloy Heat Treat. Robert Austin. Western Metalworking, v. 19, Apr. 1961, p. 46.

Heat treatment and quenching of super and refractory alloys such as Rene 41, Inconel X, HS-25 and MO at -110 to 2000° F. in a fluidized bed furnace containing minute refractory particles on the furnace floor which are agitated by air or inert gas, the turbulence causing rapid heat distribution in the furnace. (J-general, W27; SGA-h, EG-d37)

141-J. The Effect of Flow Rate on the Cooling Ability of Liquids for Steel Quenching. Masayoshi Tagaya and Imao Tamura. Osaka University, Technology Reports, v. 10, Oct. 1960, p. 797-804.

The effect of flow rate in turbulent streams on the cooling ability of water and three kinds of oil is quantitatively examined in the case of cylindrical Ag specimens at 800-300° C. The cooling ability of the liquid is determined as a function of the Reynold's number and the Prandtl's number. The relation is suggested as a foundation for designing a quench tank and its agitation for optimum quenching of steel. 17 ref. (J26, W28p, 3-67; ST, Ag)

142-J. Surface Carbide Formation in Blackheart Malleable Iron. C. T. Moore. BCIRA (British Cast Iron Research Assoc.) Journal, v. 9, Mar. 1961, p. 244-262.

Investigation of annealing atmosphere and temperature conditions as they affect formation of surface carbides. Comparison with low carbon steel and Armco iron samples. 9 ref. (J23; CI-s)

143-J. It's "Submerged" Hardening for These Gears. Metalworking Production, v. 105, Apr. 5, 1961, p. 47-50.

Induction hardening of EN 8D and EN 24T steel gears to increase wear resistance and strength. (J2g, T7a; ST)

144-J. (Pamphlet.) A Study of Temperature Uniformity in Heat Treating. Harold N. Ipsen. Ipsen Industries, Inc., 715 S. Main St., Rockford, Ill. 1961, 6 p.

Effect of temperature uniformity, time and addition of ammonia to the heating atmosphere on the Rockwell hardness, case hardness, core properties, carbon solubility and penetration rate during case hardening and carbonitriding of B 1112 steel and 1045 steel. (J28; ST)

145-J. Quench Side Rails for Hardness. Iron Age, v. 187, Apr. 27, 1961, p. 109.

Development of a die quench process for light side rails up to 40 ft. long. Knockout rods are used to lower the rail into the quench and straightening unit where a punch enters the rail and expands as the outer wall of the die contacts the side rail. A water quench circulates against all sides of the rail. (J26; 4-57)

146-J. How to Surface Harden Large Sprockets. Canadian Metalworking, v. 24, Apr. 1961, p. 32-35.

Tooth areas of 1045 or 1141 steel sprockets are hardened using heat treatment coils composed of Cu tubing. Detailed instructions are given for forming coils. (J28, T7; ST, 17-57)

147-J. Fast Heating Accomplishes Uniform Spheroidizing of Heading Stock. John Tschopp. Wire and Wire Products, v. 36, Apr. 1961, p. 463, 515.

Carbon and low alloy steel coils spheroidized in continuous pusher type furnace. (J23r; AY, CN, 4-61)

148-J. High Vacuum Annealing: Its Use in Steel Wire Drawing and Cold Rolling Mills. Werner Herdieckerhoff. Wire and Wire Products, v. 7, Apr. 1961, p. 470-473, 518-519.

Advantages of clean, dry surfaces and uniform properties produced by vacuum annealing. Conditions for bluing of wire and strip in vacuum furnaces. (J23, 1-73; ST, 4-53, 4-61)

149-J. Heat Processing of Silicon-Iron Alloys or Electrical Steels. Pt. 2. B. A. Ruediger. Industrial Heating, v. 28, Feb. 1961, p. 262-266.

Discussion of user heat treatments such as stress relief anneals, heat treatment to obtain maximum magnetic properties and bluing. (J-general; ST-f)

150-J. Carburizing and Carbonitriding in Exposed Element Furnaces. C. H. Stevenson. Industrial Heating, v. 28, Feb. 1961, p. 282-286, 288, 290, 292.

Operation of carbonitriding furnace at low voltage with increased current to remove problem of electrical leakage due to carbon saturating the brick-work and settling on the walls and resistors. (J28g, J28m, W27)

151-J. Continuous Spheroidizing of Cold-Heading Coil Stock. John Tschopp. Industrial Heating, v. 28, Apr. 1961, p. 672-674.

Report on the spheroidizing of steel coil stock (SAE 1038, 1035, 1041 and 4140) by a continuous pusher-type furnace. By a rapid heat treating cycle, stock structure is transformed to enhance subsequent cold heading fabrication operations. (J23r; ST)

152-J. Ultra-Long Anti-Aircraft Rifle Components Vertically Heat Treated in Salt Bath. Industrial Heating, v. 28, Apr. 1961, p. 676, 813.

Report on heat treatment (1575° F. for 65 min.) of 15 ft. long anti-aircraft rifle barrels. Vertical immersion in salt baths eliminates warpage through gravitational forces and prevents stresses due to localized temperature variations. (J-general, T2m)

153-J. Heat Processing of Silicon-Iron Alloys or Electrical Steels. Pt. 3. B. A. Ruediger. Industrial Heating, v. 28, Apr. 1961, p. 680-688.

Report on heating equipment for stress relieving, annealing and blue oxidizing with data given for load limitations, furnace capacity and processing effects on electrical properties of Si-Fe alloys. (J23, J1a, P15; Fe-b, Si)

154-J. Aluminum Alloy Coils Annealed Automatically in Car-Type Radiant-Tube Furnace. Industrial Heating, v. 28, Apr. 1961, p. 690-694.

Report on the automatic annealing of 5005 Al alloy coil by means of a two-zone, car-type radiant-tube, gas-fired recirculating furnace with a 30,000 lb. per load capacity. Temperature tolerances of $\pm$ 10° F. are maintained in the 500-1200° F. range. (J23, W27; Al-b)

155-J. Seamless Oil Tubing Quenched and Tempered to High Strength in Continuous Barrel Furnace Line. Industrial Heating, v. 28, Mar. 1961, p. 501-502, 504, 506, 508.

Production of carbon steel high-strength oil well casing on a hardening and tempering line consisting of a charge table, gas-fired barrel furnace units, an annular quench and conveyor equipment. (J26, J29, T26r; CN, 17-57)

156-J. Carbon Control During High Temperature Carburizing. Robert W. Krogh. Metal Treating, v. 12, Apr-May 1961, p. 10-11, 23, 32.

Regulation of dewpoints and atmospheres in batch type furnaces carburizing various steels. The generator is operated at a nominal dewpoint, adjustment being made at the various furnaces with natural gas or air additions to obtain required potentials. (J28g; ST)

157-J. Annealing Pearlitic Blackheart Malleable Iron Castings. Metallurgia, v. 63, Mar. 1961, p. 115-116.

Annealing of pearlitic blackheart castings by a successful system comprised of a high-temperature furnace, tray dumper, cooling conveyor, low-temperature furnace and a control gear. (J23; CI-s, 5)

158-J. (French.) Beilby Layer and Damage Caused by It. Pt. 13. Cayere. Machine Moderne, v. 55, Mar. 1961, p. 31-38.

Layer of adsorbed gas, oxide and nitride fragments and carbide crystals is formed during super-refining of steel surfaces. Remedies. (To be continued.) (J4; ST)

159-J. Induction Heating in the Metal Industries. Edgar Allen News, v. 40, Apr. 1961, p. 78-79.

Melting and alloying pure metals and alloys using a vacuum induction furnace. (J2g, 1-73)

160-J. The Heat Treatment of Steel. Edwin Gregory and Eric N. Simons. Edgar Allen News, v. 40, Apr. 1961, p. 84-85.

Measurement of temperature while heat treating steel using pyrometer, expansion thermometers and electrical resistance thermometers. (J-general, 1-53; ST)

161-J. Die Quenching. Production, v. 47, May 1961, p. 62-63.

Die quenching is compared with flame hardening, induction hardening and vertical quenching for production of truck frame rails from high-alloy steel, SAE-8620 steel and Mn alloy steel. Measurements of tensile strength, yield strength and grain structure. (J26, Q27a, Q23b, M27c, T21e; ST)

162-J. Best Heat Treatment for PH Stainless Steels. D. C. Ludwigson. Product Engineering, v. 32, May 8, 1961, p. 32-34.

Solution annealing, austenitic conditioning, martensitic transformation, aging and refrigeration hardening of sheet, brazed sandwich panels, springs and simple shapes of 17-7 PH and PH 15-7 Mo stainless for control of room and elevated temperature tensile strength, bearing and shear strength, ductility and wear and corrosion resistance. (J22, J27, Q-general, R-general; SS-e)

163-J. The Mechanism of Hardening in 17-7PH Stainless Steel. E. E. Underwood. Battelle Memorial Institute (Wright Air Development Division). U. S. Office of Technical Services, PB 161850, June 1960, 54 p. $1.50.

The unique hardening found in precipitation-hardening stainless steels is investigated both in commercial sheet alloys of 17-7PH and high-purity ferrite single crystals of Fe-17Cr-7Ni-2Al. Profuse precipitation of needle-shaped particles is responsible for maintaining the high hardness level in the aged crystals. (J27; SS)

164-J. Heat Treatment of Metals. OTS Selective Bibliography SB-454. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.10.

Reports of the Army, Navy, Air Force, Atomic Energy Commission and other government agencies in addition to foreign research literature from West Germany, France, the Soviet Union and other nations dealing with heat treatment of high-strength steels, Ti alloys, U-Mo alloys, Zr alloys and heat treatment research in general. (J-general; ST, SGB-a, Ti-b, U-b, Mo, Zr-b)

165-J. Levitation Heating and Its Metallurgical Possibilities. B. Harris, E. G. Price and A. E. Jenkins. Paper from

"Australian Atomic Energy Symposium". Melbourne University Press, Melbourne, Australia, 1958, p. 221-225.

Specially designed induction coil is used for the simultaneous lifting and heating of Ag, Cu, Zr, U and Ti. Levitation melting is performed using high-frequency current and a controlled atmosphere of O_2, N_2, or H_2. A study is made of the variables associated with the levitation process. 7 ref. (J2g; Ag, Cu, Ti, U, Zr)

166-J. The Heat Treatment of Grey-Iron Castings. W. M. Lord. British Foundryman, v. 54, Apr. 1961, p. 170-179.

Techniques employed in the stress relief, normalizing, annealing, hardening and tempering of gray and spheroidal graphite Fe castings. (J-general; CI-n, CI-r, 5)

167-J. (Pamphlet.) 400 Cycle Induction Heating With Proportional Control for Preheating and Stress Relieving of Welded Joints. 1961. 32 p. Hobart Brothers Co., Troy, Ohio. $.50.

Stress relief of carbon steel, martensitic steel, austenitic steel, ferritic steel, carbon molybdenum steel, CrNi steel and Cr stainless steel using an induction coil. (J2g; CN, SS)

168-J. (French.) Case Hardening. Pt. 10. Sulphur Case Hardening. G. de Smet. Pratique des Industries Mecaniques, v. 47, Feb. 1961, p. 32-40.

Composition of the salt bath, method of heating and agitation of bath for combined sulpho-cyanidation process. Wear tests of treated steel specimens. Applications and restrictions. (J28; ST)

169-J. (German.) Importance of Static Frequency Transformation in Induction Heating and Melting. R. Lethen. Elektrowarme, v. 19, Jan. 1961, p. 2-8.

Selection of proper frequency ranges in heating and melting as influenced by metal (light metal, nonferrous heavy metal, austenitic or ferritic steel) and size of workpiece or melt. Control of frequency by static frequency changers. (J2g; SS, EG-a39, EG-a38)

170-J. Distortion Control During Heat Treatment of Aircraft and Missile Components. A. L. Kitchin and H. Mansfield. Society of Automotive Engineers, Paper no. 340C, 1961, 8 p.

Distortion of aircraft and missile components caused by heat treating is controlled by restraint, reduction of temperature gradients and stresses, control of case distribution and corrective machining or straightening. (J-general, 9-74, T24)

171-J. (German.) Inductive Heat Treating of Welding Seams. H. Reinsch. Technik und Betrieb, v. 13, Feb. 1961, p. 25-27.

Stress-free annealing of nonferrous metal and austenitic and ferritic steel circular and longitudinal welds by alternating current induction. Selection of proper frequency and power range with temperature control by thermocouples. (J1a, 1-69; ST, EG-a38, 7-51)

172-J. (French.) Heating of Steels to High Temperatures for Thermal Treatment. M. Assonov. Revue de Metallurgie, v. 58, Mar. 1961, p. 267-270.

Mechanical properties of steels heated to 1100° C. and above the Ac_3 transformation temperature before forging, case hardening or carbonitriding. (J2, Q-general; ST)

173-J. Spark-Hardening of Cutting Tools, Austenite Formation and Edge Erosion. N. C. Welsh and P. E. Watts. Iron and Steel Institute, Journal, v. 198, May 1961, p. 30-37.

Description of the metallurgical changes which occur when steel is sparked with an electrode of tungsten carbide. The hardening produced by the transfer of carbide is offset by the softening effect of retained austenite. Also, the process becomes erosive and tends to blunt the cutting tool. 12 ref. (J4c, Q29n, T6n; ST)

174-J. Does Carbide Impregnation Work? L. C. Gaunt. Cutting Tool Engineering, v. 13, May 1961, p. 19, 22.

Impregnation of high-speed tool and die steels with tungsten carbide by electric-spark deposition. Effect of carbide impregnation on wear resistance, tool life, galling and surface finish of material machined. (J4c, T6n; TS-m)

175-J. (German.) Decarburization of Steel Wire. Peter Fischer. Draht-Welt, v. 46, Feb. 1960, p. 85-93.

Effect of decarburization on chipless shaping and machining, work hardening and mechanical properties of steel wire. Causes, detection and elimination of decarburization. (J4a, Q-general, Q29n, G17, 2-64; ST, 4-61)

176-J. (Pamphlet.) Heat Treatment of Eaton Permanent Mold Iron. Edward P. Rowady. 8 p. May 1961. Eaton Manufacturing Co., Cleveland 10.

Austenitizing, quenching, tempering, annealing, flame and induction methods for heat treating and surface hardening of cast Eaton iron. Influence of austenitizing temperature and quenching medium (H_2O, oil) on hardening. Effect of section size on furnace or salt bath heat treatment parameters. Influence of heat treatment on mechanical properties and microstructure. (J-general, Q-general; CI)

177-J. Salt Bath Promises Low Alloys New Horizons in Design. Iron Age, v. 187, June 1, 1961, p. 68-69.

New method of salt bath treating--Tufftriding--gives low-alloy steels both wear and fatigue strength. Service lives of SAE 1046 steel diesel engine crankshafts have been lengthened by Tufftriding them at 1050° F. for 150 min. Fatigue life of the parts has been raised 70%. (J2j; AY)

178-J. How Forst Heat-Treats Long Broaches. David Fishlock. Metalworking Production, v. 105, May 10, 1961, p. 78-81.

Production of high-abrasion resistance broaches composed of high-speed steel containing 0.85% C, 6.00% W, 4.00% Cr, 2.00% V and 5.25% Mo. Broaches up to 6 ft. long are heat-treated from 600-1250° C. in Cassel salt baths in refractory-lined furnaces and in stainless-lined preheat furnaces. (J2j, T6n; TS-m, 17-57)

179-J. Open-Coil Annealing. V. J. Gibbons. Sheet Metal Industries, v. 38, May 1961, p. 341-348.

Pilot plant studies of the temperature distribution, absorption of gases and recrystallization during open-coil annealing of 20 gage sheet steel coils in a rotary hearth furnace. Data are given for Rockwell hardness yield and tensile strengths, elongation and grain size of annealed steel. (J23, J2k, 1-52, Q-general; ST, 4-53)

180-J. Heat-Treating Springs by Shaker-Hearth. Metal Treatment and Drop Forging, v. 28, May 1961, p. 182.

Hardening of springs by heating in a mobile, oscillating hearth furnace having closed quench facilities and using a controlled atmosphere to prevent oxidation and decarburization. (J2k, T7c)

181-J. Vauxhall Commissions Mammoth Gas Carburizing Furnace. David Fishlock. Metalworking Production, v. 105, May 17, 1961, p. 71-74.

Gears, rear-axle crown wheels and pinions cut from nickel-molybdenum steel forgings are carburized and hardened in a continuous gas carburizing furnace with carburizing zones of 840° C. using propane gas for controlled atmosphere of constant composition. (J28g, J2k, T21b, 1-52; AY, 17-57)

182-J. Take the "Art" Out of Heat Treating. George H. Schubert. American Jewelry Manufacturer, v. 6, May 1961, p. 8-9, 16-19.

Review of principles and kinetics of ferrite-to-austenite and austenite-to-martensite transformations and resultant structure and hardness changes in steels by heat treatment. Transformations are shown to depend on temperature and cooling rates with optimum parameters suggested for tempering and quenching. (J-general, J26, J29, N8; ST)

183-J. Trends in Heat Treatment Observed Overseas. R. H. Atkin. Australian Institute of Metals, Journal, v. 6, Feb. 1961, p. 21-32.

Comparison of shop size, equipment, rectification methods and other aspects of heat treatment methods in Australia and overseas. Discussion of salt bath, carburizing, quenching and nitriding practice. (J-general)

184-J. (Russian.) Boriding of High-Alloy Steels. Yu. M. Lakhtin and M. A. Pchelkina. Metallovedenie i Termicheskaya Obrabotka Metallov, Mar. 1961, p. 27-35.

1Kh18N9T, Kh18N12M3T, Kh18N25S2, Kh23N18, Kh25N20S2, Kh25N25T and

Kh15N37V3T steels are borided for 2-10 hr. in B_2H_6 + H, mixed in the ratio 1:25 at 850-1100° C. and subsequently held for 4 hr. at the same temperature. Depth of borided case as a function of the Cr, Ni, Ti and Cb contents. Microstructure, microhardness and phase composition of case. 4 ref. (J28, 2-60, Q29q, M27; SS)

185-J. (Russian.) Effect of Ultrasound on the Nitriding Process. G. V. Zemskov, L. K. Gushchin, E. V. Dombrovska, A. K. Parfenov and V. T. Yarkina. Metallovedenie i Termicheskaya Obrabotka Metallov, Mar. 1961, p. 40-42.

Samples of 35KhYuA steel are nitrided at 500-550° C. in an ammonia atmosphere or in a fused salt mixture containing 48% calcium chloride, 31% barium chloride and 21% sodium chloride with or without the simultaneous application of ultrasound. Effect of ultrasound on the hardness depth and change of microhardness with the depth. (J28k, 1-74, Q29n; ST)

186-J. (Russian.) Case Hardening in the Oxy-Acetylene Flame. V. G. Podoinitsyn Metallovedenie i Termicheskaya Obrabotka Metallov, Mar. 1961, p. 58-59.

Part made from 20 steel containing 0.20% C, 0.70% Mn, 0.30% Si, 0.023% S and 0.020% P is rotated in a reducing flame. A carburized case of 0.8-1.0 mm. depth is obtained after treatment for 20-30 min. at 1050-1100° C. surface temperature. Fine grain forms in subsequent normalization at 890-950° C. Microstructure, hardness, tensile and impact strengths. (J28; ST)

187-J. Induction Heating in the Metal Industries. Edgar Allen News, v. 40, May 1961, p. 103-104.

Technological parameters for through-heating of steel stock, Al or Cu alloy billets by induction methods. Design, operation and industrial applications of induction heaters. (J2g, 1-52; Al-b, Cu-b, ST)

188-J. How Residual Stresses From Heat Treatment Affect Your Product. M. F. Spotts. Machinery, v. 67, June 1961, p. 110-112.

Thermal and transformation effects and their reactions with mechanically induced stresses are discussed for various heat treatments. (J-general)

189-J. Overcoming Distortion and Cracking in Heat Treating Tool Steels. Richard F. Harvey. Metal Progress, v. 79, June 1961, p. 73-75.

Internal stresses developed during quenching can crack or warp toolsteels. These effects may be overcome or minimized by the use of air-hardening steels or techniques such as interrupted quenching or ultrasonic agitation. (J26; TS, 9-72, 9-74)

190-J. Heating Stainless Steel Flat Products. M. R. Ogle. Metal Progress, v. 79, June 1961, p. 107-109, 131-b, 132.

Today, most strip, sheet and plate of stainless steel is annealed in continuous furnaces. Many of the factors to be considered in the production of flat products are discussed. (J23, F23; SS, 4-53)

191-J. Conventional Batch Annealing. Gerome Gordon. Iron and Steel Engineer, v. 38, May 1961, p. 71-72.

Investment cost per ton, production capacity and quality of product obtainable during batch annealing of steel sheet, tin plate and strip. (J23, 1-62; ST, 4-53)

192-J. Use of Open Coil Process to Change Composition and Improve Sheet Steels. J. A. Bauscher. Iron and Steel Engineer, v. 38, May 1961, p. 73-84.

Open coil annealing in gases of various compositions allows control and change of steel analysis during the annealing process. Data from pilot studies show mechanical properties and grain size of annealed materials. (J23; ST)

193-J. Processing Equipment for Stainless Steel Bright Annealing. S. Friedlander. Iron and Steel Engineer, v. 38, May 1961, p. 85-91.

Aspects of process development which have made bright finish and corrosion resistance requirements for stainless obtainable by bright annealing. Operation of equipment lines. Furnace design. (J23a, 1-52; SS)

194-J. Heat Treatment of Welded Joints. A. L. Brown. Welding Fabrication and Design, v. 4, Apr. 1961, p. 9-13.

Preheating, stress relieving by oxy-acetylene, resistance and induction methods and post-heat treatment of weld-

ed joints in high-alloyed, heat resistant steels. 4 ref. (J-general; SS, SGA-h, 7-51)

195-J. Designing Heat Treatment Procedure. Colin Harris. Australasian Engineer, v. 52, Mar. 1961, p. 77-80.

Heat treating and hardening of alloy steel and stainless steel bearing cups including carburizing, case hardening, refining and quenching processes used to produce the desired hardness in the bearing cup surface and core and to prevent shrinkage and distortion. (J-general, T7d; AY, SS)

196-J. Difficult Heat Treatment Accomplished by Selective Induction Heating and Quenching. Industrial Heating, v. 28, May 1961, p. 914, 916.

Controlled high frequency heating and quenching of oblong guide bar for a chain saw is achieved with hardness depth and Rockwell C hardness held within close tolerances. Equipment is designed with automatic heating cycle control (J2g, J26, 1-69, 1-52, Q29, W24m; ST, 4-55, 17-57)

197-J. Pattern Heating of Diversified Load in Hood Type Annealing Furnace. P. F. Berg. Industrial Heating, v. 28, May 1961, p. 921-922, 924, 926.

Mixed loads of steel sheets, coils, weldments and castings are annealed. Portable cover is lifted after completion of a heating cycle on one base to another base to heat work while the first load cools. Coke oven gas is used and uniformity of heat input is provided by Duradiant type burners arranged in two horizontal rows in the side walls of the furnace. (J23, W27g; ST, 4-53, 7-51, 5)

198-J. Muffle-Less Furnace for Stainless Steel. Metalworking Production, v. 105, May 24, 1961, p. 79.

Bright annealing of stainless steel strip by a furnace which dispenses with a muffle and allows the elements to radiate directly on the work. (J23a, W27; SS, 4-53)

199-J. Heat Treatment of Eaton Permanent Mold Iron. Edward P. Rowady. Eaton Engineering Forum, May 1961, 8 p.

Tensile and impact strengths and Rockwell hardness of Eaton Permanent Mold Iron can be increased by heat treatment (either by furnace or salt bath techniques or by induction heating). The response of Eaton Iron to rapid heating techniques is due to the fine graphite distribution. Hardened cases up to 58 Rockwell C can be obtained by induction heat treatment. (J2g, J2j; Fe)

200-J. (German.) Heat Treatment of Uranium. G. J. Sergeev, V. V. Titova, Z. P. Nikolaeva and A. M. Kaptel'cev. Kernenergie, v. 4, Mar. 1961, p. 196-201.

Investigation of microstructure and mechanical properties of cast and hot rolled uranium as influenced by various heat treatments, including annealing and quenching from temperatures of the beta and gamma phase. Examination of creep in the alpha phase (300-500° C.) as influenced by heat treatment and deformation. 7 ref. (J-general, M27, Q3, Q-general, 3-68; U)

201-J. (Spanish.) Heat Treatment and Techniques of Shaping and Casting Some Aluminum Alloys. Alvaro Quiroga Correa. Instituto del Hierro y del Acero, v. 14, Feb. 1961, p. 181-204.

Mechanical properties of some experimental Al-Cu-Zn alloys. As-cast and heat treated properties of castings. 12 ref. (J-general, Q-general, E-general; Al-b, Cu, Zn)

202-J. (Rumanian.) Carburization of Iron in the Cupola. Roman Krzeszewski. Studii si Cercetari de Metalurgie, v. 5, Apr. 1960, p. 443-469.

Explanation of the relationship between carbon content of cast iron and that of the charge, chemical composition of the Fe, its temperature, working conditions in the cupola and quality of coke. 63 ref. (J28g; CI)

203-J. Heat Treating Goes Automatic. R. H. Eshelman. Iron Age, v. 187, June 8, 1961, p. 79.

Piston rods of cold drawn 1040 steel are heat treated, selectively hardened and finish ground on an automated continuous flow production line. (J-general, G18, 18-74; ST)

204-J. Hardening Process Keeps Tools Bright. Steel, v. 148, June 19, 1961, p. 91.

Outline of an automatic hardening process for high-speed toolsteels that produces a bright part finish. Process

maintains correct surface carbon concentration, holds distortion to a minimum and reduces costs. Basic equipment is a modified vacuum heat treating furnace. (J28, T6n; TS-m)

205-J. (German.) Age Hardening and Precipitation of an Fe-Mo and Fe-W Alloy. Guido Elsen and Gunter Wassermann. Zeitschrift fur Metallkunde, v. 52, Apr. 1961, p. 263-269.

Investigation of precipitation-hardening of rolled and homogenized (1260-1290° C.) specimens (17.5% Mo, 0.3% Mn, 0.2% Si and 14.7% W, 9.3% Mn, 0.2% Si) aged from 500-900° C. by hardness, dilatometric and resistivity measurements and by X-ray investigation. (J27, Q29n, M23b, P15g; Fe-b, Mo, W)

206-J. (German.) Effect of Cold Pre-Aging on Aging of Various Alloys. Heinz Borchers, Max Kainz and Siegfried Pixner. Zeitschrift fur Metallkunde, v. 52, Apr. 1961, p. 276-279.

Homogenized and water-quenched sheet and plate specimens of alpha-Fe (0.014% C), $PbSb_2$, $PbSb_8$, AlMgSi and AlCuMg alloy are cold pre-aged from -20 to -195° C. and subsequently aged from 20-80° C. Investigation of effect of cold pre-aging on aging in terms of hardness measurements. (J27d; Al-b, Fe, Pb-b, Cu, Mg, Sb)

207-J. (Italian.) Siliconizing of Steel. L. Mateoli. Trattamenti Termici, v. 4, Jan-Feb. 1961, p. 3-9.

Survey of methods including packing in powdered SiC + ferrosilicon, immersion in a liquid Na-K alloy containing Si, electrolysis in fused NaF containing sodium trisilicate at 1100° C. or gas siliconizing in $SiCl_4$. Microstructure, case depth and phase composition, hardness and resistance to wear, corrosion and heat. 11 ref. (J28; ST, Si, 17-57)

208-J. (Italian.) Heat Treatment of Drawing Dies. M. Tossi. Trattamenti Termici, v. 4, Jan-Feb. 1961, p. 18-20.

Dimensional changes occurring in the hardening of 13% Cr-steel dies at 930-1010° C. with subsequent oil quenching or air cooling. Effect of the texture of starting materials. (J-general, P10d, T6r; SS-e, 17-57)

209-J. (French.) Continuous Annealing and Descaling of Brass Strip. P. Guesne. Cuivre, Laitons, Alliages, no. 60, Mar-Apr. 1961, p. 13-17.

Automated heat treatment of strip in vertical annealing furnace with automatic regulation of the temperature and the composition ratio of a propane-air mixture used as a fuel. The process includes quenching after air cooling to a certain temperature, passage through descaling, polishing and rinsing baths. Micrographs are presented for resultant structure and grain size. (J23, J-general, L-general, M27; Cu-n, 4-53)

210-J. (German.) Properties of Direct Hardenable 20 MoCr 5 Case Hardening Steel as Compared With Conventional Steels. E. Stecher. Maschinenbau, v. 10, Mar. 1961, p. 110-113.

Carburizing at 900° C. during case hardening of 20 MoCr 5 steel and fatigue testing of notchless specimens of 7.52 mm. diameter after direct and core hardening at 920° C. and subsequent 180° C. annealing. Comparison of results with properties of conventional steels including K 13 NiCr 14, 22 MnCr 6, 16 CrMo 4, 22 CrMo 4 and 16 MnCr 5 steels. (J28g, Q7; ST)

211-J. (German.) Surface Hardening of Cast Iron Guide Tracks on Machine Tools. Schlegel, Seifert and Koch. Maschinenbau, v. 10, Mar. 1961, p. 100-105.

Surface hardening of a cast iron guide tract in a 20 kw. high frequency induction plant from 700-1000° C. Temperature distribution during hardening, distortion due to hardening and microstructure, case depth and form of carbon on specimen surfaces. 7 ref. (J28, W25; CI)

212-J. (German.) Immersion Hardening of Camshafts. K. Fuchs. Maschinenbau, v. 10, Mar. 1961, p. 105-107.

Salt bath hardening of 350-400° C. preheated normalized CK 45 steel camshafts with subsequent stress-free annealing at 180° C. Elimination of defects such as distortion due to hardening and soft spots. (J2j, J23; ST)

213-J. (German.) Gage Stabilization of Hardened Toolsteel. H. Bruckner and G. H. Harnisch. Maschinenbau, v. 10, Mar. 1961, p. 113-115.

Gage stabilization of 840-860° C. hardened 100 Cr 6 and 105 Cr 4 steel specimens by transformation of tetragonal martensite during annealing from 200-250° C. and cooling to low temperatures (-40 to

-75° C.). Dimensional changes in stabilized specimens after annealing from 100-200° C. (J23q; TS)

214-J. (German.) Application and Prerequisites for Flame Hardening. Kurt Frode. Maschinenbau, v. 10, Mar. 1961, p. 108-109.

Flame hardening by acetylene-oxygen or city gas oxygen flames is discussed in terms of workpiece, case depth and material requirements (0.35-0.55% carbon steels, Cr and Mn alloyed and heat treatable steels). (J2h; ST)

215-J. Precipitation Hardening of Co-Base Alloys by an Intermetallic Co-Mo Phase. B. Lux and W. Bollmann. Cobalt, no. 11, June 1961, p. 4-20.

Hardening of Co-base alloys by precipitating Co_3Mo and Co_7Mo_6 compounds ranging from 12-17.5% Co and from 15-20% Mo. Data are given for hardness changes during aging, microstructure, phase relationships between matrix and precipitate, oxidation and thermal shock resistance and forgeability. (J27, Q29n, M27, R1h; Co-b)

216-J. A New Nitriding Process From Germany. Metal Progress, v. 80, July 1961, p. 77-82.

Medium carbon and alloy steels can be nitrided in less than 2 hr. in a cyanate-containing salt bath to produce a case which is both file-hard and rough. Much intensive investigation has indicated that the method is suitable for applications where resistance to fatigue and wear are of concern. (J28k; AY, CN)

217-J. Gas Nitriding of Stainless Steels. V. J. Coppola. Metal Progress, v. 80, July 1961, p. 83-84.

Direct nitriding of stainless steel parts is practical. No special surface preparation is needed other than finish grinding, vapor honing or lapping. (J28k; SS)

218-J. Heat Treating Stainless Steel Tubing and Wire. C. H. Vaughan. Metal Progress, v. 80, July 1961, p. 108-111.

Five types of furnaces--salt bath, bell, wire-mesh belt conveyor, roller-hearth conveyor and muffle tube--are used in annealing stainless steel wire and tubing. Article discusses advantages and limitations of each type. (J23, W27; SS, 4-60, 4-61)

219-J. Metal Stampings Gain Toughness From Automatic Austempering. Ray Howland. Iron Age, v. 187, July 6, 1961, p. 72-73.

Carbon steel toe caps and shanks are austenitized to hardness levels of 45-50 Rc on a heat treat line which includes a continuous belt furnace and a belt-type austenitizing salt bath. (J22; CN)

220-J. Heat Treating and Shot Peening Increases Torsion Strength of Automobile Shafts. Industrial Heating, v. 28, June 1961, p. 1098, 1100, 1102.

Review of the evolution of the torque-resistant steel shaft from original uniformly heat treated solid bar and tubular shaft to the surface heat treated and cold worked solid shaft. (J-general, G23n, T21b; ST)

221-J. Huge Facility for Continuous Normalizing of Electrical Steel Strip Made Operational at Allegheny Ludlum Plant. Industrial Heating, v. 28, June 1961, p. 1127-1128, 1130, 1132.

New 1040 ft. line for continuous normalizing of grain oriented Si electrical steel strip at the Bagdad, Pa. plant. Strip from 0.010-0.030 in. in thickness and up to 34 in. in width is normalized at speeds up to 300 ft. per min. (J24, 1-53; ST, SGA-r, 4-53)

222-J. (German.) Occurrence of Bands of Different Temperature in Induction Heating. J. Georges. Harterei-Technische Mitteilungen, v. 16, Apr. 1961, p. 1-6.

Nonuniform temperature distribution on the surface of steel cylinders during induction heating below the Curie temperature is investigated for pure Fe and steel of varying carbon content. Correlation between band formation and frequency and evaluation of methods for elimination of band formation. (J2g, 2-61; Fe-b)

223-J. (German.) Control of Carbon Potentials of Furnace Atmospheres. Th. Schmidt and J. Wunning. Harterei-Technische Mitteilungen, v. 16, Apr. 1961, p. 7-12.

Indirect and direct measurement of carbon potential of gas mixtures in gamma iron and in alloy steel. Method and apparatus for automatic measurement and control of carbon potentials and application in carburization of roller bearings of 13 NiCr 18 steel and

tubes of C45 steel. (J28g, J2k; Fe-a, ST)

224-J. (German.) Investigation of Decarburization Characteristics of Alkaline Annealing Baths. P. Birk. Harterei-Technische Mitteilungen, v. 16, Apr. 1961, p. 18-20.

Measurement of decarburization of unalloyed steel foil specimens containing 1-1.32 initial per cent C, after annealing from 620-900° C. in an alkaline salt bath (melting point 560° C.) and exposure to air, CO_2, N_2, O_2 atmospheres. Influence of temperature and atmosphere on decarburization phenomena. (J2j, J4a, 2-61, 2-66; ST)

225-J. (German.) Decarburization Characteristics of Salt Baths. H. Ornig. Harterei-Technische Mitteilungen, v. 16, Apr. 1961, p. 21-22.

Thermodynamic analysis and experimental methods are used to determine whether decarburization of steel in the salt bath is caused by dissolved oxides or by dissolved oxygen-gas. (J2j, J4a; ST)

226-J. (German.) Salt Bath Carburization at Extremely High Temperatures. C. Albrecht. Harterei-Technische Mitteilungen, v. 16, Apr. 1961, p. 32-35.

Salt bath carburization from 930-980° C., using an activated two-salt carburization bath (8-11% KCN), and subsequent case hardening of C15 and 16 MnCr 5 steel. Influence of temperature on microstructure, hardness and carburization depth. (J2j, J28g, Q29n, 2-62; ST)

227-J. (German.) Nitriding by Inductive Heating in Aqueous Ammonia Solution. R. Palme and W. Track. Harterei-Technische Mitteilungen, v. 16, Apr. 1961, p. 42-48.

Nitriding of unalloyed CK15 steel specimens in dilute ammonia solution by inductive heating (550-1250° C.) at a frequency of 10,000 cps. Investigation of nitriding characteristics including nitriding rate, case depth and hardness after case hardening as influenced by temperature and nitriding time. (J28k, J2g, Q29n, 2-61, 3-67; ST)

228-J. Aluminum Alloys for Deep Drawing. C. J. Smith. Metal Industry, v. 98, June 16, 1961, p. 477-478, 480.

Cold reduction, annealing, rolling and tempering of Al alloys for deep drawing. Description and comparison of specific reduction and partial and differential annealing. (To be continued.) 8 ref. (J23, J29, F23, G4b; Al-b)

229-J. Special Tooling Extends Use of Induction Heaters. G. C. Close. Modern Machine Shop, v. 34, July 1961, p. 100-105.

Application of a coil fixture assembly in brazing Ag, Au, Cu and Ni alloy and in soldering and heat treatment operations using induction heating with coaxial extension cables, permitting work coils to be used up to 60 ft. from the machine. (J2g, K7, K8, 1-52; Ag, Au, Cu, Ni-b)

230-J. (Russian.) Influence of Transformation Heat on Heating of an Infinitely Large Plate, Endless Cylinder and Sphere. G. P. Boikov. Izvestiya VUZ--Chernaya Metallurgiya, Feb. 1961, p. 148-150.

Theoretical calculation of amount of heat necessary to heat steel bodies, taking in consideration amount of heat necessary to decompose the old phase and create the new one. (J-general, N-general; ST)

231-J. (German.) Comparative Investigation of Properties of Molybdenum Case Hardening Steels Used in Automobile Construction. Adolf Rose, Hans Sigwart and Erich Theis. Stahl und Eisen, v. 81, June 8, 1961, p. 800-808.

Investigation of carburization, direct hardening, hardenability and case hardness of case hardenable 20 MoCr 4, 20 CrMo 2 and standard DIN 17210 chromium-molybdenum steel using disk specimens or employing the end-quench test and statistical evaluation of blank hardenability and end-quench properties of 20 MoCr (S) 4 and 20 CrMo(S) 2 steel. Determination of fatigue strength and machinability and investigation of effects of bending fatigue stressing on gear wheels. (J5, J-general, G17k, Q-general, T21; AY, 17-57)

232-J. (English.) Automatic Temperature Control in Progressive and Spin Flame Hardening. S. Matsuoka. Werkstatt und Betrieb, v. 94, May 1961, p. 107-111.

Temperature control by pyrometer readings in flame hardening square samples, gears and rollers of various steels from 600-1200° C. (J2h, S16, 1-52; ST)

233-J. (English.) Hot Quenching of Steels With a Carbon Content of 0.18 and/or 0.30% at Temperatures Above the A_3 Point. Julius Reschka. Werkstatt und Betrieb, v. 94, May 1961, p. 112-114.

The effect of the hold-in period in the heat treating furnace and the temperature of the salt bath on the notch impact strength at standard and low temperature. Brinell hardness and tensile strength of two steels having different carbon content in a nonaged and aged stage. (J26, Q-general; CN-g)

234-J. (Translation-Brutcher no. 4928.) Combined Heat and Ultrasonic Treatment of Chrome-Manganese-Silicon Steel. E. A. Al'ftan. Izvestiya VUZ--Chernaya Metallurgiya, July 1960, p. 129-134.

Microstructures obtained after various heat treatments under ultrasound; mechanical properties and conditions under which a maximum improvement in impact toughness is assured. (J-general, 1-74; ST)

235-J. (Translation-Brutcher no. 4982.) Heat Treatment in Drawing of Titanium Wire. V. Z. Shilkin. Metallovedenie i Termicheskaya Obrabotka Metallov, Oct. 1959, p. 20-23.

Study of most favorable conditions for homogenizing Ti wire during cold drawing. Best homogenizing temperature and time in electric air furnaces and salt baths; relative merits of the various media. (J21, F28; Ti, 4-61)

236-J. Heat Treatment of Engineering Components. E. Mitchell. Iron & Steel, v. 34, July 1961, p. 352-356.

Influence of processes which precede or follow actual heat treatment operation. Effect of carbon pickup during annealing and on subsequent plating. Description of a new method of medium frequency heating for annealing. 4 ref. (J-general; ST)

237-J. Radius Hardening Made Easy With Conduction Heating. Ed Nugent. Canadian Metalworking, v. 24, July 1961, p. 38.

Smooth hardness pattern in a radius between two different diameters in various carbon and alloy steels is achieved by heating the area on either side of the radius and quenching before the whole area drops below the upper critical temperature while avoiding overheating or burning. (J26, Q29n; CN, AY)

238-J. (Translation-Brutcher no. 5153.) Wear Resistance of Iron and Steel Improved by Electrolytic Sulfurizing. S. S. Chernyak. Izvest. Sibir. OTD. Akad. Nauk SSSR, Jan. 1961, p. 25-30.

Electrosulphurizing of toolsteels and cast irons with special reference to optimum current density and treatment time for highest wear resistance and anti-seizing properties. Advantages of electrolytic over conventional sulphur impregnation. (J28, Q9; TS, CI, S)

239-J. Isothermal Heat Treatment. Alan D. Hopkins. Metal Treatment and Drop Forging, v. 28, June 1961, p. 225-230.

Discussion of the transformation characteristics of plain carbon or alloy steel yielding pearlite, bainite and martensite through isothermal annealing, austempering and martempering. Time-temperature-transformation curves determined and discussed in relation to Davenport and Bain's studies. 19 ref. (J-general, N8g; ST)

240-J. (Translation-Brutcher no. 4978.) Determination of Optimum Heat Treatment of Cast 13% Mn Steel G13-L. Ya. K. Alekseev and P. T. Khokhlov. Metallovedenie i Termicheskaya Obrabotka Metallov, Sept. 1959, p. 60-62.

Previously abstracted from original. See item 303-J, 1959. (J-general, Q27a, 3-67; AY)

241-J. (Translation-Brutcher no. 5008.) Structure and Hardness of Surface Hardened Spheroidal Graphite Cast Iron. M. M. Klimochkin. Metallovedenie i Termicheskaya Obrabotka Metallov, Dec. 1959, p. 39-43.

Previously abstracted from original. See item 60-J, 1960. (J28, J2g, Q29; CI-r)

242-J. Heat-Treating Electrical Steels. Australasian Manufacturer, v. 46, June 10, 1961, p. 76-79.

Various parameters including effect of composition, dew point, rates of heating and cooling, surface conditions and

environment are reviewed to bring theoretical and practical experience into closer accord. (J-general, 2-60, 2-66, 2-67; ST)

243-J. Dual Atmospheres Team Up to Cut Heat Treat Costs. Iron Age, v. 187, July 13, 1961, p. 92-93.

Bright treating and brazing in a dual atmosphere of hydrogen or dissociated NH_3 plus a dry exothermic gas. Applications include bright treating of stainless steel, Cu or Ni brazing and ceramic-to-metal brazing. (J23a, K8, 2-66; SS, Cu, Ni, NM-f)

244-J. (German.) Austempering of Welded Joints of High-Strength Heat Treatable Steels. H. Tauscher and H. Buchholz. Schweissen und Schneiden, v. 13, June 1961, p. 230-233.

Austempering procedures as derived from TTT diagrams and their influence on steel properties. Fatigue testing of austempered and stress-free annealed K 30 SiMnCr 4 steel welded sheet. (J2p, N8g, Q7; ST, 4-53, 7-51)

245-J. (Japanese.) Comparative Test on the Rapid Softening of High-Speed Steels (SKH_2 and SKH_9) by Water or Air Annealing. Isothermal Transformation Annealing and Stepped Annealing. Pt. 2. Study on High-Speed Toolsteel. Hideji Hotta. Tetsu-to-Hagane (Iron and Steel Institute of Japan), v. 47, June 1961, p. 823-828.

Hardness tests and micrographic examination are used to determine the effects of the time, temperature and rate of heating and cooling in various annealing methods on the softening of quench hardened specimens. T-T-T curves are constructed with microstructures presented for austenite, pearlite, sorbite, troostite and martensite transformations from 400-900° C. (J23, J29, N8g, Q29, 2-61, 3-67; TS-m)

246-J. (Japanese.) Improvement of Various Properties of 20% Cr-Mn-Fe Alloys by Nitrogen-Absorption Treatment. Pt. 10. Function of Nitrogen as an Alloying Element in Heat-Resisting Materials. Omi Miyakawa and Masazo Okamoto. Tetsu-to-Hagane (Iron and Steel Institute of Japan), v. 47, June 1961, p. 834-840.

The formation of nitrogen-bearing austenite in 20% Cr-Mn-Fe alloys, containing up to 10% Mn, by nitrogen absorption treatment at 1250° C. for 4 hr. and subsequent water-quenching. Thermal behavior of the austenite is studied by differential dilation with test determination of elevated creep and tensile properties and oxidation resistance of the alloys as a function of Mn content. 8 ref. (J28k, M23r, M27, N8n, Q3, 2-60, 2-62, 2-64; Fe-b, Cr, Mn)

247-J. Iron Powder Part Hardness Gains Through Carbonitriding. Steel, v. 149, July 17, 1961, p. 134-135.

Production of sintered Fe powder compacts with increased, more uniform hardness by carbonitriding at 1500° F. in an atmosphere containing NH_3. The N picked up by the Fe acts as an alloying ingredient so that quenching is more uniform. (J28m, Q29n; Fe-b, 6-72)

248-J. Revise Process, Equipment, Step Up Heat-Treat Output. G. M. Seifert. Canadian Machinery and Metalworking, v. 72, July 1961, p. 62-63.

Heat treating and quenching N155 alloy steel aircraft power recovery turbines before and after welding to prevent fatigue cracks. Design and operation of heat treating oven. (J-general, W11m, W27; AY)

249-J. (Czech.) Heat Treatment of Cast Iron Shot. Antonin Tizek. Slevarensti, v. 9, May 1961, p. 180-181.

To increase its economy and effectiveness in the cleaning of castings, shot containing 3.50% C, 0.40% Mn and 0.60% Si is held at 620° C. for 5 hr. and furnace cooled to obtain a sorbitic matrix with embedded ledeburitic cementite. (J-general; CI, 6-67)

250-J. Vacuum Heat Treating. Harold P. Ipsen. Metal Finishing, v. 12, June-July 1961, p. 11-15.

Heat treating stainless steel and toolsteel parts. Design, size, operation, capacity and speed of the vacuum system. Mechanical properties of vacuum heat treated parts. (J-general, 1-73, Q-general; SS, TS)

251-J. Heat Treatment of a Special Stainless Alloy. Metal Treating, v. 12, June-July 1961, p. 16, 34.

Heat treatment of a modified 440-C stainless steel called LESCO BG41, composed of 1.05% C, 0.30% S, 0.50% Mn, 14.50% Cr, 0.12% V and 4.00% Mo. Effects of the austenitizing and tempering on hardness. (J22, J29, Q29: SS)

252-J. (German.) Descaling of Rolled and Drawn Wire of Austenitic Steel and Chromium-Nickel Alloys With Particular Reference to Vacuum Annealing. R. Ergang and H. Huppertz. Metall-Reinigung + Vorbehandlung, v. 10, June 1961, p. 89-91.

Metallographic investigation of surface structure of vacuum annealed (1050° C) Ni coated rolled and drawn wires of 80-20 NiCr and 60-20 NiCr alloys and 30-20 NiCr and 18-8 CrNi steel. Descaling effect of vacuum annealing. (J23, M28p, 1-73; Ni-b, Cr-b, SS-e, 4-61, 8-62)

253-J. Principles and Practices for Making Very Low Carbon Steel by Open-Coil-Annealing. D. J. Blickmede. Blast Furnace and Steel Plant, v. 49, July 1961, p. 639-647, 688.

Sequence of operations in making very low-carbon sheet by open coil decarburization. Open winding, spacing of laps, coil diameter and heating rate. Decarburization problems and their solutions. 12 ref. (J4a; CN, 4-53)

254-J. (German.) Nitriding of Iron, Nickel and Iron-Nickel Alloy Powders by Ammonia. G. Rienacker and K.-H. Kohl. Monatsberichte der Deutschen Akademie der Wissenschaften zu Berlin, v. 2, Feb. 1960, p. 105-108.

Powder specimens are heated at 600° C. in the presence of various catalysts with subsequent investigation of the composition and structure nitride phases by chemical analysis and X-ray examination. 9 ref. (J28k, M-general; Ni-b, Fe-b, 6)

255-J. Quenching Device Eliminates Warpage and Distortion in Induction Hardening of Stainless Steel Cutter Blades. Industrial Heating, v. 28, July 1961, p. 1298.

High frequency induction machine incorporates a quench press which receives the part after being heated to 2000° F. by the work-coil. Quench dies hold the part in position while it is cooled by air under pressure and quenched by water. (J2g, J26, 1-52, T6n; SS)

256-J. Electron Furnace Anneals Strip. Iron Age, v. 188, July 27, 1961, p. 117.

Electron beam heating of sheet metal strip composed of reactive metals such as Ta, Cb, Ti and Zr using a continuous annealing furnace in which heating is almost instantaneous and a high degree of vacuum is maintained. (J23, J2g, 1-73; Ta, Cb, Ti, Zr, 4-53)

257-J. (Russian.) Heat Treatment of Railroad Axles. Yu. V. Grdina, D. I. Tarasko and V. S. Kaigorodtsev. Izvestiya VUZ--Chernaya Metallurgiya, Apr. 1961, p. 97-106.

Strength, fatigue resistance, hardness, percussion viscosity, yield point, elongation, contraction and phase transformations as affected by new heat treating methods. (J-general, N-general, P10f, Q-general, T23)

258-J. Observation Concerning the Structure of Scale and the Mechanism of Formation During the Heating of Steel. Sten Modin and Erik Tholander. Metal Treatment and Drop Forging, v. 190. July 1961, p. 261-270.

Scale formation on 0.1%, 0.2% and 0.7% carbon steel during heating (1000-1300° C.) in an electric furnace with an air atmosphere and in an oil-fired furnace. Formation sequence and properties. 8 ref. (J2g; CN, 9-52)

259-J. Avoidance of Distortion in Heat Treatment. K. Sachs. Metal Treatment and Drop Forging, v. 28, July 1961, p. 281-287.

Analysis of extent of change, stress, plastic yielding, external forces, heating, quenching, cold treatment and tempering relative to characteristics, causes and prevention of volume and shape changes and warping of steel. (J-general, 3-66; ST, 9-74)

260-J. Heat Treating in the Fluid Bed Furnace. Metal Treatment and Drop Forging, v. 28, July 1961, p. 289-290.

Heat treating of superalloys and refractory metals. Austenitizing of intricate parts and removal of residual stresses from Al parts. Bed can be

heated by electricity, gas or oil and can be induction or radiant heat. Applications include austempering of alloy steel and inverse quenching. (J-general, 1-52, Q25h; SGA-h, EG-d37, AY)

261-J. Apparatus for Controlled Slack Quenching. N. L. Carwile, M. R. Meyerson and S. J. Rosenberg. Materials Research & Standards, v. 1, July 1961, p. 532-536.

Apparatus and technique for producing any desired slack-quenched structure in a cylindrical specimen of a steel of medium hardenability. Data are presented to show effectiveness of apparatus and technique and influence of different degrees of slack-quenching on tensile properties of AISI 9440 steel. (J26n, 1-52; ST)

262-J. (French.) An Industrial Application of the Continuous Heat Treatment of Aluminum Alloys. Y. Bresson and P. Guesne. Revue de Metallurgie, v. 58, Apr. 1961, p. 345-350.

Description of a continuous heat treatment plant. Mechanical properties of Al alloys (A. U4G, A. U4G1, A. SG and A. Z5GU) are improved by heat treating at 465-545° C. (J-general, 1-52, Q-general; Al-b)

263-J. (Japanese.) The Annealing of Cold Rolled High-Purity Aluminum Polycrystal. Isamu Igarashi and Tamotu Igarashi. Light Metals, v. 11, Mar. 1961, p. 96-100.

The isothermal softening, recovery and recrystallization of the metal are studied by measuring the diffracted X-ray intensity count number of all Debye-Scherrer rings after annealing from 160-350° C. for various times. 5 ref. (J23s, M22g, N5, Q22n, 2-64, 3-68; Al)

264-J. (Russian.) Annealing of Cold Deformed Chromium and Manganese Steels. Yu. A. Sysuev. Fizika Metallov i Metallovedenie, v. 10, Dec. 1960, p. 907-911.

Samples of 10G12 and ShKh15 steels are deformed and subsequently heated from 300-700° C. The shape of magnetization graphs and the change of coercivity and hardness with various annealing temperatures are used to determine phase composition and mosaic block disintegration. 8 ref. (N8a, M26, P16, 2-61, 2-64, 3-68; AY, Cr, Mn)

265-J. The Effect of Low Temperature Heat Treatment on the Static Mechanical Properties of Spring Wires. Wire Industry, v. 28, July 1961, p. 691.

Relief of textural (grain structure) stress in carbon spring steel wire by heat treatment at 175-350° C. Influence of treatment on strain age-hardening and recovery of mechanical properties including tensile and shear strength, elastic limit and number of twists to failure. (J1a, N7a, Q-general; SGA-b, CN, 4-61)

266-J. (German.) A New Process for Softening Copper Wires. F. Frungel. Draht, v. 12, June 1961, p. 259-262.

Continuous softening of Cu wire specimens by short-time annealing by electrical resistance heating in cooling mediums such as stirred inert gas, water, oil and trichlorethylene. Evaluation of results by comparative hardness measurements and microstructure investigation. (J23; Cu, 4-61)

267-J. Treat the Surface for Longer Tool Life. Edward A. Steigerwald. Tooling & Production, v. 21, Aug. 1961, p. 31-34.

Reduction of edge wear on tool-steels by nitriding, Cr plating, steam oxide treatments, sulphurizing and chromizing. Treatments alter surface chemistry of the tool to produce surfaces of hardness, low coefficient of friction and good wear resistance. (J28k, L14, L17, L23, Q9n; TS, Cr)

268-J. Computer Helps Speed Heat Cycles. C. L. Feng. Metal Progress, v. 80, Aug. 1961, p. 79-82.

An analog simulator, termed "Thermolog", has proved useful in obtaining hard-to-get information necessary for designing and evaluating thermal systems. Specialized heat problems can be solved in a few hours after set up of the simulator circuitry. (J2, 18-74, W23k, W24n)

269-J. Metal-Metal Oxide Composites for High-Temperature Use. Klaus M. Zwilsky and Nicholas J. Grant. Metal Progress, v. 80, Aug. 1961, p. 108-111, 122, 124.

Given the same base metal, dispersion-strengthened composites are stronger (at higher temperatures and for longer times) than their counterparts in age-hardening alloys. (J27, Q-general; 6-70)

270-J. (Italian.) Heat Treatment of Nickel Steels at a Temperature Above and Below the Top Critical Point. G. Mayer. Metallurgia Italiana, v. 53, June 1961, p. 279-289.

Effects of direct hardening, pseudo hardening, single and double hardening and martempering on the mechanical properties of nickel steels. The results show that the case hardened layer has a carbon content between 0.06-1% The influence of heat treatment, at temperatures between Ac and Ac_3 critical points, on the low temperature properties of 9% Ni steel is described for rolled and welded steel. (J26p, J28, Q-general; AY, Ni, 4-53, 7-51)

271-J. (Italian.) Heat Treatment of Light Alloys. E. Hugony. Metallurgia Italiana, June 1961, p. 290-298.

Influence of heat treatment under different heating and cooling conditions on light alloys are reported and some structural changes are discussed. Practical considerations on light alloy heat treatments are expressed and applications to electromechanical construction industries are pointed out. (J-general, 17-57; Al-b, Cu)

272-J. (Italian.) Considerations on the Rapid Efficiency of Some Hardening Media. T. Natale. Metallurgia Italiana, v. 53, June 1961, p. 299-306.

C 20 steel is subjected to water, oil, Na_2SiO_3 solution and salt bath (KNO_3+ $NaNO_2$) hardening at different temperatures. Experiments show that the salt bath has a hardening power intermediate between that of oil and water and is able to cool steel pieces at a very low rate, giving the least deformations. Methods of calculating efficiency of the most common hardening media are discussed. (J2j, J26n; ST)

273-J. (Italian.) Recent Developments in the Use of Salt Baths for Case Hardening and Heat Treatments. F. D. Waterfall. Metallurgia Italiana, v. 53, June 1961, p. 307-318.

Large documented survey of case-hardening, hardening and tempering heat treatments in salt baths. Emphasis is given to high temperature case-hardening, austempering of high-speed steels and to sulphurization. (J-general; TS-m)

274-J. (Italian.) Heat Treatment Metallography for Zinc and Lead Alloys. L. Matteoli and A. Bianchini. Metallurgia Italiana, v. 53, June 1961, p. 326-346.

Examination of the influence of heat treatments on Zn and Pb alloys, and precipitation phenomena of beta fcc. components from a supersaturated hexagonal solid solution and eutectoid decomposition of beta component at 272° C. are discussed. Study of crystallization of Pb-Sb alloys and cable alloys and factors affecting them where subjected to hardening and aging. 47 ref. (J-general, M-general; Zn-b, Pb-b)

275-J. Cast Ferrous Alloy, Hardened in Air, Shows Little Distortion. Steel, v. 149, July 24, 1961, p. 90-91.

Parts of AQ Meehanite alloy are machined as-cast and hardened in air from an austenitizing temperature of 1650° F. to minimize cracking or dimensional change. Brinell hardness and tensile strength are determined after quenching. (J2h, J26, Q29, Q27; Fe-b, 5)

276-J. Heat Treatment of Engineering Components. E. Mitchell. Birmingham Metallurgical Society, Journal, v. 41, June 1961, p. 22-44.

Review of various heat treatment methods including case hardening, induction heating, pack carburizing, annealing, tempering, austempering, Cu brazing, flame hardening, post weld heat treating and others. Techniques, equipment and applications of each method to various steels. 5 ref. (J-general, 1-52; ST)

277-J. Gaseous Annealing of Malleable Castings. C. G. W. Overton. Current Engineering Practice, v. 3, May 1961, p. 18-22.

Annealing of ferritic blackheart, pearlitic blackheart and whiteheart castings using elevator, bell, pit and log hearth batch furnaces. (J23, W27; CI)

278-J. (German.) Heat Treatment of Forgings. Herbert Bittermann and Dieter Metzner. Fertigungstechnik und Betrieb, v. 11, June 1961, p. 366-371.

Technology and equipment for heat treating (soft annealing, homogenizing, hardening and annealing, stress-free annealing) of steel forgings discussed in terms of heating rate, soaking time and temperature and cooling medium as influenced by composition and dimensions of forging; various kinds of heating furnaces. (J23, F21b, 2-60, 2-61, 3-67, 3-73; ST, 4-51)

279-J. (Translation-Brutcher no. 4995.) Steels for Surface Hardening. K. Z. Shepelyakovskii. Metallovedenie i Termicheskaya Obrabotka Metallov, Nov. 1959, p. 24-39.

Previously abstracted. See item 63-J, 1960. (J28, J2g, Q26s; CN)

280-J. (Translation-Brutcher no. 4998.) Experiences With the Introduction of Progressive Heat Treating Processes. A. A. Dubasov. Metallovedenie i Termicheskaya Obrabota Metallov, Nov. 1959, p. 45-48.

Previously abstracted. See item 64-J, 1960. (J2g, J2j, J28; ST)

281-J. (Translation-Brutcher no. 5161.) Unused Production Reserves. B. I. Shashkin. Metallovedenie i Termicheskaya Obrabotka Metallov, Nov. 1959, p. 50.

Possibility of loading carburizing boxes with up to 35% of their total useful volume with carburizing stock (instead of the present 10-15%) without detriment to product quality. Amount of carburizing compound actually needed. (J28g, 1-52)

282-J. (Russian.) Electrical Tempering of Chromium Steel. V. N. Gridney and Yu. Ya. Meshkov. Metallovedenie i Termicheskaya Obrabotka Metallov, June 1961, p. 2-4.

15 Kh, 38 KhA and ShKh6 steel wires of 1.8-2.5 mm. diameter are quench hardened and then tempered by direct passage of industrial a-c. from 200-800° C. and cooled at a rate of 1500-2000° C. per sec. by water quenching. Effects on mechanical properties and hardness. 6 ref. (J29, 1-68, J26, Q-general; SS, 4-61)

283-J. (Russian.) Hardness Depth After Interrupted Quenching. E. K. Kovshikov and F. N. Tavadze. Metallovedenie i Termicheskaya Obrabotka Metallov, June 1961, p. 5-7.

To determine the depth of hardness, the heating and cooling conditions are reconstructed under which a steel part of more than 600 mm. cross section is hardened by interrupted quenching. Samples are end quenched and in some cases subsequently tempered. Quenching media are water, oil or fused saltpeter of 275-375° C. (J26p, Q29n, 1-54; ST, 4-61)

284-J. (Russian.) Kinetics of the Heating of Steel Parts in Fused Salt Baths. E. A. Smolnikov. Metallovedenie i Termicheskaya Obrabotka Metallov, June 1961, p. 7-13.

Spherical, cylindrical and prismatic samples of several steels are heated in various salt baths. Effects of steel composition, bath temperature, preheating and shape on heat flow and the immersion time needed for heating the sample up to bath temperature. (J2j; ST, 3-73, NM-a33, 2-60, 2-61)

285-J. (Russian.) The Fluid Bed as a Cooling Medium. N. N. Yaryain. Metallovedenie i Termicheskaya Obrabotka Metallov, June 1961, p. 13-18.

Experimental cooling of a Ag sphere in quartz sand fluidized by a stream of air. Control of cooling power by regulating the speed of air. Effect of bed composition and particle size on cooling power. 12 ref. (J2, W28p, 2-60, 3-73; Ag, NM-f45)

286-J. (Russian.) Heat Treatment of Steel in an Exothermic Furnace Atmosphere With an Increased Carbon Potential. N. P. Petrov and I. T. Troshkin. Metallovedenie i Termicheskaya Obrabotka Metallov, June 1961, p. 18-21.

Samples of St. 40, 30KhGSA, 30KhGSNA, 40KhA and U8A steels are heat treated for 0.5-1.5 hr. in an atmosphere containing 0.4-0.6% CO_2, 6.5-15% CO, 13-21% H and 0.3-21.5% CH_4. Effect of the CH_4 content on recarburization and fatigue strength. (J2k, 2-66; ST)

287-J. (Russian.) Effect of the Austenitic Grain on the Ductility of 9KhF Steel. G. M. Belkov and N. T. Litenko. Metallovedenie i Termicheskaya Obrabotka Metallov, June 1961, p. 21-24.

Samples are held in a furnace at 900-1230° C. for 1 hr., transferred to a second furnace and held at 750-1180° C. for 30 min. and immediately deformed in a forging press by a force of 50 tons. Effect of overheating on austenitic grain size, ductility and deformation resistance in forging. (J-general, M27c, 2-64, 3-68; ST)

288-J. (Russian.) High-Speed Tool Steels With a Lower Carbide Inhomogeneity. Yu. A. Geller, L.S. Kremner and Ts. L. Olesova. Metallovedenie i Termicheskaya Obrabotka Metallov, June 1961, p. 25-35.

Steels containing 0.72-0.87% C, 3.63-17.8% W, 2.18-4.2% Cr, 1-2.26% V, 0-0.9% Ni and 0-0.26 N are quenched from 1180-1260° C. and tempered at 200-600° C. Bend strength, retained austenite, hardness and carbide inhomogeneity as functions of the W, Cr, Ni and N contents. Thermodynamic decomposition of subcooled austenite. Service life of toolsteels containing 7-12% W and 3% Cr. 15 ref. (J26, J29, N8n, N8r, Q5g, Q29n, 2-60, 2-64; ST, W, Cr, Ni, N)

289-J. Nitrogen in Metalworking. Metalworking Production, v. 105, July 26, 1961, p. 50-52.

Utilization of nitrogen in metalworking applications including freeze fitting of male and female metal components, degassing of Al and Cu and their alloy production of inert atmosphere and desulphurizing and recarburizing of steel. (J2k, F-general, G-general; N, 17-57)

290-J. Induction Heating Solves a Variety of Production Problems. Nicholas G. Gagliardi. Machinery, v. 67, Aug. 1961, p. 95-101.

Application of induction heating to hardening, brazing and annealing of automotive wrist-pins and aircraft fuel lines produced from plates of 1020 hot rolled steel and hollow high carbon steel tubing and cast Al alloy at 1400-1500° F. (J2g, K8k; ST, Al, 4-53, 4-60)

291-J. Three-Stage Heat-Treating Line Adds to Product Uniformity. F. F. Bach and J. Jones. Iron Age, v. 188, Aug. 24, 1961, p. 70-71.

Wear resistance of forged steel grinding balls is improved by a heat-treat line which carries them through a hardening furnace, into a quench tank and finally through a 750° F. draw furnace. (J-general, 1-52, Q9; ST, 6-67)

292-J. How to Get Better Heat Treated Work. Steel, v. 149, Aug. 21, 1961, p. 60-63.

Review of part requirements, mechanical properties and materials selection factors, heat treatments and inspection techniques for use in treating steel parts with a minimum of distortion and cracking. (J-general, 10-54; ST)

293-J. How to Induction Harden Axle Spindles. Pt. 7. Ed Nugent. Canadian Metalworking, v. 24, Aug. 1961, p. 60-61.

Hardening SAE 1340 spindles to Rockwell C40 at a minimum depth of 0.096 in. and maximum of 0.160 in. over both radii and for almost the full length of the shaft. (J2g, T7j; AY)

294-J. Decarburization by Open-Coil Annealing. D. J. Blickwede. Journal of Metals, v. 13, Aug. 1961, p. 548-554.

Decarburization-annealing of steel coils to make porcelain enameling sheet. Procedures for open and tight winding of coils, gases used for decarburizing and major problems encountered. 12 ref. (J4a; ST; 4-53)

295-J. Continuous Annealing of Brass Tubing Sixty Feet Long. Gordon E. Signor and Douglas M. Estelle. Industrial Heating, v. 28, Aug. 1961, p. 1470-1472, 1474, 1476, 1478.

Production of cupro-nickel and brass tubing using two modern continuous roller hearth bright annealing furnaces in connection with drawing routines. Control of temperature, time and furnace atmosphere permits production of tubing from 1/8-3 1/2 in.diameter in length up to 60 ft. to exact requirements of surface finish, hardness and grain size. (J23a, F26r; Cu-b)

296-J. Heat Treating and Finishing Cold-Rolled Steel Strip and Strapping at the Stanley Works. Industrial Heating, v. 28, Aug. 1961, p. 1507-1508, 1510, 1512.

Description of bright annealing, normalizing, heat treating, lithographing and japanning process for cold rolled steel strip and strapping. (J-general, L-general; ST, 4-53)

297-J. Continuous Electric Furnace Installation Bright Heat Treats 40'-Long Stainless Tubing at H&R Metal Treating Company. Industrial Heating, v. 28, Aug. 1961, p. 1589-1590.

Use of a continuous controlled-atmosphere electric furnace for bright annealing and bright hardening of stainless steel and other high temperature alloys. The conveyor-belt furnace comprises a charging area, a retort for preheating and soaking and a cooling chamber. (J23a, J2k, 1-52; SS, 4-60)

298-J. Atmosphere Annealing Cuts Aluminum Coil Rejects. Steel, v. 149, Aug. 28, 1961, p. 83.

Controlled atmosphere annealing of Al in a gas-fired furnace designed with a high recirculation rate and automated temperature cycling. Use of a N-H-CO atmosphere prevents oil staining. (J2k, J23; Al, 4-53)

299-J. The Patenting Process in the Production of High Quality Patent Steel Wire. A. Cooper. Wire Industry, v. 28, Aug. 1961, p. 771-773.

Review of the air patenting process for low-carbon steel rod. Evaluation of carbon influence on possible reductions and of cooling rate on microstructure. Survey of equipment for air and Pb patenting. (J25, 1-52, 2-60; ST, 4-61)

300-J. (German.) Austempering of Welding Joints of High-Strength Heat Treatable Steel. H. Tauscher and H. Buchholz. Schweissen und Schneiden, v. 13, July 1961, p. 278-281.

Austempering of welded K 30 SiMnCr 4 steel specimens at 320-425° C. for 1 hr. with subsequent tensile and fatigue testing and hardness investigation of mechanical properties as influenced by austempering temperature. (J26p, Q-general; AY, 7-51)

301-J. (Italian.) Department of Physics. Istituto Sperimentale dei Metalli Leggeri--Rapporto Annuale 1960, 1961, p. 58-66.

Effect of aging on various Al alloys. Influence of lattice vacancies, introduced by annealing, on the kinetics of Guinier-Preston zone formation. Preparation of Al by the fused-zone method, determination of impurities (Fe, Mg, Si) and measurements of thermal conductivity. (J27d, M26, P11h, S11; Al-b)

302-J. (Italian.) Researches on the Effect of Boron on Low-Alloyed and Carbon Steels. A. Bargone, L. Marchesini and G. Libondi. Technica Italiana, v. 26, June 1961, p. 247-261.

Examination of the effect of boron on hardenability, mechanical properties after hardening and tempering, structure and transformation point of Uni C 40, 32 CD 4, 15 CD 3, 35 CM 4 and 38 NCD 4 steel castings, showing changes in specimens subjected to the hardening process do not appear in specimens subjected to the normalizing process. Relation between boron, carbon and hardenability is investigated. (J5, N8, Q-general; AY, CN, B)

303-J. (German.) Trends of Development in Electric Sheets. G. Rassmann. Elektrie, v. 15, June 1961, p. 176-181.

Improvement of electrical and magnetic properties particularly, high inductivity at low magnetization losses, of dynamo and transformer sheets (Fe-Si alloys containing up to 4.5% Si) by control of texture through proper annealing and nitriding techniques. (J23, J28k, P15, P16; SGA-n)

304-J. Observations on the Decarburization of Mild Steel by Reaction With a Surface Scale. Donald J. Knight. Metallurgical Society of AIME, Transactions, v. 221, Aug. 1961, p. 891.

Vacuum heat treatment at 1500° C. of oxidized 0.1% mild steel specimens having cracks in the oxide scale surface layer. The mechanism of the observed ferrite layer growth on the metal-oxide-void interface is explained in terms of the decarburization reaction in which carbon reacts with oxygen at the interface forming CO_2 and reducing the oxide to metal. In turn, oxygen diffuses through the ferrite film to react with carbon at the newly formed ferrite-void interface causing thickening of the film. (J4a, 1-73, N8, 9-52; CN-g)

305-J. Investigations of the Influence of Thermal Treatments on the Performance of Mould Irons. D. K. Hill. Glass Technology, v. 2, June 1961, p. 110-113.

Field trials of gray cast iron molds subjected to various heat treatments (annealing, stress relief, normalizing) indicate a beneficial effect on mold performance. (J1a, J23, J24, T29a; CI-n, 17-52)

306-J. Oxygen-Free Ovens Anneal Coils. Iron Age, v. 188, Sept. 21, 1961, p. 100.

Medium sized ovens with accelerated heating and cooling rates are used to anneal Al at 775° F. in an oxygen-free atmosphere. The oxygen level is maintained at less than 0.5% by an automatic analyzer and recorder. The atmosphere is supplied by two 15,000-cfh. exothermic generators. (J23, J2k, 1-55; Al)

307-J. Nitriding in a Salt Bath. Metalworking Production, v. 105, Aug. 1961, p. 43.

Nitriding of low-carbon steel, heat-resisting steel and cast iron using molten salt composed of potassium cyanide and potassium cyanate at 1050° F. (Tuffriding). Properties affected include fatigue life and corrosion and wear resistance. Industrial applications are noted. (J2j, J28k, Q-general, 17-57; ST, CI)

308-J. Castings Annealed in Molds by Controlled Cooling in Automatic Line. Steel, v. 149, Sept. 11, 1961, p. 114.

Annealing of tractor and implement castings of nodular cast iron while still in the molds by automatically programed storage and cooling lines which can hold the castings for 1/2-1 3/4 hr. (J23, 1-52, T3n; ST, 5-63, 17-57)

309-J. The Ferritization of S.G. Cast Iron by the Controlled-Cooling Process. G. J. Cox. Metallurgia, v. 64, July 1961, p. 15-21.

Investigation of composition of Fe and amount of pearlite permissible as factors affecting the cooling rate during controlled cooling of S.G. iron to develop the ferritic matrix necessary where increased ductility and shock resistance are required. (J26, 2-60, 3-71; CI-r)

310-J. (Italian.) The Commercial Heat Treatment of Large Stampings, Drawn Parts and Forgings. Trattamenti Termici e Protettivi dei Metalli, v. 4, May-June 1961, p. 3-8.

Technological and economic parameters of a plant of six furnaces heated by naphtha, two quenching machines and one loading machine which transports heavy coarse parts automatically from one furnace to the other. Oil and water quenching are both carried out. (J-general, 1-52; 4-51, 4-55, 4-59)

311-J. The Anatomy of a Specification. John M. Kelso. Metal Treating, v. 7, Aug-Sept. 1961, p. 10-12.

The importance of heat treating specifications for processing austenitic, martensitic and alloy steels are outlined in regard to temperature control, carburizing, nitriding, hardening, cooling, quenching, tempering and stock removal. (J-general; ST)

312-J. Effect of Different Types of Heat Treatment on the Mechanical Properties and Structure of Hard-Rolled and Hard-Drawn Stainless Chromium-Steel Wire. K. H. Kayser. Wire World International, v. 3, June 1961, p. 129-137.

Testing of stainless chromium-steel wire of ferritic, semiferritic and martensitic grades suitable for quenching and tempering includes determination of soft annealing, recrystallization and maximum tensile strength temperatures. (J-general, Q-general; SS, Cr)

313-J. Heat Treatment of Cold Extrusions. Metal Treating, v. 7, Aug-Sept. 1961, p. 16-18.

Unheated Al, Cu and 4130 steel slugs are extruded into tubes, lugs, bosses, ribs, fluts and gears by cold steel impacting. Forward and backward impacting of an ambient-temperature die is combined with heat treatment prior to the final extrusion stage. (J-general, F24, G5; Al, Cu, ST)

314-J. (Japanese.) Electrolytic Hardening. Pt. 5. Abrasion Tests on Electrolytically Hardened SKS 7 Steel. Toshinori Kuroda and Haruki Kondo. Osaka Industrial Research Institute, Bulletin, v. 12, Jan. 1961, p. 41-44.

Comparison of electrolytically-hardened hack saws of SK-3 and SKS-7 steel with those hardened in ordinary furnaces or by high frequency methods. Superior sawing quality of the former is due to rapid heating, strong quenching, low decarbonization, carbonization and tip heating of saw teeth at high temperatures. (J2, Q9, T6p, 1-54, 2-64; ST)

315-J. (French.) Heat Treatment of SG. Cast Iron. Semin and Strub. Trempe, no. 39, Sept. 1961, p. 17-21.

Pearlitic iron containing 3.34% C, 2.61% Si, 0.16% Mn, 0.1% P, 0.05% Cr

and 0.007% S is heat treated at 700° C. for 2 hr. to produce a ferritic structure, allowed to cool, held at 820-920° C. for 0-4 hr., 45 min. and subsequently quenched in water or oil or allowed to cool in the furnace or in air. Tempering of water quenched samples at 450° C. Flame hardening with water shower of ferritic samples. Effect of heat treatment on microstructure and hardness. (J-general, N8, Q29n, 2-64; CI)

316-J. Some New Developments in the Application of Furnace Atmosphere. P. Burtenshaw. Wild-Barfield Heat Treatment Journal, v. 8, June 1961, p. 2-5.

High-pressure hydrogen and atmosphere-protected brazing furnaces are used for heat treatment of high-strength, high-temperature Ni and steel alloys to prevent chemical reactions, surface oxidation and vapor gas absorption during the heating and cooling stages. (J2k, 1-52; Ni-b, ST, EG-n, SGA-h, SGB-a)

317-J. Overcoming the Downtime "Hurdle". Production, v. 48, Sept. 1961, p. 59-61.

Heat treatment of replacement gears for production machines by flame hardening prior to hobbing and shaping. Use of portable equipment permits fabrication of the gears on site using a minimum of time. (J2h, G17, T7a)

318-J. (German.) Heat Treatment of Antifriction Bearing Steel. Development of a New Process Using Inert Gas. Karl-Heinz Skarupke, Helmut Marschner, Manfred Gross and Curt Bager. Neue Hutte, v. 6, July 1961, p. 399-410.

Soft annealing of rolled high-carbon 105Cr4 and 100Cr6 steel without preceding pickling at temperatures from 600-720° C. under a protective $CO/CO_2/H_2$ atmosphere (50 -75% CO, 1% CO_2, 8-10%) which is continuously regenerated in a closed circuit. Thermodynamics of Fe gas equilibria. (J2k, J23, N15f; CN-r)

319-J. (Italian.) Practical Contribution to Heat Treatments of Light Alloys. Eugenio Hugony. Fonderia Italiana, v. 10, July 1961, p. 274-280.

Annealing, tempering, aging, casting and homogenizing of Al and Al alloys with special emphasis on structural phenomena that occur in the material during heating and cooling processes under different conditions. (J-general, E25; Al, Al-b, 9)

320-J. (German.) Consequences of Selective Oxidation of Binary and Ternary Alloys. Harald Pfeiffer. Zeitschrift fur Metallkunde, v. 52, July 1961, p. 481-488.

Annealing of NiCr (80/20 and 30/20) and CrAl (20/5) alloy sheet and wire specimens with and without small concentrations of B at 1200° C. under atmospheres of varying H and O content. Measurement of length changes, caused by selective oxidation during annealing, as influenced by B content of specimens and O content of annealing atmosphere. (J2k, P10d, 1-53, 2-62, 2-66; Ni, Cr, Al, 4-53, 4-61)

321-J. Stress Relieving of Steel Weldments. Louis J. Larson. Machine Design, v. 33, Sept. 14, 1961, p. 179-183.

Discussion of corrosion and caustic embrittlement, machinability and stability, flaws of fabrication and brittle fractures of pressure vessels, boilers and other steel structures in terms of welding codes and the utility of thermal stress relieving. (J1a, Q26s, R1, T26q; ST, 7-51)

322-J. (Translation-Brutcher no. 5094.) Induction Hardening of Metal Powder Compacts (Especially Iron Powders). I. N. Kidin. Izvestiya VUZ-Chernaya Metallurgiya, v. 11, Nov. 1960, p. 113-120.

Kinetics of induction heating on their structure and hardness after quenching. Induction heating curves for Fe compacts of 80-90% density and with 0.63-0.76% C compared with curve for a 0.60% C fusion made steel. (J2g; Fe-b, C, 6)

323-J. (German.) Descaling of Rolled and Drawn Wires of Austenitic Steels and Chromium-Nickel Alloys With Particular Reference to Vacuum Annealing. R. Ergang and P. H. Huppertz. Metall-Reinigung + Vorbehandlung, v. 10, July 1961, p. 108-113.

Vacuum annealing at 1050° C. of wire (0.4-6 mm. diameter specimens of 18/8 CrNi, 30/20 NiCr, 60/20 NiCr and 80/20 NiCr alloy and powders of Ni, Cr, Si and Fe with and without prior oxidation treatment for investigation of oxidation and evaporation equilibria. Influence of 0-0.1% C on scale formation. (J23, 1-73, L10, R1h; SS-e, Ni-b, Cr-b, 4-61)

324-J. (Russian.) Annealing of Sheets and Strips in Hood and Shaft Furnaces. A. K. Chertavskii, B. S. Tikhonov and V. P. Katasonova. Tsvetnye Metally, Apr. 1961, 1. 61-65.

Annealing of Cu, Ni, Cu-Ni and brass sheets and strips for automotive applications. Strip rolls are annealed in shaft furnace with compulsory air circulation to provide uniform temperature distribution throughout the roll. (J23, T21, 1-52; Cu, Ni, 4-53)

325-J. Strain-Free Annealing Aluminum Sheet for Big or Small Orders. Modern Metals, v. 17, Sept. 1961, p. 36-39.

High heating and cooling rates of oxygen-free ovens permit the production of high-volume, quality Al sheet while reducing annealing time by 1/3 to 1/2. Controlled atmosphere prevents breakdown of rolling lubricants when oxidized at high temperature and thus avoids staining and oxidation of sheet. (J2k, 1-52; Al, 4-53)

326-J. Heat Treating Aluminum in Steam Atmosphere Cuts Finishing Costs. F. L. Spangler and M. E. Lackey. Modern Metals, v. 17, Sept. 1961, p. 68.

Nonferrous metal parts are treated in a steam atmosphere using a sealed, forced convection type furnace. Finishing costs are reduced since steam atmosphere inhibits oxidation and subsequent cleaning operations are reduced or eliminated. (J2k, 1-52; Al)

327-J. Stress-Relieving First Pressure Vessel at Hunterson. Engineer, v. 212, Aug. 25, 1961, p. 331-333.

An 1800-ton steel pressure vessel, at a mean height of 85 ft. above ground, is stress relieved by heating to 550° C., soaking for 13 hr. and slow cooling with radiant heating applied mainly by bare strip elements. Design considerations are given for heating system, power and thermocouple cabling and thermal insulation. (J1a, T26q; ST, 17-57)

328-J. Largest Flame-Hardening Plant Makes Excavator Components. Industrial Gas, v. 40, Aug. 1961, p. 8-9.

Design of automatic oxygen-town gas machine to harden track links. Another application is a spinning method for hardening large gears. (J2h, T4a, T7a, W27g, 1-52)

329-J. Induction Device Hardens Parts for Huge Construction Machines. Steel, v. 149, Oct. 2, 1961, p. 66-67.

Parts fabricated from 1045 carbon steel are induction hardened and tempered without excessive distortion in a single scanning process, followed by oil quenching. (J2g, J26n, T4; CN)

330-J. New Era in Heat Treating. O. E. Cullen. Metalworking, v. 17, Oct. 1961, p. 17-19, 30.

Improved metallurgical control of metal products obtained through better atmospheres, quenching techniques and process controls achieved in modern heat treatment equipment. Effect of process variables during annealing, quenching and marquenching on transformation microstructures, distortion growth and mechanical properties of 1060, 1025, 1040 and 1141 steels. Evaluation of carbon control occurring during gas-carburization of medium and high carbon steels. (J-general, 1-52; ST)

331-J. Vacuum Heat Processing. John H. Durant. Metalworking, v. 17, Oct. 1961, p. 20-23.

Design criteria for selection of vacuum furnaces for annealing, degassing, hardening, homogenizing, sintering, tempering, brazing, diffusion bonding, soldering, refining and other operations requiring close metallurgical control of materials and prevention of contamination. Application to refractory and high temperature metals and alloys. Effect of process control on physical and mechanical properties of materials. (J-general, C-general, W18, W27, 1-73, 17-51; EG-d37, SGA-h)

332-J. (Japanese.) Sulphurizing Treatment of Cast Iron With H_2S and Wear Resistance Property of the Sulphurized Layer. Taketomo Yamazaki. Imono (Japan Foundrymen's Society, Journal), v. 33, July 1961, p. 503-511.

Cast iron specimens containing 3.10% C are heated in H_2S atmospheres at 200-600° C. for 1-5 hr. with conditions of sulphide formation on and beneath the surface being studied by X-ray, metallography and chemical analysis and hardness measurements, followed by wear testing. Surface films (determined as pyrrhotite) and sulphide diffusion layers

affect wear properties according to sulphur content and thickness, both being functions of diffusion temperature and time. (J28, M-general, N1, Q9, 2-60, 2-61, 3-67; CI)

333-J. (Italian.) Flame Hardening of Lathe Beds. J. Obrebski. Trattamenti Termici e Protettivi dei Metalli, v. 4, Mar-Apr. 1961, p. 3-8.

Flame hardening and decarburizing of lathe beds made of pearlitic cast iron (C = 3.30%, Mn = 0.7-0.9%, Si = 1.2-1.5%). Effect of flame distance and temperature on the microstructure and hardness. (J2h, M27, Q29; CI-r)

334-J. (Italian.) Phenomena Occurring During the Annealing of Cold Rolled Mild Steel Plates. G. Odone and V. Berruti. Trattamenti Termici e Protettivi dei Metalli, v. 4, Mar-Apr. 1961, p. 17-24, 35.

Effect of thermal cycling and annealing time and temperature (350-500° C.) on the structural modifications, grain size and Rockwell and Vickers hardness of mild steel plates used for producing deep drawing sheets. (J24, M27c, Q29; ST, 4-53)

335-J. Steel Sheets for Single Coat Porcelain Enameling. R. S. Burns and R. L. Myers. Paper from "Regional Technical Meetings, 1960". American Iron and Steel Institute, New York 17, 1961, p. 171-186.

Design requirements for production of a nonfishscaling enameling sheet including controlled carbon content in the ingot, coiling temperatures of the hot band which is high enough to form massive carbides and cold reduction that is adequate to produce microscopic voids. Decarburization and microscopic roughening procedures are used to prevent enamel boiling and improve bonding. (J-general, L27, 2-60, 17-52; ST, 4-53, 17-51)

336-J. Computerized Control of a Continuous Annealing Line. Robert H. Smith. Paper from "Regional Technical Meeting, 1960". American Iron and Steel Institute, New York 17, 1961, p. 313-331.

Continuous annealing of steel strip on a line having a digital control computer system, a package control system and processing line tensiometer regulators. (J23, 1-61, 18-74; ST, 4-53)

337-J. Heat Treatment of Stainless Steel Tubing and Wire. C. H. Vaughan. Industrial Heating, v. 28, Sept. 1961, p. 1664-1670, 1672, 1674, 1676.

Facilities (equipment and atmospheres) used for annealing the 200, 300, 400 and 500 series stainless steels. (J23, 1-52; SS)

338-J. Tower-Type Electric Furnaces Continuously Bright Anneal Stainless Strip Up to 27 In. Wide. Industrial Heating, v. 28, Sept. 1961, p. 1678, 1680.

Production of "bright annealed" stainless steel with a mirror like finish and improved corrosion resistance at Allegheny Ludlum Steel Corp. using furnace facilities 100 ft. high. (J23a, W27, 1-52; SS)

339-J. Processing of Stainless Steel Flat Products. M. R. Ogle. Industrial Heating, v. 28, Sept. 1961, p. 1701-1716.

Annealing, descaling and surface conditioning of sheet, plate and strip. (J23, L10, 1-52; SS, 4-53)

340-J. (English.) Controlled Furnace Atmospheres and Heat Treatment. Werner J. Hahn. Werkstatt und Betrieb, v. 94, July 1961, p. 169-171.

Calculation of air-gas proportions, split-gas compositions and expansion factors as a function of physical chemistry interrelationships, especially the neutral nonoxidizing hardening procedure applied to steel. (J2k, 1-53; ST)

341-J. (French.) Gas Carburizing. W. T. Goves. Traitements Thermiques des Metaux, v. 2, Jan-Feb. 1961, p. 3-15, 18.

Carburizing of carbon and low-alloy steels containing 0.20-1% carbon at 1500-1750° F. in an atmosphere containing approx. 20% CO. Steel is examined to determine depth of case as a function of time and temperature, tensile and compressive residual stresses and hardness of case as a function of carbon content. $CO-CO_2$ mixing ratios are indicated to be in equilibrium with various carbon contents at a given temperature. (J28g, 1-53; CN, AY)

342-J. Applications of Electron Bombardment Heating in Metallurgy. Metal

Treatment and Drop Forging, v. 28, Aug. 1961, p. 327-330.

Intense and controlled heating over small areas without contamination of the material as obtained with electron bombardment heating. Use of electron beam techniques in zone melting, single crystal growth, welding and ingot production of refractory, reactive and semiconductor metals. (J2h, C28k, K6, 10-54; EG-d37, EG-h, EG-j31)

343-J. Heat Treatment Research at A.E.I.-Birlec. Metal Treatment and Drop Forging, v. 28, Aug. 1961, p. 336-338.

Review of annealing, quenching and tempering projects including bright annealing of stainless steel strip for furnace lining, operation of pilot sealed-quench and shaker-hearth furnace units and testing of radiant tubes. Gas plant operations include improved exothermic gas generators, removal of CO_2 from gas and air mixtures, catalysts for endothermic gas generators and dryers for compressed air and gases. (J-general, A9m, 10-54; ST)

344-J. (German.) Die Cast Malleable Iron, Its Quality, Testing and Standardization. Josef Czikel and Karl Stolzel. Freiberger Forschungshefte, no. B 59, July 1961, p. 45-63.

Sand and die cast rods of malleable iron containing up to 0.5% Si are annealed at 900° C. and subjected to controlled cooling and subsequent mechanical testing, in an effort to standardize methods of testing for quality control. (J23, J2, Q-general, 1-54, 17-54; CI-s, Si)

345-J. (German.) Heat Treating of Cast 13% Cr Steels. Stanislav Drapal. Freiberger Forschungshefte, no. B 59, 1961, p. 99-121.

Heat treatment at 750-1150° C. of steel with carbon content varying from 0.05-0.34%, the austenitization temperature being magnetically measured, is followed by investigation of grain size and mechanical properties. (J-general, N8; CN-g)

346-J. Hunterston Vessel Stress Relieved. Electrical Times, v. 140, Aug. 24, 1961, p. 259-260.

The vessel is heated to 550° C. and its heating pattern is recorded and logged by 400 thermocouples fed into digital typewriters and strip chart recorders. Elements of the reactor individually studied during the process include the inner heat shield, graphite core support grid and main gas seals. (J1a, T11, T26q, 1-52; ST)

347-J. What Steels Shall I Use...for Heat-Treated Parts in Business Machines and Home Appliances? Metal Progress, v. 80, Oct. 1961, p. 77.

Though manufactures make many different types of items, heat treatment processes are usually restricted to case-hardening methods because wear resistance is the chief property desired. (J-general, T10c, X14; ST, 17-57)

348-J. What Steel Shall I Use...for Nitrided Parts? Wilson Leeming. Metal Progress, v. 80, Oct. 1961, p. 82.

As a means of imparting wear resistance at elevated temperatures, nitriding is receiving much consideration. For example, H11 gears for long-time service at 500° F. are now being nitrided. (J28k, Q9h; CN, AY)

349-J. Hardenability Bands for 1041 and 1045 SAE Recommended Practice. Metal Progress, v. 80, Oct. 1961, p. 96B.

These bands are applicable to semifinished products for forging, hot rolled and cold finished bars, wire rods and seamless tubing. (J5, 15-69; ST, 4)

350-J. The Heat Treatment of Steel--Base-Metal Thermo-Couples. Edwin Gregory. Edgar Allen News, v. 40, Sept. 1961, p. 207-208.

Properties of combinations of Cu-Ni alloys with wires of Cu, Ag, Ni or Fe, with data given for temperature ranges and resistances. Prevention of oxidation of thermocouple wires at high temperatures using a protective sheath. Method of calibrating thermocouples and converting emf. values into temperature. (J-general, P-general, 2-62; SGA-a)

351-J. Carbon Restoration in Investment Castings. E. M. Broad. Precision Metal Molding, v. 19, Oct. 1961, p. 86-87.

Review of carbon restoration process to bring the carbon content of the surface layer of steel up to the level of the core and the case carburization process to bring the carbon content of the surface layer to a level above that of the core. Effect on final mechanical

properties and service life of the part. (J3n, J28g, E15, Q-general; ST)

352-J. Mechanized Heat-Treatment Installation for Transmission Parts. Herbert Chase. Machinery (London), v. 99, Sept. 13, 1961, p. 633-639.

Equipment layout, assembly line operations and processes including annealing, carbonitriding, oil quenching, washing and tempering. (J-general, 1-52, 18-67, T21)

353-J. Open-Coil Process Makes Bid for Stainless Market. Iron Age, v. 188, Oct. 19, 1961, p. 133-135.

"Alphatizing", a process of diffusing Cr into the surface of mild steel and low carbon steel coils by the circulation of Cr-halogen gases around the coils in a furnace. Alphatized steel samples are tested to determine tensile properties, weldability, oxidation resistance and case depth and ductility. Automotive applications. (J2k, K9s, Q23p, Q27a, R-general, T21; CN, Cr, EG-k)

354-J. A Special Induction Hardening Installation. Wild-Barfield Heat-Treatment Journal, v. 8, Sept. 1961, p. 8-10.

Induction hardening of 0.35% carbon steel shafts horizontally and in pairs on an automatic and continuous production line. (J2g, T7j, 1-52, 1-61; CN)

355-J. Bright Annealing Copper Wire and Strip. Metal Industry, v. 99, Sept. 8, 1961, p. 186.

Production line equipment includes 8 bell 32 base installation with four exothermic generators and an automatic control system. Annealing is done at temperatures up to 550° C. (J23a, 1-52; Cu, 4-53, 4-61)

356-J. (German.) Improved End-Quench Test and Its Application in High-Precision Testing. Heinz Borchers and Hans Schlicht. Archiv fur das Eisenhuttenwesen, v. 32, Sept. 1961, p. 637-643.

Design of end-quench testing equipment which permits control of cooling rate and which yields results of improved repeatability. End-quench testing of heat treated 100 Cr 6 steel specimens for various austenitizing temperatures, annealing temperatures and quenching media. Repeatability of results. (J5; ST)

357-J. (German.) Correlations Between Gas Content of Hardening Salt Baths and Decarburization of Toolsteels at Bath Temperatures of 1000-1100° C. Siegfried Wilmes and Helmut Taxhet. Archiv fur das Eisenhuttenwesen, v. 32, Sept. 1961, p. 645-649.

Measurement of gas content (H, CO_2 and O) of graphite-containing or carbon-free $BaCl_2$ or $BaCl_2$-KCl salt baths at 1000-1100° C. and investigation of decarburization of foils of unalloyed steel containing 1% C and of BMo 9, C 100 W 1 and 105 WCr 6 steel. Decarburization as influenced by gas content of hardening bath. (J2j, J28; TS, 4-56)

358-J. Industrial Applications of Induction Heating. Engineer, v. 212, Sept. 1, 1961, p. 384-386.

Use in forging, extrusion, brazing, soldering and strip heating for axle, crankshaft, tool bit and cable production. Other applications of induction heating include zone refining, growing and doping of semiconductor materials. (J2g, C28k, F22, F24, K7, N3, 1-69, 10-54)

359-J. Stress Relief of Butt Welds in Rectangular Plates by Local Heating. B. Cotterell. British Welding Journal, v. 8, Oct. 1961, p. 485-490.

Uniform heating to 650° C. of a strip somewhat greater than the width of the plate so that the maximum residual stress at the center is of the order of half the cold yield stress. 6 ref. (J1a, 1-52, 7-51)

360-J. (Book-French.) Oxy-Acetylene Flame Hardening. Marcel Vilez. 1961. 160 p. Dunod, 92 Rue Bonaparte, Paris 6e, France.

Review of surface hardening by deformation, cementation, nitriding, carbonitriding, hard facing, metal spraying, electrolytic deposition or flame hardening. Surface hardness and hardness depth as a function of gas-oxygen ratio, distance and angle between flame and surface. Thermal flow in heating and water cooling and its effect. Applications of process to various carbon and alloy steels, gray cast iron, SG. cast iron and special cast irons. 57 ref. (J-general, J2h, 10-54; CN, AY, CI-b)

361-J. (Italian.) Heat Treatment of Alloyed and Gray Cast Iron. G. Somigli. Fonderia Italiana, v. 10, Aug. 1961, p. 299-332.

Hardening, stress relieving, casting, annealing, normalizing, carburizing, austempering, sulphonizing and aging of cast iron below and above the critical point. Tensile strength, yield point, wear resistance, resilience and T-T-T diagrams. (J-general, E-general, N8g, Q9, Q23; CI-n, CI-q)

362-J. (Italian.) Heat Treatment of Cast Iron. D. Fortino. Fonderie Italiana, v. 10, Aug. 1961, p. 333-340.

Stress relieving, annealing, hardening, tempering and normalizing of castings made of gray and nodular cast iron in order to improve workability and resistance to static and dynamic stresses. Determination of Brinell and Rockwell hardness, tensile strength and structure. (J-general, Q-general; CI-n, CI-r)

363-J. (Russian.) Dependence of Heat Treating Temperatures on Melting Temperatures for Nonferrous Metals. M. V. Zakharov. Izvestiya VUZ--Tsvetnaya Metallurgiya, Mar. 1961, p. 115-119.

Tabulation of correlations between recrystallization-annealing temperatures and melting temperatures for Al, Cu, Ni and Fe-based alloys. 8 ref. (J23c, P12n; Al-b, Cu-b, Fe-b, Ni-b)

364-J. Heat Treatment of a Reactor Pressure Vessel. Instrument Practice, v. 15, Oct. 1961, p. 1253-1254.

Vessels are heat treated for stress relieving to 800° C; temperature and strain data are recorded with thermocouples and strip chart recorders. The vessels are tested for weld quality and cracks. (J1a, 1-52, K9r, T11, T26q)

365-J. Hardening Gear Teeth for Paul Bunyan--Heat Treating Case Histories. No. 8. Joseph H. Bockrath. Metal Treating, v. 12, Oct-Nov. 1961, p. 31.

Use of a gradiation heating system permitting selective heating and quenching of each steel gear tooth under controlled gas-air rates, resulting in uniform diamond pyramid hardness of 500, controlled penetration depth and no scaling or decarburization. (J2k, Q29c, T7a, 1-52; ST)

366-J. High-Production Electric Furnace for Continuous Bright Annealing. Metal Treatment and Drop Forging, v. 28, Oct. 1961, p. 423.

Stainless steel strip is bright annealed in controlled hydrogen atmospheres in a continuous vertical furnace designed to exert minimum tension on the moving strip. The heated strip is cooled by high velocity hydrogen or dissociated ammonia streams with resultant low scale formation (J23a, 1-52; ST, 4-53)

367-J. (German.) Heat Treatment in Welding of Heat Resistant Chromium Steels Containing 12% Chromium. G. Faber. Brown Boveri Mitteilungen, v. 48, Aug-Sept. 1961, p. 485-489.

Tensile testing of nonwelded, austenitized specimens at 110-300° C. and of specimens welded at preheating temperatures of 150-350° C. Determination of favorable preheating temperatures. 4 ref. (J-general, K9p, Q27, 2-61; AY, Cr, SGA-h)

368-J. (French.) Effect of Cooling Conditions on the Mechanical Properties and Microstructure of Leaded Brass. F. Santini, A. Szyszkowski and D. Whitwham. Cuivre Laitons Alliages, no. 62, Aug. 1961, p. 27-31.

Samples of V-Z39Pb1 brass are heated to 700-850° C., furnace cooled at a velocity of 20° C. per hr., cooled in air or water quenched. Tensile and yield strengths, elongation, hardness, microstructure and phase composition are determined as functions of heating temperature and cooling velocity. (J26, M27, Q-general, 2-61, 3-67; Cu-n)

369-J. A Superior Microstructure for Optimum Induction Hardening. Richard J. Gould. Metal Progress, v. 80, Nov. 1961, p. 66-70.

In the development of the hardened and tempered microstructure of steel, as commonly used in induction hardening, there exists a critical carbide particle size. A slight deviation from this critical size will result in either optimum or inferior case hardnesses. Also, prolonged tempering times adversely affect the response of the microstructure to induction hardening. (J2g, N8, 3-67; ST)

370-J. Heat Treating in a Vacuum. Metal Progress, v. 80, Nov. 1961, p. 75-77.

Vacuum heat treating has much potential for producing parts which meet critical hardness, tolerance and surface finish requirements. (J2k; ST, SS, TS)

371-J. (German.) Measurement of Stress Relief in Steel at Elevated Temperatures. Jaakko Salokanagas. Valtion Teknillinen Tutkimuslaitos Statens

Tekniska Forskningsanstalt, no. 57, 1961, 19 p.

Investigation of stress relief during aging from 150-550° C. by measurement of force required to provide a defined elongation and by X-ray techniques for cold stretched and as-normalized steel specimens containing 0.11% C, 0.35% Si, 0.44% Mn, 0.011% P, 0.028% S. (J1a, J27d, 1-54; ST)

372-J. (German.) Lifetime and Economy of Rotary-Hardened Gears. H. G. Sossinka. Harterei-Technische Mitteilungen, v. 16, July 1961, p. 80-87.

Comparative rotary and case hardening of gears of 16 MnCr 5, 50 CrMo 4, 42 CrMo 4 steel, 18 CrNi 8 steel and 41 Cr 4 steel with measurement of resultant hardness distribution, fatigue strength, internal stresses and toughness. Evaluation of process economy. (J28, Q-general, T7a, 17-52; ST, 17-57)

373-J. (German.) Experiences in Case Hardening of Small, Ring-Shaped Parts by Controlled Drop-Gas Carburization. G. Stahli. Harterei-Technische Mitteilungen, v. 16, July 1961, p. 93-96.

Case hardening of small CK 15 steel rings by gas carburization at 820-900° C. with subsequent drop quenching in oil in an automatic plant. Design and mode of operation of plant are discussed, with measurement of hardness, carbon content and depth of case. (J28, 1-52; ST, 4-57)

374-J. (German.) Effect of Wrapping Material on Surface in Case Hardening of Toolsteel. A. Lundgren. Harterei-Technische Mitteilungen, v. 16, July 1961, p. 97-102.

Case hardening at 790-1150° C. of 0.98% carbon, MnCrWV, CrNiMo, CrW, SiCrMoV and free-cutting steel specimens in wrapping materials such as cast iron chips, newspaper, coke, charcoal, aloxite (Al_2O_3) and Cu-wool. Measurement of case hardness, carbon content and retained austenite in case as influenced by wrapping material. (J28; TS, ST)

375-J. (German.) Controlled Atmosphere in Annealing of Malleable Cast Iron. H. Muller. Harterei-Technische Mitteilungen, v. 16, July 1961, p. 105-110.

Annealing of castings of white and ferritic black malleable iron in continuous furnaces with controlled CO-CO_2, H_2-H_2O and inert gas (nitrogen) atmosphere. Design of furnaces and gas producers; and annealing technology. (J2k, J23, 1-52; CI-s)

SECTION K

JOINING

1-K. Friction Welding. Machinery, v. 97, Oct. 19, 1960, p. 892-896.

Description, technology, equipment and applications for a new form of pressure welding in which two workpieces are held in contact and rotated relative to each other, under pressure. (K6, 1-52)

2-K. Spot Welding Is the Key to Reliable Miniaturized Electronic Parts. Welding Design and Fabrication, v. 33, Nov. 1960, p. 34-35.

Spot welding of minute dissimilar parts composed of stainless steel, Ni, Cu and W to form electron beam. (K3n, T1; Cu, Ni, W, SS)

3-K. Leak-Free Welds Are the Key to World's Largest Stainless Steel Spheres. Welding Design & Fabrication, v. 33, Nov. 1960, p. 38-40.

Arc welding of 321 stainless steel spheres and carbon steel vacuum jackets for holding liquid oxygen at low temperatures. (K1, T26q; CN, SS)

4-K. Sea Will See More Aluminum Boats. Welding Design & Fabrication, v. 33, Nov. 1960, p. 43.

Fabrication of an all Al, all-welded passenger boat composed of 5086 H-32 Al alloy by consumable gas arc welding. (K1d, T22; Al-b, 17-57)

5-K. Why Have Fabricated Turbine Runners Replaced One-Piece Castings? Clayton R. Frounfelker, Jr. Welding Design and Fabrication, v. 33, Nov. 1960, p. 48-50.

Fabrication of water turbine wheels from smaller castings and steel plates by skip welding. (K-general, W11n; ST, 4-58, 5)

6-K. Why Martin Brazes in a Vacuum Furnace. Mel Schwartz. Welding Design and Fabrication, v. 33, Nov. 1960, p. 52-54.

Brazing, sintering, heat treating and annealing at 4500° F. using a specially designed cold wall vacuum resistance furnace. (K8, J-general, W29n, 1-66)

7-K. (German.) Problems in Welding High-Temperature Steels. E. Kauhausen, P. Kaesmacher and S. Sadowski. Werkstatt und Betrieb, v. 93, Oct. 1960, p. 653-661.

Welding of austenitic stabilized Cr, Ni, Cb, V, W and Mo alloyed heat resistant steels for gas turbines and high pressure boilers. Welding faults and susceptibility to crack formation. Selection of electrodes for joining ferritic and austenitic steels. 13 ref. (K1, W16; SS, SGA-h)

8-K. Welding of High-Strength Low-Alloy Structural Steel for Bridges. John L. Beaton and Paul G. Jonas. Welding Journal, v. 39, Nov. 1960, p. 1117-1123.

Fillet welding of structural components from T-1 ASTM A242 and ASTM A373 steels. Welding quality control; influence of welding practice on defects. 3 ref. (K-general, T26p; AY, SGB-s, SGB-a)

9-K. (German.) Arc Welding of a Complex Manganese Bronze. P. Schmidt and S. Zschotge. Metall, v. 14, Nov. 1960, p. 1093-1097.

Welding of a bronze containing 10-15% Mn, 7-9% Al, 2-4% Fe and 1.5-5% Ni with an electrode producing a filler metal composed of Cu, 13% Mn, 8% Al, 2% Fe and 2.5% Ni. Tensile strength, yield strength, elongation, hardness

bend strength and structure of the weld seam. 5 ref. (K1, Q-general; Cu-n, Mn)

10-K. Welding Centrifugal-Compressor Impeller Wheels. J. H. Matheny and E. L. Aul. Welding Journal, v. 39, Nov. 1960, p. 1127-1135.

Equipment and procedures for modified inert gas shielded metal arc welding of SAE 4340 steel components. Tooling, assembly and heat treatment of impeller wheels. (K1d, W13f; ST)

11-K. Weldment Failures Caused by Fabrication and Service. Helmut Thielsch. Welding Journal, v. 39, Nov. 1960, p. 1136-1144.

Examples of service failures in stainless steel pipe weldments caused by material discontinuity, decarburization, metallic contamination, mechanical notches, incorrect material identification and improper welding techniques. 3 ref. (K9; SS, 4-60, 7-51)

12-K. Welding of Nickel-Chromium-Iron Alloy for Nuclear-Power Stations. C. E. Witherell. Welding Journal, v. 39, Nov. 1960, p. 473s-478s.

Use of covered electrodes and filler wire for TIG welding 15% Cr-7% Fe-Ni alloy, joining Ni alloy to steel and for overlaying steel. Room and elevated temperature tensile properties, stress rupture strength, hardness and impact strength of weld metals. Effect of stress relieving heat treatments on weld metal properties. 6 ref. (K1d, Q-general, 2-64, W29h; Ni-b, ST)

13-K. Fabrication Principles for Welded Inconel X Structures. H. P. Schane and E. E. Weismantel. Welding Journal, v. 39, Nov. 1960, p. 479s-483s.

Inert gas tungsten arc welding and heat treatment of large size pressure vessels for operation at high stress levels above 1000° F. Elevated-temperature tensile properties of heat treated base and weld metals. (K1d, J-general, T26q, Q27a; Ni-b, 17-57)

14-K. Welding of High-Strength Steels for Rocket Cases. W. H. Kearns, J. W. Semmel and J. D. Marble. Welding Journal, v. 39, Nov. 1960, p. 484s-492s.

Inert-gas-shielded welding of 300M, X-200 and D6A steels. Preheating and post heating procedures. Influence of filler wire composition and grain refinement on mechanical properties and microstructure of the welds. 5 ref. (K1d, Q-general, M27, T2p, 2-59, 2-60; ST)

15-K. (Japanese.) Electro Slag Welding. Sato'o Kitani and Tsuneo Akutagawa. Metals, v. 30, Sept. 1, 1960, p. 44-47.

Submerged arc welding of very thick steel plates, using a slag melt in the gap. Structure and strength of the welded joint. (K1e, Q-general; ST, 4-53)

16-K. Welding Aluminum. R. R. Kottmeier. Canadian Welder, v. 51, Nov. 1960, p. 10-15.

Mechanical properties of welded and cut Al as improved by alloying with Mg, Mn, Cu, Si, Zn and magnesium silicide. Physical properties are compared with those of steel. (K-general, Q-general, 2-60; Al-b, Cu, Mg, Mn, Si, Zn)

17-K. Furnace Brazing Cuts Cost. Canadian Welder, v. 51, Nov. 1960, p. 16-17.

Brazing of stainless steel and cast iron with a Ni base alloy in a dry hydrogen furnace at 2150° F. in the production of jet engine turbine compressor and metal cutting blades. (K8; CI, SS)

18-K. Welding Technology in Russia. Canadian Welder, v. 51, Nov. 1960, p. 20-22.

Arc, inert gas, cold press, friction and diffusion welding of steel, Fe, Al alloys and Ti alloys. (K-general; Al-b, Fe, ST, Ti-b)

19-K. (German and French.) Welding in Fabrication of Gas Turbines. A. Luthy. Zeitschrift fur Schweisstechnik (Journal de la Soudure), v. 50, Sept. 1960, p. 273-277.

Welding gas pipes and distribution chambers in gas turbine plants by the "Mig" process, electrowelding with an additional currentless wire. Welds are tested for susceptibility to crack formation. (K1d, K9r, 9-72, W11n)

20-K. (German.) Resistance Welding of Carbon Containing Wire. H. Zech and G. Deubel. Draht, v. 11, Oct. 1960, p. 659-660.

Welding current, time and pressure specifications for condensor-butt welding, flash-butt welding and pressure-butt welding of drawn steel wire of varying diameter, carbon content and mechanical properties. (K3, 2-60; ST, 4-60)

21-K. (German.) Economics of Welding Processes in Production and Repair of Agricultural Vehicles. H. Wirtz. Schweissen und Schneiden, v. 12, Sept. 1960, p. 413-415.

Comparison of autogenous welding, flame cutting, arc welding and riveting processes for the repair of agricultural equipment. (K1, K3, K13n, G22g, T3)

22-K. Brazing Fuel Elements for the OMR. N. W. D. Chrimes. Nuclear Power, v. 5, Oct. 1960, p. 97-98.

Use of Pd-base brazing alloys with melting points above 800° C. to join fuel elements for organic moderated reactors. 4 ref. (K8j, T11g; SGA-f, Pd-b)

23-K. Short-Arc Welding Pinpoints the Heat. Canadian Machinery and Metalworking, v. 71, Nov. 1960, p. 108, 110.

Short arc consumable electrode inert gas welding of thin cross sections composed of carbon and stainless steel, Al and Cu. (K1d; CN, SS, Al, Cu)

24-K. Alberta Hydro Penstocks Fabricated From T1 Steel. Canadian Machinery and Metalworking, v. 71, Nov. 1960, p. 112.

Butt and fillet welding of steel shell plates to produce hydro penstocks. (K-general, T26r; TS)

25-K. (German.) Welding of Gray and Nodular Cast Iron. M. Puschner and G. Suchanek. Technica, v. 9, Oct. 7, 1960, p. 1295-1298.

Welding of gray cast iron by a cast iron electrode and by the "dot weld" process (modified spot welding process). Welding of nodular cast iron by Ni containing and pure Ni electrodes. Butt flash welding, electroslag welding and post heat treatments. Microstructure and hardness diagrams. 7 ref. (K-general, M27, Q29n; CI-n, CI-r)

26-K. Square-Butt Welding Costs Less. Iron Age, v. 186, Dec. 1, 1960, p. 139.

Data for wire diameter, welding speed and current, wire feed speed and number of passes. (K-general, F26p; Al)

27-K. (German.) Bonded Light Metal Aircraft Components and Structural Elements. H. Winter, H. Meckelburg and W. Althof. Aluminium, v. 36, Nov. 1960, p. 658-665.

Bonding of aircraft structures composed of AlMgCu alloys with thermosetting adhesives. Curing, inspection and fatigue testing of the bonds. 135 ref. (K12, Q7, T24a; Al-b, Cu, Mg)

28-K. Liquid Lock for Metal Parts. Australasian Manufacturer, v. 45, Oct. 15, 1960, p. 77-78, 80, 82-83, 85.

Properties and industrial uses of a liquid sealant for bonding metals, glass, ceramics and phenol plastics. (K11, K12; NM-d34, 17-57)

29-K. Electron Beam Welding of Nuclear and Electronic Parts. Western Machinery and Steel World, v. 51, Nov. 1960, p. 67.

Vacuum electron beam welding of light-weight stainless steel, Ni alloy and Cu containers using a remote controlled welder. (K6, 1-73; Cu, Ni-b, SS)

30-K. TIG Welding of Tantalum, Columbium, Molybdenum and Tungsten. Alan F. Busto. Fansteel Metallurgy, Oct. 1960, p. 2-3, 4.

Physical and mechanical properties of Ta, Cb, Mo and W compared to SAE 1020 steel. Effect of properties on weldability by the TIG welding process. Strength of the weldments. (K1d, K9s, P-general, Q-general; Cb, Mo, Ta, W, EG-d37)

31-K. Design Considerations in Welded Ship Construction. R. F. Pearce. Welding Fabrication and Design, v. 4, Oct. 1960, p. 19-23.

Comparison of welded and riveted joints in ships for steel weight and fabrication costs, structural strength and effects on hull resistance to propulsion. (K-general, T22; ST)

32-K. Welding Applications at Mount Isa Mines, Limited. S. A. Eyers. Welding Fabrication and Design, v. 4, Oct. 1960, p. 23-31.

Arc welding repair techniques applied to mining and smelting equipment such as cone crusher frames and adjustment rings, cast steel mine car wheels, cast steel ladles and mild steel mixer blades. (K1, W15, W18n, 18-72; ST)

33-K. Overseas Developments and Trends in Welding. W. Bernard. Welding Fabrication and Design, v. 4, Oct. 1960, p. 37-44.

Survey of welding techniques and equipment used for steels, Al, bronze, Ti, Zr, Ta and plastics, including manual, open arc, CO_2, plasma, oxy-acetylene, electroslag, resistance, ultrasonic and electron beam welding. (K-general, W29; ST, Cu-s, Ti, Zr, Ta, Al)

34-K. Trends in Structural Steel Designs. P. O. Miller. Welding Fabrication and Design, v. 4, Sept. 1960, p. 9-11.

Availability of stock, range of sections and methods of joining as they affect use of structural steel members. (K-general; SGB-s, ST)

35-K. On-the-Spot Welding With a New Transformer Welder. Welding Fabrication and Design, v. 4, Sept. 1960, p. 16.

Arc welding of mild, low-alloy and 18-8 stainless steel using a portable transformer welder. (K1, W29a, 1-52; AY, CN, SS)

36-K. (German.) Welding of Gray Cast Iron and SG Iron. M. Puschner and G. Suchanek. Industrie-Anzeiger, v. 82, Nov. 15, 1960, p. 1582-1585.

Arc welding, flash welding and electroslag welding practices. Effect of preheating at 100-600° C. and of heat treatments at 700-900° C. followed by cooling at various rates on structure tensile and hardness of weldments. Influence of filler material compositions. 7 ref. (K1, K3r, K6, Q-general, 2-64; CI)

37-K. Fundamentals of Projection Welding. Douglas D. Williams. Welding Engineer, v. 45, Nov. 1960, p. 40-42.

Projection welding of carbon and stainless steel, galvanized or tinned steel, Al and Al alloys and alloy steels, the welding area being subjected to pressure with the passage of secondary current governed by shape and size of the projections. (K3q; Al-b, AY, CN, SS)

38-K. TIG Welding Joins Small Stainless Tubes to Thick Tube-Sheet. J. M. Gerken and D. B. Kittle. Welding Engineer, v. 45, Nov. 1960, p. 46-48.

347 stainless steel tubing is internally butt welded to thick tube-sheets by the TIG process. Data for arc length, rotation time and welding speed. (K1d; SS, 4-60)

39-K. Welded Design, Process Control Guarantee Better Products. William C. Nemitz. Welding Engineer, v. 45, Nov. 1960, p. 52-54.

Manual metal-arc welding of a steel fan wheel using a low-hydrogen powdered Fe electrode. Weldments are stress-relieved before finish machining by heating and cooling at controlled rates. (K1g, J1a, W13e; ST)

40-K. Brazing Produces Smooth Surface for Cab Doors. George A. Medsker. Welding Engineer, v. 45, Nov. 1960, p. 60, 62.

Brazing of 18 gage SAE 1020 steel for door panels using a flame-fluxing process and a low fuming bronze filler metal. (K8, T21a; ST)

41-K. Inert-Gas Tungsten Arc Spot Welding in Missile Production. W. P. McGregor. Machinery, v. 67, Dec. 1960, p. 110-121.

Tests on several gages of 301 stainless steel with reference to current amperage, arc length, cycles, gas coverage and flow, electrode type and preparation, base metal preparation, contact of faying surfaces and various backup materials. (K1g, K3n; SS)

42-K. Welding Aluminum. Pt. 7. Torch, Furnace and Dip Brazing. Modern Metals, Nov. 1960, p. 62-67, 70.

Basic steps relating to preparation of materials and torch equipment, degreasing and cleaning, flux preparation and application. Brazing techniques; common types of brazed joints. (K8; Al)

43-K. Stud Welding System Speeds Curtain Wall Production. H. P. Blood. Modern Metals, Nov. 1960, p. 88-89.

System of stored energy percussive stud welding applicable to Al. Feasability studies indicate that it is also suited to Mg and Ti. (K1f; Al)

44-K. X-Ray Examination and Weld-Strength Factor. Olavi Eiro. Lastechniek, v. 26, Sept. 1960, p. 166-172.

Carbon steel containing 0.12% C, 0.01% Si, 0.31% Mn, 0.035% P and 0.02% S is welded with a low-hydrogen electrode producing a filler metal containing 0.10% C, 0.6% Si and 0.6% Mn or an electrode with acid coating producing a metal containing 0.10% C, 0.2% Si and 0.4% Mn. Comparison of X-ray and mechanical tests data. (K9r, S13e; CN, 7-51)

45-K. New Welding Methods Push State of Art in Joining. Thomas McElrath and Irwin Stambler. Space/Aeronautics, v. 34 Nov. 1960, p. 68-72.

Short arc welding of thin-gage materials to eliminate cooling period and permit welding of small diameter wire. Electron beam welding of advanced refractory alloys. (K1, K6; EG-d37, 4-61)

46-K. Joining With Adhesives in Automated Assembly Systems. J. W. Janson. Automation, v. 7, Dec. 1960, p. 73-79.

Description of methods and equipment for use of various types of adhesives in bonding, sealing and joining of metals, plastics, wood, paper or cement asbestos, or combinations of these materials. (K11, K12, 18-74)

47-K. Welded Penstocks for Hydro-Electric Power Stations. Pt. 2. Pipes and Pipelines, v. 5, Nov. 1960, p. 31-34.

Submerged-arc welding, testing and machining of steel pipeline sections, stiffening collars and branch pipes used in hydro-electric power station penstocks. (K1e, G17, T26r; ST)

48-K. Welder Repairs Dies on the Job. Tooling and Production, v. 26, Dec. 1960, p. 44.

Correction of defects in tools, dies and molds without disturbing the machine setup by resistance welding with a small, gun-type welding device. (K3, T6, W19)

49-K. Large Pipe Mill Put in Operation at Calgary, Canada. Iron and Steel Engineer, v. 37, Nov. 1960, p. 152.

Continuous resistance welding of cold rolled steel to form high strength transmission line pipe for oil, gas and water, using a high frequency resistance welder. (K3, T26r; ST, 17-57)

50-K. Remote Induction Brazing of Steel Tube Couplings in B-70 Bomber. Industrial Heating, v. 27, Nov. 1960, p. 2364, 2366.

Brazing of tube couplings in areas of aircraft components that are inaccessible to a large high-frequency generator using a remote portable induction brazing accessory. (K8k, W29q, T24; ST)

51-K. Applications for Ultrasonic Welding of Aluminum. J. R. Terrill, F. R. Collins and J. D. Dowd. American Society of Mechanical Engineers, Paper no. 60-WA-322 1960, 5p. $1.

New uses of ultrasonic welding in structural applications such as automobile, aircraft and missile construction, in electrical applications and in fabrication of consumer products. 7 ref. (K6r; Al)

52-K. (German-French.) Heavy Industry Maintenance and Repair Welding. Pt. 1. Zeitschrift fur Schweisstechnik, v. 50, Nov. 10, 1960, p. 343-353.

Repair welding of cast iron rolls and wobblers using electrodes with a high Ni content or, in the case of white cast iron surfaces or alloyed cast irons, low-alloyed Cr-Mn-C electrodes. Use of special electrodes for hardened steel rolls. Surfacing of soft steel rolls with high-alloyed austenitic-ferritic, or austenitic Mn-alloyed electrodes. (K1d, W23, W29h; CI)

53-K. How to Weld Graphitic Tool Steel. C. F. Jatczak and C. A. Pfouts. Steel, v. 147, Nov. 17, 1960, p. 116-117.

Surface preparation, selection of electrode, preheating, weld deposition and stress relieving during joining of graphitic toolsteels. (K1, N8r; TS)

54-K. Designing for Spot Welding Aluminum Alloys. Mechanical World, v. 140, Nov. 1960, p. 470-471.

Data for spot weldability of Al alloy sheets and minimum weld spacing, edge distance and clearance during welding. (K3n; Al-b, 4-53)

55-K. Wave Soldering Ups Output of Printed Circuits. Mill & Factory, v. 67, Dec. 1960, p. 106-107.

Use of a wave soldering method to deposit solder on work while the soldering equipment remains stationary. A pump creates a fountain of solder on the surface of the bath which is deposited at each of the fluxed joints of the circuit board as it moves across the bath. (K7, T1c)

56-K. Technique for Welding Very Thin and Thick Sections Together. Machinery, v. 97, Nov. 16, 1960, p. 1133-1135.

Resistance welding of thin stainless steel strips to thick stainless steel sheets of Ti alloy tube assemblies. Effect of electrode contact pressure on interface resistance of the materials. Microstructure of welds. (K3, M27; SS, Ti-b, 4-53; 4-60)

57-K. Design Factors for Lined Vessels and Piping. H. Thielsh. Petro and Chem Engineer, v. 32, Dec. 1960, p. C 50-51, C 54-56.

Plug, strip and through welding of thin stainless steel or Ni alloy to carbon or low-alloy steel backing materials formed into tanks, pressure vessels or piping. Data for electrode and welding-rod compositions. (K1, T26; AY, CN, Ni-b, SS, 4-53)

58-K. Joining of Tungsten. Defense Metals Information Center, Batelle Memorial Institute, DMIC Memo 74, Nov. 24, 1960, 8 p.

Procedures for cleaning tungsten. Brief comment on following welding techniques: Tig welding, electron beam welding, plasmajet welding, resistance spot welding, atomic hydrogen welding and brazing. 3 ref. (K-general, L-general; W)

59-K. Tig Welding Joins Copper to Stainless. J. M. Gerken, American Machinist/Metalworking Manufacturing, v. 104, Nov. 14, 1960, p. 126.

Stainless steel strips are joined to Cu tubes by a Tig welding process in which most of the heat is put into the Cu so that it is fused to the stainless rather than having the two metals melt together. (K1h; Cu, ST, 4-53)

60-K. (Italian.) Automatic Submerged Arc Welding. Pt. 4. Franco Calcaterra. Rivista di Meccanica, v. 11, Sept. 26, 1960, p. 13-16.

Data are given for edge preparation requirements, choice of backing materials, welding voltage, current intensity, welding speed and electrode consumption in connection with execution of butt, lap and corner joints in carbon steel. (K1e; CN)

61-K. (Italian.) Automatic Submerged-Arc Welding. Pt. 3. Franco Calcaterra. Rivista di Meccanica, v. 11, Sept. 12, 1960, p. 19-26.

Characteristics and applications of electrode wire, granular powders and backing materials; edge preparation techniques; welding positions; and positioning of electrodes in submerged-arc welding of steel. (K1e, W29h; ST)

62-K. How to Choose the Right Shielding Gas. I. D. Holster. Steel, v. 147, Dec. 12, 1960, p. 78-81.

Effect of various shielding gases on the TIG or MIG welding of Al, Mg and Ni alloys, mild, stainless and low alloy steels, bronzes and brasses. (K1d; Al-b, AY, CN, Cu-b, Mg-b, Ni-b, SS)

63-K. Automation Speeds Brazed Heating Units; Quality Up. Steel, v. 147, Dec. 12, 1960, p. 92-93.

Cu return bends are silver brazed to the ends of Cu tubes in heating and cooling convectors by an automatic brazing machine. (K8; Cu, 4-60)

64-K. (Pamphlet.) Projection Welding Low Carbon Steel With Embossed Projections. J. F. Harris and J. J. Riley. Bulletin SP-27, 1960, 20 p. Taylor-Winfield Corp., Warren, Ohio.

Welding techniques, projection forming tools, welding electrodes and joint design. Influence of weld current, electrode force, weld time, electrode design, part preparation and projection size and shape. Specific recommendations for welding of projections embossed in thicknesses from 0.011 to 0.245 in. (K3q; CN-g)

65-K. (Translation-Brutcher no. 4919.) Friction Welding of Metals. Pt. 3. V. I. Vill. Svarka Metallov Treniem, 1959, p. 36-60.

Principal variables of welding process; total upset. Recommended friction welding conditions; specific pressure; relative speeds of rotation. Welding conditions and characteristics of welded joints. Results of tensile, bend, impact and hardness tests on welds of similar and dissimilar ferrous and nonferrous metals. (K6)

66-K. (Translation-Brutcher no. 4920.) Friction Welding of Metals. Pt. 3. V. I. Vill. Svarka Metallov Treniem, 1959, p. 60-86.

Industrial equipment for friction welding; principal data on general-purpose machines MST-1, MST-2 and MST-3. Examples of industrial applications. (K6)

67-K. (German.) Welding of Nickel and Nickel Alloys. Kocher. Schweisstechnik, v. 14, Oct. 1960, p. 111-113.

Welding of pure Ni and Ni alloys (Monel, Inconel, Hastelloy and Remanit) by open-arc welding with coated electrodes and by protective gas welding. Elimination of sulphur and oxygen contamination during welding. (K1a, K1d; Ni-b)

68-K. (German.) Welding of Thin Steel Sheets by the Under-Powder Process. Stenke. Schweisstechnik, v. 14, Oct. 1960, p. 109-111.

General features of "Ellira" or "under-powder" welding of thin steel sheets using a Cu electrode. Application to welding of bushings, automobile components, expansion vessels and bearings. (K1, T7d, T21b; ST, 4-53)

69-K. (Italian.) Study of Welding Times. B. Perego and G. Bellettati. Rivista di Meccanica, v. 11, Aug. 29, 1960, p. 41-49.

Calculation of total time required to execute a joint in arc welding with fusible electrodes, automatic submerged-arc welding and oxy-acetylene welding. (K9)

70-K. (Italian.) Automatic Submerged Arc Welding. Franco Calcaterra. Rivista di Meccanica, v. 11, Aug. 29, 1960, p. 65-70.

Typical voltage regulators and starting mechanisms used on automatic welding equipment. Influence of voltage, current intensity and welding speed on width and thickness of bead and on weld penetration. (K1e, W29c)

71-K. (German.) Weldability of Various Sheet Qualities Under Protective CO_2 Atmosphere. R. Glockner and H. Wirtz. Schweissen und Schneiden, v. 12, Nov. 1960, p. 482-484.

Arc welding of ship and boiler steel plates (0.14-0.30% C, unalloyed) and subsequent mechanical, X-ray and metallographic testing and examination of welds to determine tensile and bend properties. (K1d, Q27, Q5, M-general; ST)

72-K. Recent and Current Developments in Electric Arc Welding. W. A. Wrate. Production Engineer, v. 39, Nov. 1960, p. 646-655.

Review of advances in semi-automatic and automatic electric arc welding. Use of newly designed electrical equipment and advantages of iron powder electrodes. Applications of the electro-slag process. (K1, W29h, 1-52)

73-K. Evaluation of Weld Quality on a Submarine Pipe Line. Paul W. Turner. Welding Journal, v. 39, Dec. 1960, p. 1215-1221.

Radiographic inspection and statistical quality control of welding on a submarine pipe line built for crude oil service. Joint design requirements and method of installation of the seamless pipe using portable shielded metal arc welding equipment. Types of defects and their repair or removal. (K1d, S13e, T26r)

74-K. Inert-Gas-Shielded Metal-Arc Spot Welding of Aluminum. S. Eric McFall. Welding Journal, v. 39, Dec. 1960, p. 1230-1236.

Adaptation of the inert gas shielded metal arc process to arc spot welding of Al alloy sheet. Preweld and postweld cleaning. Shear testing of spot welds; mechanical properties of arc spot welds. 3 ref. (K1d, K3n, Q2; Al-b, 4-53)

75-K. Properly Designed Weld Tooling and Fixturing Greatly Simplifies the Welding of Large Rocket Motors. J. E. Bartley and R. E. Frola. Welding Journal, v. 39, Dec. 1960, p. 1237-1243.

Gas tungsten arc welding and submerged arc welding of rocket motor cases by longitudinal and circumferential welding machines specifically engineered and designed for inside-out welding. Methods of stress relieving using induction heating coils and sizing of cylinders and heads by a stretch press. (K1d, K1e, J1a, T2p)

76-K. Superior Welds Make Superior Tanks. F. A. Henninger and W. F. Beldon. Welding Journal, v. 39, Dec. 1960, p. 1247-1248.

Fabrication of steel storage tanks in 6000 gallon capacities using submerged arc welding. Application as propane tanks and for storage of other liquified petroleum products. (K1e, T26q; ST)

77-K. Current Welding Research Problems. Welding Journal, v. 39, Dec. 1960, p. 547-s to 552-s.

A list of 152 research problems on the welding of carbon and low alloy steels, pressure vessels and piping, structural materials, stainless steel and high alloys and aircraft and missile components. (K-general, T24, T26q; AY, CN, SS, SGB-s)

78-K. (Russian.) Automatic CO_2 Shielded Arc Welding of a Steel Steam Turbine Diaphragm. D. S. Verbin and V. M. Shepilevskii. Energo-Mashinostronie, July 1960, p. 29-31.

Methods for eliminating porosity and slag inclusions and obtaining good weld penetration and minimum surface oxidation during welding of turbine diaphragms for operation at 300-540° C. (K1d, K9, W11k; ST, 17-57)

79-K. High-Temperature Base-Tab for Silicon. Leon Maissel. Electrochemical Society, Journal, v. 107, Dec. 1960, p. 1007-1009.

A Ni-Pt solder is used to bond a Mo base tab to Si. Tabs could not be separated from the Si below 800° C. 4 ref. (K7; Mo, Si)

80-K. How to Weld Columbium Alloys. Iron Age, v. 186, Dec. 15, 1960, p. 110-112.

Application of tungsten inert gas, resistance, electron beam and ultrasonic welding techniques. Effect of alloying elements on ductility and brittle-to-ductile transition temperature. (K-general; Cb)

81-K. (French.) The Oberems Aqueduct, First Argon Arc Welded Pressure Pipe in Peraluman 30 Alloy. R. Heglund, H. Hiltebrand, H. Walser, H. J. Rodewald and E. von Burg. Aluminium Suisse, v. 10, Sept. 1960, p. 231-259.

Fabrication, assembly, inspection and testing of 63-meter long, 1.65-meter internal diameter pipe replacing former concrete structure serving Swiss hydroelectric plant. (K1d, S13, T26r; Al-b, 17-57)

82-K. (German.) Friction Welding. Wilhelm Hofmann and Svein Jenssen. Zeitschrift fur Metallkunde, v. 51, Nov. 1960, p. 642-645.

Al and Cu tubing are friction welded to flanges of Al or Cu. Effects of angular velocity, contact pressure, surface treatment and friction coefficient on the tensile strength of weldments. Structure of welded seam. 5 ref. (K-general, Q27a; Al, Cu, 4-60)

83-K. Welding in Russia. Metal Treatment and Drop Forging, v. 27, Nov. 1960, p. 473-474.

Review of recent developments. Power economy. Example given for mass-produced storage tanks. Friction and diffusion welding. (K-general, T26q)

84-K. (German.) Welding of Heat Resistant Materials. Werner Weinmann. Industrie-Anzeiger, v. 82, Nov. 18, 1960, p. 1595-1601.

Resistance, gas-shielded arc and arc welding by electrodes with lime-basic covering and electron beam welding and heat treatment after welding of heat resistant 12% Cr steel, austenitic steel and Fe-Co-Cr-Ni alloy, Co alloy, Ni alloy and alloys of high melting metals such as Cb, Ta, Mo and W. Evaluation of welding faults such as crack formation and porosity. (K1, K6, J-general; SGA-h)

85-K. (German.) Auxiliary Equipment and Machines for Automatic Nonhorizontal Welding ("Zwangslagenschweissung"). F. Wiest. Industrie-Anzeiger, v. 82, Nov. 18, 1960, p. 1601-1603.

Automatic vertical and transverse arcless electroslag welding of thicknesses over 25-30 mm., using direct, alternating and three-phase current and 1-3 electrodes. (K6)

86-K. (German.) Automatic Nonhorizontal Welding Processes and Their Practical Uses. Th. Ammerling. Industrie-Anzeiger, v. 82, Nov. 18, 1960, p. 1603-1606.

Nonhorizontal under powder welding, He, Ar and CO_2 shielded welding, welding with folded slag containing electrodes and electroslag welding of large vessels. Methods of seam preparation. Computation of welding efficiency and welding rate. (K1d, K6, 1-52)

87-K. (German.) Metallurgy, Microstructure and Mechanical Properties of Automatic Machine Welded Nonhorizontal Welds. M. Puschker. Industrie-Anzeiger, v. 82, Nov. 18, 1960, p. 1606-1610.

Metal-slag reactions, temperature distribution and formation of shrink holes during under powder and electroslag welding. Microstructure as-welded and after annealing and tensile strength,

hardness and impact strength at -40 to 20° C. of electro-slag welds. (K6, K9, M27, Q-general, 2-61)

88-K. Dip Transfer Process. Airco News, v. 20, Feb. 1960, p. 6-7.
Fabrication of heavy-duty air filters composed of mild and low-alloy steel by CO_2 shielded dip transfer arc welding process in which a moving electrode comes into repeated contact with the weld pool creating a pulsed arc. (K1d, W13c; AY, CN)

89-K. Pre Packaged Liquid Rocket Engines. Airco News, v. 20, Feb. 1960, p. 8-10.
Gas-shielded metal-arc and Tig welding of liquid rocket engines containing fuel tanks, combustion chambers and propellant but no moving parts. (K1d, T2p)

90-K. Spot-Welded Steel Truss Sections. Airco News, v. 20, Feb. 1960, p. 11.
Fabrication of steel roof and floor sections up to 32 ft. in length by CO_2 shielded spot welding. (K3n; ST, 4-57)

91-K. Fashioning Steel Barrels. Airco News, v. 20, Feb. 1960, p. 12-13.
Fabrication of engine containers from mild steel drums by CO_2 shielded welding with flame cut interior brackets and gussets welded to the inside of the drums by dip treatment and skip welding. (K1d, T21b; CN)

92-K. Aircomatic Welding in the Far North. Airco News, v. 20, Feb. 1960, p. 16-19.
Sheet steel structures are spot welded at low (arctic) temperatures using complete welding units with control panels, wire feeders, pull guns and power supplies. (K3n, 1-67; ST, 4-57)

93-K. Girding the Globe. Airco News, v. 20, Feb. 1960, p. 24-25.
Pipe couplings, fittings, repair clamps and sleeves for gas engines are fabricated by shielded metal arc welding, Tig welding and flame cutting. (K1d, G22g, W11j)

94-K. The Problem of Welding High-Temperature Service Materials. E. Kauhausen, P. Kaesmacher and S. Sadowski. British Welding Journal, v. 7, Dec. 1960, p. 693-707.
Submerged-arc, inert-gas metal-arc and gas welding of ferritic steels containing 1-9% Cr and 0.5-1% Mo, 12% Cr steel and fully austenitic stabilized steels. Comparison of welding characteristics of basic lime-coated and acid rutile-coated electrodes. (K1d, K1e, K2; SS, SGA-h)

95-K. Hot Pressure Welding of Titanium. C. F. Wilford and R. F. Tylecote. British Welding Journal, v. 7, Dec. 1960, p. 708-712.
Values of deformation and pressure required for pressure butt welding of Ti bar at 20-900° C. Tensile strength and microscopic changes occurring at the interface of the weld as a function of heat treatment. (K5, Q27a, M27, 2-64; Ti, 4-55)

96-K. Inconel Piping Welded With "62" Filler Wire. Inco Nickel Topics, v. 13, no. 8, 1960, p. 5.
Fabrication of Ni-Cr alloy pipe and fittings for primary coolant components in atomic reactors by Tig and Mig welding. (K1d, T11; Ni-b)

97-K. The Metal-Arc Welding of Stainless Steel. M. C. T. Bystram. Edgar Allen News, v. 39, Nov. 1960, p. 253-256.
Metal-arc welding and mechanical finishing of austenitic stainless steels at ambient pressures and temperatures. Applications in appliances subjected to mild corrosion. (K1g, L-general; SS-e)

98-K. Friction Welding Studied. Canadian Welder, v. 51, Dec. 1960, p. 10-11.
Process for converting the mechanical energy of two metal, plastic or ceramic objects revolving or sliding in contact with one another into thermal energy, which under proper conditions and controls results in a weld at the place of contact. It is thought that a layer of fluid metal forms at the interface and that this layer acts as if it were a hydrodynamic thrust bearing or extreme pressure lubricant. (K6)

99-K. Space Metal Spotwelding. Ryan Reporter, v. 21, no. 3, 1960, p. 9-10, 24.
Resistance welding of very thin sheet metal (up to 0.016 in.) to plates of considerable thickness by a process in which a welding electrode is applied under heavy pressure at the spot to be welded, a heavy pulse of current

is shot to the electrode and the electrode contact pressure is continued until the weld nugget is sufficiently cooled. (K3n; 4-53)

100-K. Welding or Brazing Dissimilar Metals. Jay Bland. Product Engineering, v. 31, Dec. 19, 1960, p. 46-49.

Techniques used to secure integral joints in the welding or brazing of dissimilar metals including stainless steel, Inconel, Zircaloy and carbon steel. Mechanical and thermal properties of various weld combinations. Stress relief heat treatment is used to reduce weld distortion. 5 ref. (K-general, J1a; CN, Ni-b, SS, Zr-b)

101-K. How Friction Welding Joins Bar Stock and Tubing. R. R. Irving. Iron Age, v. 186, Dec. 29, 1960, p. 47-49.

Metals, ceramics and plastics are friction welded on a lathe-like machine by rotating one upon the other at 2000-12,000 rpm, under pressure of 10,000 psi. (K6; 4-60)

102-K. "Square Butt" Welding Aluminum. Light Metal Age, v. 18, Dec. 1960, p. 18.

Joining of heavy wall Al cylinders by a square butt welding process in which one pass welds are made on square machined joint edges at low current densities under Ar shielding. (K-general, K1d; Al, 4-60)

103-K. Aluminum Window Assembly Speeded by Change to Soldering. Light Metal Age, v. 18, Dec. 1960, p. 20.

An Al stick solder requiring no flux is used to join Al storm windows and screens previously assembled by mechanical methods. (K7; Al)

104-K. The Metal-Arc Welding of Stainless Steels. M. C. T. Bystram. Edgar Allen News, v. 39, Dec. 1960, p. 273-275.

Techniques for bonding corrosion resistant stainless steel linings to mild steel backings by square edged butt welding and for depositing a thin Cr-rich layer on mild steel by the chemical decomposition of Cr chlorides and fluorides at controlled temperatures. (K1g, L22; CN, SS, Cr)

105-K. Vickers Aircraft Engineers Adopt Iron-Powder Electrodes. D. Meredith Jones. Lastechniek, v. 26, Nov. 1960, p. 224-226.

Metal-arc welding operations using Fe powder electrodes in the construction of the Vickers VC10 airliner. (K1g, T24a)

106-K. Production of High-Strength Bellows. Metal Industry, v. 97, Nov. 18, 1960, p. 423-424.

Fabrication of bellows joint from stainless steel and Monel sheet by automatic welding. The joint is used in pipelines to accommodate linear thermal expansion and contraction. (K-general, T26r; Ni-b, SS, 4-53, 17-57)

107-K. Push Button Machines Improve Brazing. J. Van Opynen. Industrial Gas, v. 39, Dec. 1960, p. 8-9.

Stellite inserts are brazed into steam-turbine blades by an automatic machine with 14 toggle clamps and two groups of nine refractory lined burners. (K8, W29; SGB-q)

108-K. (German.) Novel Metal Adhesives and Their Application. E. Bader. VDI Berichte, no. 46, 1960, p. 51-56.

Use of metal adhesives (Agomet U, Agomet R, Agomet E, VP 292 and VP 456) for metal-metal, metal-plastics, metal-glass and metal-diamond joints by electric and precision mechanical engineering. Mechanical and electrical properties. Selection of adhesives. (K12)

109-K. (German.) Economical Welding in Repair Shop. E. Frei. Technica, v. 9, Oct. 21, 1960, p. 1371-1372.

Horizontal, vertical and over-head repair-welding with coated and noncoated contact electrodes. Mechanical properties of welds, welding rate and welding time for various electrode compositions. (K1, W29h)

110-K. Short Arc Welding Slashes Reject Rate. Steel, v. 148, Jan. 9, 1961, p. 64.

Production of front end cones composed of 1020 steel for practice bombs. Sheets are cut to size, rolled into a cone and short arc welded in a jig. After welding, the cone is stretched to shape in a form die with a contoured punch. (K1, T2k; ST)

111-K. Stouter Metal, Weld Design Upgrade Trailer Ore Feeder. Steel, v. 148, Jan. 9, 1961, p. 77.

Oxy-acetylene welding of steel back and wear plates to form a pan feeder which handles ore, rock or gravel from dump trucks. Strength is built in by bending the edges of the reinforcing plates and adding a horizontal stringer along the outside lower edge of the hopper. (K2h; ST, 4-53)

112-K. High-Strength Structural Adhesives. E. F. Hess. Machine Design, v. 33, Jan. 5, 1961, p. 149-152.

Thermosetting films of the elastomeric-phenolic type made in continuous form are used to join metals and plastics at -80 to 600° F. Data are given for shear and peel strength of modified-epoxy adhesives and film adhesives. (K12)

113-K. Welding Plays Key Role in Aluminum Fishway. Robert Austin. Western Metalworking, v. 18, Dec. 1960, p. 46, 49.

6061 T6 Al alloy I beams, panels, rotary gates and wing gates are fabricated by Mig welding into a U-shaped channel, 50 ft. high and 16 ft. wide. (K1g, Al-b, 4-57)

114-K. Continuously Welded Rails. M. G. R. Smith. New Scientist, v. 8, Dec. 15, 1960, p. 1577-1579.

Continuous flash and thermit welding of railroad rails to eliminate buckling in track joints. (K3r, K4, T23q)

115-K. When a Clean Weld Is Needed. Charles E. Reeb. American Machinist/Metalworking Manufacturing, v. 104, Dec. 26, 1960, p. 68-69.

Two forgings of 1050 steel are joined to form a tractor track-roller using automatic submerged arc welding to prevent flash or foreign matter from getting into a lubricant recess at its center. (K1e; ST, 4-51)

116-K. 45,000,000 Watts Fabricate Chrysler Floor Pans. Raymond H. Spiotta. Machinery, v. 67, Jan. 1961, p. 102-107.

Resistance welding of steel sheets to form floor pan assemblies using a bank of several press welders integrated by automation. (K3, T21c; ST, 4-53)

117-K. Designing Ferrous Parts for Furnace Brazing With Copper. E. C. Buckingham. Machinery, v. 67, Jan. 1961, p. 125-137.

Permanent joining of two or more ferrous parts above 800° F. by atomic bonding through the intermediation of a fused nonferrous filler metal whose melting point is lower than that of the base metal. Parts may be heat treated, annealed, carburized or nitrided after bonding. Data are given to show the relationship between brazed joint strength and temperature for Ni-Si-B alloy joined with Cu brazing fillers. (K8j; Ni-b, SGA-f, Cu-b, 17-57)

118-K. Single Pass Joining With Square Butt Welding. Pacific Factory, v. 101, Dec. 1960, p. 20.

Production of heavy wall Al cylinders using square butt Mig welding also known as high-current welding. Welding proceeds with less total heat input and at greatly increased speeds. (K1d; Al)

119-K. Welding Dissimilar Metals. Metal Industry, v. 97, Dec. 1960, p. 461-462.

Low temperature arc welding of metal combinations such as Cu to steel, Ni to steel and of ferrous materials in which the welding process is based upon diffusion phenomena and requires only low heat input. (K1; Cu, Ni, ST)

120-K. Foil Brazing of Honeycomb Panels. Modern Assembly Practice, v. 2, Jan. 1961, p. 5-6.

Graphite cloth brazing using a platen incorporating graphite cloth, heating elements and glass rock brazing with glass-ceramic platens of stainless steel honeycomb sandwich panels for airframes. (K8, T24a; ST, 4-57)

121-K. (German.) Experiences in Sigma-Welding With "Coxogen" (Protective Gas Mixture for Gas-Shielded Welding). S. Hausotter. Schweisstechnik, v. 14, 1960, p. 128-131.

Use of "coxogen" as protective gas in semi-automatic horizontal and nonhorizontal Sigma welding of unalloyed steels to eliminate susceptibility to porosity. Welding parameters such as efficiency, welding current, preparation of seam and gas and electrode consumption. Mechanical properties of welds. (K1d, K9; ST)

122-K. Ceramic Tooling and Honeycomb Brazing Fixtures for Supersonic Aircraft

Production. J. D. Walton and N. E. Poulos. American Ceramic Society Bulletin, v. 39, Dec. 1960, p. 740-748.

Simultaneous forming and heat treating of stainless steel using ceramic dies of bonded fused silica. Blanket brazing of honeycomb stainless steel panels at 1700° F. using fixtures of rebonded fused silica and an alloy of Ag, Cu and Li. Comparison with furnace brazing. (K8, G-general, J-general; SS, 4-57)

123-K. The Flash-Butt Welding of Wheel Rims for the Motor Industry. D. D. Williams. Current Engineering Practice, v. 3, Sept. 1960, p. 25-28.

Steel composed of 0.2% C, 0.5% Mn, 0.02% S and 0.03% P and supplied in hot rolled profiles is cut and bent, then flash butt welded on a rim welding machine. (K3r, G17, G6, T21e; ST)

124-K. New Boons to Brazing. Mill and Factory, v. 68, Jan. 1961, p. 79.

Development of Ag alloy brazing filler metal with a core of flux to assure correct combination of brazing alloy and flux. Description of a brazing and hard facing process in which powdered metals are simultaneously sprayed and fused on a base metal by an oxy-acetylene flame. (K8, L24)

125-K. Stainless Steel Foil Sticks Tight. Steel, v. 147, Dec. 26, 1960, p. 68-69.

302 stainless steel foil coated with a pressure sensitive adhesive is used as a corrosion resistant covering or trim. (K12; SS, 4-56)

126-K. (Slovakian.) Butt Welding of Thin Transformer and Dynamo Sheet. Ladislav Muncner. Zvaracsky Sbornik, v. 9, Mar. 1960, p. 259-276.

Sheets of 0.35-0.5 mm. thickness containing 0.04-0.13% C, 0.025-0.50% Mn, 1-4.6% Si, 0.015-0.07% P, 0.009-0.04% S, 0-0.03% Cr, 0.15-0.25% Cu and 0-0.15% Ni are Tig welded, oxy-acetylene welded or resistance welded. Data are given for tensile strength and alternate bend strength in the welded state and after annealing at 860° C. for 1 hr. followed by furnace cooling. 3 ref. (K1d, K2h, K3, Q27a, Q5g; SGA-n)

127-K. (Czech.) Strength of Weldments From 10523.3 Steel. Vladimir Gregor. Zvaracsky Sbornik, v. 9, Mar. 1960, p. 277-303.

15 mm. thick sheet is butt welded by the submerged arc process. Fatigue strength and notch sensitivity of weldments and base material are tested. Fatigue testing of 10523.3 steel structural shapes. (K13, Q7, Q23s; ST, 4-53)

128-K. (Slovakian.) Development of Ferritic Layer in Resistance Butt Welded Carbon Steels. Pavol Galan and Marcel Zitnansky. Zvaracsky Sbornik, v. 9, Mar. 1960, p. 367-381.

Micrographic tests performed on weldments of a steel containing 0.14% C, traces of Si, 0.43% Mn, 0.016% P and 0.005% S show that the ferritic layer has not formed. It is assumed that the decarburization occurring during welding is not sufficient for the formation of ferrite. 21 ref. (K3, N8j, M21; ST)

129-K. (Czech.) Soldering and Brazing. Otakar Moravek. Zvaracsky Sbornik, v. 9, Mar. 1960, p. 382-397.

Theory of soldering and brazing with Cu-base, Ag-base and Al-base solders. Quality of soldered assemblies depends on fluidity of solder, capillary effect, surface tension and diffusion. 7 ref. (K7, K8; SGA-f)

130-K. (Czech.) Welding of Nickel-Free Austenitic Stainless Steel of the CrMnN Type, in a Protective Atmosphere. Karel Lobl and Adolf Kabrhel. Zvaranie, v. 9, Oct. 1960, p. 286-290.

Sheet and tubing of CSN 17241 or CSN 17242 steel containing nominally 0.1% C, 15% Mn, 0.8% Si, 17% Cr, 0.5% Mo and 0.35% N are resistance or arc welded. Corrosion resistance of welds is measured in citric acid, CH_3COOH, NaCl, HNO_3, lactic acid, formic acid and oxalic acid. 7 ref. (K1, K3, R7; ST, 4-53, 4-60)

131-K. (Slovakian.) Procedures in Electroslag Welding. Pt. 1. Martin Mosny. Zvaranie, v. 9, Oct. 1960, p. 290-293.

Determination of welding parameters including amperage and voltage. Use of an auxiliary electrode or metal shavings to start the welding process. (K6)

132-K. (Czech.) Repair Welding of Reactor Vessels for Hydrogenation Damaged by Bomb Splinters. Rudolf Halbich. Zvaranie, v. 9, Oct. 1960, p. 296-301.

Material which showed cracks during electromagnetic or ultrasonic testing is removed by grinding. Reactors are then preheated to 350° C. in a gas-fired special furnace built around them, then welded with a 5-mm. diameter E-N5 electrode at a current of 200 amp. 5 ref. (K1, 18-72, G18; T26q)

133-K. Silver Brazing. M. W. McKinley. Welding Fabrication and Design, v. 4, Nov. 1960, p. 7-13.

Review of methods including selection of fluxes based on fused borax, borates, fluoborates and fluosilicaborates, selection of brazing material and methods of torch, furnace and electrogas brazing. (K8; SGA-f)

134-K. Welded Titanium Tubing Curbs Corrosive Attack of Acids. Iron Age, v. 187, Jan. 12, 1961, p. 68-69.

Ti legs, spacers and risers are arc-welded to heat exchanger units using a modified Heliarc welding gun, a cannister packed with Cu turnings to diffuse argon over the weld zone and a bronze diffuser to prevent argon from seeping away from the weld zone. (K1d, W13b; Ti, 4-60, 17-57)

135-K. (German.) Production Problems Caused by Welding in Ship Building. P. Werf. Industrie-Anzeiger, v. 82, Nov. 25, 1960, p. 1637-1639.

Faults caused by residual stresses in arc-welded ship parts where stress-free annealing is impossible. Approximate evaluation of stresses depending on ship construction. Control of deformation of ship-body by proper sequence of construction operations and by autogenous spot-wise heat adjustment. (K1, J1, T22g; 7-51)

136-K. Welding Research--Programme of the British Welding Research Association. Iron & Coal Trades Review, v. 181, Oct. 28, 1960, p. 935-937.

Review of welding research. Major topics covered are wide plate testing for brittle fracture of ferrous and nonferrous alloys; steel composition and microstructure as affected by aging; yield point, yield-ultimate ratio and microstructure of mild-steel weld metal; and heat affected zone studies. (K-general, Q-general; CN, ST)

137-K. Braiding Machines and Metal Braid. W. Douglass. Wire Industry, v. 27, Nov. 1960, p. 1087-1090.

Braiding of Cu or steel wire into narrow ribbons, cords or tubes using two types of maypole machines to produce symmetric or asymmetric diamond braids. (K13s; Cu, ST, 4-61)

138-K. (German.) Electroslag Welding. W. Krieweth. Industrie-Anzeiger, v. 82, Nov. 22, 1960, p. 1622-1629.

Process and machinery for automatic electroslag welding of vertical and tangential seams in steel machine parts over 40 mm. thick. Reactions between slag and metal under various welding conditions. (K6; ST)

139-K. (German.) Welded Aluminum Heavy Derrick for Sea-Going Freighter. Victor Rosch. VDI-Zeitschrift, v. 102, Dec. 11, 1960, p. 1752-1757.

Design and construction by sigma welding of a 6.2 ton AlMgSiF32 alloy derrick of 152 ton safe loading capacity. (K1d, T28n; Al-b, Mg, Si)

140-K. (German.) Aluminum Domes. Rudolf Lang. VDI-Zeitschrift, v. 102, Dec. 11, 1960, p. 1758-1761.

Construction of a plastic covered cantilever dome consisting of AlMgSi1-F32 alloy tubes of 70 mm. diameter and 3-4 mm. wall thickness joined into triangles by galvanized screw joints in AlMgSi1F20 circles. Data for buckling strength and rigidity of the structure. (K13p, T26; Al-b, Mg, Si, 4-60)

141-K. Electron Beam Welding Those Hard-to-Join Metals. Mars Hablanian. Assembly & Fastener Engineering, v. 4, Jan. 1961, p. 36-40.

Applications to metals that must be welded in vacuum or an inert gas atmosphere, dissimilar reactive and refractory alloys and extremely thin sections. Machine settings and results are tabled for welding of Zircalloy, Mo, stainless steel, Cb, Ta and V-Cb alloy. (K6; Cb-b, Mo, SS, Ta, Zr-b)

142-K. Soldering, Welding Miniature Products. Assembly & Fastener Engineering, v. 4, Jan. 1961, p. 44.

Description of an ultrasonic micro-joining unit for fluxless soldering and heatless welding. Micro-joining operations include the welding of 0.004 in.

diameter Au wire; welding 0.002 in. diameter CP Ni leads; soldering Au wire on 0.003 in. Al foil and joining 0.0015 in. Au-Ga alloy. (K7h, K6r; Al, Au-b, Ni, 4-61)

143-K. Axles Welded in a Vapor Shield. R. H. Eshelman. Iron Age, v. 187, Jan. 19, 1961, p. 78-80.

Control arm brackets are welded onto rear axle housings on a mechanized auto line using a new arc welding process in which a thick vapor shield, composed of vaporized compounds having different condensation temperatures, protects metal transfer through the arc. (K1d, T21)

144-K. Tooling Up to Weld Refractory Metals. Fansteel Metallurgy, Dec. 1960, p. 2-3.

Tig welding of W, Mo, Ta and Cb in an inert gas chamber by an automatic airline (Tig) welder with automatic lateral and vertical motion provided for the torch and automatic longitudinal and rotational motion for the carriage. (K1g; Cb, Mo, Ta, W)

145-K. Vapor-Shielded Arc Welding at 200 Rpm. R. A. Wilson. Welding Journal, v. 40, Jan. 1961, p. 13-17.

Welding sheet and plate metal using a cored bare electrode to provide a vaporized shield and clean surface for good electrical contact. The tubular wire is filled with granular and chemical ingredients which boil in the arc heat and then condense to a vapor which shields and deoxidizes the weld metal. (K1d, W29h; 4-53)

146-K. Electrode for Spatter-Free Welding of Steel in Carbon Dioxide. Everett Cushman. Welding Journal, v. 40, Jan. 1961, p. 14s-21s.

Metal-arc welding of mild steel using electrode wire coated with Cs and Na compounds forming a thin coating which does not interfere with electrical contact between the wire and welding equipment. Rigid control of arc length is no longer required. (K1d, W29h; CN)

147-K. Arc Welding of a Ni-Cr-Fe (Inconel) Alloy for Nuclear Power Plants. Jay Bland and W. A. Owczarski. Welding Journal, v. 40, Jan. 1961, p. 22s-32s.

Inert-gas metal-arc, inert-gas tungsten-arc and shielded metal arc welding of Inconel to clad carbon steel and form structural joints. (K1d, L22; CN, Ni-b)

148-K. Inert-Gas Spot Welding in the Aircraft and Missile Industry. R. L. Hackman. Welding Journal, v. 40, Jan. 1961, p. 25-33.

Fabrication of high-strength low-weight ratio structures from high-tensile steels such as 17-7 pH and 15-7 Mo by tungsten arc spot welding. Consideration of welding parameters including current, welding time, arc length and electrode shape. (K1, K3n, T24a; SS)

149-K. Bonuses From Welding With CO_2 and Flux-Cored Wire. Welding Journal, v. 40, Jan. 1961, p. 41.

Tensile and bend properties of carbon steel welds made on pressure vessels and bushings, using a combination of wire drive unit, air-cooled gun, CO_2 shielding gas and flux-cored wire. (K1d, Q27, Q5; CN)

150-K. (Italian.) Automatic Submerged Arc Welding. Pt. 1. Franco Calcaterra. Rivista di Meccanica, v. 11, Aug. 1, 1960, p. 9-16.

Definition and general features of process. Design and operation of an automatic installation, including welding, head, head and work positioners, and regulation and control devices. Factors in choice of a-c. or d-c. current. (To be continued.) (K1e, W29)

151-K. Status of Welding Processes in Europe. Maximilian Komers. Metal Progress, v. 79, Jan. 1961, p. 107-112.

Notable progress has been made in the production of strong, tough steels of good weldability and in devising various schemes for delivering powdered flux and protective atmospheres simultaneously to the arc. Electroslag welding is still under experimental study. (K1)

152-K. Bonding Steel With Plastics. Karl Mohler. Metal Progress, v. 79, Jan. 1961, p. 195-196. (Digested from VDI Zeitschrift, Jan. 1, 1959, v. 101, p. 1-8.)

Joining structural members of steel bridges by gluing together with phenolic resins, epoxy resins and unsaturated polyester resins. (K12, T26p; ST)

153-K. Adhesive Bonded Metal Tubing Holds Promise for Missile Bodies. Steel, v. 148, Jan. 16, 1961, p. 76-77.

Fabrication of missile engine cases by winding alternate layers of steel or Ti strips and adhesive around a cylindrical Al mandrel. Techniques used in curing the tubes and adding end rings. Dimensions and strength properties of the finished tubes. (K12, T24e; ST, Ti, 4-53)

154-K. Special Fasteners for Aluminum. Pt. 2. Bolt Type Fasteners. H. Hinxman. Metal Industry, v. 97, Dec. 16, 1960, p. 495-497, 504.

Mechanical fastening of Al sheets by Huckbolts consisting of an Al alloy bolt and locking collar; Jo bolts consisting of a heat treated steel nut and bolt and stainless steel sleeve and by stainless steel studs. Tables of chemical composition and mechanical properties of certain Al alloys used in the manufacture of rivets and fasteners. (K13; Al, 4-53)

155-K. Special Fasteners for Aluminum. H. Hinxman. Metal Industry, v. 97, Dec. 9, 1960, p. 475-477.

Mechanical fastening of Al by blind rivets and bolt-type fasteners made of B.S. L58, L69 and 3L37 Al alloys. Setting sequence for various types of rivets. (K13; Al, 4-53)

156-K. (Czech.) Starting Procedures in Electroslag Welding. Martin Mosny. Zvaranie, v. 9, Nov. 1960, p. 326-330.

Start is facilitated by addition of powdered Fe or Fe alloys to give the electrode end an adequate shape, addition of thermite mixture, use of an auxiliary electrode, insertion of a semiconductor material between electrode and bottom of weld or addition of liquid slag. 5 ref. (K6)

157-K. A Guide to Blind Riveting. Australasian Manufacturer, v. 45, Nov. 19, 1960, p. 52-53, 55.

Dimensions, ultimate tensile strength and recommended hole dimensions are given for blind rivets composed of Monel, mild steel and Al-Mg alloy. (K13n, T7f; Al-b, CN, Mg-b, Ni-b, 17-57)

158-K. Design Details of Blind Riveted Joints. Australasian Manufacturer, v. 45, Nov. 19, 1960, p. 54-55.

Diagrams and dimensional specifications for blind riveting of Al, cast iron and plastics. Methods of countersinking and sealing of rivets. (K13n; Al, CI, NM-d30, NM-d31)

159-K. New Concept in Cast Iron Welding. Australasian Manufacturer, v. 45, Nov. 19, 1960, p. 80-82.

Cast iron welds which can be immediately cooled with water or compressed air are produced by cutting antistress grooves in the weld area, sealing the surface to avoid porosity and welding by back-step stringer passes of 1-4 in. (K1; CI)

160-K. New Adhesive Films Give Optimum Glue Line in Honeycomb Structures. Materials in Design Enginnering, v. 53, Jan. 1961, p. 12-14.

Self-filleting unsupported film adhesives with high tensile and shear strengths are used to bond the skin to the core and form structural fillets between the skin surface and the inside cell walls of the honeycomb core. (K12; 7-59, NM-d34)

161-K. 45 Years of Welding. Welding Engineer, Jan. 1961, p. 31-34.

Review of the history of welding processes including development of gas and arc welding, resistance welding and newer techniques such as electroslag, electron-beam and plasma heat welding and explosive forming and cutting. (K-general, G-general, NM-k34)

162-K. American Laboratory Studies Practical Friction Welding. Welding Engineer, Jan. 1961, p. 39.

Advantages of friction welding, a process in which metal, ceramic or plastic workpieces are heated by sliding or rotating them in contact with each other. Evidence is presented to show that a layer of fluid metal is formed at the interface of the two objects and acts as a hydrodynamic thrust bearing or pressure lubricant. (K6)

163-K. Army Shipments Travel in Welded Steel Containers. Welding Engineer, Jan. 1961, p. 48.

Fabrication of corrugated steel boxes by butt, arc and resistance welding. Welds must be free from excessive porosity, overlap, entrapped slag,

undercut and burn through. (K-general; ST)

164-K. Survey of Welding Metallurgy Shows Problems and Solutions Encountered in Fabrication. W. H. Bruckner. Welding Engineer, Jan. 1961, p. 72-74.

Methods of preventing grain boundary carbide precipitation, unfavorable stress states and contamination when welding structural steels. (K9; ST, SGB-s)

165-K. Square-Butt Mig Welding Joins Aluminum Cylinders. Welding Engineer, Jan. 1961, p. 75-76.

Joining of heavy-wall Al cylinders for nuclear equipment by a new high current welding process in which arc instability is overcome by improved gas shielding and wire quality and use of a slope-controlled power supply. (K1g, K-general; Al, 4-60)

166-K. All-Welded Tank Cars Are World's Largest. Welding Engineer, Jan. 1961, p. 78.

Fabrication of railroad tank cars with 30,000 gal. capacity from structural steel sections by manual metal arc and submerged arc welding. (K1, T23p; ST, SGB-s)

167-K. Ceramic Blanket Brazing. Metalworking Production, v. 104, Dec. 28, 1960, p. 49-50.

Three brazing techniques for contoured stainless steel honeycomb panels based on replacing graphite with ceramic platens, which are resistance-heated by flat Nichrome strips. (K8j; SS, 4-57)

168-K. Magnetic Force Welding. C. A. Rowlands. Welding and Metal Fabrication, v. 28, Dec. 1960, p. 474-481.

Magnetic force welding sintered Ag to brass or Cu blanks using a welding machine which can maintain an indirect relationship between heat and electrode pressure thereby compensating for minor variations in power and workpiece contact resistance. (K3, W29, 1-52; Ag, Cu-b, 6-72)

169-K. Recent Work on Pressure Welding. R. F. Tylecote. Welding and Metal Fabrication, v. 28, Dec. 1960, p. 491-494.

Survey on the possibility of pressure welding steel tubes, foils and Zr, Ti, Cu, Zn, Mg, Fe-C and Au-Ge alloys. Methods of surface preparation and mechanisms of oxide film breakdown. Mechanical properties of pressure welds. (K5; 4-56, 4-60)

170-K. Fabricated High Duty Boilers. Welding and Metal Fabrication, v. 28, Dec. 1960, p. 503.

Boiler tubes are butt welded to short stubs which form an integral part of the boiler drums using a multirun seam welding procedure and a double U-type edge preparation. (K3p, T26q; 4-60)

171-K. Welding of Columbium and Columbium Alloys. W. J. Lepkowski, R. E. Monroe and P. J. Rieppel. Defense Metals Information Center, Battelle Memorial Institute, DMIC Memo. 69, Oct. 24, 1960, 30 p. (Available as PB 161219 from U. S. Office of Technical Services, Washington 25, D. C.)

Evaluation of Mig, Tig, ultrasonic, resistance, diffusion bond and electron beam welding techniques used on available Cb and Cb alloys to meet the requirements of oxidation resistance and high strength at elevated temperatures in weldments. Data for mechanical properties of welds. (K-general, Q-general, R1h; Cb-b)

172-K. Vapor Shield Speeds, Upgrades Welds. Steel, v. 148, Jan. 30, 1961, p. 99.

Semi-automatic joining of open web steel joists using a hollow electrode which is fed through a hand welding gun. Materials in the core volatilize to provide a vapor shield, deoxidizer and flux. (K1d; ST, 4-57)

173-K. (Swedish.) Friction Welding. Teknisk Tidskrift, v. 90, Nov. 18, 1960, p. 1169-1171.

Cylindrical parts of 10-20 mm. diameter composed of mild steel containing 0.20% carbon, carbon steel containing 0.45% C, alloy steel with 0.12-0.40% C, 0.75-13% Cr and 0.25-2% Ni, 60/40 brass and brass containing 58% Cn, 2% Mn and 40% Zn are welded. Relationship between upsetting occurred in welding and tensile, impact and bend strengths of weldments. (K6, Q27a, Q6n, Q5g; AY, CN, Cu-b)

174-K. (Russian.) Welded Structures. G. A. Nikolaev. Svarochnoe Proizvodstvo, Dec. 1960, p. 2-6.

Description of various types of modern welded structures used in ship building, metallurgical machine construction and automobile manufacture, as displayed at a welding exhibition. Application of new increased strength steels with yield point of 30 kg. per sq. mm. and resistance to brittleness at low temperatures in these structures. (K-general; SGB-a, SGB-r, ST, 4-57)

175-K. (Danish.) Welding in Atomic Power Plants. R. W. Nichols. Ingenioren, v. 69, Oct. 15, 1960, p. 592-598.

Arc welding of Monel 60, 130 and 140, vanadium, Cb and various alloy steels. Influence of relief annealing for 48-100 hr. at 600° C. and of neutron irradiation on transition temperature for the embrittlement of base and filler metal. 6 ref. (K1, Q23r, 2-64, 2-67; AY, Cb, Ni-b, V)

176-K. (Swedish.) Welding of Aluminum. Erik Karlsson. Teknisk Forum, no. 16, 1960, p. 258-260.

Survey on welding methods for Al and other light metals including soldering, gas welding, arc welding, Tig welding and Mig welding methods. Joint design. (K-general; Al)

177-K. Joining Aluminum Alloys. Metal Industry, v. 97, Dec. 30, 1960, p. 538.

Development of a paste compound that gives high strength corrosion resistant joints on Al and Al alloys and requires no finishing or after treatment. (K6; Al-b)

178-K. Diffusion Method Bonds Copper Perfectly. Steel, v. 148, Jan. 23, 1961, p. 55.

Joining of Cu-to-Cu and Cu-to-alloy bonds by a new diffusion bonding technique in which components to be joined are coated, then heated to 1700-1800° F. in a hydrogen or inert gas atmosphere. (K5k; Cu)

179-K. (French.) Welding and Brazing of Copper and Its Alloys. Cuivre-Laitons-Alliages, Sept-Oct. 1960, p. 3-11.

Methods and principles for flame and arc welding and brazing of Cu with attention to elimination of refractory oxides, metal losses, internal tensions, intergranular fissuration and other harmful effects. (K1, K2, K8; Cu-b)

180-K. (German.) Tests on Tubes With Induction Welded Longitudinal Seams. T. Furkel. Schweissen und Schneiden, v. 12, Dec. 1960, p. 517-525.

Automatic pressure welding of tubes of unkilled unalloyed 0.08-0.13% C openhearth steel. Results of chemical examination, nondestructive X-ray and ultrasonic testing, mechanical testing at 20 and 400° C., flanging, folding, busting, roll-in and bending tests, aging and microstructural investigations. (K5, S13, Q-general, N7a, M27; ST, 4-60)

181-K. (German.) Inductive Welding of Longitudinal Seams of Tubes. D. Kronauer and M. Thiele. Schweissen und Schneiden, v. 12, Dec. 1960, p. 525-530.

Mechanism of inductive fusion welding above liquidus temperature and inductive pressure welding below solidus temperature of steel tubes is discussed in terms of formation of metal bond, diffusion and recrystallization. Interpretation of reactions using the Fe-C phase diagram. Macrostructure and microstructure of seam. (K6n, K5, N1, N5f; ST, 4-60)

182-K. (German.) Welded Live Rings for Swivelling Cranes. A. Bucholz. Schweissen und Schneiden, v. 12, Dec. 1960, p. 530-532.

Production of live rings from rolled CK 45 steel (0.42% C) by welding of bearing surface with special electrodes composed of 0.15% C, 0.5% Si, 1.44% Mn, 0.14% Cu, 0.80% Cr and 0.05% Mo to obtain high strength and wear resistance. Comparison of strength and production costs of seamless forged and welded live rings. (K1, W29h; ST)

183-K. How to Weld the Cobalt Alloys. W. J. Lepkowski and R. E. Monroe. Welding Design & Fabrication, v. 34, Jan. 1961, p. 37-39.

Welding guide for Co alloys of the Fe, Ni or Co base types. Material thickness, current in amperes for various electrode diameter, arc voltage, weld speed and argon flow rate given for each major alloy type. (K-general; Co-b, Fe-b, Ni-b)

184-K. Unique Design: 39 Steel Cylinders Replace One Vessel. Welding Design & Fabrication, v. 34, Jan. 1961, p. 40.

Swaging and seal welding of one end of high strength seamless steel tubing into 39 air storage bottles to form a high pressure air storage receiver for a supersonic wind tunnel. Cylinders are stress relieved by heating to 1150° F. with oxy-acetylene flame, air cooled and tested hydrostatically at 3000-4500 psig. (K1, F25, T26q; ST, 17-57)

185-K. CO_2 Welding Saves GM $8000 a Month. Welding Design & Fabrication, v. 34, Jan. 1961, p. 49-50.

Rectangular electric motors are produced on a conveyorized welding system using automatic CO_2 welders to join the motor pole-piece to the rectangular frame, both of low carbon, electrical quality steel. (K1d, W11q; CN-g, 17-57)

186-K. Technique for Fabricating and Welding Aluminum Tank Cars. J. F. O'Connell. Welding Design & Fabrication, v. 34, Jan. 1961, p. 52-55.

Tank cars are fabricated from 5052, 5052-H-112, 6061-T-6 Al and 6063-T-42 Al alloy plate by automatic and manual inert gas-consumable electrode arc welding. Data are given for process parameters and weld quality as determined by radiographic inspection. (K1d, T23p; Al-b, 4-53)

187-K. Technique for Faster, Cheaper Welding of Heavy Al Plate. Welding Design & Fabrication, v. 34, Jan. 1961, p. 56-57.

Square-butt, or high-current, welding of 1 1/4 in. Al plate into cylinders for the nuclear industry using sigma equipment. Parameters are given for joint design, edge preparation, welding speed and wire feed notes, welding current and argon shielding flow for plate of varying thicknesses. Weld quality is examined by radiographic testing. (K1d, T11; Al-b)

188-K. Filler Wire Is Key to New CO_2 Spray Arc Welding Process. C. R. Sibley. Welding Design & Fabrication, v. 34, Jan. 1961, p. 60-63.

Semi-automatic welding of steel plates and shapes producing sound weld metal by adjusting filler wire composition for deposition by a CO_2 open spray arc. Effect of arc length, travel speed, gun angle on bead shape and penetration determined at 240-280 amp. and 18-22 volts. (K1d; ST)

189-K. Four Methods for Brazing B-70 Stainless Honeycombs. Welding Design & Fabrication, v. 34, Jan. 1961, p. 64-65.

Precipitation hardening steel, PH 15-7 Mo (containing 15% Ni, 7% Cr and some Mo), is brazed into stainless steel honeycomb panels at 1625° F. using Ag-Cu alloys in luminous wall furnace, furnaceless, salt bath and die quench brazing methods. (K8, T24a; SS-e, 7-59)

190-K. Oil Storage Tanks. A. B. Fieldhouse. Welding and Metal Fabrication, v. 29, Jan. 1961, p. 2-7.

Method for welding vertical seams on large steel storage tanks. Plate preparation, electrode consumption and welding speeds for vertical downward butt welds. Results of mechanical tests on weldments. (K-general, K1, T26q; ST)

191-K. Nuclear Fuel Handling Equipment. T. J. Palmer. Welding and Metal Fabrication, v. 29, Jan. 1961, p. 8-21.

Fabrication of welded charge face machinery for a nuclear power station using both gas and arc welding for steel sheet and structural materials. (K-general, T11q; ST)

192-K. Fusion Welding of Titanium and Its Alloys. W. G. Hull. Welding and Metal Fabrication, v. 29, Jan. 1961, p. 24-31, 36.

Review of the problems of atmospheric contamination and hydrogen embrittlement and their effect on joint properties. Prevention of contamination during welding by using vacuum purged and flow purged welding chambers and by inert gas protection in open air welding. (K1d, Q26s; Ti-b)

193-K. The Theory and Practice of Spot Welding. Douglas D. Williams. Welding Fabrication and Design, v. 4, Dec. 1960, p. 9-12.

Theory of the formation of a spot weld. Data are given for cold contact resistance between steel plates for varying electrode pressures and electrode dimensions for different plate thicknesses. Relation between current intensity, welding time and weld spot diameter. (K3n)

194-K. How to Join Beryllium. Metalworking Production, v. 105, Jan. 4, 1961, p. 19.

Fusion welding, diffusion welding, braze welding and furnace brazing techniques for Be. (K1, K5k, K8; Be)

195-K. Quality in Welding. E. Fuchs. British Welding Journal, v. 8, Jan. 1961, p. 4-9.

Review of weld quality in welded Al pressure vessels, pipe welds and welded mild steel tube. Illustrations of faulty flash, arc and oxy-acetylene welds. (K9, K1, K2h, K3r, T26q; Al, CN, 4-60)

196-K. Welding in the Production of Marine Oil Engines. J. A. Dorrat. British Welding Journal, v. 8, Jan. 1961, p. 10-17.

Materials and design consideration in planning mild steel engines to be welded by open or submerged arc process. Control of weld size, load carrying capacity, corrosion fatigue and distortion. (K1, T22h; CN, 17-57)

197-K. Welding Mission to the USSR. British Welding Journal, v. 8, Jan. 1961, p. 18-23.

Report on the following areas of Soviet welding technology: arc welding, surfacing by strip electrodes, inert-gas shielded arc welding, electro-slag welding, resistance welding, friction welding, gas welding and cutting and prefabrication of large storage tanks. (K-general)

198-K. Trolley Tools Work Honeycomb Panels. Metalworking Production, v. 104, Nov. 16, 1960, p. 67-68, 78.

Routing, welding and X-ray inspection of large stainless steel panels for aircraft and missiles, using separate trolley mounted tools for each operation. (K-general, S13e, T24; SS, 4-57)

199-K. New Welding Processes. John J. Chyle. Machine Production, v. 20, Jan. 1961, p. 19-23.

Survey of developments in and characteristics of ultrasonic, high frequency resistance, foil seam, magnetic force and percussion welding. Applications in welding refractory metals, Al, Cu, Zr and their alloys and stainless steels. (K-general, 10-54; Al-b, Cu-b, SS, EG-d)

200-K. Brazing of Sandwich Structures of Columbium Alloys. Mel M. Schwartz. American Society of Mechanical Engineers, Paper no. 60-WA-312, Dec. 16, 1960, 7 p. $1.

Brazing of refractory metals in a "cold wall" vacuum retort furnace at 3300° F. Test data show strength and ductility at 3000° F. under severe stress. (K8j, 1-73; Q27, Q23p, 1-66; Cb-b, 4-57)

201-K. Mig, Submerged-Arc Join Wind Tunnel Parts. S. J. Buell, Welding Engineer, v. 45, Dec. 1960, p. 37.

Multi-power submerged arc welding and Mig spot welding are used to fabricate steel vessels for wind tunnel sections and line them with stainless steel. (K1; SS, 4-53)

202-K. Tig Welded Insert Ring Helps Increase Pipe Quality. C. H. Voelker. Welding Engineer, v. 45, Dec. 1960, p. 46-47.

Preplaced filler metal in the form of an insert ring is used to give high quality root welds in pipes designed for severe and cyclic services. (K1d, W29h, T26r)

203-K. Controlled Angle Tig Torch Simplifies Cabinet Welding. Forde M. Simms and John V. Warinsky. Welding Engineer, v. 45, Dec. 1960, p. 50.

Fabrication of a Mg-alloy cabinet for missiles by using a flexible, telescoping welding torch to reach recessed corners through restricted openings. (K1d, W29d; Mg-b)

204-K. Brazing Used for Tube Cooling Parts. Welding Engineer, v. 45, Dec. 1960, p. 57.

Cu tubes are brazed to sheet metal fins by Ag and Au brazing alloys to form cooling radiators, devices which dissipate the heat from tubes in electronic equipment. (K8; Cu, 4-60)

205-K. Technical Control of Welding in the Steel Foundry. M. G. Hipkins. Foundry Trade Journal, v. 110, Jan. 3, 1961, p. 3-9.

Steel alloy castings are repaired and fabricated by metallic arc welding with covered electrodes, Tig and Mig welding, submerged-arc welding and electro-slag welding. Post-weld treatments include

stress relieving at 600-650 C. and normalizing at 830-880° C. (K1, K6, J1a, J24; ST, 5)

206-K. Producing Pipeline Valves by the Fabrication Method. Howard E. Jackson. Modern Machine Shop, v. 23, Feb. 1961, p. 116-123.

Channels, angles and plates are cut by multiple torches on a flame planar carriage, then beveled, vacuum blasted and submerged arc welded to form pipeline valves. (K1e, G22g, L10c, 1-73, T7b)

207-K. High Speed Welding of Center Sills. Modern Machine Shop, v. 33, Feb. 1961, p. 140-142.

Welding of 63 ft. longitudinal flat center sills by a semi-automatic arc welding process in which vapor shielding, deoxidizing and fluxing are all obtained with a tubular fabricated electrode containing filler metal. (K1d, W29h)

208-K. What's the State of Welding Behind the Iron Curtain? E. E. Claussen. Iron Age, v. 187, Feb. 2, 1961, p. 81-83.

Development and examples of application of electroslag welding in the Soviet Union. (K6)

209-K. Fastening Aluminum. Modern Metals, v. 16, Jan. 1961, p. 27-28, 30, 32, 34, 36.

Selection and heat treatment of aluminum alloy fasteners. Comparison of joining methods as to cost, equipment, speed, mechanical properties of joint and versatility. (K13, T7f; Al-b, 17-57)

210-K. Switch to Tig Welding Ends Repair Headache for Office Furniture Firm. Modern Metals, v. 16, Jan. 1961, p. 38.

Conversion to tungsten inert gas process for welding Al office chairs eliminates flux contamination and other problems associated with oxy-acetylene welding. (K1d, T10b; Al)

211-K. (German.) The Electron Beam as a Tool. Siegfried Panzer and Karl-Heinz Steigerwald. Elektrotechnische Zeitschrift, v. 81, Dec. 19, 1960, p. 925-932.

Method and apparatus for electron-beam melting, welding, cutting, soldering, milling, drilling, alloying and evaporation of metallic and nonmetallic materials. Design details of electron beam welding and milling machine. (K6, C-general, G-general)

212-K. Metal Bonding--the Better, Faster Way. Gilbert C. Close. Mill and Factory, v. 68, Feb. 1961, p. 116-117.

Production of metal bonded aircraft parts by spraying adhesive onto the sheet with an airless spray gun in a humidity and temperature controlled room. Parts are then mounted on a large pot platen and cured in an autoclave. (K12, T24; 4-53)

213-K. (German.) Repair Welding of Cast Iron. G. M. Blanc and Heinrich Edel. Schweisstechnik, v. 14, Dec. 1960, p. 133-139.

Review of autogenous and electric arc welding of gray and nodular cast iron using cast iron, steel, Cu alloyed, Ni alloyed and Ni electrodes. Soldering and brazing to repair cracks and holes in thin-walled parts. Microstructure and hardness of seam. (K1, K3, K7, K8, W29h; CI)

214-K. (German.) Processing and Machining by Electron Beams. K. H. Steigerwald. Schweisstechnik, v. 14, Dec. 1960, p. 139-141.

Electron beam milling and welding apparatus for treatment of high melting metals (Ti, Zr, W, Mo), sintered metals and nonmetallic materials including quartz. Milling of 40 micro-meter wide crossholes in steel die for spinning plastic fibers. (K6, G17b; SGA-h, Mo, Ti, W, Zr)

215-K. (German.) Tool Production and Repair by Arc Welding. Bela Zorkoczy. Industrie-Anzeiger, v. 82, Dec. 20, 1960, p. 1751.

Repair of composite steel machining tools and cracked hot forging dies by arc welding. Production of cold and hot working tools by deposit welding. Selection of electrodes. (K1, L24, T6; ST)

216-K. Welding and Heat Treating a 60 Ton Cryogenic Vessel. Warren H. Vetter. Metal Progress, v. 79, Feb. 1961, p. 88-90.

A huge storage tank for liquid oxygen was fabricated by joining 5 in. thick segments of type 321 stainless steel with 12,000 lb. of weld

metal. The entire tank was annealed after welding. (K1, J23, SS, 2-63)

217-K. Carbon Dioxide Simplifies Welding Mechanization. Mass Production, v. 36, Nov. 1960, p. 65-66.

Clean, self-disposing quality of carbon dioxide and high deposition rate of process make it suitable for mechanized welding of steel sheet. (K1d; ST, 4-53)

218-K. Welding Techniques for New Materials. L. M. Gourd and F. W. Copleston. Indian & Eastern Engineer, v. 101, July, 1959, p. 443-445.

Considerations in the inert gas shielded arc welding of Ti, Zr and Ta. Special gas shields and welding cabinets; welding conditions; physical properties of Ti, Zr and Ta. (K1d; Ta, Ti, Zr)

219-K. Welded Aluminum Suits Sonar. Welding Design and Fabrication, v. 34, Feb. 1961, p. 55-56.

Use of tungsten arc and resistance welding for the fabrication of light, strong, compact and corrosion resistant cabinets for seagoing sound system instruments. (K1, K3; Al)

220-K. Close Control of Preheating Temperatures Can Prevent Weld Failures. Helmut Thielsch. Welding Design and Fabrication, v. 34, Feb. 1961, p. 58-59, 62.

Preheating prevents cracking, provides a favorable metallurgical structure and minimizes weld shrinkage and distortion. (K9)

221-K. Developments in the Welding of Nickel and High Nickel Alloys in the Chemical Industry. J. Hinde. Australian Institute of Metals, Journal, v. 5, Nov. 1960, p. 254-263.

Preparation for welding; heat treating requirements; use of resistance, oxy-acetylene, argon and metal arc welding; weld finish and weld quality; clad steels, overlays and linings. 11 ref. (K1; Ni-b)

222-K. Two Passes Weld Heavy Plate. Iron Age, v. 187, Feb. 9, 1961, p. 120.

Mig welding of 2 in. thick Al plate in two passes by a high current density process which produces finer spray transfer from filler wire to weld pool, reduces weld contamination and permits escape of gases by maintaining a large, molten weld pool. (K1d; Al, 4-53)

223-K. Welding at Chalk River. J. V. Cornwell. Canadian Welder, v. 51, Jan. 1961, p. 12-14, 16-18.

Welding tests and specialized welding techniques used at an atomic reactor installation. Methods of remote control and induction pressure welding. Applications to stainless steel, Al alloys and carbon steels. (K-general, T11q; Al-b, CN, SS)

224-K. Welded Aluminum Watercraft. Harry Peacor. Canadian Welder, v. 52, Jan. 1961, p. 22.

Fabrication of a ferryboat from 5086 Al plate (2.5-5.5% Mg, 1% Mn) by automatic inert-gas welding using filler wire with a melt temperature of 1055° F. (K1d, T22; Al-b, 4-53)

225-K. Autos Eyed for Boost in Adhesive Joining. Steel, v. 148, Feb. 13, 1961, p. 125.

Use of adhesive bonding to join Al castings in an engine block, Mg frames and door and body sections having bonded sandwich structures. (K12, T21; Al, Mg)

226-K. (French.) Basic Principles of Electroslag Process. Goran Almqvist. Revue de la Soudure-Lastijdschrift, v. 16, Mar. 1960, p. 195-205.

Vertical welding of steel in a "sliding mold" by fusion of basic metal, deposit metal and flux to form a deep slag bath whose depth, viscosity, chemical composition, surface tension and conductivity influence the stability of the process. Description of equipment. (K6; ST)

227-K. (French.) Microfissures in Mild Steel Welds--Problem Synthesis. J. Sebille. Revue de la Soudure-Lastijdschrift, v. 16, Mar. 1960, p. 222-249.

Relation between hydrogen content in mild steel welds and formation of microfissures. Influence of electrode covers, storage, current density, atmospheric humidity, cooling speed and interpass temperature on cracking. Correlation between microfissuring and presence of inclusions. (K9, 2-60, 2-61, 9-72; CN, 7-51)

228-K. From Forging to Weldment. Production, v. 47, Feb. 1961, p. 72-73.

Production of tractor transmission cluster gears by arc welding two or three component alloy steel forgings, with most machining and tooth finishing done after welding. Use of a low hydrogen, Fe powder electrode permits faster deposition of metal. (K1, T3n; AY, 4-51)

229-K. Automatically Braze Stainless Honeycomb Panels. Production, v. 47, Feb. 1961, p. 86.

Brazing of high-strength stainless steel components for aircraft and space vehicles, using electronically controlled banks of radiant quartz lamps to heat panels to 1725° F. Process is also applicable to Cb and Mo. (K8, T24; Cb, Mo, SS, 4-57)

230-K. New Magnetic Test Includes Stainless Steels. Maxwell Pevar. Product Engineering, v. 32, Feb. 1961, p. 41-43.

Magnetic particle analysis of 301, 201, 302, PH 15-7, Mo and AM355, cold rolled stainless steel, medium carbon steel, 4130 and 4340 alloy steel used to determine spot weld and weld nugget size. Solution containing magnetic particles is sprayed onto parts held in a magnetic field. Particles migrate to outline any magnetic discontinuities. (K9r, S13j; AY, CN, SS, 7-51)

231-K. (Japanese.) Advances in the Glass Lining Techniques. Yuu Kawada. Metal Finishing Society of Japan, Journal, v. 11, Oct. 1960, p. 606-609.

Acid and mechanical shock proof glasslined steel is immersed in acid or alkaline solution to test corrosion resistance as influenced by microscopic defects and temperature. (K11a, R6, 2-61, 3-71; ST)

232-K. (Translation.) Special Features of the Use of a Polyisocyanate Adhesive for Bonding Rubber to Metal. B. G. Lipkina and M. V. Timofeeva. Soviet Rubber Technology, v. 19, Aug. 1960, p. 28-34. (A translation of Kauchuk i Rezina, Mar. 1960.)

The bond strength and adhesion of rubber bonded to steel by the adhesive leikonat (triisocyanate triphenyl methane) are measured by static direct pull tests after preheating at 80-140° C. to determine the optimum application conditions for preventing defect formation and change of properties during use. (K11c; ST)

233-K. Welding Transformer Tanks at Ferranti Ltd., Hollinwood, Lancs. Welder, v. 29, July-Sept. 1960, p. 61-63.

Mild steel plates are arc welded and fabricated into large transformer tanks weighing approximately 30 tons. Completed tanks withstand oil pressures of 12 psi. during 24 hr. test periods. (K1, T26q; CN, 4-53)

234-K. Reactor Gets Repair Free Welds. Iron Age, v. 187, Feb. 16, 1961, p. 106-107.

Production of flaw-free welds in Al-3.5% Mg alloy reactor components by Mig welding, using argon as a shielding gas. (K1d, T11; Al-b, Mg)

235-K. (German.) Autogenous Welding of Copper and Copper Alloys. G. Schreiber. Schweissen und Schneiden, v. 13, Jan. 1961, p. 7-12.

Welding of sheet, blast furnace tuyere and large machine parts composed of Cu, various bronzes, brass and "Kuprodur", a Ni-Si Cu alloy with neutral acetylene-oxygen flame or acetylene-oxygen flame with oxygen surplus. Influence of deoxidizers and residual elements in the components on weld quality. (K3, T7; Cu-b)

236-K. (German.) Selection of Current Sources for Automatic Welding. Schweisstechnik, v. 15, Jan. 1961, p. 1-5.

Matching of electrical power equipment to provide optimum current conditions for arc welding with alternating and direct current. Emphasis on argon arc and Ellira (under powder) welding. (K1, W29a)

237-K. (German.) Improvement of Welding Efficiency in Autogenous Welding of Thin Sheets. Hans H. Reinsch. Schweisstechnik, v. 15, Jan. 1961, p. 5-8.

Autogenous automatic and manual welding of 0.3-2.5 mm. thick steel sheet. Selection of gas mixture; welding techniques with and without additional wire; welding of butt, flanged, flat and fillet weld seams with efficiency being improved by use of two-flame burners. (K3; ST, 4-53)

238-K. Welding by the Mile. John Poulson and Charles L. Rundell. Metalworking, v. 17, Jan. 1961, p. 15.

Technology for metal inert gas shielded arc welding of new type Al

radar antennas by semiautomatic welding machines. Surface oxidation and contamination are checked by a surface resistance analyzer. (K1d, X15q; Al, 17-57)

239-K. (French-German.) Joining of Copper Tubes by Flanged Fittings. M. A. Moia. Pro-Metall, v. 13, Dec. 1960, p. 418-421.

Joining of Cu tubes for hot and cold water, gas and oil, pneumatic and hydraulic control lines by Cu flanged fittings. Comparison of flanged and soldered joints. (K13; Cu, 4-60)

240-K. Aluminum Windows by Mass Production. Light Metals, v. 24, Jan. 1961, p. 26-27.

Fabrication of window frames from Al extrusions and sheet metal using butyl adhesive dry glazing, flash and arc welding, P. K. self-tapping screws and mechanical joining methods. (K-general; Al, 4-53, 4-58)

241-K. Stud Welding Solves Handling Problem. Automation, v. 8, Feb. 1961, p. 85.

To prevent unrolling, ends of strip steel coils are stud welded as they come from the hot strip mill at 1000° F. An automatic positioner carrying a stud welding gun is used. (K1f; ST, 4-53)

242-K. Diffusion Bonding, Brazing Join Copper Parts. Welding Engineer, v. 46, Feb. 1961, p. 46.

Description of a new bonding technique in which a special coating on the metal surface diffuses into parts to be joined at 1700° F. in a hydrogen or inert gas atmosphere. Resulting bonds are without interface and are as strong or stronger than the base metal. (K5k, K8; Cu)

243-K. Tig Welding Cuts Costs 50% in Oxygen Line Fabrication. Welding Engineer, v. 46, Feb. 1961, p. 48.

Butt welding of 321 stainless steel by an automatic Tig process, using a torch mounted on an automatic welding machine. An automatic device built into the welding head compensates for eccentricities of alignment of the workpiece. (K1d; SS)

244-K. Fluxless Solder Cuts Aluminum Window Costs. Clyde James. Welding Engineer, v. 46, Feb. 1961, p. 53.

Cut to length Al shapes are heated to 720° F. by propane torches, soldered with fluxless, rub-on solder, then stress relieved to produce bonds up to 20,000 psi. tensile. (K7; Al)

245-K. Vapor Shielding Process Cuts Welding Time. Welding Engineer, v. 46, Feb. 1961, p. 54.

Metal-arc welding of I-beams and cover plates to form center sills by a process in which ingredients for vapor shielding, deoxidizing and fluxing are produced by a tubular, fabricated electrode containing metallic salts and oxides which vaporize in the intense heat of the arc. (K1d; 4-57)

246-K. (Pamphlet.) Submerged Arc Welds Meet Rigid Requirements for L. P. Gas Cylinders. Hobart Arc Welding News, AWN-165, Hobart Bros. Co., Troy, Ohio, p. 2-3.

Brazing and welding high-strength steel sheet to produce liquified petroleum gas cylinders. Testing of the parent metal, brazed seams and welds of cylinders for strength under pressure. (K1e, K8; ST, SGB-a, 4-53)

247-K. All Purpose Welders for Industry. Australasian Manufacturer, v. 45, Jan. 14, 1961, p. 30.

Welding of cast iron, mild steel, stainless steel, Cu, bronze and brass using specially designed arc welders with stepless current adjustment. (K1, W29; CI, CN, Cu-b, SS)

248-K. Lower Cost Sheet Metal Working. Australasian Manufacturer, v. 45, Jan. 14, 1961, p. 43.

Water tight, corrosion resistant welds are produced in 12 and 14 gage galvanized sheet metal using bronze rods and a carbon arc welding process. (K1; 4-52, 8-65)

249-K. Defects in Welding--Their Cause and Detection. L. Bracewell. Australasian Engineer, Dec. 1960, p. 87, 89.

Blow holes, porosity, penetration and undercutting in welded metal joints as related to voltage, current, welding speed, weld preparation, electrode composition and impurities. (K9)

250-K. (Spanish.) Electrodes With Iron Powder for Electric Welding. Jose Izaguirre Cobo. Ciencia y Tecnica de la Soldadura, v. 10, July-Aug. 1960, p. 1-5.

Comparison of contact welding with Fe powder electrodes and other arc welding processes. Gravimetric yield, fusion coefficient and ease of handling. (K1, W29h; Fe, 6, 17-57)

251-K. (Spanish.) Specialized Applications of the "Unionmelt" Process. Benigno Cuesta. Ciencia y Tecnica de la Soldadura, v. 10, July-Aug. 1960, p. 1-6.

Principles of the process. Application to the welding of butane bottles, thin plate and cylinder blocks. (K-general)

252-K. (Spanish.) Wear of Electrode Ends in Series Spot Welding. E. F. Nippes, W. F. Savage, S. M. Robelotto and K. E. Dorschu. Ciencia y Tecnica de la Soldadura, v. 10, July-Aug. 1960, p. 1-11.

Effect of geometric form of electrode, its material, pressure exerted on it and current intensity on resistance of the weldment, its diameter and on wear of the electrode in series spot welding of autobody steel. (K3m, T21a, Q9, W29h; ST)

253-K. (Spanish.) Spot Welding in the Construction of Metal Structures. M. de Izuzquiza. Ciencia y Tecnica de la Soldadura, v. 10, Sept-Oct. 1960, p. 1-14.

Equipment, including electronic contractors and tri-monophase transformers for spot-welding of thick steel plates. (K3n, 1-52; ST, 4-53)

254-K. (Italian.) Welding of Cast Iron. Fonderia, v. 9, Nov. 1960, p. 497-499.

Review of oxy-acetylene, arc, aluminothermal, mild, contact and bimetallic welding and brazing. (K-general; CI)

255-K. The Solderability of Some Tin, Tin Alloy and Other Metallic Coatings. C. J. Thwaites. Institute of Metal Finishing, Transactions, v. 36, 1958-1959, p. 203-219.

The solderability of various coatings of Sn, Sn alloys with Pb, Zn, Cd and of Cd and Ag is compared on brass, steel and Cu surfaces using a spread-of-drop type test. Influence of coating thickness, basis metal, undercoat layers and after-treatment. 26 ref. (K7, 17-52; Cu-b, ST, Sn-b, Ag, Cd, Pb, Zn, 8-62)

256-K. Current Trends in Resistance Welding Equipment. Ivan Reynolds. Welding Fabrication and Design, v. 44, Jan. 1961, p. 9-14.

Spot, projection, seam and flash welding and stud forming of steel, stainless steel and nonferrous alloys, including vinyl coated sheets using resistance welders with current controlled by ignition contactors. Control devices for timing, phase shift heat, slope and pressure. (K3, W29; SS, EG-a38)

257-K. Ryan Dotwelds Through Thick and Thin. Steel, v. 148, Feb. 27, 1961, p. 126.

Joining of sheets up to 0.016 in. thick to much heavier pieces of metal by a new resistance welding method in which a welding electrode is applied under pressure, a heavy current pulse is discharged and pressure is continued until the weld nugget coals. (K3; 4-53)

258-K. (German.) Development of Welding Technology in Production of Reinforced Concrete Construction Parts in the DDR (German Democratic Republic). Th. Kornosz. Schweisstechnik, v. 15, Feb. 1961, p. 13-19.

Review of resistance welding techniques used in joining reinforcing steel rods in concrete parts, including use of a single spot resistance welding machine. Cold deformation testing of spot welded reinforcing steel rod. (K3; ST, 4-55)

259-K. (German.) Deposit Welding of the Worn Clover Leaf Neck of a Nodular Cast Iron Shape Roll. Josef Totz and Wolfgang Pirker. Schweisstechnik, v. 15, Feb. 1961, p. 22-23.

Repair welding of cast iron necks by preheating to 200° C. with an acetylene flame, welding with coated electrodes and hammering to reduce shrinkage and susceptibility to crack formation. (K1a; CI)

260-K. Engineers Come to Grips With Weld Distortion. Iron Age, v. 187, Feb. 23, 1961, p. 104-106.

Methods involved in production welding of diaphragms for steam turbines and repair welding of a steam turbine spindle without distortion. (K-general, W11k)

261-K. Automatic Pipe Welding Device. Pipe Line News, v. 33, Feb. 1961, p. 20.

Grinding with an air driven abrasive cutting wheel and welding with a rotating arc welder in a continuous process to produce joints as strong as those produced manually in much less time. (K1, G18, T26r)

262-K. Fusion Welding of Titanium and Its Alloys. W. G. Hull. Welding and Metal Fabrication, v. 29, Feb. 1961, p. 72-75.

Joint design, jigging, precleaning and preparation of thin sheet for tungsten-arc welding in argon atmosphere. (K1d; Ti-b)

263-K. The Basics of Soldering. American Machinist/Metalworking Manufacturing, v. 105, Feb. 6, 1961, p. 99-106.

Soldering and tinning operations. Use and maintenance of soldering irons and cups. Relative solderability of various metals. (K7)

264-K. Precision Welding in Nuclear Reactor Construction. C. R. Allison, Jr., and J. LaForce. Machinery (London), v. 98, Jan. 4, 1961, p. 23-26.

Submerged arc and heliarc welding processes are used to join 304 and 317 stainless steel reactor core members or Zircaloy-2 components, respectively, in forming fuel rod assemblies. (K1, T11g; SS, Zr-b)

265-K. (French.) Titanium and Its Alloys. Pt. 2. Welding of Titanium and Its Alloys. R. Lachenaud. Soudage et Techniques Connexes, v. 14, Nov-Dec. 1960, p. 420-429.

Welding of Ti and its alloy TA5E under inert atmosphere with a trailer or in a chamber and of Ti and the alloy TA6V by spot welding. Mechanical and fatigue tests on welded assemblies. (K1d, K3n, Q-general; Ti-b, 7-51)

266-K. (French.) Welding of Galvanized Steel. M. Evrard. Soudage et Techniques Connexes, v. 14, Nov-Dec. 1960, p. 437-446.

Braze welding, arc welding with coated electrodes and spot welding of galvanized steel components (plates or sections), with attention to prevention of damage to the protective zinc layer. Mechanical test and corrosion data with micrographic study of weldment structures. 11 ref. (K-general, K9, R-general; ST, 8-65)

267-K. Square-Butt Welding. Canadian Welder, v. 52, Feb. 1961, p. 20.

A sigma welding process used for fabrication of heavy (1 1/2 in.) Al plate at currents above 400 amp. The process eliminates arc instability, severe oxide folds and weld porosity and the need for V-joint preparation, preheating, back-chipping and stringer-bead passes. (K1d; Al-b, 4-53)

268-K. How to Make Efficient Induction Coils. Ed Nugent. Canadian Metalworking, v. 24, Feb. 1961, p. 27-31.

Description of heating, cutting, bending and soldering operations needed for manufacture of helical, pancake or internal induction coils from Cu tubing. (K7, G6, T1m; Cu, 4-60, 17-57)

269-K. Reciprocating Burners Braze Heater Elements. Automation, v. 8, Mar. 1961, p. 81.

Mechanized brazing of Cu tubing with an Ag alloy filler to produce heating and cooling elements. (K8, T1p; Cu, 4-60)

270-K. Fastening Aluminum, Riveting Aluminum. F. L. Church. Modern Metals, v. 17, Feb. 1961, p. 28-30, 32, 34, 36, 38.

Comparisons of rivets as to head size, form, cost and composition. Recommendations for edge distance, rivet spacing and size of rivet hole. (K13n; Al)

271-K. Stitching Aluminum. K. B. Rhodie. Modern Metals, v. 17, Feb. 1961, p. 40, 42, 44, 46.

Determination of maximum thickness of materials which can be stitched as related to hardness, machine size and wire hardness and gage. Factors in selection of stitch types, stitching systems and wire. (K13; Al)

272-K. Diffusion-Bonding of Copper and Its Alloys. Assembly & Fastener Engineering, v. 4, Feb. 1961, p. 34.

Diffusion bonding is achieved by heating coated parts at 1700-1800° F. in a hydrogen or inert atmosphere so that the carrier volatilizes. Resulting bonds are homogeneous, as strong as the base metal and equal in electrical properties to Cu base metal. (K5k; Cu-b)

273-K. Butt Welding of Gold Rings. American Jewelry Manufacturer, v. 6, Feb. 1961, p. 12-13.

Water cooled semi-automatic butt welding by the resistance process to connect shank ends of high-quality gold rings. Method prevents color shading. (K3; Au)

274-K. Electron Beam Welds Pay Off for Bellowsmaker. Steel, v. 148, Mar. 6, 1961, p. 78-79.

Electron beam welding of delicate pressure sensing devices made of stainless steel to achieve porosity free welds and assure a vacuum tight seal. (K6; SS)

275-K. Hot-Cracking in Mild and Alloy Steels. Commonwealth Engineer, v. 48, Nov. 4, 1960, p. 52.

Review on the problem of hot cracking in weld metals as a function of solidification and transformation phenomena, stress forming elements and composition. (K9, N-general, 2-60, 3-66; AY, CN, 7-51, 9-72, 10-54)

276-K. (Japanese.) Ultrasonic Welding. Fukusaburoh Tokoroyama. Ohm, v. 47, Nov. 1960, p. 48-51.

Seam welding of homometallic or heterometallic sheets of Al, Cu, Ge, Au, Kovar, Mo, Ni, Pt, Si, Zr or steel using ultrasonic welding machine. (K3p, 1-74; Al, Au, Cu, Ge, Mo, Ni, Pt, Si, Zr)

277-K. (Japanese.) Ultrasonic Soldering. Kenjiroh Azumi. Ohm, v. 47, Nov. 1960, p. 58-60.

Al is soldered by ultrasonic heating with solder containing Zn, Sn and Cd. Electrolytic corrosion resistance of joint is tested by salt water immersion. (K7, 1-74, R4b; Al)

278-K. The Metal-Arc Welding of Stainless Steels. M. C. T. Bystram. Edgar Allen News, v. 40, Jan. 1961, p. 6-8.

Solution composition, time and temperature conditions for chemical surface treatment of stainless steels to be used in chemical processing equipment. Heat treatment, surface conditions and design as they affect the finished weld. (K1g, 2-64, L12, T29; SS, 17-57)

279-K. Rotating Unit Welds Pipeline. Iron Age, v. 187, Mar. 9, 1961, p. 95.

Outline of a new arc welding process for steel pipelines, in which an air-driven abrasive wheel slices a small sliver from each pipe end and an arc welder follows the cutter's track and performs the weld. (K1, T26r; ST)

280-K. Brazing Missile and Electronic Components in Dry Hydrogen. Pt. 1. H. E. Lewis. Metal Progress, v. 79, Mar. 1961, p. 93-97.

Because dry hydrogen is highly reducing to most oxides at high temperature, it makes an excellent brazing atmosphere. But successful brazing in dry hydrogen requires careful consideration of many factors. (K8; SS, SGA-h)

281-K. Brazing Shortcuts for the B-58. D. R. Torgeson and J. J. Kenna. Metal Progress, v. 79, Mar. 1961, p. 121-125.

Several devices and methods have been developed to lower brazing costs and shorten brazing time of honeycomb panels. (K8; SS, Al)

282-K. Brazing Ceramics to Metals. Leon Lerman. Metal Progress, v. 79, Mar. 1961, p. 126-129.

Two methods, the Mo-Mn and the active alloy, have been devised for joining ceramics to metals. (K11b, K8)

283-K. Welding Bases for Steel Mill Tension Drives. S. A. Wilson. Machine Production, v. 20, Feb. 1961, p. 43-44.

Sections fabricated from hot rolled openhearth steel plate are arc welded to support a drag generator payoff drive. High deposition rates are achieved with Fe powder electrodes. (K1, ST, 4-53)

284-K. Friction Welding Study Completed by U. S. Research Laboratory. Machine Production, v. 20, Feb. 1961, p. 45, 62-63.

Investigation of basic parameters under which mechanical energy of two metals, plastics or ceramics is converted into thermal energy, resulting in a weld at the place of contact. (K6)

285-K. Weld Studs Picked for Double-Duty. Metalworking, v. 17, Mar. 1961, p. 17.

Drilling, end welding of studs with hand gun and puddle welding of final joint to produce steel steam pressure vessel. (K1f, T26q; ST)

286-K. Weldability of Mild Carbon Steel. H. F. F. Koch. Indian and Eastern Engineer, v. 102, Dec. 1960, p. 685-691.

Effects of microstructure, hardening, residual stress and martensite content on welding susceptibility, welding safety and brittle fracture resistance. (K9s, 3-66, 3-71; CN)

287-K. The Mechanics of Adhesive Bonding. N. K. Benson. Applied Mechanics Review, v. 14, Feb. 1961, p. 83-86.

Review of adhesive joint stress analysis literature. Composition and mechanical properties of various types of adhesives used for structural bonding. Methods of testing and analyzing results to determine stress distribution and resistance to peeling. Aircraft and rocket applications. 44 ref. (K12)

288-K. Welding of Conducting Electrodes to Thin Metallic Films. St. Dembicka-Jellonkowa. Journal of Scientific Instruments, v. 38, Feb. 1961, p. 62.

An accurate potentiometric measurement of the electrical resistance of thin Ag and Cr films is made feasible by welding the electrode to the film with a suitable current pulse to insure contact between them. 3 ref. (K1; Ag, Cr, 14-62)

289-K. (German.) Brazing With Silver Solder. G. Schneider. Mitteilungen der BEFA, Nov. 1960, p. 2-5.

Test soldering of brass rods with Ag solder at 610° C. to determine optimum conditions for use in electric motor manufacturing. Design of a soldering device for joining steel screws to brass sheet. (K7, W11q; Cu-n, ST, SGA-f)

290-K. (German.) Soldering of Copper Current Junctions to Rails. F. Fries. Mitteilungen der BEFA, Nov. 1960, p. 1-2.

Soldering of Cu junctions to steel rails with Ag solder having a 600-620° C. melting temperature and a composition of 44-46% Ag, 18-22% Cd, 19% Cu, rest Zn. (K7; Cu, ST)

291-K. (Russian.) Kinetics of Interaction of Molten Metal With Gases and Slag During Arc Welding. A. A. Erokhin. Svarochnoe Proizvodstvo, Nov. 1960, p. 4-8.

Composition changes in welded metals as affected by the rate and duration of the metal gas-slag reaction. Oxidation of small amounts of Si and Mn contained in melt is studied during welding in CO_2 or air, using SV-08 or SV10GS electrode wire. 26 ref. (K1, N16m)

292-K. (Russian.) Welding by Twin Independent Arcs. Yu. L. Krasulin. Svarochnoe Proizvodstvo, Nov. 1960, p. 29-30.

New welding method permits regulation of the arc heat, thus preventing formation of microcracks and porosity in metal. Twin arc welding is recommended in hard facing and welding of alloy steel and copper coated titanium. (K1; AY, Ti, 8)

293-K. (Russian.) Welding of 27KHGSNL Cast Steel With Low Alloyed Structural Steels. F. E. Tret'yakov and E. Yu. Freidlina. Svarochnoe Proizvodstvo, Nov. 1960, p. 30-32.

Method of automatic or manual submerged arc welding under CO_2 shield. Selection of electrodes which provide minimum welding defects, good mechanical properties and easy slag separation from the seam. Product welds exhibit high tensile strength at room and elevated temperatures. (K13; AY, SGB-s, ST)

294-K. (Russian.) A Simple Method of Ultrasonic Cold Welding. L. O. Makarov. Akusticheskii Zhurnal, v. 6, Apr. 1960, p. 507.

Cold welding of 0.07 mm. Al foil using V-block to angle foil in reference to vibrator. Welding dependent on block angle, force and time of vibration. (K6r; Al, 4-56)

295-K. The Arc Welding of Galvanized Steels. M. Puech. Acier-Stahl-Steel, v. 25, Dec. 1960, p. 503-508.

33-50 basic Bessemer mild steel is Zn galvanized by hot dipping and then arc welded to form butt, lap and internal corner welds. Tests are made to study the soundness of the joints as a function of the type of electrode coating and to determine the mechanical properties of the joint and the corrosion resistance after different reconditioning treatments. (K1; CN, 8-65)

296-K. Electron Beam Weld Shows Light Touch. Steel, v. 148, Mar. 13, 1961, p. 135.

Electron beam welding of vacuum feed through nipples to form vacuum tight joints which stand bake-out temperatures over 500° F. (K6)

297-K. Welded Surface Plates. A. K. Kleinsorge. Mechanical Engineering, v. 83, Mar. 1961, p. 52-54.

Fabrication of deflection resistant surface plates by welding T-1 construction steel to form a box whose cross section is symmetrical about the neutral axis. (K-general; ST, SGB-s)

298-K. (French.) Welding of Very Thin and Thick Metal Foil. Machine Moderne, v. 55, Jan. 1961, p. 39-40.

Method developed for welding very thin metal foil on thicker foil by applying strong unilateral pressure through an electrode on the point to be welded, sending strong pulsating current through the electrode and maintaining the pressure until the weldment is sufficiently cooled. Application to welding of stainless steels. (K6, 3-73; SS, 4-56)

299-K. Weldable As-Cast Nickel Aluminum Bronze Composition and Microstructure. M. L. Foster and S. Goldspiel. Modern Castings, v. 39, Feb. 1961, p. 72-92.

Determination of composition and structure of NiAl bronze to produce consistently weldable as-cast material with improved mechanical properties and cavitation resistance suitable for propellar castings. The relationship between Al content, mechanical characteristics, microstructure and weldability is analyzed and data presented for optimum application. Optimum as-cast structure is obtained with 9.5% Al, 5% Ni, 4% Fe and 0.5% Mn. 13 ref. (K9s, Q-general, M27, 2-60; Cu-s, Al, Ni, 5)

300-K. New Methods Set Pace of Progress for Sandwich Production. Space/Aeronautics, v. 35, Mar. 1961, p. 50-55.

Brazing of A286 alloy and PH 15-7 Mo alloy sandwiches by blanket, furnace and banks of radiant quartz lamps. Core fabrication and grinding processes. (K8, G18; SS, SGA-h)

301-K. (French.) Argon Shielded Arc Welding. A. Moreau. Revue de la Soudure--Lastijdschrift, v. 16, Apr. 1960, p. 265-275.

Arc voltage as a function of amperage. Melting velocities for individual voltages and amperages. Welding equipment. 3 ref. (K1d)

302-K. (French.) Electron Bombardment Welding. J. van Audenhove, M. Meulemans, D. Tytgat and E. Jonckheere. Revue de la Soudure--Lastijdschrift, v. 16, Apr. 1960, p. 276-289.

Welding of reactor fuel element sheaths. Testing by pressurizing with He. Welding temperature as a function of electron emission intensity. Effect of voltage on penetration depth. 10 ref. (K6, T11g)

303-K. Cheaper Way to Weld Tubes. Helmut Thielsch. Product Engineering, Design Work Sheets, 14th Series, 1961, p. 74-75.

Consumable insert rings containing deoxidizer eliminate porosity in tungsten inert gas welds in carbon steel tubes. Costs. (K1d; CN, 4-60)

304-K. Why Not Weld it Chemically? A Review of Structural Adhesives. A. F. Martin. Product Engineering, Design Work Sheets, 14th Series, 1961, p. 76-78.

Factors affecting joint strength. Types of adhesives. Fabricating techniques for Al and Mg alloys and stainless steels. (K12; Al-b, Mg-b, SS)

305-K. High Frequency--What it Means to Welding Design. Richard J. Allen. Product Engineering, Design Work Sheets, 14th Series, 1961, p. 79-80.

High-frequency resistance welding for production of continuous weld seams in carbon and alloy steel and Cu, Ni and Zr alloys. (K3; AY, CN, Cu-b, Ni-b, Zr-b)

306-K. High Resistance Slag Speeds Welds. Product Engineering, Design Work Sheets, 14th Series, 1961, p. 82-83.

Electroslag welding requires less filler material and only one path to join steel forgings and plate up to 10 in. thick. (K6; ST, 4-51, 4-53)

307-K. What the Tests Show About Soldered Aluminum Joints. W. McQuillan. Product Engineering, Design Work Sheets, 14th Series, 1961, p. 84-85.

Relative strength and life of joints soldered with various alloys. Mechanical method of removing oxide coating. Fluxes for soldering. (K7; Al)

308-K. Fabrication of Nuclear Piping Demands Revised Welding Procedures. R. H. Hoefler. Welding Engineer, v. 46, Mar. 1961, p. 25-26.

Arc welding of stainless steel piping for nuclear applications. (K1, T11q; SS, 4-60, 17-57)

309-K. Fiber Metallurgy Promises Greater Efficiency in Resistance Welding. Harry Schwartzbart. Welding Engineer, v. 46, Mar. 1961, p. 27-29.

Techniques and advantages of fiber metal resistance welding and shim brazing. Fiber metal mats placed between surfaces to be welded increase contact resistance so that there is a steeper thermal gradient away from the joint interface. (K3)

310-K. Proper Welding Saves Thousands of Dollars for Ford Motor. F. T. Tancula. Welding Engineer, v. 46, Mar. 1961, p. 34-36.

Arc welding techniques for repair of entry rolls, shear blade holders, slag car frames, back-up chucks, collar rolls and drive pinions. (K1, W25)

311-K. Production Line Practices Speed Heavy Equipment Fabrication. Welding Engineer, v. 46, Mar. 1961, p. 38, 40.

CO_2 shielded, self-fluxing welding process is used in conjunction with welding positioners to produce gas drums. (K1d)

312-K. (Italian.) Welding of Stainless Steel. Acciaio Inossidabile, v. 27, Nov-Dec. 1960, p. 542-549.

Various steels containing 0.03-0.40% C, 17-25% Cr, 4.5-36% Ni, 0-4.5% Mo, 0-8.5% Mn, 0-0.35% Ti, 0-0.63% Cb and 0-2% Cu are Argon arc, Sigma or submerged-arc welded or welded with a coated electrode. Corrosion resistance of the seam in boiling 10% H_2SO_4. Bend testing of weldments. (K1, R6g, Q5; SS)

313-K. Repair Welding of Cast Iron. G. M. Blanc, E. Hindson and H. E. Z. Gordon. Welding and Metal Fabrication, v. 29, Mar. 1961, p. 104-110.

Repair of cast iron structures by oxy-acetylene welding, bronze welding, silver brazing, soft soldering and arc welding. Effect of Si, Ni, Mn, C and P content upon weldability and mechanical properties of cast iron. 5 ref. (K-general; CI)

314-K. Fusion Welding of Titanium and Its Alloys. Pt. 3. W. G. Hull. Welding and Metal Fabrication, v. 29, Mar. 1961, p. 111-113.

Tungsten arc and self-adjusting arc welding of commercially pure Ti, 6Al4VTi alloy and 5Al2.5SnTi alloy. Welds are stress relieved at 425-650° C. to minimize risk of delayed cracking. (K1, J1a; Ti-b)

315-K. Shrink Till it Screams. Harry J. Kent. American Machinist/Metalworking Manufacturing, v. 105, Feb. 20, 1961, p. 98-99.

A hollow 4340 steel shaft is shrink fitted into a disk of the same material by heating the disk to 900° F. and cooling the shaft to -60° F. Components are assembled and returned to room temperature to form an extremely heavy shrink fit. (K13r; ST)

316-K. A New Way to Make Stainless Honeycomb. G. Jewitt Crites. American Machinist/Metalworking Manufacturing, v. 105, Feb. 20, 1961, p. 100-101.

Resistance welding of stainless steel foil strips to form stainless honeycomb core using electrodes inserted between the steel strips to insure the progressive joining of cells at the nodes. Applications in aircraft and missile industry. (K3; SS, 4-53)

317-K. Properties of Mild Steel Weld Metal Not Revealed by the All-Weld Metal Tensile Test. K. Winterton. Welding Journal, v. 40, Mar. 1961, p. 106s-109s.

Comparative tensile testing of mild steel weldments produced from four electrode classifications to determine ductility and hydrogen content as affected by aging and electrode type. Results show that the mechanical properties are favorably affected by subsequent heat treatment so that values obtained are misleading. (K9r; CN)

318-K. Evaluating Crack-Resistant Electrodes for Welding HY80. S. I. Roberts. Welding Journal, v. 40, Mar. 1961, p. 110s-112s.

Controlled testing, utilizing comparative electrode bend tests, of coated E-9018 electrodes (iron-powder, 80,000 psi.) to determine their sensitivity to cracking when used in the welding of HY80 steel. (K9r, 9-72, W29h; AY)

319-K. Notched Longitudinal Bend Specimens for Evaluating Armor Weldments. S. M. Silverstein, R. P. Sopher and P. J. Rieppel. Welding Journal, v. 40, Mar. 1961, p. 113s-117s.

Specimens are used to evaluate the toughness performance of high-strength armor steel weldments prepared with austenitic and ferritic Grades 180 and 230 coated electrodes. Results show that notched bend testing may be used as a partial substitute for the more expensive H-plate test. (K9r, Q5h; ST)

320-K. Brazing of Beryllium for High Temperature Service. S. R. Maloof and J. B. Cohen. Welding Journal, v. 40, Mar. 1961, p. 118s-122s.

Procedure for Ag brazing of Be to produce strong joints for use up to 1450° F. Data are given for design and preparation of braze materials and results of wettability tests. Effect of brazing time and joint structure on the strength of butt-brazed joints. (K8; Be)

321-K. Today's Industrial Role of Magnetic-Flux Gas-Shielded Arc Welding. R. T. Telford. Welding Journal, v. 40, Mar. 1961, p. 237-243.

Characteristics and application of the magnetic-flux-gas-shielded arc welding process for mild steel fabrication. Use of continuous wire feeder achieves increased welding speeds, penetration and lower costs. 4 ref. (K6, K1d; CN)

322-K. Tungsten Arc-Welding Saves Trucking Firm $3000. Welding Journal, v. 40, Mar. 1961, p. 249.

Salvage of damaged Al truck parts through tungsten arc welding results in reduction of repair costs. (K1g, T21e; Al)

323-K. An Aluminum Back-Up Bar for Automatic Metal-Arc Gas-Shielded Welding. C. M. Jenkins. Welding Journal, v. 40, Mar. 1961, p. 250-251.

A change over from stainless steel to Al back-up bars with steel inserts for automatic metal-arc gas-shielded welding of missile parts results in increase in weld quality and decrease in parts cost. (K1d, W29)

324-K. Automatic Welding for the Right of Way. Melvin A. Judah. Pipe Line Industry, v. 14, Mar. 1961, p. 26-29.

Automatic welding of square cut pipe by a new circumferential process which does not require pipe rotation. Process utilizes a CO_2 shield in place of flux and a reverse polarity arc welder. (K1d, T26r)

325-K. Electron Beam Welds Molybdenum Sheets. Steel, v. 148, Mar. 27, 1961, p. 166-167.

Short time tensile tests at 80-3000° F. of Mo base sheet materials welded by electron beam methods show that these materials can be successfully welded by this method. Welds are also checked by dye penetrant and radiographic methods. (K6; Mo, 4-53)

326-K. Square-Butt Welding: Time and Money Saver. Western Metalworking, v. 19, Mar. 1961, p. 43-44.

Sigma welding of heavy wall Al cylinders for use in the nuclear industry to eliminate V-joint preparation, preheating, back-chipping and stringer-bead passes. (K1d, T11; Al, 4-60)

327-K. Determination of the Causes of Weld Metal Cracking in High-Strength Steels and the Development of Heat Treatable Low Alloy Steel Filler Wires for Use With the Inert Gas Shielded Arc Welding Process. H. W. Mishler. Battelle Memorial Institute (Wright Air Development Division). U. S. Office of Technical Services, PB 161981, May 1960, 60 p. $1.50.

The first test described is similar to the standard Lehigh test, except that the degree of restraint on the weld metal increases from low to high as the test weld is deposited. Thus, only one specimen is needed to test a particular filler wire. The second test employs apparatus that applies an adjustable restraining force to the test weld. The force is applied to test specimens prior to deposition of the test weld through an air cylinder. A separate specimen is needed for each pressure used. (K9r, K1d; ST, SGB-a)

328-K. Simplest Joint Preparation With Square-Butt Welding. Canadian Machinery and Metalworking, v. 72, Mar. 1961, p. 112, 114.

Sigma welding of heavy-wall 6061 Al cylinders for nuclear applications. Joint preparation. Welding speeds, current densities, voltages and wire feed speeds for various plate thicknesses. (K1d, T11; Al-b, 4-60)

329-K. New Welding Processes. John J. Chyle. Machine Production, v. 20, Mar. 1961, p. 28-35.

Joining of low and medium carbon steels, stainless and free machining steels, cast iron, brass, Al, Ti, Cu, Monel and beryllium copper by friction, diffusion bond, fusion electroslag, electron beam and arc plasma welding processes. Stainless steel, Ti alloy and high-temperature alloys are brazed to form honeycomb sandwich panels. Applications. 13 ref. (K-general)

330-K. (French.) Welding of Chromium Steel. Pt. 1. H. Gerbeaux. Metallurgie et la Construction Mecanique, v. 93, Jan. 1961, p. 19-27.

Phase transformations elastic limit at low and room temperatures, heat and corrosion resistances and weldability of Cr steels such as 25CD4S, 15CDV6, 35CD4 and others with 1-6% Cr and 0.5-1% Mo and austenitic stainless steels. (K9s, N-general, R-general, Q21; SS)

331-K. Welding of Medium-Carbon Low-Alloy Steels. F. Watkinson. British Welding Journal, v. 8, Mar. 1961, p. 93-103.

Influence of diffused hydrogen in the weld metal on the critical cracking of medium carbon low-alloy steel arc welded joints. Martensite formation is influenced by the Ni, Cr, Mn, Mo and Cr content of the various steels and as it affects critical cooling rate. 6 ref. (K1, N8p; CN)

332-K. (German.) Aluminothermic Welding in Production of Continuous Railway Tracks. J. Wodara and W. Novak. Deutsche Eisenbahn-Technik, v. 9, Jan. 1961, p. 23-26.

Aluminothermic test welding of railway tracks with molds of various ingates for evaluation of optimum ingate design and preheating temperature. Microstructure and hardness investigation of welds. (K6, K9r, T23q)

333-K. Brazing for High-Temperature Service. H. E. Pattee and R. M. Evans. Defense Metals Information Center, Battelle Memorial Institute, DMIC Memo. 149, Feb. 21, 1961, 32 p. (Available as PB 151108 from U. S. Office of Technical Services, Washington 25, D. C.)

Brazing processes and atmosphere control, filler metals and heating methods involved in joining stainless steels, super alloys, refractory metals and nonmetallics for 300-2000° F. service in sandwich structures, rockets, aircraft, missiles, gas turbines and nuclear reactors. 118 ref. (K8, T-general; SGA-h, SS, EG-d37, SGA-f, 7-59, 17-57)

334-K. Designing for Chemical Welding. Pt. 2. Joint Design. H. J. Jankowski. Design Engineering, v. 7, Mar. 1961, p. 41-43.

High-strength phenolic elastomers and epoxy resin adhesives are used for the structural joining of Al, brass, Mg, steel, Ti, Cu and stainless steel. Service temperature range for the adhesives is -65 to 500° F.; 180° F. is a common limit. (K12; Al, Cu-b, Mg, Ti, ST, NM-d34, 17-57)

335-K. Joining Copper Parts. Electromechanical Design, v. 5, Mar. 1961, p. 41.

Two or more Cu components are joined with a homogeneous bond by a special coating on the metal surface which diffuses into the parts to be joined and produces a bond without an interface. Joints retain the high electrical and thermal conductivity of Cu with superiority to soft soldered joints in respect to tensile, shear and fatigue properties. (K5k; Cu)

336-K. Tig Welding Joins Copper to Stainless. J. M. Gerken and D. B. Kittle. Metalworking Production, v. 105, Mar. 1, 1961, p. 53.

Inert gas shielded tungsten arc welding of Cu to stainless steel by concentrating most of the heat into the Cu and fusing the Cu to the steel, rather than both metals melting and fusing together. (K1d; Cu, SS)

337-K. Welding Aluminum. Pt. 2. Mechanical Properties of Welds. Modern Metals, v. 17, Mar. 1961, p. 32-34.

Mig welding of heat treatable and nonheat-treatable Al alloys with Al alloy fillers. Data for shear strength, tensile strength, yield strength and elongation for resulting weldments. (K1d, K9r, Q-general; Al-b, 7-51)

338-K. Extrusions Plus Adhesives Equals Versatile Light Poles. J. P. Brush and J. A. Scott. Modern Metals, v. 17, Mar. 1961, p. 46-48.

Bonding of solid Al extrusions with an epoxy resin to produce 17.5 ft. circular, tapered poles. Physical testing of strength with bending and torsional loads. (K12; Al, 4-58)

339-K. Projection Welding. Douglas D. Williams. Welding Fabrication and Design, v. 4, Feb. 1961, p. 9-13.

Projection welding methods used on carbon, stainless, alloyed and galvanized or tinned steels and under certain conditions on Al and its alloys. Use in joining dissimilar metals, such as steel and brass, steel and Al or two steels with different properties. (K3q; ST, Al-b, Cu-n, 8-65)

340-K. Portable Shielded Arc Welding. Production, v. 47, Apr. 1961, p. 83.

A semi-automatic shielded arc welding process using a mild steel electrode filled with metallic oxides and salts which vaporize when heated and form a shielding, deoxidizing and fluxing atmosphere around the weld. (K1d)

341-K. Production Procedures at the Beacon Works of John Thompson Motor Pressing, Ltd. Sheet Metal Industries, v. 38, Mar. 1961, p. 162-170, 222.

Arc, spot and projection welding assembly of automobile underbodies. (K1, K3, T21a)

342-K. Welding Meets Challenge of Space Age Metals. R. R. Irving. Iron Age, v. 187, Apr. 6, 1961, p. 99-106.

Electron-beam, inert-gas shielded and vacuum chamber techniques for welding W, Ta, Mo, Cb, Zr, Ti and Be with attention to effects of purity of base metal and welding environment on weld strength and ductility. (K-general; SGA-h, EG-d37, W, Ta, Mo, Cb, Zr, Ti, Be)

343-K. Are You in Step With Welding Progress? Steel, v. 148, Apr. 10, 1961, p. 90-94.

Survey of semi-automatic welding processes such as electron beam, arc and CO_2 welding and evaluation in terms of lower costs for joining steels and alloys. Use of low temperature, small wire methods to join light metals such as 5083 and 5086 Al alloys. (K-general; ST, Al-b)

344-K. Automatic Welder Insures Annealing Line Continuity. Steel, v. 148, Apr. 10, 1961, p. 96.

Automatic resistance seam welding of the ends of coiled strip tin plate producing lap welds having tensile strength greater than that of the parent metal. (K3p; ST, 4-53, 8-62)

345-K. Roll Welding Opens Way to Honeycomb Forming. Steel, v. 148, Apr. 10, 1961, p. 98.

Fabrication of corrugated honeycomb sandwich structures by hot rolling 2014 Al alloy, Ti, Mo, steel and Inconel to form pressure welds. (K5, F23; Al-b, Ni-b, Mo, Ti, ST, 7-59)

346-K. Electron Beam Welding Breaks the Size Barrier. Steel, v. 148, Apr. 10, 1961, p. 100-102.

Electron beam welding of Mo, Ta and W in a 40 ft. vacuum chamber to form weldments of high-tensile strength in 20 ft. long sections for advanced aircraft and missiles. (K6, T24e; Mo, Ta, W)

347-K. CO_2 Welding Speeds Can Exceed 300 Ipm. Steel, v. 148, Apr. 1961, p. 99.

High speed CO_2 welding of 1010 steel and 1015 steel producing clean and spatterfree weldments in automobile frames. (K1d, T21a; ST)

348-K. Are You Buying Too Much Weld Metal? Welding Design & Fabrication, v. 34, Mar. 1961, p. 33-34.

Methods of reducing weld size during arc welding of mild steel. (K1; CN)

349-K. Graphite Cloth Speeds Honeycomb Brazing. Welding Design & Fabrication, v. 34, Mar. 1961, p. 40, 48.

Blanket or furnace brazing of stainless steel honeycomb panels using a graphite heating element cloth in a protective argon atmosphere to reduce brazing time. (K8; SS, 4-57)

350-K. New Process for Welding Mild Steel Combines Features of CO_2 and Shielded Arc Welding. Western Machinery and Steel World, v. 52, Mar. 1961, p. 44.

Development of a gas shielded metal-arc welding process using a specially treated low-alloy steel welding wire to produce a spatter-free arc. Process can be applied to tubing, landing mats,

die posts, car frames, compressor castings, pressure vessels and machine mountings. (K1d; CN)

351-K. Square-Butt Welding of Heavy Aluminum Plate. Western Machinery and Steel World, v. 52, Mar. 1961, p. 51.

Al cylinders of 1 1/4 in. thickness are square-butt welded by a process incorporating gas shielding and wire quality and slope-controlled power supply improvements to overcome arc instability. Current of up to 600 amp. increases heat input at the weld zone and eliminates porosity. (K1d; Al, 4-53)

352-K. Uses of Precious Metal Alloys in Brazing. Engineering, v. 191, Feb. 10, 1961, p. 210-211.

High temperature brazing of Nimonic alloys, W, Mo, Zr, Be and ceramic materials using Ag, Au and Pd brazing alloys. (K8; Be, Mo, Ni-b, W, Zr)

353-K. Resistance Welding Sets New Trend in Module Production. R. A. Wray and H. G. Stech. Space Aeronautics, v. 35, Apr. 1961, p. 93, 96, 98-99.

Resistance welding of Ni and Cu strip and wire to produce joints which retain high strength at high temperatures and when exposed to shock and vibration. Applications in fabrication of electronic modules used in pocket instrumentation with resultant higher packaging density and quicker assembly. (K3, T1; Ni, Cu, 4-53, 4-61, 17-57)

354-K. (Spanish.) Theory and Practice of Spot Welding. Douglas D. Williams. Ingenieria Industria, v. 27, Oct. 1960, p. 131-134, 136, 138.

Electrode composition and type, welding resistance, dimensions of the plate and intensity and rate of welding as they affect spot diameter. (K3n)

355-K. Tests Demonstrate Payoff of New Brazing Alloy. R. C. Kapituk. Iron Age, v. 187, Apr. 13, 1961, p. 90-91.

Data are given for strength, ductility, tendency toward undercutting, grain growth and age hardening of a newly developed Mn-base alloy used to braze 347 stainless steel thin-wall tubing. (K8, Q27, Q23p; SS, 4-60, SGA-f, Mn-b)

356-K. Tooling Up a Stainless Balloon. H. M. Edwards and W. P. McGregor. American Machinist/Metalworking Manufacturing, v. 105, Jan. 9, 1961, p. 63-65.

Fabrication of thin stainless steel sheet to form 10 ft. diameter tanks for the Atlas missile. Methods of forming, abrasive trimming, cutting-off and precision spot, seam and Tig welding of the skin to internal and external backup rings. (K-general, G-general, T21e; SS, 4-53, 17-57)

357-K. (German.) Welding Problems in the Construction of Nuclear Reactors. A. Schiller. Schweissen und Schneiden, v. 13, Feb. 1961, p. 39-43.

Elimination of welding defects such as tungsten inclusions and oxide films in welding of alloyed steel tubes (18-8 CrNi steel). Deposit welding of heat and corrosion resistant surface areas using age-hardenable electrode materials (Inconel alloys). Welding of thick clad plates and clad or austenitic fittings. (K-general, T11)

358-K. (German.) Welding Problems in the Construction of Nuclear Reactors. H. Oehme. Schweissen und Schneiden, v. 13, Feb. 1961, p. 43-48.

Special welding techniques such as motor-arc-welding of 0.5 mm. thick Al coatings for cylindrical uranium fuel elements, welding of fuel element plates by an automatic spot-welding machine under protective atmosphere, welding of pressure vessels under high-purity Ar or He and welding of Zircaloy, Hastelloy, Inconel and alloyed steel. (K-general, T11)

359-K. (German.) Welding Techniques Employed in Constructing the Condensate Subcooler for the RWE Nuclear Power Station at Kahl. H. Henseler. Schweissen und Schneiden, v. 13, Feb. 1961, p. 49-56.

Techniques in welding of various parts of alloy steel (15Mo3, 20Mo3, 19Mn5, 24CrMoV55, 24CrMo5 and X10CrNiNb 18/9 steel) with particular reference to plating by deposit welding, welding of austenitic tubes and welding of a 180° bend. Comparison of microstructure of matrix and weld. (K-general, T11; ST)

360-K. (German.) Manual Arc Test Welding of Thick Unalloyed Steel Plates. Th. Schlieper and M. Deeskow. Schweissen und Schneiden, v. 13, Feb. 1961, p. 56-60.

Welding of preheated 100 mm. thick MRSt 37 steel plates under varying

mounting and welding conditions using high-tensile strength electrodes. Subsequent ultrasonic testing of welds, hardness measurements and macrostructure examination. (K1; ST, 4-53)

361-K. (German.) Welding Conditions During Resistance Spot Welding of Stainless 18/8 Chromium Nickel Steels. R. Oppenheim and W. D. Brand. Schweissen und Schneiden, v. 13, Feb. 1961, p. 61-70.

Test welding using low current and high-electrode pressure of 1 and 1.5 mm. thick X5CrNi 18 9 steel sheets to sheets of same material and to 3 mm. thick St 37.12 steel sheets. Spot welding of stabilized X10CrNiNb 18 9 steel and X10CrNiTi 18 9 steel. Macrostructure investigation of inclusions and holes. Shear testing of welded joints. (K3n; SS, 4-53)

362-K. Chrysler Automatic Plant for Resistance Welding Motor-Car Floor Pan Assemblies. Machinery (London), v. 98, Mar. 22, 1961, p. 649-653.

Two 685 ft. long resistance welding and assembly lines incorporating welding presses controlled by an electronic scanner produce floor pan assemblies for cars with different wheel bases at the rate of 2000 per 8 hr. shift. (K3, T21b, W29)

363-K. Martin Successfully Joins Columbium Alloys. C. Burrows, L. J. Gagola and M. M. Schwartz. Fansteel Metallurgy, Feb. 1961, p. 1-3.

Fansteel 82, an alloy of Cb, Ta and Zr, is resistance and fusion welded with or without filler metal and brazed using Ti braze alloy at 3300° F. in vacuum. (K-general, K8, K9s; Cb-b, Ta, Zr)

364-K. (German.) Resistance Butt Welding of Steel Wire of High Carbon Contents. Herman Josef Bockenhoff. Stahl und Eisen, v. 81, Mar. 16, 1961, p. 337-349.

Pressure butt test welding of open-hearth steel wire (0.06-0.87% C) of given mechanical properties by a conventional welding machine for evaluation of best welding conditions. Influence of heat treating and deformation on properties of weld. Comparison with flash welding. (K3; ST, 4-61)

365-K. Radiographs Show Quality of Panel Brazing. B. H. Faulkenberry, R. H. Johnson and C. E. Cole. Nucleonics, v. 19, Apr. 1961, p. 126-130.

Inspecting stainless steel honeycomb sandwich is made possible by including radioactive tracer elements in the brazing foil. Sensitized film indicates presence of brazing fillets. (K9r, 1-59; SS, 7-52)

366-K. Oxy-Propane Brazing With Flux Injection. Sid Smith. Canadian Welder, v. 52, Mar. 1961, p. 10-12.

Joining of steel parts using a propane with oxygen and in-flame fluxing to prevent discoloration of base metal and brazing material in the surrounding area. Fuel costs are substantially reduced. (K8; ST)

367-K. (French.) Weldability of Coatings of Tin, Tin Alloys and Other Metals. C. J. Thwaites. Galvano, v. 30, Jan. 1961, p. 24-25.

Weldability of coatings of Sn, of Sn-Pb and Sn-Zn alloys and of Cd and Ag determined by adherence tests. Effect of the thickness of the deposit, the subcoat and the base metal. (K9s; Sn-b, Pb, Zn, Cd, Ag, 8-62)

368-K. Submerged Arc Welding of Stainless Steel. Machinery, v. 67, Apr. 1961, p. 107-113.

Limitations of submerged arc process. Selection of filler metals and fluxes for welding stainless steels. Mechanical properties of submerged arc welded stainless steel. (K1e; SS)

369-K. Open Air Tig Welding Fabricates Complex Underwater Pipeline. T. Anderson and E. L. Trimble. Machinery, v. 67, Apr. 1961, p. 147.

Tig and conventional arc welding of a steel pipeline consisting of three concentric pipes and two "piggyback" lines. (K1d, T26r; ST)

370-K. (Slovak.) Use of Radioisotopes in the Investigation of Welding Processes. Bohumil Zitnansky. Zvaranie, v. 9, Dec. 1960, p. 350-353.

Use of the isotopes in studying the transition of alloying elements from the coating and core of an electrode into the weld metal at the beginning of melting, the passing through the arc and the penetration into the bath at the interface slag-metal. Investigation of carburization, decarburization and segregation process

and of the mechanism of intercrystalline corrosion. 29 ref. (K-general, 1-59)

371-K. (Czech.) Furnace Soldering in an Exothermic Atmosphere. Otakar Moravek. Zvaranie, v. 9, Dec. 1960, p. 357-362.

After cleaning by compressed air and addition of the solder--mostly in the form of a wire--the parts are soldered while passing through a furnace in an atmosphere obtained by the partial combustion of a city gas-air mixture, purified from SO_2 and H_2S. 10 ref. (K7g)

372-K. (Czech.) Hot Straightening. Boleslav Vrana. Zvaranie, v. 9, Dec. 1960, p. 362-364.

Deformation of welded parts can be avoided by a design providing for a symmetric distribution of weldments about the neutral axis, or symmetric heating and cooling; prestressing before welding; fastening of the parts to be welded in water cooled fixtures; design of rims and supporting ribs; hot straightening. (K9, F29r)

373-K. Assembling Circuitry Board for Airborne Computers. P. E. Boron. Assembly & Fastener Engineering, v. 4, Apr. 1961, p. 31-36.

Dip soldering, microwelding and adhesive bonding in assembly of airborne computer components. Design features. (K7d, K12, T1)

374-K. RCA Welds Transistor Parts in Controlled Atmosphere. Assembly & Fastener Engineering, v. 4, Apr. 1961, p. 43-44.

Transistor cover joined to base by electric resistance welding. (K3, T1)

375-K. Find New Adhesive Uses in Typewriters. Assembly & Fasteners Engineering, v. 4, Apr. 1961, p. 48.

Adhesive bonding of vinyl plastic to other plastic materials and to Al and steel. Joining anodized Al to enameled Al. (K12; Al, ST)

376-K. (French.) Electron Bombardment in Metallurgy. P. Thome and C. Bridoux. Societe Francaise des Electriciens, Bulletin, v. 2, Jan. 1961, p. 24-34.

Design of bombs for electronic bombardment. Application to welding and fusion under high vacuum. 11 ref. (K6, 1-73)

377-K. Spotlight on Arc Welding. Welder, v. 29, Oct-Dec. 1960, p. 77-80.

Applications of arc welding to production of components ranging from light gage metal to massive plate constructions including a brake press base, automatic strapping machine and gas scrubbing plant. (K1)

378-K. Welding in the Production of Hydraulic Jacks and Similar Equipment. Welder, v. 29, Oct-Dec. 1960, p. 81-85.

Metal arc welding is used in manufacture of hydraulic jacks, rams, presses and various tools. A lighter, stronger jack is produced by replacing castings for the handle, frames and hydraulic oil box with welded components. (K1g, T6)

379-K. (German.) Weld Cracking of Aluminum Alloys. Z. Buray. Acta Technica Academiae Scientiarum Hungaricae, v. 32, Jan-Feb. 1961, p. 93-118.

Various binary and complex alloys containing Mg, Zn, Si, Cu, Fe, Ti and B and filler metals used in their welding are tested by oxy-acetylene welding or argon arc welding in a water cooled fixture or by the casting of ring-shaped test pieces. Suppression of cracking by the use of filler metals containing increased amounts of Mg, Si, Cu or Ti. 23 ref. (K1d, K2h, 9-72; Al-b)

380-K. Experiences in Welding of Cold Rolled Steel. D. B. Tolly and J. A. Schiefferle. Paper from "Porcelain Enamel Institute Forum, Proceedings". v. 1. Porcelain Enamel Institute, Inc., Washington, D. C., 1959, p. 64-66.

Review of observations made in welding refrigerator liners fabricated wholly or in part from low-carbon cold rolled steel. Influence of weld caused defects in the porcelain enamel finish. Measurement of surface resistance. Effect of welding current. Influence of surface roughness and hardness on weldability. (K-general; CN-g, 8-71)

381-K. Pipeline Welding Goes Automatic. Steel, v. 148, Apr. 24, 1961, p. 136, 141.

Girthwelding of steel pipelines at welding speeds up to 55 ipm. using CO_2 shielding and a rotary carriage device which prepares the pipe ends and welds them in two 360° rotations. (K1d, T26r; ST)

382-K. Brazing Missile and Electronic Components in Dry Hydrogen. Pt. 2. H. E. Lewis. Metal Progress, v. 79, Apr. 1961, p. 94.

Purity of the atmosphere and control of temperature will determine the results obtained in brazing in dry hydrogen. Pointers on minimizing contamination and regulating heating and cooling. (K8, T24e, T1)

383-K. In Solder, Flux Makes the Difference. Joseph D. Keller. Metal Progress, v. 79, Apr. 1961, p. 111.

A simple test enables engineers at Martin-Orlando to select one particular solder from a group, all of which had previously met government specifications for metallic content. (K7; SGA-f)

384-K. Welding Engineers Meet. Metal Progress, v. 79, Apr. 1961, p. 124-126, 128, 130, 132, 134, 136, 138, 142.

Welding of stainless steel; hot cracking; use of filler metals; data on precipitation hardening stainless steels. (K1; SS)

385-K. Hydrogen in Arc Welding With Coated Electrodes. N. Christensen. Welding Journal, v. 40, Apr. 1961, p. 145s-154s.

Sources of hydrogen in metal arc welding. Determination of hydrogen in mild and low alloy steel weld metals and effect of hydrogen on mechanical properties and structures. 39 ref. (K1a, K9, Q26s, Q-general; ST, 7-51)

386-K. Effects of Repeated Repair Welding of Two Aluminum Alloys. F. G. Nelson. Welding Journal, v. 40, Apr. 1961, p. 166s-168s.

Hardness and tensile tests used to study effects of repeated arc welding on the width of the heat affected zone on either side of groove welds in 6061-T6 and 5456-H321 Al alloy plates. (K9, K1, Q-general; Al-b, 4-53, 7-51)

387-K. Some Metallurgical Aspects of CO_2-Shielded Arc Welding. M. D. Randall, P. J. Rieppel, S. L. Hoyt and A. F. Chouinard. Welding Journal, v. 40, Apr. 1961, p. 169s-174s.

Gaseous end products and oxidation losses in carbon dioxide shielded welding; mechanical properties of carbon and alloy steel welds deposited by CO_2 shielded consumable electrode process; and resistance of welds to hot and cold cracking. 27 ref. (K1d, Q-general; ST, 7-51)

388-K. Quenched and Tempered Steels in Ship Structure. Thomas J. Dawson. Welding Journal, v. 40, Apr. 1961, p. 173s-181s.

Composition and tensile and impact properties of HY-80 steels. Investigation of pre-heat and electrode moisture control problems, electrode coatings, weld design and quality control into ship hulls and superstructures. (K-general, K9, T22; AY, 17-57)

389-K. Ferritic Welding of Steel Armor. Z. J. Fabrykowski. Welding Journal, v. 40, Apr. 1961, p. 339-342.

Development of ferritic electrodes and welding procedures for high-strength steels. Principles of "H" plate test and its significance in welding quality control. (K1, K9r, T2g, W29h; ST, 4-53)

390-K. Ultrasonic Welding Engineering, Manufacturing and Quality Control Problems. Welding Journal, v. 40, Apr. 1961, p. 349-358.

Principles of ultrasonic welding and applications in joining dissimiliar metals, alloys and other materials. Data are given for cooling, clamping force and welding tip requirements, vibration problems and their control and ultrasonic welding schedules. 9 ref. (K6r)

391-K. Welding of Massive Manganese-Vanadium Steel Assemblies for Varrazano-Narrows Bridge Tower Piers. Irving Diamond. Welding Journal, v. 40, Apr. 1961, p. 359-362.

Submerged arc and covered arc-welding of ASTM 242 low-alloy high-strength Mn-V steel plate. (K1a, K1e; AY, 4-53)

392-K. Projection Welding Low-Carbon Steel Using Embossed Projects. J. F. Harris and J. J. Riley. Welding Journal, v. 40, Apr. 1961, p. 363-376.

Method and equipment for welding low-carbon steel sheets with embossed projections. Influence of electrode and projection design, sheet thickness, electrode force, welding current and welding time on formation of projection welds. 5 ref. (K3q; CN-g)

393-K. Brazing of Sandwich Structures of Columbium Alloys. M. M. Schwartz.

Welding Journal, v. 40, Apr. 1961, p. 377-382.

Survey of metallurgical aspects of brazing refractory metals. Procedure for brazing Cb and Cb alloys in cold wall, high-temperature vacuum resistance furnace, using Ti as brazing alloy. Shear strength of brazed 33% Ta-0.7% Zr-Cb alloy joints at 70-3000° F. (K8, Q2; Cb-b, EG-d37, 7-52)

394-K. Role of the Engineer in Designing for Carbon-Steel Structures. J. F. Lincoln. Welding Journal, v. 40, Apr. 1960, p. 383-384.

Design consideration of stresses in welded structures with attention to adverse effects of over welding. A limited degree of porosity in weldments is suggested as insurance against cracking. (K-general, 3-66, 9-68; CN, SGB-s)

395-K. (German.) Current State of Metal Bonding by Adhesives. H. Winter and H. Meckelburg. Metall, v. 15, Mar. 1961, p. 187-198.

General review of metal bonding in terms of classification and technological properties of adhesives; bonding techniques; mechanical, fatigue, chemical and weater resistance of bonds; destructive and nondestructive testing of bonds; construction techniques for bonded parts; and application of metal bonding in aircraft and vehicle construction. (K12)

396-K. Fastening Aluminum. Pt. 4. Special Rivets, Screws and Bolts. F. L. Church. Modern Metals, v. 17, Apr. 1961, p. 68, 72, 74, 76, 78, 80, 82, 84.

Design and use of special fasteners for the Al industry. Various types of tools and methods of installation with blind rivets, pop rivets and self-sealing fasteners. (K13; Al)

397-K. Factors in Resistance Welding. D. Endquist. Canadian Welder, v. 52, Apr. 1961, p. 20, 22.

Weldability of steels, alloys and light metals as affected by resistivity, thermal conductivity, hot working temperature and prior surface preparation. Welding heat required determined by physical properties of metal. (K9s, K3)

398-K. (Russian.) Fluxless Welding of Aluminum and Its Alloys by Soft Solders. Ya. M. Kanevskiy. Izvestiya Akademii Nauk SSSR, May 1960, p. 146-149.

Simultaneous removal of oxide film, tinning and soldering of Al specimens using a portable electrofurnace and an abrasive wheel consisting of compressed solder chips and asbestos. (K7, 1-52; Al)

399-K. Resistance Welding Characteristics of Sheet Steels. G. E. Grotke and W. D. Doty. Paper from "Porcelain Enamel Institute Forum, Transactions". v. 20, Porcelain Enamel Institute, Inc., Washington, D. C., 1958, p. 13-23.

Review of the basic principles of resistance welding processes to show why incompatibility of different types of low-carbon steel sheet is to be expected. Spot welding, projection welding, seam welding, upset-butt welding and flash welding. Influence of carbon content, electrical resistivity, microstructure, grain size and surface condition on resistance welding characteristics. (K3; ST, 4-53)

400-K. New Welding Laboratory. Inco, v. 28, no. 1, p. 28-29.

Submerged-arc welding and automatic gas-shielded consumable electrode welding of Ni alloys, cast iron and dissimilar metals. Welds are inspected by X-rays. (K1e, K1d; CI, Ni-b)

401-K. Long-Armed Welder Reaches the Inaccessible. Metalworking Production, v. 105, Mar. 29, 1961, p. 62-63.

Blind spot welding of stainless steel corrugated parts inside airplane wings using a machine that applies 2500 lb. electrode pressure. (K3n, T24a; SS)

402-K. Arc Welding Rear Axle Housings and Related Assemblies. W. F. Williams and S. M. Spice. SAE Preprint 329A, 1961, 8 p.

Automatic submerged arc welding, using bare or copper-coated steel wire and externally added granular flux and "Inner shield", a process using a flux cored steel wire without externally applied flux or gas shield, are used with seam and Mig welding techniques to fabricate automobile axle assemblies. (K1, K3, T21c; ST)

403-K. Gas Shielded Fusion Welding in Automotive Production. R. E. Brooks. SAE Preprint 329B, 1961, 9 p.

Development of CO_2 shielded welding and inert gas-shielded consumable electrode welding processes and equipment. Application in the fabrication of automobile parts. (K1d, T21)

404-K. (French.) Welding and Brazing of Copper and Its Alloys. Pt. 6. Silver Brazing. Cuivre Laitons Alliages, Jan-Feb. 1961, p. 3-9.

Torch brazing of steel and Cu using Ag containing Cu, Zn and Cd as filler metal. Characteristics of the filler metal and of the surfaces to be joined. (K8g; Cu, Ag-b, SGA-f, 17-57)

405-K. When a Clean Weld Is Needed. Charles E. Reeb. Metalworking Production, v. 105, Apr. 5, 1961, p. 57, 59.

Production of a tractor track-roller by submerged arc welding of steel forgings using a mild steel electrode. (K1e, T3n; ST, 4-51)

406-K. (French.) Calculation of the Thermal Processes of Welding. N. N. Rykaline. Soudage et Techniques Connexes, v. 15, Jan-Feb. 1961, p. 5-38.

Calculation of heat distribution on the surface or in the interior of parts during arc, oxy-acetylene and resistance butt welding. 6 ref. (K-general)

407-K. (Italian.) Formation of Hydrogen Bubbles Under the Action of Static Loads. V. O. Valanti. Rivista Italiana Della Saldatura, v. 12, Nov-Dec. 1960, p. 269-281.

Ultrasonic investigation of the formation of hydrogen bubbles (fish eyes) in weld metal under static load during application of basic, acid and rutile electrodes. (K1, S13g, 3-68; 7-51, 9-68, H)

408-K. Gas Pressure Bonding Ready for Production Role. Steel, v. 148, May 1, 1961, p. 56-58.

Diffusion bonding, a technique employing high pressures and temperatures to join refractory metals, is applied to bonding of fuel element components, Cb, Mo and other metal alloys. (K5k; EG-d37)

409-K. New Techniques, Alloys Widen Brazing Horizon. Steel, v. 148, May 1, 1961, p. 70-72.

Review of recent advances in brazing technology including wide gap brazing, fiber metal shim method and plasma spray application of braze materials. (K8)

410-K. Argon Flush: Key to Fabrication of Titanium Clad Steel. C. L. Kobrin. Iron Age, v. 187, Apr. 27, 1961, p. 110-111.

Stainless steel sheets are roll bonded to Ti strip in an argon atmosphere at less than 1750° F. to produce four deck sandwiches with strong, ductile bonds. (K5j; SS, Ti)

411-K. Roll Weld Method Bonds Panels. Iron Age, v. 187, Apr. 27, 1961, p. 114.

Roll welding produces sound core-to-cover bonds in corrugated-core Ti and Al alloy panels without jigging. Materials are hot rolled to pressure weld the peaks of the corrugated metal core to the cover sheets. (K5j; Al-b, Ti-b, 4-57)

412-K. Arc Spot Welding in Automotive Production. B. L. Kosink. SAE Preprint 329C, 1961, 9 p.

Principles of nonconsumable and consumable arc spot welding processes with design considerations for selection in welding automobile components of various steels of different configurations and heat treated hardnesses. (K3n, T21)

413-K. Adhesives for Ordnance. M. J. Bodnar. Ordnance, May-June 1960, p. 954-955.

Epoxies, epoxy-phenolics, nitrite-phenolics and vinyl-phenolics are used to obtain high-strength bonding of missile components. Bonding tests are performed on steel, Al, Cu, Cd, Zn, Be, Nb, Ag, Mo, Re, Ta, W, U238 and Zr. Data are given on adhesive bonding of high explosives to themselves and to other adherents. (K12, T2p)

414-K. Designing Ferrous Parts for Furnace Brazing With Copper. E. C. Buckingham. Machinery (London), v. 98, Apr. 12, 1961, p. 816-825.

Data given for the effect of brazing temperature on the tensile strength of the joint and on the degradation of the joint through progressive oxidation. (K8j, Q27a; Fe-b)

415-K. How Explosives Weld Metals. Iron Age, v. 187, May 4, 1961, p. 83-85.

Advantages of explosive welding of Al to Al, stainless steel to Ni alloys,

stainless steel to stainless steel and Cu to Cu systems. Effect of plate thickness, explosive thickness, length and width of the system and other parameters. (K6, NM-k34; Al, Cu, Ni, SS)

416-K. (Swedish.) Adhesive Bonding of Aluminum. S. Backman. Industriell Teknik, v. 88, Nov. 30, 1960, p. 867-872.

Evaluation of strength of various joint designs with emphasis on tensile strength of overlap joints as functions of the length of overlap and the material thickness. Deformation of base material and adhesive is observed under tensile stress. 5 ref. (K12, Q24, Q27; Al, 7-58)

417-K. Production Equipment and Methods for Cross Wire Welding. Wire Industry, v. 28, Apr. 1961, p. 363-364.

Production of mild steel wire mesh by spot welding of a parallel system. (K3n, 1-52; CN, 4-61)

418-K. Dip Brazing Aluminum Assemblies in Large Facility at Meridian Metalcraft, Inc. Industrial Heating, v. 28, Mar. 1961, p. 468-470, 472, 480.

New process permits fabrication of assemblies from stock or machine formed shapes and of brazing parts into an integral unit in production quantities without warpage or high scrap loss. (K8n; Al)

419-K. Honeycomb Structure Output Speeded. Missiles and Rockets, v. 8, May 1961, p. 42-43.

Brazing of stainless steel and A-286 high-temperature steel in a vacuum furnace at 1640° F. using a brazing foil containing 93% Ag, 7% Cu and 0.2% Li. Ultimate tensile strength, yield strength and elongation given for resulting structures. (K8j, 1-73; SS, SGA-h, 4-57)

420-K. Tools From Honeycomb Scrap. Waldo C. Voth. Metalworking Production, v. 105, Apr. 19, 1961, p. 76-78.

Al honeycomb scraps from production runs on aircraft components are joined together by simple presswork then covered with glass cloth and epoxy resin to stiffen the mass and provide smooth outside surfaces. Application of the laminate panels in assembly jigs, fixtures and inspection tools. (K13r; Al, 4-57)

421-K. Plasma Torch Learns to Weld. American Machinist/Metalworking Manufacturing, v. 105, Apr. 17, 1961, p. 115.

Description of an advanced form of Tig welding in which the arc and the inert gas pass through a constricted orifice designed to turn the gas into a plasma at 10,000° F. and up. (K6)

422-K. Now It's Explosive Welding. American Machinist/Metalworking Manufacturing, v. 105, Apr. 17, 1961, p. 119.

A jetting effect is produced when two metal plates come together with a high relative velocity at some angle to each other; material at interface plastically deforms into ripples. Interaction between the two surface jet elements and a rapid release of the load permanently welds parts. (K6)

423-K. Joining Refractory Metals Is Tricky Business. G. M. Slaughter. SAE Journal, v. 69, May 1961, p. 52-55.

Welding and brazing of Be to refractory metals W, Ta, Mo, Cb, Fe and Ni. A study is made on the influence of impurities on transition temperature for recrystallized metals. Intermetallic formation, weld porosity and thermal expansion behavior are discussed. (K-general; Be, Cb, Fe, Mo, Ni, Ta, W)

424-K. Adhesive Takes High Heat and Shock. Missiles and Rockets, v. 8, Apr. 24, 1961, p. 40.

Development of an adhesive with low expansion coefficient, "Astroceram", for bonding ceramics, refractories, quartz and metals which withstands continuous service temperatures of over 4000° F. Data are given for mechanical properties including 8-9 Moh hardness, 10,000-15,000 psi. tensile strength and compressive strength of 80,000-150,000 psi.; physical properties and chemical composition with suggested missile-space applications. (K12, 2-62; SGA-h, NM-d34, 17-57)

425-K. Roll Wobbler Reconditioning. Welding Fabrication and Design, v. 4, Mar. 1961, p. 17-18.

Rebuilding of worn roll wobblers by metal arc welding with a low hydrogen, mild steel electrode and hard facing using a Cr, Mo, medium carbon steel alloy in submerged arc welding process. (K1e, K1g, W23p)

426-K. (German.) Welding of Large Tubes by the Under-Powder Method. Schweisstechnik, v. 15, Apr. 1961, p. 43-46.

Welding operations (seam preparation, adjustment of welding heads, pouring of powder) and welding conditions (purity and grain size of powder, amperage and voltage ranges) in under-powder welding of large-diameter steel tubes. Welding defects including cracking of Ellira seam, incomplete welds, necking and notch formation. (K6; ST, 4-60)

427-K. Design for Faster Spotwelding. Walter Blumenstein. Product Engineering, v. 32, Apr. 24, 1961, p. 76-80.

Design considerations for welds and weld spacing for producing stronger welds at faster production rates. Recommended practices for spotwelding austenitic stainless, hardenable and low, medium and high-carbon steels; Cu and Be-Cu alloys; and Al, Mg, Ni and their alloys. Materials are rated in terms of weldability and minimum shear strength per spot. (K3n, K9; ST, Cu-b, Al-b, Mg-b, Ni-b)

428-K. New Techniques in Bonding Solid Fuel Rocket Motor Cases. Philip Rosenberg and Samuel J. Dastin. SAE Preprint 330C, 1961, 5 p.

Evaluation of various structural adhesives and techniques for fabrication of high-strength steel bonded cases based on metal design allowables up to 350,000 psi. Materials considered include polyamide epoxy, vinyl-phenolic, rubber phenolic-epoxy, epoxy, rubber-phenolic, epoxy-phenolic and epoxy-silicone-phenolic. Tests failed on motor cases at 250,000 psi. 5 ref. (K12, Q10c, T2p; AY, NM-d34, 17-57)

429-K. Vanadium at the Keystone. Union Carbide Metals Review, v. 4, Winter-Spring, 1961, p. 26-27.

Vanadium is used for arc and resistance welding of Ti to steel, forming corrosion resistant, strong and nonbrittle joints. Data are given for tensile and shear tests on weldments. (K1, K3; ST, Ti, V)

430-K. (Dutch.) Oxy-Acetylene Welding of Aluminum. Lastechniek, v. 27, Feb. 1961, p. 27-29, 32-33.

Choice of welding wire composition and diameter for pure and alloyed Al sheet of 1-10 mm. thickness. Use of hygroscopic and nonhygroscopic fluxes. Joint design, cleaning of parts to be welded, fixtures used for keeping the parts in place. Protection of still hot weldments against air drafts. Removal of hygroscopic flux residues. (K2h; Al, 4-53)

431-K. (Dutch.) Argon-Arc Welding of Small Pressure Vessels From Alloy Steel for Use in Airplanes and Rockets. Lastechniek, v. 27, Feb. 1961, p. 36-38.

Welding of spherical and cylindrical containers of 0.16-32 l. capacity from SAE 4130 steel sheet using a filler wire of Mn steel with a low carbon content and no more than 0.010% S and 0.015% P. Previous cleaning with trichloroethylene and shot blasting. X-ray testing. Heat treatment of welded containers at 900° C., oil quenching, tempering at 480° C. Pressurizing and fall testing. (K1d, T26q, T24; AY, 4-53)

432-K. (Dutch.) Welding of Cupronickel Tubing to a Steel Plate for Use in High-Pressure Pre-Heaters. G. E. Tummers. Lastechniek, v. 27, Jan. 1961, p. 1-3.

Tubing is arc welded to a ST 50 steel plate using an Incoweld A electrode containing 13-17% Cr, 1-3% Cb, maximum 0.5% Cu, maximum 0.75% Si, 6-12% Fe, 0.5-2% Mo, 1-3.5% Mn, maximum 0.15% C, remainder Ni or a Monel 140 electrode. To avoid absorption of S, P, C, H or O, cleanness of the joint from oil or fat and working with a dry electrode are essential. 14 ref. (K1; Cu-b, Ni, ST, 4-60)

433-K. (Dutch.) New Publications in the Field of Welding. G. van Schaick Zillesen. Lastechniek, v. 27, Jan. 1961, p. 3-10.

Literature review on welding equipment, materials, welding processes, design of welded structures, nondestructive testing and examples for welding operations performed. 99 ref. (K-general)

434-K. Developments in Stud Welding. D. J. N. Lauri. British Welding Journal, v. 8, Apr. 1961, p. 113-121.

Stud welding processes adapted to the welding of shear connectors utilized in bridge fabrication. Developments in Al alloy and steel stud welding are noted in terms of research designed to eliminate erratic welding results. (K1f; Al-b, ST)

435-K. Foil Seam Welding. F. Busse. British Welding Journal, v. 8, Apr. 1961, p. 123-129.

Working principles for the foil seam welding of butt joints in sheet metal panels. Practical results are given including guidance on sheet preparation techniques, choice of foil and selection of welding machine variables. (K3p; 4-53)

436-K. Automatic Tungsten-Arc Welding of Heat Exchangers. N. T. Burgess. British Welding Journal, v. 8, Apr. 1961, p. 141-150.

Development of procedures and inspection methods for welding power-station feedwater heaters and, in particular, the fabrication of precision points in tubular heat exchangers. 8 ref. (K1g, W13b)

437-K. Mild Steel Welding With Argon/CO_2 Mixtures. B. H. Baker, N. Crevis, J. A. Lucey and F. W. Lunau. British Welding Journal, v. 8, Apr. 1961, p. 151-161.

Report on argon/CO_2 mixture (20-25% CO) utilized in the bare wire, gas-shielded welding of mild steel indicates superior results over those obtained with argon/O_2 or CO_2 including better weld bead shape and lower voltage in deep transfer welding. 9 ref. (K1d, K1g; CN)

438-K. Some Recent Developments in Brazing. G. R. Bell. British Welding Journal, v. 8, Apr. 1961, p. 166-171.

History and application of brazing techniques including use of nickel-base brazing alloys with high alloy materials. Choice of flux is considered and need for joint clearance design stressed. 20 ref. (K8)

439-K. Ultrasonic Welding. S. W. Meville. British Welding Journal, v. 8, Apr. 1961, p. 177-187.

Report on welding by ultrasonic vibrations without the use of external heat. Investigations conducted utilize a rig applying axial pressure between two rotating disks, a rig using a vibrating reed principle and an ultrasonic cleaning set using piezo-electric barium titanate crystal blocks. 50 ref. (K6, 1-74)

440-K. Adhesives Open New Design Potential. H. J. Jankowski. Design Engineering, v. 7, May 1961, p. 48-50.

Data given for methods of surface cleaning, adhesive application and bonding cycle for bonding Al and Mg foils to form honeycomb structures. (K12; Al, Mg, 4-56)

441-K. Tests Prove 9% Nickel Steel Meets Requirements for Cryogenic Service. Pt. 1. Welding Engineer, v. 46, Apr. 1961, p. 46-47.

Tensile and bend test data for arc weldments in pressure vessels and plate specimens of a low-carbon, high-Ni steel developed for pressure vessel use at -100 to -320° F. Tensile and yield strength, elongation, ductility and notch toughness are compared to A-353 steel. (K9r, Q-general, 2-63; SS, 7-51)

442-K. Thin-Metals Percussive Welded Without Marring or Distortion. Charles A. Gunn. Welding Engineer, v. 46, Apr. 1961, p. 48-49.

Stud welding process uses electrical stored energy for simultaneous fusion of the abutting surfaces of the stud and workpiece. Applications include welding of similar and dissimilar metals such as Al, Zn, Cu, brass and stainless and plated steels. (K3a; Al-b, Cu-b, Zn-b, ST)

443-K. How to Evaluate Shrink and Draw Strains. Nicholas S. Hodska. Welding Engineer, v. 46, Apr. 1961, p. 50-54.

Design considerations for welding techniques and stress relief for minimizing shrink and draw strain variations in weldments involving study of grain growth, recrystallization and heat reactions of metals to be used. (K-general, J1, N-general, Q25; 7-51)

444-K. Reactive Metal Tubing is Tig Welded on a Production Basis. Welding Engineer, v. 46, Apr. 1961, p. 60, 62.

Welding of Ta, Cb, Zr and Hf tubes of 3 1/2-48 in. diameter using a-c. and d-c. Tig welders. (K1d; Cb, Hf, Ta, Zr, 4-60)

445-K. Automatic Mig Unit Slashes Field Pipe Welding Time. Welding Engineer, v. 46, Apr. 1961, p. 66.

Steel pipe of 4, 6 and 8 in. diameter is welded in situ with 0.040 in. wire at 45 in. per min. using Ar, He or CO_2 shielding by automatic equipment which does not require rotation of the pipe. (K1d, T26r, 1-52; ST)

446-K. Survey of Notch Tough Steels Shows Fabrication Problems. Thomas J. Dawson. Welding Engineer, v. 46, Apr. 1961, p. 75-76, 78.

Welding and heat treatment parameters for maintaining optimum ductility in quenched and tempered, notch tough, high-strength steels with emphasis on HY-80 low alloy steel. Mechanical properties, nature of the heat affected zone and weldability are given with some attention to development of notch toughness by alloying with Ni, Cr and Mo. (K-general, K9s, J-general, Q26s, Q-general, 2-60; AY, SG-a)

447-K. Nickel-Silver Brazing Solves Stapling Machine Production Problems. Jack Poulson. Welding Engineer, v. 46, Apr. 1961, p. 88, 90.

Fabrication of intricate stapling machine subassemblies from cold rolled L-5-C steel strip by brazing with a Ni-Ag alloy and using an automatic fluxing system. (K8; ST)

448-K. Flux-Cored Process Makes 5 Ft. Pass in 80 Sec. Welding Engineer, v. 46, Apr. 1961, p. 96.

Flux-cored CO_2 welding of rubber or neoprene covered 1020 steel rolls, the electrode wire being fed continuously from coils. (K1d; ST, 8-70)

449-K. Weld and Drag Pipelaying. Light Metal Age, v. 19, Apr. 1961, p. 4-5.

Seamless 6061 T6 Al alloy pipes, having regular wall thickness at the ends and thin walls along the length, are joined by stationary welding machines and then dragged or pulled across rough terrain to form a permanent pipeline. The uncoated and unwrapped buried pipeline is protected by Mg anodes. (K-general, T26r; Al-b)

450-K. World's Tallest Structure...Design Said "Weld It". Elda Jones and K. H. Zeigler. Welding Engineer, v. 46, May 1961, p. 46-47.

Structural componenents of Man-Ten and A-7 steel are manual metal-arc welded to form a 1676 ft. television transmitting tower. (K1g; ST, 4-57)

451-K. 1280 Tons of Blast-Proof Doors for Missile Site. Howard E. Jackson. Welding Engineer, v. 46, May 1961, p. 48-49.

Submerged-arc and metal-arc welding are used to join steel beams to form a blast proof door. (K1e, K1g; ST, 4-57)

452-K. Old Standby A-7 Steel Used in All-Welded Building Frame. E. E. Hanks. Welding Engineer, v. 46, May 1961, p. 50-51.

Beams of A-7 steel are submerged-arc and metal-arc welded to form a 120 by 208 ft. building. (K1e, K1g; ST, 4-57)

453-K. Automatic Welder Joins Aluminum Gas Line. Welding Engineer, v. 46, May 1961, p. 54.

Mig welding and drag pipelaying operations are combined to produce a permanent Al pipeline. (K1d, T26r; Al)

454-K. Low Cost Sandwich Panels. Welding Engineer, v. 46, May 1961, p. 63.

Development of a new roll-welding process for production of corrugated-core sandwich panels which may be extensively formed after assembly. (K5j; 4-57)

455-K. Speed Auto-Body Production by 40%. Welding Engineer, v. 46, May 1961, p. 64.

Mig spot welding has replaced manual metal arc welding in a Detroit automotive body plant. Welds are made 3-20 times faster, weld characteristics being controlled by the arc duration time and electrode feed rate. (K1d, T21a)

456-K. Integral Pressure-Vessel Welding Techniques. Leo E. Gatzek and Ivan Rattinger. American Society of Mechanical Engineers, Paper no. 61-AV-14, 1961, 8 p.

Fusion and resistance welding techniques for welding Al alloys, stainless steels and other materials found in pressure vessels. Inspection and nondestructive test methods. (K1, K3, T26q; Al-b, SS, 17-57)

457-K. New Joining Processes for Uncommon Materials. R. E. Monroe. American Society of Mechanical Engineers, 61-AV-61, 1961, 7 p.

Review of electron beam, ultrasonic, plasmajet and explosive welding, inert gas-shielded electrode welding, diffusion bonding and brazing techniques for uncommon materials such as Cb, W, Ti and Zr. (K-general; Cb, Ti, W, Zr)

458-K. Bonding of Structural Adhesives. E. J. Sydor. SAE Preprint 330B, 1961, 5 p.

Review of developments in structural adhesives, in particular thermosetting compounds, and bonding methods. Evaluation of bonding strength of adhesives containing cyanoacrolates and modified epoxies by lap-joint bonding of coupons of Alclad Al 24ST3 under varying conditions with subsequent determination of room temperature tensile shear strength. (K12; Al-b, NM-d34)

459-K. Fusion Welding of the Less Common Metals. J. M. Newburn. Paper from "Australian Atomic Energy Symposium". Melbourne University Press, Melbourne, Australia, 1958, p. 216-220.

Review of the literature on the fusion welding of Be, Hf, Cb, Ta, Th, Ti, U, V and Zr. Direct current inert gas-shielded arc process is the preferred welding procedure. 65 ref. (K1; Be, Cb, Hf, Ta, Th, Ti, U, V, Zr)

460-K. (German.) Maximum Tensile Shear Strength in Spot-Welding of Carbon Steel Sheet With Up to 6 Mm. Thickness. O. Becken and K. Havers. Schweissen und Schneiden, v. 13, Apr. 1961, p. 127-135.

Test spot-welding of 0.88-6.2 mm. thick steel sheet (0.03-0.09% C) of given tensile strength using spot-welding machines of 0.5-3 tons electrode force. Subsequent tension-shear testing to evaluate strength as influenced by sheet thickness and spot diameter. (K3n; ST, 4-53)

461-K. (German.) Influencing Factors, Quality and Strength in Resistance Spot Welding. W. Glage. Schweissen und Schneiden, v. 13, Apr. 1961, p. 135-140.

Criteria for assessment of spot quality. Representation of quality (in terms of tensile shear strength) of spot-welding junctions of 1 mm. thick steel sheet as a function of welding variables such as welding current, welding time, electrode force, spot diameter and electrode diameter in terms of a nomogram. (K3n, Q2g; ST, 4-53)

462-K. (German.) Projection Welding Reduces Production Time. E. A. Otto. Schweissen und Schneiden, v. 13, Apr. 1961, p. 146-151.

Projection welding of sheet and tube material is discussed in terms of electrical features including current distribution, geometrical shape and size of projections and welding tools, welding machines and economics. (K3q; 4-53, 4-60)

463-K. (German.) Root Welding of High-Stress Tubes of Low and High-Alloy Steels. R. Faulstich. Schweissen und Schneiden, v. 13, Apr. 1961, p. 160-165.

Root welding of 13CrMo44 and X10 CrNiMoTi1810 steel tubes of varying diameter and wall thickness using quartz ring with hard glass fiber texture and steel rings for root support. Reaction mechanism. Quality of weld. (K-general; AY, SS, 4-60)

464-K. (French.) Welding of Chromium Steel. H. Gerbeaux. Metallurgie et la Construction Mecanique, v. 93, Feb. 1961, p. 111, 113-114, 117.

Fusion welding of steel with varying Cr content. Composition of welding metal. Treatment of welded seam. (K1; ST, Cr)

465-K. Furnace Brazing of Stainless Steel Assemblies. H. M. Webber. Metal Progress, v. 79, May 1961, p. 108-111, 118, 120, 122, 124, 126, 128.

Furnace brazing, employing a variety of protective atmospheres, furnaces and filler metals, offers a number of advantages. Many flux-free nonporous joints can be brazed simultaneously and economically, dissimilar metals with wide thickness variations can be joined and close tolerances can be held. (K8j; SS)

466-K. Welding Engineers Meet in California. R. C. Bertossa. Metal Progress, v. 79, May 1961, p. 136, 138, 140, 142, 144, 150.

Short summaries of papers on the welding of Al and high-temperature alloys. (K-general)

467-K. The Role of Joint Design in Furnace Brazing. Ray N. Omans. Assembly & Fastener Engineering, v. 4, May 1961, p. 25-28.

Forming of lap joints, butt joints and scarf joints by Cu furnace brazing. Brazed joints show uniform strength, have low residual stress and minimal heat distortion. (K8j)

468-K. (German.) Estimation of Strength and Dimensions of Single Overlapped Metal

Bonds. Heinz Muller. Fertigungstechnik und Betrieb, v. 11, Feb. 1961, p. 131-135.

Calculation of bonding strength depending upon dimensions of overlap. Tensile-shear tests for varying lapping lengths and thickness of adhesive of polyurethane bonded AlMg3 sheets. (K12; Al-b)

469-K. (Dutch.) Carbon Steel Tubing Butt Weldments With and Without Backing. Lastechniek, v. 27, Mar. 1961, p. 64-67.

Butt joints produced by oxy-acetylene welding or manual arc welding are exposed to an internal pressure causing a static tangential stress of 10 kg. per sq. mm. and an axial stress of 5 kg. per sq. mm. and simultaneously to tensile cycling at loads ranging from 12-26 kg. per sq. mm. and a frequency between 10^5 and 10^7 to determine fatigue strength. (K1, K2h, Q7a; CN, 4-60, 7-51)

470-K. (Slovak.) Welding of Thick Steel Parts. Josef Cabelka. Zvaracsky Sbornik, v. 10, Jan. 1961, p. 3-20.

Carbon steel is tested for its weldability by the VUS2S method. Effect of oxygen and nitrogen on aging notch impact strength and weldability. Use of vacuum melted steels or steels that were refined under special slags and preheating up to 250° C. prior to manual arc or electroslag welding are suggested. (K1, K6, K9s; CN)

471-K. (Slovak.) Spot Welding of Low and High-Alloy Steels Combined With a Heat Treatment Carried Out by Means of Plier Electrodes. G. A. Maslov. Zvaracsky Sbornik, v. 10, Jan. 1961, p. 21-33.

Sheets of 30KhGSA, 12G2A and EI659 steels of 0.8-3.5 mm. thickness are spot welded by a process allowing regulation of heating and cooling velocities. Embrittlement of the center of weld and the heat exposed zone is avoided and increased strength of the weldment achieved. 5 ref. (K3n; AY, SS, 4-53)

472-K. (Slovak.) Welding of Thin Sheet in a CO_2 Atmosphere. I. I. Zaruba. Zvaracsky Sbornik, v. 10, Jan. 1961, p. 34-40.

Automatic and semi-automatic welding by carbon or very thin consumable electrodes of 0.5-1.2 mm. diameter. Mixed Ar/CO_2 atmospheres can be used. Materials include 1-3 mm. thick sheets of NL2, SKhL1, SKhL4, 14KhGS, MSg4, 15KhM, 20KhM, 20KhMF, 2Kh13, Kh17N2 or 1Kh18N9T steel. (K1; ST, 4-53)

473-K. (Slovak.) Automatic Flash Welding. Viorel Miclosi. Zvaracsky Sbornik, v. 10, Jan. 1961, p. 51-64.

Description of equipment used in the welding of tracks. Wiring diagrams and diagrams showing phases of the welding current. Relationship between current and the velocity at which the portions to be welded are brought together. (K3r, 1-53)

474-K. Beryllium Joining RAD Sponsored Program. J. B. Cohen. Avco Corp. (Wright Air Development Division). U. S. Office of Technical Services, PB 161830, Apr. 1960, 45 p. $1.25.

New brazing techniques for joining Be to itself. A Be 20 at.% Ag brazing alloy yields joint strengths at room temperature of 60% (30,000 psi.) of that of the base metal. In temperature ranging from 700-1450° F. the joint strength is 80% that of the base metal. (K8; Be)

475-K. Beryllium Joining WADS Sponsored Program. E. M. Passmore. Avco Corp. (Wright Air Development Division). U. S. Office of Technical Services, PB 161831, Apr. 1960, 127 p. $2.75.

Joining of Be plates and rods by braze welding, fusion welding and pressure welding investigated to develop improved methods for applications at both room and elevated temperatures. Braze welding with Ag filler metal and pressure welding without filler are the most promising techniques for joining Be. (K-general; Be)

476-K. Some Design Considerations for Welded Aluminium. S. R. Banks and R. E. Smith. British Welding Journal, v. 8, May 1961, p. 199-206.

Paper outlining factors relevant to the design of welded Al structures. Characteristics of various Al alloys are described and comparisons are made with structural steel. Typical applications. Static and fatigue strength of welded Al joints. 19 ref. (K-general; Al, 4-57)

477-K. Development of Mig Welding Techniques for Aluminium. J. E. Tomlinson and D. Slater. British Welding Journal, v. 8, May 1961, p. 216-226.

Development of inert-gas metal arc welding equipment, practice and standards as applied to Al. Material preparation, joint configurations, welding procedure and standards of weld quality. 10 ref. (K1d; Al)

478-K. Factors Influencing the Properties of Welds in Aluminium. J. C. Bailey and G. W. Eldridge. British Welding Journal, v. 8, May 1961, p. 227-236.

Review of the currently established procedures for Tig and Mig welding of Al and its alloys and the methods developed for testing the welds. Factors underlying the occurrence of defects such as weld cracking, porosity and oxide inclusions. Other factors influencing properties such as filler rod composition, extent of the heat affected zone and welding variables of speed and current. 16 ref. (K1d, K1g; Al-b)

479-K. Aluminum Welding Practice. L. Capel. British Welding Journal, v. 8, May, 1961, p. 245-257.

Factors that affect quality of welds in Al made by Mig and Tig welding processes. Illustrated formulae for calculation of distortion. Nondestructive methods for examination of welds. Detailed recommendations for radiographic methods. (K1d, K1g; Al)

480-K. Welding Progress: Has it Levelled Out? Harry Thomasson. Canadian Metalworking, v. 24, May 1961, p. 41-45.

Evaluation of the state of research and development in automatic arc welding, arc grouping, oxy-fuel gas cutting and resistance welding and brazing with emphasis on techniques for joining steel, cast iron and exotic metals. (K-general, 10-54; ST, CI, EG)

481-K. The Soldering of Magnesium. Tin and Its Uses, no. 51, 1961, p. 13-14.

Deposition of Ni or Cu on Zn coated Mg prior to electroplating with Sn and subsequently "flow melting" with tinning oil to form an easily solderable layer. (K7; Mg)

482-K. Now... Pre-Shaped Epoxy Adhesives. Vincent Sussman. Product Engineering, v. 32, May 22, 1961, p. 43-45.

Applications of preshaped epoxy adhesive pellets in metal-plastics and metal-metal bonding of Al, Cu, brass, plated Cd, stainless and alloy steels, Ta and other metals. Data are given for curing temperatures and times, surface preparation of the metals and bond properties. (K11, K12; Al, Cu-b, Cd, ST, Ta, NM-d34, 17-57)

483-K. Metal Honeycomb Costs Cut. Materials in Design Engineering, v. 53, May 1961, p. 19, 203.

Development of a roll welding process in which plates of corrugated metal cores are hot rolled and pressure welded simultaneously to cover sheets. (K5, F23, 1-66; 4-53)

484-K. Ultrasonic Welding Joins Stainless to Aluminum in Nuclear Power Plant. J. Koziarski and P. Dick. Materials in Design Engineering, v. 53, May 1961, p. 146-147.

Ultrasonic welding is used to produce joints which withstand 30-40 psi. gage air pressure and 1 atm. He pressure without leaking in a double shell having the inner skin composed of 321 stainless and the outer of 6061-T6 Al alloy. (K-general, 1-74; Al, SS)

485-K. Welding and Brazing of Refractory Metals. G. M. Slaughter. Society of Automotive Engineers, Paper no. 340E, 1961, 5 p.

Procedures for welding and brazing refractory metals and Be taking into account problems of transition temperature, reactivity with impurities, recrystallization of parent material, porosity in welds and intermetallic formation and thermal expansion differences in brazing. 20 ref. (K-general; Be, EG-d37)

486-K. The Fabrication of High Thrust Lightweight Jet Engines. S. Weiss and D. E. Hacker. Society of Automotive Engineers, Paper no. 340F, 1961, 7 p.

Tig welding procedures for 17-7 PH and 410 stainless steels, Inconel W, A 286 alloy and other materials for use in lightweight jet engines. Data are given for stress endurance, tensile strength, yield strength and elongation. (K1d, T24b; Ni-b, SS, SGA-h)

487-K. (German.) Automatic Welding of Large-Size Tanks. Technica, v. 10, Mar. 31, 1961, p. 388.

Automatic welding of up to 22 mm. thick tank steel walls in a single operation by the "circomatic" welding process, combined inert-gas-slag welding at high speed, using two welding heads, with

CO_2 as the protective gas. (K1d, K6, T26q; ST, 17-57)

488-K. (German.) New Welding Processes. J. J. Chyle. Technica, v. 10, Mar. 31, 1961, p. 401-406.

Review of special welding techniques such as thermocompression welding (wires to semiconductors), diffusion welding (Au-plated Be-Cu alloy to Cu-plated Monel), electroslag welding of very thick steel and iron plates, electron welding of high melting metals (W, Mo, Be, Ta, Zr, Hf), welding by ionized gases at 2800-16500° C. and soldering of sandwich constructions. (K-general, K6, K7, 10-54; W, Mo, Be, Ta, Zr, Hf, Fe-b, ST, Ni-b, Cu-b, 8-62)

489-K. (French-German.) Welding of Aluminum. Fritz Meier. Aluminium Suisse, v. 11, Mar. 1961, p. 70-75.

Review of modern Al arc welding methods using nonmelting (tungsten inert gas welding, argon arc) and flash-off electrodes (metal inert gas welding) and Ar as protective gas. Design of welding equipment; mechanical properties of welds. (K1d, W29, 1-52, 10-54; Al)

490-K. (German.) Autogenous and Electric Fusion Welding. Technik und Betrieb, v. 13, Feb. 1961, Insert.

Review of fusion welding principles in terms of pressure welding where metals are heated to the plastic state and joined under pressure (e.g., hammer welding, spot welding, thermit pressure welding, resistance pressure welding) and autogenous and electrical fusion welding where metals are heated to the liquid state. (K-general, 10-54)

491-K. (German.) Novel Development in Ultrasonic Technology. Technik und Betrieb, v. 13, Mar. 1961, p. 41.

Use of ultrasonic spot, seam and butt welding in joining metal foils to plates, welding of thin sheets and bonding of metals of different melting points. Discussion of reaction mechanisms, applicability of the process and welding equipment design. (K6r, 10-64; 4-53, 4-56)

492-K. Development of an All-Welded Tubular Truss Core Sandwich. Bertram Klein. Aerospace Engineering, v. 20, May 1961, p. 22-23, 54-55.

Step by step fabrication of a structural stainless steel sandwich consisting of a tubular truss core and two chemical-milled skins, one of which is perforated to facilitate spot welding. (K3n; SS, 4-57)

493-K. Effect of Surface Resistance on Seam Welding Cold-Rolled Steel. J. A. Schiefferle and D. B. Tolly. Paper from "Porcelain Enamel Institute Forum, Proceedings". v. 22. Porcelain Enamel Institute, Inc., Washington 6, D. C., 1960, p. 41-42.

Mechanical sanding and light pickling are used to decrease the surface resistance of cold rolled steel in preparation for resistance welding. (K3p; ST)

494-K. (Czech.) Welding of Steel Castings. Jan Plachy. Slevarenstvi, v. 9, Feb. 1961, p. 56-57.

Survey on weldability, correct choice of electrodes, directions for preheating and heat treatment of weldments. Materials considered are a number of steels of the CSN4226, 4227, 4228, 4229 groups and CSNN2713 steel. (K9s; ST, 5)

495-K. How Planemakers Weld Thin, Curved Pieces. Steel, v. 148, May 22, 1961, p. 116-117.

Argon arc welding of stainless foil, Ti, Rene 41 and Armco PH 15-7 Mo. (K1d; Ni-b, SS, Ti, 4-56)

496-K. Rubber to Metal Bonding Needs No Primer, Adhesive. Steel, v. 148, May 22, 1961, p. 118.

New compound is applied to the metal surface under pressure to improve surface contact and to force out trapped air and volatiles which may degrade the rubber structure and bonding capacity. The rubber can be used for both ferrous metals and for nonferrous metals such as Al. (K11c; Al, Fe-b)

497-K. Inert-Gas Tungsten-Arc Spot-Welding for Missile Assemblies. W. P. McGregor. Machinery (London), v. 98, Apr. 19, 1961, p. 886-888.

Tig spot-welding of Atlas missile components composed of 301 and 321 stainless steels, Cu, Al, K-Monel, brass, Ti and Al alloys. Inert shielding gases are He and A. The weld quality is influenced by current density, arc length, number of cycles, gas coverage and flow, type of electrode and

its preparation, base metal preparation, back-up material and contact of mating surfaces. (K1d, T24e; Al-b, Cu-n, Ni-b, SS, Ti)

498-K. Fundamental Study of Weld Joint Behavior (Experimental Submarine Structural Materials: Evaluation of Cast HY-80). A. J. Babecki and P. P. Puzak. Report of NRL (Naval Research Laboratory), Apr. 1961, p. 39-41.

Comparison between wrought and cast HY-80 Ni-Cr-Mo alloy steel for optimum weldability and weldment strength properties by Charpy V-notch, Navy drop-weight and tensile tests at low temperature. Data are given for mechanical properties after various heat treatments. (K9s, Q-general, 2-63, 2-64; AY, 7-51)

499-K. Development of D-6-A Steel Rocket Motor Cases. George R. Sippel, George L. Vonnegut and Dean K. Hanink. Paper from "Symposium on the Testing and Evaluation of Materials for Solid Propellant Rocket Motor Casings". Report no. MAB-156-M. National Academy of Sciences, Washington 25, D. C., 1959, p. 273-304.

Tig welding, heat treatment, inspection and pressure testing of high-strength D-6-A alloy steel rocket motor cases. Development of instrumented bend test and correlation of bend test parameters with hoop burst strength of 24 in. diameter cases. Effect of tempering temperature. (K1d, J-general, Q-general, T2p, 2-64; SGB-a, TS, 17-57)

500-K. Switch to Semiautomatic Welder Speeds Railcar Assembly Work. M. H. Waggener. Iron Age, v. 187, May 25, 1961, p. 113-114.

Fabrication of railcar by arc welding steel structural shapes with inner shield semi-automatic squirt welder that has an 80% operating factor and can deposit a 1/4 in. fillet at up to 50 ipm. (K1, T23p; ST, 4-57)

501-K. Producing Brazed Honeycomb Panels for the B-70 Bomber. C. L. Pelton. Assembly & Fastener Engineering, v. 4, June 1961, p. 37-40.

Brazing PH-15-7 Mo stainless steel in an inert atmosphere to form honeycomb panels for aircraft structures. (K8, T24a; SS-e)

502-K. Seam Welder Joins Strip Quickly. Iron Age, v. 187, June 1, 1961, p. 78.

Resistance welding machine used together with a continuous annealing line. It moves in automatically joining the stainless steel strip for its trip through the furnace. (K3, J23; SS, 4-53)

503-K. Adhesive Bonding of Metals for Advanced Ordnance Applications. John J. Veliky. Feltman Research Laboratories. U. S. Office of Technical Services, PB 161863, Sept. 1960, 21 p. $. 75.

The practicability of bonding unusual metals such as Be, Cr, Au, Ag and U^{238} with two thermosetting adhesives, a polyester and a polysulphide-modified epoxy are explored. Two additional adhesives, a polyurethane and an epoxy polyamide are used with the uranium because of difficulties encountered in bonding to this material. (K12; Be, Cr, Au, Ag, U)

504-K. Adhesive-Bonded Rocket Cases. Samuel J. Dastin and Philip Rosenberg. SAE (Society of Automotive Engineers) Journal, v. 69, June 1961, p. 90-91.

Fabrication of rocket motor cases with higher resistance to internal pressure using overlapping rings of high-strength, H11 hot work die steel with bonding by a "composite" epoxy resin structural adhesive. Data are given for shear stress distribution as a function of load and flexibility. (K12, T2p, 3-66; TS-k, 17-57)

505-K. How They Made the Space Capsule. William Dubusker. American Machinist/Metalworking Manufacturing, v. 105, May 15, 1961, p. 130-132.

Fabrication of Project Mercury capsule from Ti sheets and Rene 41 alloy by resistance-welding, arc-welding and hot forming at 1000^{o} F. Fiberglass is used as thermal and electrical insulation. (K-general, G-general, T24e; SGA-h, Ti, NM-f, 17-57)

506-K. Mig Welder Boosts Arc Time. Frank Kopczyk. American Machinist/Metalworking Manufacturing, v. 105, May 15, 1961, p. 138.

Semi-automatic welding of Fe tractor radiator guards using the Dual Shield process which employs a flux-cored electrode wire and an arc shielded with CO_2. Both the electrode and the CO_2

are fed through a water-cooled welding gun at present rates governed by an electrical control unit. (K1d, 1-52, T3n; Fe-b)

507-K. New Brazing Method Cuts Honeycomb Production Time 80%. J. F. Cochran. Metalworking, v. 17, May 1961, p. 18-19.

Honeycomb sandwich steel panels are brazed in an electrical resistance-heated fixture equipped with a bottom platen, a pressure box acting as the upper platen and an atmosphere barrier that protects the work from contamination. The fixture is also used for aging operations. (K8, 1-52; ST, 7-59)

508-K. Arcspots Speed Auto Body Production. Steel, v. 148, May 15, 1961, p. 149.

Consumable electrode spot welding of auto bodies by a process using a burnback control unit to eliminate problems of the electrode freezing in the molten pool and electrode burnback into the gun. (K3n, T21a)

509-K. Welding Plastic-Coated Steel Sheet. Sheet Metal Industries, v. 38, May 1961, p. 330, 358.

Steel sheet covered with polyvinyl chloride is projection-welded using a high-current short-duration pulse to form the weld without disturbing the plastic coating. (K3q; ST, 4-53, 8-70)

510-K. Automatic Large-Diameter Pipeline Welding. Canadian Welder, v. 52, May 1961, p. 28, 30.

CO_2 shielded arc welding of large diameter transmission pipe line in a fixed position in the field using a welding machine with a rotating head. No grinding or cleaning is required for the joints after welding. (K1d, T26r)

511-K. Plasma Arcs Set for Full Production Role. Steel, v. 148, May 29, 1961, p. 70-72.

Description of plasma arc torches. Application in cutting 4 or 5 in. ferrous and nonferrous metals at speeds up to 300 ipm., plating missile and rocket parts, surfacing and welding all metals at speeds comparable to those of standard Mig and Tig arc welding processes. (K6)

512-K. Automatic Arc Welding. J. R. Morgan. New Zealand Engineering, v. 16, Apr. 15, 1961, p. 142-146.

Advantages of automatic welding, especially submerged arc and open arc processes. Applications of automatic arc welding in constructional steelworking, sheet metal fabrication, hardfacing and welding of pressure vessels. Use of manipulators and positioners. (K1, T29n; ST, 4-57)

513-K. Friction Welding Behind the Iron Curtain. Machinery, v. 67, May 1961, p. 108-113.

Characteristics and technology of the friction-welding process. Influence of speed of rotation, preheating pressure and upsetting time on welding operations. Relationship between mechanical properties of weld and amount of upset. Design and automation of friction-welding machines for processing alloy and carbon steels, Al, Cu, bronze, brass and Ti. (K6; ST, Al, Cu-b, Ti)

514-K. Thin Gage Butt Welding "Grows Up". Gilbert C. Close. Mill & Factory, v. 68, June 1961, p. 89-90.

Thin gage butt welding and weld seam roll planishing of stainless steel sheet and screen to produce tubing, honeycomb and centrifuge screens with seam tolerances to 0.002 in. (K-general, K5j; SS, 4-53)

515-K. Review of Recent Developments in Metals Joining. J. J. Vagi, H. E. Pattee, H. W. Mishler, R. E. Monroe and R. M. Evans. Defense Metals Information Center, Battelle Memorial Institute, DMIC Memo. 109, May 25, 1961, 5 p. (Available as PB 171628 from U. S. Office of Technical Services, Washington 25, D. C.)

Flash welding, electron beam welding, inert gas shielded welding with tungsten arc, resistance spot welding, brazing and adhesive bonding of Mo-0.5 Ti alloy, F-48 Cb alloy, FS-82 Cb alloy, Cb-33 Ta-0.7 Zr alloy, Ta alloy, Ta, Mo and W. Testing at temperatures to 3200° F. to determine bend ductility and shear strength. 9 ref. (K-general; Cb-b, Mo, Ta, W)

516-K. Mechanical Properties of Molybdenum Welds Below 700° F. R. E. Pavlak, M. Christensen and A. L. Lowe, Jr. Welding Journal, v. 40, May 1961, p. 197s-201s.

Inert-gas-shielded tungsten arc welding of Mo and Mo alloyed with 0.5% Ti

to Mo and to low-alloy steels. Tensile strength and ductility of butt and lap joints in the temperature range 70-700° F. Microstructure of joints. 16 ref. (K1g, Q27, Q23p, M27; Mo, AY, 7-51)

517-K. A Solution Adopted in Some Difficult Applications of Flash Welding. Evert Bylin. Welding Journal, v. 40, May 1961, p. 229s-240s.

Investigation of flash welding with automatically controlled motor-operated upsetting as employed for joining flanges to centrifugally cast iron pipes and creep and heat resisting Ni alloys with the basic analysis of 50-70% Ni, 20% Cr, 0-20% Co, 5% Fe and 5% Al + Ti + Si. Influence of welding conditions on structure and UTS of the welds. 3 ref. (K3r, 1-52, M26, Q27; CI, 4-60, Ni-b, Cr, Co)

518-K. Pittsburgh Public Auditorium--Retractable Roof. E. Cohen and R. H. Goldsmith. Welding Journal, v. 40, May 1961, p. 501-516.

Design of cantilever space frame, movable leaves and rain-girder of dome-like auditorium roof with special attention to utilization of welded components and connections. Visual, radiographic and ultrasonic inspection of semi-automatic submerged arc and manual arc welded components. (K1, T26n, 17-51, S13; ST. 7-51)

519-K. Resistance Autobrazing of Wires to Intermetallic Thermoelectric Materials. W. A. Owczarski. Welding Journal, v. 40, May 1961, p. 517-521.

Process permits joining of metallic probes to compound thermoelectric materials and is characterized by self-melting of one base metal and wetting of second base metal to complete joint. Fe, chromel, alumel and Pt probes are joined to PbTe, Bi_2Te_3 and ZnSb. (K6q; Fe, Pt, Ni-b, Cr, Al, 4-61, 14-68)

520-K. A Welded Tubular-Bucketed Turbine Wheel. E. J. Clark. Welding Journal, v. 40, May 1961, p. 522-528.

New concept in turbine wheel design incorporates buckets formed from 0.01 in. thin-walled, age hardenable Ni alloy tubing which are welded to the wheel using the tungsten arc process. Development of welding procedures. Performance tests. (K1g, T7h; Ni-b, 4-60, 17-57)

521-K. Welded Steel Office Buildings. John F. Gulley. Welding Journal, v. 40, May 1961, p. 529-530.

Arc welding of steel structures. Emphasis on beam-to-column welded connections. (K1, T26n)

522-K. Stainless Steel Coil Permits Internal Cooling of Unique Welder Ignitron With Help of Tungsten-Arc Welding. Welding Journal, v. 40, May 1961, p. 530-531.

Forming of 304L stainless steel tubing into coils for water-cooled, Hg-pool vacuum tubes designed especially for welder control and similar a-c. control operations. Tungsten-arc welding is used to close one end of coils after winding and to join coil to cold rolled steel plates on the ends of the ignitron tube. (K1g, G6, W29c; SS, 4-60, 17-57)

523-K. Savings Made in CO_2-Shielded Welding. Foundry, v. 89, June 1961, p. 189-190.

Substitution of CO_2 for argon as a shielding agent in semi-automatic repair welding of steel castings. Analysis of welding quality and process cost. (K1d; ST, 5)

524-K. Factors in Joint Design Using Adhesives for Metal Bonding. H. R. Butzlaff and K. F. Charter. American Society of Mechanical Engineers, Paper no. 61-MD-14, 1961, 9 p. $1.

Effect of metal thickness, overlap and impact resistance on the ability of bonded lap joints to carry a load. Temperature, bond film thickness, joint geometry, time and loading, as they affect adhesive shear strength of mild steel, Al, Alclad and Dural test specimens. 19 ref. (K12; Al, CN)

525-K. Impact of Recent Developments in High-Strength Steels on Structural Design and Fabrication. Pt. 2. Design and Fabrication. R. H. Marvin. American Society of Mechanical Engineers, Paper no. 61-MD-8, 1961, 12 p. $1.

Evaluation of strain hardening and precipitation hardenable steels in practical structural designs. Determination of the uniaxial tensile strength-to-density ratio and elastic stability of

sandwich specimens of 301 stainless steel, 17-7 PH, PH 15-7 Mo and AM-355 steels fabricated by resistance and fusion welding. (K3; ST, SGB-a)

526-K. Stud Welding by Capacity Discharge. Light Metals, v. 24, May 1961, p. 143-144.

Ferrous and nonferrous small diameter studs are welded to plates by a capacity discharge. Process advantages and applications are noted. (K1f)

527-K. Seam-Welding Stainless-Steel Foil. W. A. Owczarski and R. E. Beach. Machinery, v. 67, June 1961, p. 106-109.

304 stainless steel foil, carbon steel, brass and Pt in thicknesses ranging from 0.002-0.006 in. are seam welded by using the proper current control and a modified bench-model spot welder. (K3p; SS, 4-56)

528-K. You Can--Flash-Weld Aluminum to Copper If You Have the Proper Tools. C. Dana Moore. Machinery, v. 67, June 1961, p. 144-147.

Al is flash welded to Cu using a welding machine which synchronizes the heat and force cycles and equates the differences in the conductivity of the two metals. The electric current produced is intense and synchronized with extreme accuracy. (K3r; Al, Cu)

529-K. (Italian.) Welding of Stainless Steel. Pt. 2. l'Acciaio Inossidabile, v. 28, Jan-Feb. 1961, p. 9-17.

Arc welding of 393 M and 249 M steels containing 13-17% Cr and 453 E, 832 MV and 254 E austenitic steels containing 18-26% Cr and 5-20% Ni. Thermal expansion, thermal conductivity and electrical resistivity as a function of composition. Effect of Ti addition on carbide precipitation. Directions for welding and subsequent descaling, mechanical polishing and sand blasting. (K1, P11, P15g, N7b, 2-60; SS)

530-K. Adhesives for Fabricating Speed Capsules. Harold H. Rosenbaum. Metal Progress, v. 79, June 1961, p. 80-85.

Adhesives are used extensively during construction of the capsules for the Convair 990 to bond components to the honeycomb floor panel and to seal all joints, thus forming a leak-proof tank for fuel. Added bonus is greater strength than obtained by using riveted construction alone. (K12, T24)

531-K. Testing Ceramic-Metal Brazes. J. Patrick Sterry. Metal Progress, v. 79, June 1961, p. 109-111.

The results of preliminary tensile and shear tests of ceramic-metal brazes show that the technique has a good potential for critical missile structures such as radomes. However, much work remains to be done before the method can achieve status as a standard practice. (K11b, K8, Q27, Q2)

532-K. Corrugated-Core Sandwich Construction. Metal Industry, v. 98, May 26, 1961, p. 413.

Production of corrugated-core sandwich construction from 2014 Al alloy, B 120 VCA Ti alloy, A-55 Ti, steel, Mo and Inconel sheet by roll welding, a process utilizing hot rolling to pressure weld the peaks of the corrugated metal core to the cover sheets. (K5j; Al-b, Mo, Ni-b, ST, Ti-b, 4-57)

533-K. Large Aluminum Heat Exchangers for Cryogenics Field Dip Brazed in Huge Salt Bath Furnace. Industrial Heating, v. 28, May 1961, p. 884-886, 888.

Dip brazing of Al heat exchanger cores with 22,000 sq.ft. of heat transfer surface. Equipment and procedure. (K8n, W13b, 17-57; Al)

534-K. Now. . . It's Explosive Welding. Metalworking Production, v. 105, May 24, 1961, p. 75.

Description and mechanisms of explosive welding. Present application for Al and steel plates. Effect of explosive welding on hardness values. Possible application in cladding of chemical vessels and piping. (K6, NM-k34; Al, ST, 4-53)

535-K. Stainless Welds Simplified. Steel, v. 148, June 5, 1961, p. 98-99.

Production of tough, ductile joints in austenitic stainless steels using arc and resistance welding and brazing techniques. (K1, K3, K8; SS-e)

536-K. Welding Zircalloy Tubing, Fin at Hanford Employs High Frequency Resistance Method. Western Metalworking, v. 19, May 1961, p. 28-29.

Process for welding Zr alloy tubing utilized in the fabrication of nuclear reactors by a resistance weld technique in which current reverses at 450,000 cps. and follows a low inductance path. Tubing, strip, channels, fins or ribs and T sections can be welded. (K3; Zr-b, 4-60)

537-K. Vacuum Process Solves Nuclear Weld Problem. Western Metalworking, v. 19, May 1961, p. 31.

Electron beam vacuum welding of nuclear fuel elements. Heated tungsten filaments (to 4150° F.) emit electrons which are then focused as a beam on the metal. Electron kinetic energy converts to heat resulting in melting and fusing. (K6, 1-73, T11g)

538-K. Roll Welding Method for Corrugated Core Panels. Western Metalworking, v. 19, May 1961, p. 45-48.

Roll welding process for producing metal corrugated-core sandwich panels. Hot rolling pressure welds the peaks of the core to cover sheets. (K5j; 4-57)

539-K. (Dutch.) Electron Beam Drilling and Welding. H. Huizing. Metaalbewerking, v. 26, Nov. 24, 1960, p. 208-210.

Electron drilling and welding of W, Mo, Ta and high-alloy steel sheet. Energy supplied per surface unit. Smallest surface to which the electron beam can be limited is 0.01 sq. mm. Apparatus. Structure of weldments. (K6, G24; Mo, SS, Ta, W)

540-K. Fundamentals of Resistance Welding. F. A. Bodenheim. Porcelain Enamel Institute Forum, Proceedings, v. 22, 1960, p. 34-40.

Review of process variables including current and resistance parameters and design of transformers and timers. Application of equipment in spot, projection, seam and butt and flash-butt welding. (K3, 1-52, 10-54)

541-K. Bi-Metallic Pipe. Dan Christopher. Mechanical Engineering, v. 83, June 1961, p. 68-71.

Electric arc and inert gas welding of bimetallic tubing consisting of carbon steel base material with thin Al, Zr, Ti, Cu, Monel, Ta, Ni, Inconel or 304, 316, 321, 347 stainless steel liners. Evaluation of corrosion resistance, stress-strain relationships, tensile modulus of elasticity, yield point, heat transfer, coefficient of thermal expansion and effects of applied pressure. 7 ref. (K1, P-general, Q-general; CN, Al, Zr, Ti, Cu, Ta, Ni-b, SS, 4-60, 8-62, 17-57)

542-K. Inclusions Are Eliminated in Upside-Down Welding. Steel, v. 148, June 19, 1961, p. 94.

Inclusions are eliminated during production of stainless steel, Ti and Zr tubing for reactor use by an upside-down welding process in which the contaminating tungsten flows downward because the electrode is under the work. (K1d; SS, Ti, Zr, 4-60)

543-K. (Spanish.) Flash Welding of Light Alloys. Jose Manuel and Gomez Martinez. Ciencia y Tecnica de la Soldadura, v. 10, Nov-Dec. 1960, p. 5-511, 1-15.

Experimental determination of the constants of Al-Mg alloys. Influence of butt welding on mechanical properties of Al and Al-Mg alloys. Welding equipment and applications. 9 ref. (K3r, Q-general, W29, 17-57; Al, Mg)

544-K. Friction Welding. Australasian Manufacturer, v. 46, May 13, 1961, p. 44-47.

Method and technology of friction welding for high-speed and carbon steels, 18-8 steel, Al, Cu, bronze, brass and Ti. Power consumption, friction moment, speed, pressure and volume of upsetting during a welding cycle. Relationship between amount of upsetting and tensile strength for friction welded high-speed and carbon steel. (K6; Al, CN, Cu-b, SS, TS-m, Ti)

545-K. Welding Is Adaptable. Engineering Materials and Design, v. 4, June 1961, p. 346.

Welding of ferrous metals, Al, Mg, and Cu by various techniques including argon arc. Applications in design and engineering, maintenance and repair. Mechanical repair of castings by stitching of metal. (K-general, K1d, 18-72; Fe-b, Al, Mg, Cu)

546-K. Stud Welding to Thin Sheet. Engineering Materials and Design, v. 4, June 1961, p. 370.

Capacity discharge stud welding utilizing a large bank of capacitors

and a power pack to recharge them. The advantage claimed is the use of single-phase current where three-phase is not available or convenient. Application to welding studs or attachments to thinner plate than is feasible by conventional arc stud welding. (K1f)

547-K. Adhesive Bonding of Metals--What Are Design Factors. Iron Age, v. 187, June 15, 1961, p. 110-112.

Lap, bevel and bonded joints of phenolic and epoxy adhesives to Al and mild steel. Overlap, thickness and joint design affect lap joint strength. Peeling stresses combined with effects of differential straining reduce strength of lap joints. (K12; Al, CN)

548-K. (French.) Soldering and Brazing of Copper and Its Alloys. Pt. 4. Cuivre, Laitons, Alliages, no. 60, Mar-Apr. 1961, p. 3-10.

Furnace induction, resistance, dip and fused bath brazing of carbon and alloy steel and Cu and brass. Use of solders containing Cu, Ag or P and methods of application. (K7, K8; Cu-b, ST, SGA-f, 17-57)

549-K. (Book-French.) Metallurgy of Steel Welding. D. Seferian and P. Chevenard. 1959. 393 p. Dunod, 92, Rue Bonaparte, Paris 6e, France.

Review of principles and technological parameters of gas, arc, resistance and other welding processes. Transformations, phase constitution and microstructures observed in weldments; gas absorption and causes for cracking. Weldability tests and factors influencing the weldability of carbon, austenitic, low-alloy and chromium-molybdenum steels. (K-general, 10-54; ST)

550-K. Wanted: Welds With 100,000-PSI Yield Strength. Welding Design and Fabrication, v. 34, May 1961, p. 48-49.

Techniques and materials employed in the welding of high strength, heat treated structural alloy steel. Use of low-hydrogen electrodes for manual butt welding as well as automatic welding using a mild steel flux. Inspection by magnetic particle and radiography methods. (K1; AY, SGB-s)

551-K. Automatic Welding Solves 5 Problems. Welding Design and Fabrication, v. 34, May 1961, p. 56.

Automatic butt welding of duct work of galvanized and hot rolled steel, stainless, Cu, Al and Monel eliminates tacking and distortion, improves weld quality and increases welding speed. (K-general; Al, Cu, Ni-b, ST)

552-K. CO_2 Plug Welding Is 95% Faster. Michael Bender. Welding Design and Fabrication, v. 34, May 1961, p. 58.

Decrease in welding time and improvement of weld quality in semi-automatic CO_2 plug welding of steel using flux-cored electrodes. Smaller holes may be punched rather than drilled. (K1d; ST)

553-K. One Hundred Fixtures Speed Welding of Aluminum Trailers. Welding Design & Fabrication, v. 34, June 1961, p. 36-37.

Welding of 6061, 2024 and 17 MT5 Al alloys fixtures to trailers using water or air cooled semi-automatic welding guns. Weld penetration and porosity are improved by the 25/75 helium-argon mixture used to shield the weld. Finished weldments are inspected using a dye penetrant. (K1d; Al-b)

554-K. Is There a Future for Friction Welding. Welding Design & Fabrication, v. 34, June 1961, p. 42.

Friction welding of a variety of materials including carbon, alloy and stainless steels, brass, Al, Cu, Zr and plastics. Friction welds are formed by revolving or oscillating two metal, ceramic or plastic objects against each other under pressure until the rubbing surfaces become fluid. The objects are then held rigidly under pressure and bond on cooling. (K6; Al, AY, CN, Cu-b, SS, Zr)

555-K. Load Design Means Faster Low Cost Resistance Welding. Simon Fisher. Welding Design & Fabrication, v. 34, June 1961, p. 47-49.

Resistance welding with emphasis on design in seam welding. Design is of particular importance since a poorly designed form can shunt the current necessary to form the weld away from the area to be welded. (K3, 17-51)

556-K. Automatic Welder Makes Stainless Honeycomb. G. Jewett Crites. Metalworking Production, v. 105, May 31, 1961, p. 57, 59.

Production of stainless steel core up to 6 in. thick and within ±0.001 in. tolerance

by process involving insertion of Cu electrodes between strips of stainless steel fail for progressively joining cells at nodes. (K1; SS, 4-57)

557-K. (German.) The Electro Slag Welding Process. W. Krieweth. Elektor-Anzeiger, v. 14, Apr. 26, 1961, p. 113-120.

Review of electro slag welding in terms of reaction mechanism. Welding technology such as materials used, characteristic electrical data and welding efficiency. Applications including welding of a turbine shaft and of a thick-walled (100 mm.) steel drum. Mechanical strength of welds. (K6, T7h; ST)

558-K. Percussive Welding Does the Finest Work. W. A. Owczarski and A. J. Palmer. American Machinist/Metalworking Manufacturing, v. 105, June 12, 1961, p. 114-116.

Two dissimilar metals are brought together rapidly; before meeting the approaching surfaces are melted by an arc powered by a capacitor bank, then the molten surfaces are squeezed by collision and metal is forced to sides of joint. Description of a shop-made percussive welder. Tests conducted on chromel-alumel, Cu-Nichrome, Cu-Type 304 plate, Th-Th and Th-Zircaloy-2. (K3a; Al-b, Cr-b, Cu-b, Ni-b, Th, Zr-b)

559-K. A Coated Electrode for Fusion Welding AISI 4340 Steel for Ultra High Strength Applications. E. F. Deesing. Welding Research Council, Bulletin Series, no. 68, Apr. 1961, p. 1-7.

Evaluation of four welding electrodes with core wires of rimmed steel or 4340 steel and coatings of TiO_2 or lime base. Compatibility of weldmetal deposited by these electrodes and AISI 4340 steel heat treated to ultra-high strength levels. Base metal-weldmetal compatibility is based on chemical composition, hardenability, response to heat treatment, microstructure and tensile, impact and fatigue properties. (K1, W29h; ST)

560-K. (German.) Temperature, Material Transfer and Physical Properties of Slags of Unalloyed Electrodes. W. Hummitzsch. Schweissen und Schneiden, v. 13, May 1961, p. 187-195.

Study of physical parameters of welding with unalloyed electrodes including measurement and estimation of arc temperature and heat balance for electrodes, mechanism of material transfer from electrode to weld and physical properties of slags including specific weight, viscosity, surface tension, thermal expansion, thermal conductivity, specific heat, microstructure and hardness. (K1g, W29h)

561-K. (German.) Material Transfer and Shape of Liquid Welding Drop in the Welding Arc. R. Faulstich. Schweissen und Schneiden, v. 13, May 1961, p. 201-204.

Cinematographic investigation at 6500 exposures per sec. frequency of material transfer and shape of welding drop in welding operations including manual open-arc welding, overhead with lime basic electrode, Mig welding with Ar as protective gas using austenitic and ferritic feed wire, shielded arc welding using CO_2 as inert gas and ferritic uncoated, folded and grooved wire. (K1, K9n; ST)

562-K. Projection Welding Best for Spot Work. Harry Thomasson. Canadian Metalworking, v. 24, June 1961, p. 38-41.

Comparison of projection with spot welding in terms of production cost, dimensional accuracy, uniformity of weld and electrode life. Application in joining stamped, drawn or pressed steel parts. (K3m, K3q; ST)

563-K. What's Happening at Mines Branch Will Benefit All Welding Shops. W. P. Campbell. Canadian Metalworking, v. 24, June 1961, p. 41-43.

Review of welding research projects including induction welding of piping, butt welding of reinforcing bars and tin-bronze castings, properties of mild steel weld metal, weldability testing of high-strength alloy steels and steels containing uranium. Weldability production from steel composition, behavior of the cruciform test for weldability and influence of arc strikes in initiating brittle fractures in steel. 4 ref. (K-general, 10-54; Cu-b, ST)

564-K. Enterprise in South Wales. Welding and Metal Fabrication, v. 29, June 1961, p. 236-246.

Operation and equipment for welding fabrication of metal furnaces, flame deflectors, ingot casting machines, ingot pushers, skips, hydraulic presses, grinding machines, tube stills, coolers and structural work composed of steel. (K-general, W-general; ST)

565-K. Low Alloy Steel Welding. E. Freeth. Welding and Metal Fabrication, v. 29, June 1961, p. 252-255.

Preheating, welding and heat treating of low-alloy steel plate. Control of cracks due to laminations and segregates, brittle phases produced during the welding cycle and diffusion of hydrogen. (To be continued.) (K-general, K9, 9-69, 9-72; AY)

566-K. Explosive Welding. Welding and Metal Fabrication, v. 29, June 1961, p. 259-261.

Bonding of similar and dissimilar materials including Al, steel, Inconel, stainless steel, Cu, Ti, Zr, ceramics, cermets and plastics by high energy techniques. Other applications of the process include forming of brazed laminates and work hardening by using the blast. (K6; NM-k34, 17-57, Al, ST, Ni-b, Cu, Ti, Zr, 6-70, NM-f)

567-K. Fusion Welding of Titanium and Its Alloys. Pt. 4. W. G. Hull. Welding and Metal Fabrication, v. 29, June 1961, p. 262-266.

Weldability and mechanical properties of alpha and beta phase Ti sheets. Effects of various alloying elements on quality of welds produced by arc, gas and resistance welding. 45 ref. (K-general, K9; Ti-b)

568-K. CO_2 Welding Gets Quality Tag. Steel, v. 148, July 3, 1961, p. 58-59.

Results of research on the CO_2 weldability of stainless, alloy and mild steels and other materials, behavior of alloying elements during welding, ways of avoiding severe oxidation and effect of CO_2 on the mechanical properties of the weld. (K1d; ST)

569-K. Progress in Brazing. Digest of "Report on Several Papers on Brazing Presented at the 42nd Annual Meeting of the American Welding Society, Apr. 1960, New York, N. Y.". Metal Progress, v. 80, July 1961, p. 132, 134, 136.

Covers exothermic brazing, joining of refractory metals and ultrahigh-strength steels, techniques for using inert gases and studies of penetration and base metal erosion during brazing. (K8; ST, SGB-a, EG-d37)

570-K. CO_2 Welding Triggers Output. Iron Age, v. 187, July 6, 1961, p. 80-81.

Applications of CO_2 process in welding control arms for wheel suspension systems in passenger cars, storage tanks, truck frames and machine parts. (K1d)

571-K. The Role of Stud Welding in Product Design. Frank Wille. Assembly & Fastener Engineering, v. 4, July 1961, p. 24-27.

Stored energy percussive stud welding of carbon steels, stainless steels, leaded free brass, electrolytic Cu and Al alloys. Application in attaching threaded studs to panels. (K1f; Al-b, Cu-b, CN, SS)

572-K. Flame Soldering Technique for Multi-Row Aluminum Coils. Assembly & Fastener Engineering, v. 4, July 1961, p. 37.

Joining of return bends of Al tube in multi-row coils using an automatic Zn soldering technique. (K7; Al, 4-60)

573-K. Factors in Joint Design for Adhesive Bonding. Kenneth F. Charter and Harry R. Butzlaff. Assembly & Fastener Engineering, v. 4, July 1961, p. 28-32.

Shear strength, stress-rupture strength, impact resistance, load-carrying ability and corrosion resistance of adhesive bonds used for joining steel and Al. Effect of adhesive composition, bond film thickness, overlap and other joint design variables. (K12; Al, ST)

574-K. Positioning--Better Welds in Less Time. Welding Design and Fabrication, v. 33, Dec. 1960, p. 33-34.

Examples of positioners for manual and automatic welding to improve speed, quality and uniformity of welds. (K9)

575-K. How to Design a Welded Roll. Welding Design & Fabrication, v. 33, Dec. 1960, p. 47-49.

Determination of hub weld size by using standard bending and tension formulas. Examples and illustrations. (K9n)

576-K. Automatic Line Combines Resistance Welding With Forming and Piercing. Thomas C. Falter. Welding Design & Fabrication, v. 33, Dec. 1960, p. 62-64.

Assembly line schematic and tooling for fabrication of refrigerator condenser assemblies in one continuous automatic operation. (K3, G17, F26q, 1-52, T10c)

577-K. Northrop Brazes Honeycomb Panels in 15 Min. Welding Design & Fabrication, v. 33, Dec. 1960, p. 66-67.

New process which uses heat from banks of radiant quartz lamps replaces furnace brazing methods of fabricating panels from stainless steel, Ti, Cb and Mo. (K8; SS, Ti, Cb, Mo, 7-59)

578-K. Should You Switch to Automatic Arc Welding? Welding Engineer, v. 46, June 1961, p. 41-43.

Advantages, limitations and applications of automatic submerged arc, Mig, Tig, electroslag and electrogas welding. (K1, K6, 18-74)

579-K. Space Age Requirements Spur Resistance Welding Innovation. Welding Engineer, v. 46, June 1961, p. 54-55.

Joining of stainless steel strips up to 0.016 in. diameter to stainless sheet of thickness up to 4:1 ratio. Process includes applying welding electrode under heavy pressure at spot to be joined and continuing electrode contact pressure until weld nugget is sufficiently cooled. (K3; SS, 4-53)

580-K. Welding Will Replace Mechanical Fasteners in the Aerospace Industries. Welding Design & Fabrication, v. 34, Apr. 1961, p. 47, 89.

Trends and requirements of the aerospace industries. Automation and built-in sensing devices. Brazing. (K-general, 18-74, T24; SGA-h, SGB-a)

581-K. The Right Way to Join Dissimilar Metals. Jay Bland. Welding Design & Fabrication, v. 34, Apr. 1961, p. 56-58.

Welding, brazing and braze welding pressure-tight joints in dissimilar metals. Techniques for avoiding failure in dissimilar-metal welds. (K-general, K8)

582-K. MIG Spot Welding of Aluminum Is In: Riveting Is Out! Welding Design & Fabrication, v. 34, Apr. 1961, p. 64, 66, 68.

Elimination of layout, drilling, punching and bolting by Mig spot welding of nonstructural Al products. (K1d; Al)

583-K. Will Your Next Car Have a One-Piece Brazed Stainless Steel Block? Scholer Bangs. Welding Design & Fabrication, v. 34, Apr. 1961, p. 70, 75.

Stainless steel stampings are furnace brazed to make a single-unit block including cylinders and head for a 175 hp. water-cooled 4-cylinder engine. (K8j, T21b; SS, 4-59, 17-57)

584-K. The Plasma Arc Can Now Be Used for Welding and Weld Surfacing. R. M. Gage. Welding Design & Fabrication, v. 34, Apr. 1961, p. 76-78, 80.

Principles of plasma arc welding, heat transfer, transferred and nontransferred arc torches. Plating, cutting, welding and weld surfacing operations with high-strength materials and refractory metals. (K1, L24; SGB-a, EG-d37)

585-K. Electronic Brain Controls Welding of Unitized Bodies. Welding Design & Fabrication, v. 34, Apr. 1961, p. 82-83.

Electronic scanner controls 24 welding machines in the spot welding of automobile rail and floor pan assemblies. Scanner permits only one machine to operate at a time and assures each machine the same amount of current when it welds. (K3n, T21a, X14)

586-K. Designers! Don't Overlook On-The-Job Stress Relieving. Otto Kreisel. Welding Design & Fabrication, v. 34, Apr. 1961, p. 85-87.

Electrical resistance and induction heating elements are used in preheating and stress relieving high carbon and alloy steel thick wall weldments for high temperature and pressure applications. (K9q, J1a; CN, AY, 7-51, 17-57)

587-K. CO_2 Welding: A Stronger, Lighter Building. Welding Design & Fabrication, v. 34, Apr. 1961, p. 88.

Deep penetration by this process requires fewer passes and less weld metal. Process produces joints that resist dead, live and wind-loading, reduces or eliminates edge separation and permits use of small joint openings. (K1d, T26n)

588-K. (Italian.) Electroslag Welding. Macchine, v. 16, May 1961, p. 517-525.

Steel sheets and plates of 50-350 mm. thickness are welded using 1-3 electrodes at a velocity of 0.87-1.21 meters/

hr. Composition of fluxes used to prepare the slag bath. Design of joints. (K6; ST, 4-53)

589-K. Is Habit Needlessly Increasing the Cost of Out-of-Position Welding? J. E. Hinkel. Welding Journal, v. 40, June 1961, p. 605-609.

Welding techniques, process parameters and weld quality are evaluated for using E-XX 18 powdered, low-hydrogen electrodes in arc welding steel plate in horizontal, vertical and overhead positions. Effects of joint level, plate thickness and preheating conditions. Cost comparison with use of E-XX 10 electrodes. (K1, W29h; ST, 4-53)

590-K. "Wide Gap" Brazing for High-Temperature Service. P. R. Mobley and G. S. Hoppin. Welding Journal, v. 40, June 1961, p. 610-617.

Development of Cu and Ni alloys capable of brazing joint with gaps up to 0.06 in. Application with furnace brazing techniques in fabrication of 321 stainless steel, Inconel X and L 605 Co base alloy jet engine components suitable for operation in the 1500-1800° F. range. Microstructure and elevated temperature shear strength of brazed joints. (K8j, K9, T24b; SS-e, Ni-b, Co-b, SGA-h, Cu-b, SGA-f, 17-57)

591-K. Enclosed Welding Technique Applied to Welding of Reinforcing Bars. W. P. Campbell. Welding Journal, v. 40, June 1961, p. 629-633.

Evaluation of the technique by visual, radiographic and metallographic examinations and by bend and tensile tests of weldments. Effect of hydrogen producing potential of the electrodes on weld quality. (K1, K9; ST, 4-55)

592-K. Metalworking Progress Report: Square-Butt Welding of Aluminum. Welding Journal, v. 40, June 1961, p. 634-635.

Square butt or high current welding by an inert gas arc shielded process of edges of 1 1/4 in. thick 6061 Al alloy cylinders at less total heat input, fewer passes and increased speeds. (K1d; Al-b, 4-53)

593-K. Welding of an Ultra-High Strength Steel for Missile Motor Cases. J. F. Rudy, J. I. Fisher, J. P. Sheehan, F. Suyama and H. Schartzbart. Welding Journal, v. 40, June 1961, p. 241s-252s.

Behavior of Tig welded joint in 0.08 in. thick 300 M alloy steel under uni-axial loading, transverse and parallel to direction of welding and under bi-axial loading. Tensile properties after various heat treatments, surface decarburization and cold rolling. (K1d, K9, Q27, T24e, 2-64, 3-68; AY, SGB-a)

594-K. Weldability Prediction From Steel Composition to Avoid Heat-Affected Zone Cracking. K. Winterton. Welding Journal, v. 40, June 1961, p. 253s-258s.

Review of formulas available for prediction of the weldability in terms of composition with derivation of new formula, based on the end of transformation temperature in the austenite-martensite transformation, for the calculation of equivalent carbon content. Correlation of carbon equivalent with heat affected zone cracking and with weldability data for high-strength steels. 24 ref. (K9s, N8, 2-60, 9-72; AY, SGB-a)

595-K. Welding Techniques Boost Shipbuilding at Whyalla. Australian Mechanical Engineering, v. 48, May 5, 1961, p. 37-41.

Development of techniques for fully welded ship construction. Submerged and visible arc welding methods, plate preparation, prefabrication, handling and radiography. (K1, K9p, S13e, T22)

596-K. (German.) Welding of Austenitic Steels. Herbert Krainer. Schweisstechnik, v. 15, May 1961, p. 54-59.

Review of welding processes including autogenous, arc, Tig, Sigma, Mig and resistance welding and welding defect occurrence with emphasis on intercrystalline corrosion, stress cracking and hot tearing in joining conventional austenitic steel types. (K1, 9-71, 9-72, SS-e)

597-K. Welding and Joining--New Applications of Explosives. L. Zernow, I. Lieberman and W. L. Kincheloe. Tool and Manufacturing Engineer, v. 47, July 1961, p. 75-78.

Theory and use of explosives and tooling required in welding and joining of Al, Al alloy and low-carbon steel. (K-general, NM-k34; Al, CN)

598-K. The Welded Maidenhead Bridge. Gilbert Roberts. British Welding Journal, v. 8, June 1961, p. 291-309.

Design, fabrication, erection and welding details. Bridge is made of reinforced concrete and high-tensile steel. (K-general, T26p, 17-51; ST)

599-K. Weldability of Aluminum. G. Westendorp. British Welding Journal, v. 8, June 1961, p. 310-315.

Weld porosity and reduction in strength caused by welding heat. Use of dry argon atmosphere for reducing porosity. (K9s; Al)

600-K. Temperatures in Spot Welding. J. A. Greenwood. British Welding Journal, v. 8, June 1961, p. 316-322.

Calculation of temperature distribution and temperature cycle of a particular point after various welding times, assuming no contact resistance, constant material properties and no surface loss of heat. 4 ref. (K3n, K9n)

601-K. Simple Jointing Methods for Aluminium Busbar. F. G. McDonald. Light Metals, v. 24, June 1961, p. 170-172.

Welding, bolting, clamping, insulating and screening operations on D50S Al alloy in fabrication of conductors of various shapes and sizes for use in a large power station. (K1d, K13, T1; Al-b)

602-K. The Reclamation of Diesel Locomotive and Rolling Stock Wheels by Welding. R. G. Kirk. Australasian Engineer, v. 52, Apr. 1961, p. 46-49.

Submerged-arc welding of preheated worn solid-disk wheels and tire wheels of Class "E" steel with an automatic welder using mild steel electrode wire. (K1e, T23s, 18-72; ST)

603-K. Workpiece Becomes Part of Welding Machine. Western Metalworking, v. 19, June 1961, p. 38-39.

An extended-reach resistance welder is used to spot weld critical stainless steel joints that require reaching long distances into small openings like wing assemblies. Reference guides are assembled in the structure before welding. Welding of a corrugated shear web to channel shaped web caps within two sandwich sections. (K3n, 1-52; SS, 7-59)

604-K. Brazing Refractory Metals. Mel M. Schwartz. Mechanical Engineering, v. 83, July 1961, p. 30-33.

High temperature vacuum brazing of Cb alloys, Ta, Mo and W using 70 Pd-30 Cu, 70 Pd-30 Ni, 84 Ni-16 Ti, 52 Cb-48 Ni, 90 Pt-10 Ir and 90 Pt-10 Rh alloys and Ti and Pt as filler materials. Limitations caused by recrystallization, ductile-brittle transition temperatures, formation of intermetallics and weakness of the filler material. (K8j, 1-73; Cb-b, Ta, Mo, W, SGA-f)

605-K. Welded Joints Increase Life of Commutator Connections. Harry Thomasson. Canadian Metalworking, v. 24, July 1961, p. 34-36.

Tungsten inert gas shielded process using argon protective atmosphere is used to replace Pb-Sn soldered connections for elimination of hot spots and temperature limitations. (K1d, T1)

606-K. Cast Iron Welded in 1/10th the Time. Metalworking Production, v. 105, June 28, 1961, p. 63.

Quenchweld, a 3-rod welding process with quenching of the weld after each pass by a damp cloth or air blast, is used for repairing thin sections or heavy castings and joining of cast iron to steel. Three electrodes are used with either a-c. or d-c. arc. (K1a, 1-52, 18-72; ST, CI, 5)

607-K. Welding in Engineering. Australasian Manufacturer, v. 46, June 3, 1961, p. 44-50.

Welding processes available to engineers are classified and discussed in two groups, fusion processes and resistance processes. Brazing and gas cutting and cutting machines. Quality control. (K-general, K8, G22g, 1-52, S13)

608-K. How Arc Spotwelding Simplifies Terminal Joining. Steel, v. 149, July 10, 1961, p. 85.

Arc spot welding is used to join electrical stainless steel pins to Al alloy caps in the production of automatic Al frying pans. Terminal joint is made in 6 sec. Process reliability depends upon accurate positioning, pushbutton control of the cycle and a pilot starting device. (K1, T10c; Al-b, SS)

609-K. The Characteristics and Fabrication of Plastic-Metal Laminates. E. J. Williams. Australian Institute of Metals, Journal, v. 6, May 1961, p. 83-89.

Characteristics of metal-plastic laminates including bond strength, chemical and wear resistance and electrical properties. Fabrication methods including deep drawing, fastening, bonding or welding. (K11d)

610-K. Arc Welding of Thin Materials (MIG Process). G. A. Scott. Australian Institute of Metals, Journal, v. 6, May 1961, p. 90-98.

Welding equipment for short-arc techniques and suitable power sources used in welding Al and its alloys, mild steel, stainless steel, Cu and aluminum bronze. Details of wire and methods of wire feeding. 6 ref. (K1d, 1-52; Al, CN, SS, Cu, Cu-s)

611-K. The Fabrication and Use of Some Nickel Alloys. K. H. Belcher. Australian Institute of Metals, Journal, v. 6, May 1961, p. 150-159.

Classification of Ni-containing materials including Ni-Cu, Ni-Cr-Fe and Ni-Mo-Cr-Fe alloys, Nimonic 75, 80A, 90, 105 and 115, 'O' Ni, H.P.A. and H.P.W. Ni, Duranickel and various alloys possessing special electrical resistance, controlled expansion and magnetic properties. Methods of welding and extrusion. Application of powder metallurgical techniques to production of high-purity magnetic materials. 17 ref. (K-general, F24, H-general, P15g, P16; Ni-b)

612-K. Argon-Nitrogen Mixtures for the Self-Adjusting Arc Welding of Copper. J. G. Young. British Welding Journal, v. 8, July 1961, p. 349-353.

Influence of gas composition on metal transfer and penetration in the Cu self-adjusting arc is examined for Ar, N and mixtures of the two gases. For currents below the threshold value in Ar (310 amp.), the metal transfer rate in mixtures containing from 5-33% N is higher than the transfer rate in Ar. (K1, K9n; Cu)

613-K. Inert Gas Shielded Metal Arc Welding of Thick Copper Without Preheat. K. J. Clews. British Welding Journal, v. 8, July 1961, p. 353-359.

Tests are carried out on 1/2 in. thick phosphorus-deoxidized Cu plate using Ar, N and mixtures of the two gases. Current, wire feed speed and travel speed are varied and the dependent arc voltage is measured. Results show the influence of gas composition on required preheating temperatures and welding speed. 5 ref. (K1d; Cu, 4-53)

614-K. Filament-Wound Pressure Vessels. Richard Gorcey. American Society of Mechanical Engineers, Paper no. 61-MD-17, 1961, 12 p. $1.

Fabrication of compressed gas bottles, liquid propellant tanks, rocket engine thrust chambers and nozzles and solid-propellant cases by filament winding which consists of wrapping a reinforcing material such as Fe, Ti or steel and a resinous binder around a mandrel to form a part. The technical advantages are analyzed with discussion of the winding equipment, techniques, materials and designs. (K11, G-general, T26q; Fe, Ti, ST, 4-61, NM, 17-57)

615-K. Design for Welding. T. B. Jefferson. Welding Engineer, v. 46, Mid-June 1961, p. 5-17.

Comparison of welding with other fabrication processes. Design information for joining methods and types of weld loading. Calculation of weight of weldmetal and formulas for computing stresses on butt, lap and fillet welds. Description of structural carbon steels, high-strength steels and heat treated alloy steels for welded construction. (K-general; CN, AY, SGB-a)

616-K. Molten Salt Process Picked to Break Brazing Bottleneck. Metalworking, v. 17, July 1961, p. 11.

Dip brazing 6061 and 6062 Al alloy sheet, plate, forgings and extrusions with BAlSi-4 alloy in a molten bath of fluorides and chlorides at 1100° F. to produce jet engine compressor parts with good joint strength and quality. (K8n, T24b; Al-b, 4-53, 4-51, 4-58)

617-K. Statistical Variations in the Lap-Joint Strength of Metal Bonding Adhesives at Elevated Temperatures. H. W. Eickner and W. Z. Olson. ANC-23 Panel on Composite Construction for Flight Vehicles, Report no. 1880, Feb. 1961, 22 p.

Sources and degree of variability in strength obtained in elevated temperature tests of adhesive-bonded, lap joint specimens of 301 corrosion resisting steel using four representative adhesives.

Fixed effects evaluated include operators, presses and press-by-operator interaction. Random effects include time, bonding runs and cleaning runs. (K12; SS)

618-K. Welding Keeps Up With Uncommon Metals. Steel, v. 149, July 17, 1961, p. 121-122.

Electron beam, ultrasonic and arc welding; diffusion bonding and brazing as methods for joining W, Cb, Mo, Ti, Zr and Be. (K-general, 10-54; Be, W, Cb, Mo, Ti, Zr)

619-K. High Speed Welder Tames Production Problems. Iron Age, v. 188, July 20, 1961, p. 100-102.

Applications of high frequency resistance welding to high speed joining of various structural shapes composed of steel, Cu, Zr, heat resistant alloys and other materials. (K3; SGA-h, ST, Cu, Zr)

620-K. Designing and Fabricating the Air Force Space Test Capsule. Western Machinery and Steel World, v. 52, July 1961, p. 34-35.

Cylindrical shell is fabricated from 6061-T6 Al alloy using an all-welded construction. Closures are made by spinning with hydraulic spinning lathes. (K-general, G13, T24e; Al-b, 17-57)

621-K. New Ablative Skirt for Titan Second-Stage Engines. Western Machinery and Steel World, v. 52, July 1961, p. 38-39.

Fabrication of ablative skirt from asbestos tape, preimpregnated with phenolic resin, and cellular figerglass, which permits a "dry jacket" engine start at altitude. The skirt is bonded by liquid adhesive to the combustion chamber by a segmented flange of Al alloy 6061-T6. (K11, K12, T24e; Al-b, NM, 17-57)

622-K. Cusilman Bronze and Carbon Arc Help Cut Fabrication Costs. Welding Fabrication and Design, v. 4, May 1961, p. 17.

Light sheet metal bent with a 3/4 in. flange, is welded in vertical up, side horizontal and overhead positions using filler rod and carbon electrodes. (K1d; Cu-s, 4-53)

623-K. Developments and Techniques in Resistance Welding. R. W. Ayers. Welding Fabrication and Design, v. 4, May 1961, p. 5-8.

Review of resistance welding techniques and applications particularly in the sheet metal industry. Advantages of three phase processes in seam and projection welding. (K3, 10-54; 4-53)

624-K. Ottawa Firm's Big Assembly Breakthrough. Melba B. Woelfle. Canadian Machinery and Metalworking, v. 72, July 1961, p. 48-49.

Connecting hub assembly system, called Triodetic assembly, is used to join Al, Mg or plastic structural members in the construction of space frames and towers, boat docks, antennas and other structures. (K13q, T26, T24d, T22k; Al, Mg, 4-57)

625-K. Two-Pass Machine Butt-Weld in Aluminum Tank Cars. Canadian Machinery and Metalworking, v. 72, July 1961, p. 94-96.

Two-pass butt welding of ALCAN B53S plate cylindrical courses and ALCAN C54S heads with ALCAN 6209 filler wire. Preliminary machining is almost eliminated and arc time is reduced to nearly 1/3. (K1, T23p; Al-b, 4-53)

626-K. Low Alloy Steel Welding. E. Freeth. Welding and Metal Fabrication, v. 29, July 1961, p. 283-290.

Investigation of weldmetal porosity, cracking, fissuring, creep resistance and stress rupture properties and impact resistance in manual, Tig, Fusarc, Fusarc/CO_2 and submerged arc welding. Selection of filler rod to suit applications. 18 ref. (K-general, K1, Q3, Q7, W29h; AY, 9-68, 9-72)

627-K. Design and Strength of Brazed Joints. M. H. Sloboda. Welding and Metal Fabrication, v. 29, July 1961, p. 291-296.

Effect of joint design on flow of brazing alloy, deformation, fracture and soundness of Cu and Cu alloy, carbon steel, stainless steel, Al and Al alloy, Nimonic and Ti brazed assemblies. 5 ref. (K9, Q24, Q26; Cu, CN, SS, Al, Ni-b, Ti, 7-52, 17-51)

628-K. Orbital Welding of Stainless Steel Tube. L. Keble Hill. Welding and Metal Fabrication, v. 29, July 1961, p. 301-307.

Use of an Ar-H shrouding in arc welding of aircraft tubing. Equipment and sequence of operations. (K1d, 1-52, T24; SS, 4-60)

629-K. A Displacement Copper System for the Soldering of "Pure" Aluminum. Sheldon L. Matlow. Electrochemical Society, Journal, v. 108, July 1961, p. 709-710.

Cu deposited from ammoniacal $CuCl_2$ is used to provide an adherent base for soldering Al. (K7, L17; Al, Cu)

630-K. (German.) Technology and Machinery of Electroslag Welding. G. Almquist. Schweisstechnik, v. 15, July 1961, p. 73-75.

Mechanism of electroslag welding and technological features such as physical properties of welding additions, influence of electrical factors on welding and preparation of parts for butt welding and welding of "T" and corner joints. (K6)

631-K. (German.) Welding Under Protective Inert Gas, Powder and Slag. W. Hummitzsch. Schweisstechnik, v. 15, July 1961, p. 75-81.

Study of welding mechanisms including material transfer in the drop, with emphasis on Tig (tungsten inert gas) and Mig (metal inert gas) welding, using Ar and CO_2 as inert gas. Survey of welding machinery, welding efficiency and quality of welds. (K1d, K4, K6, 1-52)

632-K. (German.) High-Strength Steels and Their Welds in the Case of Large Sheet Thickness. Werner Hummitzsch. Schweisstechnik, v. 15, June 1961, p. 61-67.

Welding technology of high-strength, fine-grain steels is discussed in terms of transition behavior of steel, weldability, welding by manual electrodes, inert gas shielded welding, thermit powder welding and electroslag welding. 5 ref. (K-general, K9, 2-59, 3-73; SGB-a, ST)

633-K. How to Fasten Carbide to Steel. Pt. 2. Grant A. Morrison. Machine and Tool Blue Book, v. 56, Aug. 1961, p. 118-124.

Mechanical mounting overcomes some of the limitations of brazing and cementing carbides. A mechanically attached bond is stronger than an adhesive bond and is not limited to a narrow operating range. Use of threaded bolts, brazed plugs and wedges. (K11b; ST)

634-K. Automatic Welding Is Volkswagen's Secret. Chuck Berka. Welding Design & Fabrication, v. 34, July 1961, p. 27-28.

Automatic resistance welding and arc welding of subassemblies (doors and roofs), front and rear end assemblies and wheels. (K1, K3, 18-74, T21)

635-K. Automatic Resistance Welding: The Only Way to Make Telephone Relay Contacts at a One-Second Clip. Welding Design & Fabrication, v. 34, July 1961, p. 30-31.

Automatic relay spring processing machines are used to weld Ag contacts to flat Ni-Ag springs, coin the contacts, tin the other end for connecting wires and form the spring to the right tension. (K3, 1-52, X15r; Ag, Ni-b, Ag)

636-K. Portable Induction Brazing Makes Better Hydraulic Joints. C. G. Brock. Welding Design & Fabrication, v. 34, July 1961, p. 32-34.

Comparison of brazed joints to threaded steel fittings in high-pressure aircraft hydraulic systems. Brazing of AM 350, AM 355, A 286, Inconel X and 321 stainless steel alloys with Ag-Cu-Li alloys. Fatigue curves are plotted from vibration, pressure-impulse tests. (K8k, Q7k, T24; SS, 4-60)

637-K. Projection Welded Part Absorbs Shocks Better, Longer. Welding Design & Fabrication, v. 34, July 1961, p. 41.

Locknut-bolt joint is replaced by a projection welded stud in an automobile shock-absorber stud-spring-plate assembly. Fatigue tests. (K3q, Q7, T21c)

638-K. Welded Girders Solve Design Dilemma. Welding Design & Fabrication, v. 34, July 1961, p. 42-43.

Cable-suspended, double-cantilever roof of an airport hanger consists of 16 welded box girders. Design provides open areas without columns or cantilever trusses. Fillet welding of girder webs and cross frames. Assembly details. (K-general, T26n; 4-57)

639-K. Phenomenological Considerations in Ultrasonic Welding. J. B. Jones, N.

Maropis, J. G. Thomas and D. Bancroft. Welding Journal, v. 40, July 1961, p. 289s-305s.

Survey of research and instrumentation for observing stress, energy and temperature relations in the weld zone and interpreting factors relevant to the ultrasonic welding process. Comparison of weldability of various materials on the basis of net energy required to generate a weld with data given for Al and Al alloys, Cu, Armco iron and 302 stainless steel. (K6r, K9, 1-54, S13; Al-b, Cu-b, Fe, SS, 4-53, 7-51)

640-K. Experimental Determination of Dimensional Heat Flow in Weldments. S. S. White. Welding Journal, v. 40, July 1961, p. 317s-319s.

Technique utilizing temperature-sensitive lacquers to determine heat flow transient temperature--the temperature above which heat flow is more three than two- dimensional--of various Ti alloy sheets of constant thickness. Measurement of peak temperature locations and fusion zone geometries. 3 ref. (K9n, 2-62; Ti-b)

641-K. Weldability of a Modified Hot-Work Die Steel. W. A. Sipes and E. J. Fogarty. Welding Journal, v. 40, July 1961, p. 320s-323s.

Study of the weldability of a modified hot work die steel of the AISI H-11 type. Satisfactory joints are produced using an experimental coated low hydrogen electrode. After suitable heat treatment, joints achieve strength levels in the 300,000 psi. range with efficiencies approximating 100%. 30 ref. (K9s, K1a, Q27, 2-64; TS-k)

642-K. Welding PH 15-7 Mo Precipitation Hardening Stainless Steel. H. Smallen. Welding Journal, v. 40, July 1961, p. 324s-329s.

Microstructure, tensile properties and hardness values of PH 15-7 Mo stainless steel after inert gas shielded tungsten arc and spot welding and various heat treating sequences. UTS values approximating 100% of parent metal strength are obtainable for fusion weldments when austenite conditioning and transformation treatments are performed after welding. Highest lap shear values for resistance weldments are obtained by welding after transformation and before final hardening treatment. (K1d, K3n, K9, M27, Q-general, 2-64; SS-e)

643-K. CO_2 Shielded Welding of Horizontal Joints in Oil Storage Tanks. Paul W. Turner. Welding Journal, v. 40, July 1961, p. 707-713.

Horizontal seams in 1/4-1 1/2 in. thick steel plates of tanks for crude oil storage are welded by CO_2-shielded metal arc process. Radiographic tests disclose that key junctions are more susceptible to defects than the remainder of the seam. 6 ref. (K1d, T29n, 9-69; ST, 4-53)

644-K. Consumable Electrode Spot Welding. J. A. Howery and G. F. Mack. Welding Journal, v. 40, July 1961, p. 714-722.

Basic equipment for consumable spot welding--a gas shielded arc process using solid wire or flux cored electrodes. Application in the assembly of automobile bodies. Survey of process variables for fillet, lap, through and butt welds in mild steel sheet; tensile strength of test welds and cost comparison with other methods. (K3n, K1d, K9r, T21a; CN, 17-57)

645-K. Series Spot Welding of Missile Fins. D. W. Herold. Welding Journal, v. 40, July 1961, p. 723-725.

Direct and indirect series spot welding of 1018 steel in the production of a dorsal fin for a missile. Survey of weld requirements and operating problems. (K3n, T24e; ST, 17-57)

646-K. Use of Inconel Deposited Weld Metal for Nuclear Component Parts. R. W. Minga and W. H. Richardson. Welding Journal, v. 40, July 1961, p. 726-735.

Welding and weld overlaying with Inconel using inert gas shielded tungsten arc and metal arc processes. Survey of problems in meeting nuclear quality requirements; weld defects and their control; and identification grain boundry constituents causing fissuring and hot cracking. (K1d, K9, L24, T11; Ni-b, 17-57)

647-K. Highway Tunnel Has Welded Tube. J. F. Gulley. Welding Journal, v. 40, July 1961, p. 736-737.

Arc welding of a 33 ft. ID steel plate structure for use as a vehicular river tunnel. (K1d, T26; ST, 4-53, 17-57)

648-K. Self-Contained Mobile Rigs for Flux-Cored Welding Process Speed Fabrication at Naval Weapons Plant. Welding Journal, v. 40, July 1961, p. 738.

Carbon dioxide shielded flux-cored electrode process and equipment used for welding steel plates. (K1d, 1-52, T2; ST, 4-53, 17-57)

649-K. Geared for Production. R. E. McLane and P. T. Sessions, Jr. Welding Journal, v. 40, July 1961, p. 739-740.

Magnetic flux shielded arc process used to weld cast steel half gear to 1 in. thick frame in the fabrication of large gears for gate hoists for river dams. (K1d, K6, T7a; ST, 5)

650-K. Arteries of a Stratofort. G. R. Clay and J. C. Rodgers. Welding Journal, v. 40, July 1961, p. 747-748.

Argon shielded tungsten arc welding used to produce Al alloy and stainless steel tubing assemblies and 6061 Al alloy fuel tanks for aircraft. (K1d, T24a; Al-b, 17-57)

651-K. Into the Winner's Circle. R. M. Stuchell and J. R. Flynn. Welding Journal, v. 40, July 1961, p. 749.

Carbon dioxide shielded magnetic flux consumable-electrode welding used for welding carbon steel plate in the fabrication of 5-million gal. water tank. (K1d, K6, T26q; CN, 4-53)

652-K. Researches on the Welding of Galvanized Steel Sheets. G. Odone, G. Milanese and A. Porta. Acier-Stahl-Steel, v. 26, June 1961, p. 283-292.

Evaluation of bronze and electric arc welding of rectangular specimens. Macroscopic and microscopic examinations of the end-to-end joints. Welding parameters and efficiency of joints as determined by mechanical tests. Salt spray, salt solution immersion and marine atmosphere corrosion tests before and after weld reconditioning. 9 ref. (K8, K1, K9r, M27, M28, R3p, R11; ST, 4-53)

653-K. Bonding Irregular Shapes. Mill and Factory, v. 69, July 1961, p. 72.

Al to Al, Mg and fiberglass bonding with 1/4 in. diameter hollow Al balls which are spread over the components to be bonded and subjected to pressure. The balls redistribute the pressure evenly over the bond area, including indented and other irregular contours. Cure is effected in an autoclave at 325-350° F. (K11a, K12; Al, Mg)

654-K. New Multi-Weld Lines at Dagenham. H. Baldwin. Tooling, v. 15, June 1961, p. 62, 64.

Production of automobile underbody assemblies from separate components at Ford Motor Co.'s Dagenham factory with a multiweld assembly line which makes 750 spot welds in a complete run. (K3n, 1-52, T21a)

655-K. (French.) Chemical Composition and Weldability. A. Leroy. Revue de Metallurgie, v. 58, Apr. 1961, p. 321-329.

Methods for determining weldability of alloy steels. Effects of chemical composition, mechanical properties and aging behavior. Influence of C, Mn, Si, P, N and S concentration. (K9s, 1-54, 2-60, 2-65, Q-general; AY)

656-K. (French.) Notes on Weldability Tests. H. Granjon and A. Audige. Revue de Metallurgie, v. 58, Apr. 1961, p. 330-338.

Evaluation of operational, local and over-all weldability tests. Criteria are established for developing precision in these tests and for localizing the position occupied by them in welding specifications. 16 ref. (K9s, 1-54)

657-K. Welding Iron Castings. C. G. Bainbridge. Machinery Lloyd (Overseas Edition), v. 33, July 1961, p. 47-50.

Method of repairing fractures in Fe castings by arc or oxy-acetylene welding. Preparation of castings prior to welding by grinding and by separating fracture edges. Use of preheating to prevent chilling and cracking in weld deposits. (K1, K2h, K9p, Q26; Fe, 5, 7-51, 9-72)

658-K. The Metal-Arc Welding of Stainless Steel. M. C. T. Bystram.

Edgar Allen News, v. 40, July 1961, p. 147-149.

Analysis of the mechanism of intergranular cracking in the weld and in the heat affected zone of the stainless steel base metal. Effects of shrinkage stresses, weld boundary precipitates and heat treatment by superimposed runs on weld cracking and failure. 12 ref. (K1g, 2-64, 3-66; SS, 7-51, 9-72)

659-K. Giant Radio-Telescope Will Tune-In Outer Space. Welding Engineer, v. 46, July 1961, p. 35-37.

Manual metal-arc, submerged arc and Mig welding are used to fabricate antenna superstructure of 3/16-3 in. thick 5456 Al. Stress relieving and magnetic particle and ultrasonic inspection of the welds. (K1, J1a, S13g, S13j; Al-b, 7-51)

660-K. Aluminum Alloy Bids for Larger Share of Cryogenic Market. Pt. 2. Welding Engineer, v. 46, July 1961, p. 38-39.

Plates of 5083-H113 Al alloy are Mig welded using a 3/32 in. diameter filler wire with argon atmosphere. Test results indicate good weldability, weld ductility and corrosion and stress concentration resistance at temperatures as low as -320° F. (K1d, K9s, Q23p, Q25k, R-general, 2-63; Al-b, 7-51)

661-K. Giant Steel "Cans" Line Hydroelectric Power Tunnels. Welding Engineer, v. 46, July 1961, p. 48.

Rolled steel plate is joined by submerged arc welding with medium carbon steel wire to form tunnel lining in dam construction. The 24-ft. diameter sections are hydrostatically tested to 120 psi. (K1e, Q10b, T26s; ST, 4-53)

662-K. 192 Joints Brazed Simultaneously to Chemical Reactor. Welding Engineer, v. 46, July 1961, p. 60.

Carbon steel tubing 3/4 in. in diameter is brazed to a vessel chamber with tolerances of ± 0.002 in. in a dry hydrogen furnace at 1950-1980° F. (K8, T29; CN, 4-60)

663-K. The Connection of Zircaloy-2 With Stainless Steel for Operation Over a Wide Temperature Range. C. Gordon Duff. Nuclear Science and Engineering, v. 10, July 1961, p. 278-284.

A method for joining Zircaloy-2 with 347 stainless steel using controlled expansion transition sections consisting of Ni-Fe elements of the Invar type, ranging from low expansion rate 43% Ni-Fe, at the Zircaloy-2 end, to high expansion rate 60% Ni-Fe, at the stainless steel end. Discussion of the mechanical joining and Tig-welding problems in producing a pressurized hot water loop. 14 ref. (K1d, K13, T11, 17-57; Zr-b, Ni-b, SS)

664-K. (Russian.) Electroslag Welding of 1Kh18N9T Steel Using a Wire Electrode. V. I. Rabinovich. Avtomaticheskaya Svarka, Jan. 1961, p. 27-33.

Steel plates 65 mm. thick are welded using Sv-1Kh18N9T, Sv-1Kh18N11M or Sv-0Kh18N9 electrodes and AN-8, AN-26, ANF-6 and 48-OF-6 and nonoxidizing electrodes. The weldments are tested without subsequent heat treatment; after austenitization and air cooling; and after austenitization and water quenching. Properties investigated include macrostructure and microstructure, resistance to intercrystalline corrosion and hot cracking, creep strength, ductility and impact strength of weldments. 6 ref. (K6, K9, M-general, Q-general, 2-64; ST, 7-51)

665-K. (Russian.) Metal Transport in Manual Arc Welding. A. G. Mazel'. Avtomaticheskaya Svarka, Jan. 1961, p. 34-43.

MSt 3 steel is welded using Sv-10G2, Sv-08A, 7064, 7060, Sv-10GS and 7063 electrodes, with the metal transport being studied by cinematography and oscillography. Data are given for effect of nominal voltage, arc length, welding position and polarity on the formation of drops and frequency of short circuits per second. 10 ref. (K1d, K9n; ST)

666-K. (Russian.) Electroslag Welding of Titanium With a Wire Electrode. V. P. Didkovskii and S. M. Guervich. Avtomaticheskaya Svarka, Jan. 1961, p. 48-51.

VT1 Ti plate 40-50 mm. thick is electroslag welded using an electrode of the same material and AN-T2 flux, with clearance of 25-28 mm. and transverse movement imparted to the

electrode. Properties studied include macrostructure, microstructure, tensile and impact strengths, elongation and reduction of area of weldments. 5 ref. (K6, K9, M-general, Q-general; Ti, 7-51)

667-K. (Russian.) Effect of Electroslag Remelting on the Quality of Cr-Ni-Mo Steel. Yu. K. Vorob'ev, V. M. Doronim, M. M. Klyuev, V. V. Topilin, N. A. Shityaev, E. V. Voinovskii, B. I. Medovar, Yu. V. Latash and B. I. Maksimovich. Avtomaticheskaya Svarka, Jan. 1961, p. 52-56.

A 140 mm. diameter bar of EI 847 steel is electroslag remelted into a 320 kg. ingot to study the effect of remelting on structural homogeneity, quantity of nonmetallic inclusions, torsional strength of 900-1300° C. and the tensile and yield strengths at 20 and 600° C. (K6, K9n, M-general, Q-general, 2-62, 9-72; AY)

668-K. (Russian.) Determination of Electrode Pressures Applied in the Spot Welding of Smaller Parts. N. M. Sokolov. Avtomaticheskaya Svarka, Jan. 1961, p. 64-66.

Pressure measurements with an electronic instrument and a transmitting unit based on the piezoelectric effect in the spot welding of light metals. (K3n, K9n, 1-52; EG-a39)

669-K. (Russian.) Use of Radio-Frequency in Buff Welding Stainless Steel Tubing. I. V. Kirdo and Yu. N. Skachko. Avtomaticheskaya Svarka, Jan. 1961, p. 75.

Thin-walled tubing is machine induction welded at a current frequency of 70 kcps. with removal of the resulting flash in a machining operation simultaneously with the welding. Data are presented for process economy and quality of weldments. (K6n, K9; SS, 4-60)

670-K. (Russian.) Aging Behavior of Welded Two-Phase Titanium Alloys. V. F. Grabin, S. M. Gurevich, V. A. Rafalovskii and V. I. Trefilov. Avtomaticheskaya Svarka, Apr. 1961, p. 3-12.

Samples of VT6 alloy containing 6.1% Al and 4.1% V, an alloy with 2.5% Al, 9.7% V and 3.8% Mn and a binary alloy containing 6.34% Mn are submerged arc welded using electrodes of the same composition as the base metal. Properties investigated include microstructure of seams in the welded and artificially aged states; change of volume and electroresistivity in continuous heating up to 1050° C. Effect of holding at 200-500° C. on volume and hardness and mechanical properties after aging from 300-500° C. 14 ref. (K9, K1e, N-general, P-general, Q-general, 2-65; Ti-b)

671-K. (Russian.) Effect of Ferrite Content on the 475° C. Embrittlement of Austenitic-Ferritic Filler Metal. N. I. Kopersak. Avtomaticheskaya Svarka, Apr. 1961, p. 13-17.

The alpha-phase content of filler metal obtained from the welding wire Sv-0Kh18N9 is varied by using granulated fluxes of various Cr contents. Effect of holding at 475° C. for 1000 hr. followed by slow cooling on the impact strength. 4 ref. (K9r, Q6n, Q26s, 2-60, 2-61, W29h; AY, 17-57)

672-K. (Russian.) Optimum Width of Heat Exposed Zone in the Butt Welding of Rails. S. I. Kuchuk-Yatsenko. Avtomaticheskaya Svarka, Apr. 1961, p. 28-34.

Resistance welding of R50 rails containing 0.70-0.78% C, 0.88-1.08% Mn, 0.15-0.24% Si, 0.034-0.043% P, 0.025-0.030% S and 0-0.15% As. Tensile and bend testing. Effect of the heat affected zone width on microstructure, plasticity and strength. (K3, K9h, Q-general, T23p, 3-73; ST)

673-K. (Russian.) Introduction of Elastic Ultrasonic Waves Into the Welding Bath. V. D. Kodolov. Avtomaticheskaya Svarka, Apr. 1961, p. 35-39.

Parameters governing design and use of equipment for applications in the electroslag welding and arc welding of thick plates of austenitic steel. Effect of ultrasonic waves on resistance to hot cracks and intercrystalline corrosion. 12 ref. (K6r, 1-52, 17-51; ST, 4-53)

674-K. (Russian.) Appearance of a D-C. Component During Electroslag Remelting Into a Water Cooled Mold. B. I. Maksimovich. Avtomaticheskaya Svarka, Apr. 1961, p. 47-53.

Armco iron consumable electrodes are remelted at a-c. intensities between 1500 and 2400 amp. to study the

undesired development of a d-c. component, caused by the temperature gradient between electrode and melt. Effects of flux composition, depth of molten slag, electrode diameter and electrical insulation of the mold on the d-c. component. 9 ref. (K9, K6, W29c, W29h, 2-60, 3-73; Fe-a)

675-K. (Russian.) Static Strength of Spot Welds at Room and Low Temperatures. G. V. Zhemchuzhnikov and R. G. Romanovskii. Avtomaticheskaya Svarka, Apr. 1961, p. 54-60.

Spot welded samples of 6-8 mm. carbon steel sheet are tension and shear tested to investigate influence of weld diameter from -55 to 20° C. 5 ref. (K3n, Q27, Q2, 2-61, 3-73; CN, 4-53, 7-51)

676-K. (Russian.) Welding With a Consumable AMg6 Alloy Electrode in an Argon-Chlorine Atmosphere. D. M. Rabkin and B. A. Steblovskii. Avtomaticheskaya Svarka, Apr. 1961, p. 78-82.

Arc welding of Al alloy containing 7% Mg, adding 1-5% Cl to Ar atmosphere to determine effect on porosity, microstructure, tensile and yield strength and elongation. (K1d, P10m, M27, Q-general; Al-b, Mg)

677-K. (Russian.) Effect of the Shape of Melt in Electroslag Welding on the Tendency of Austenitic Steel and Alloys to Develop Heat Cracks. B. I. Medovar and A. H. Safonnikov. Avtomaticheskaya Svarka, Apr. 1961, p. 87-88.

Relationship of width to depth in the weld roof, width of gap, current intensity and voltage are studied as they affect development of heat cracks. (K6, K9n, 9-72)

678-K. (Italian.) Applications of the "Electronic Gun" in Mechanical Working. Sirio Leporatti. Rivista di Ingegneria, v. 11, Apr. 1961, p. 373-380.

Use of the "electronic gun" (Zeiss welding machine) and its application in welding, fusing, drilling and cutting of refractory metals and steels. The process is based on the emission of high accelerated electrons (10,000-150,000 km. per sec.). Upon hitting, the energy changes in form from kinetic to thermal. The advantage of this process is the development of a localized high temperature (6000° C.) which can be confined to a spot as small as 0.02 mm. by focusing the electron cloud. (K6, 1-52)

679-K. (German.) Metallic Bonding Between Uranium and Aluminum for Fuel Elements for Nuclear Reactors. G. Schneider. Metall, v. 15, July 1961, p. 675-679.

Review of application and properties of uranium-to-Al solders including Al-13g Si solder, Zn-Sn pressure solder for water-cooled reactors at temperatures below 230° C. and Ni diffusion solder for temperatures from 350-500° C. Data given for microstructure and corrosion resistance of joints. (K7, T11g; U, Al, SGA-f, 17-57)

680-K. (German-French.) Inert Gas Welding of Copper and Copper Alloys. C. G. Keel and W. Nyffenegger. Pro-Metal, v. 14, June 1961, p. 495-513.

Welding technology and machinery for Tig and Mig welding and inert gas cutting of Cu and Cu-Zn, Cu-Sn, Cu-Al and Cu-Ni alloys. (K1d, G22h; Cu-b)

681-K. Joining Coil Strip on a Continuous Line. Automation, v. 8, Aug. 1961, p. 71.

Coil steel strip is joined on a continuous line by a high speed shearing and automatic end welding machine which uses a tungsten arc process at a rate of 30 ipm. (K1d, 1-52; ST, 4-53)

682-K. (Italian.) Electroslag Welding. Giuseppe Foti. Rivista Italiana della Saldatura, v. 12, Nov-Dec. 1960, p. 282-287.

Applications of process to various types of joint, to the welding of alloy steels and the surfacing and fabrication of pressure vessels, presses and electric machines. 4 ref. (K6, T26q, W11q, W24g; 1-52, 17-57)

683-K. (Italian.) Mechanical and Nondestructive Testing of Welding Processes. G. Moravia. Rivista Italiana della Saldatura, v. 13, Mar-Apr. 1961, p. 53-59.

Parameters of the welding process are reviewed with a discussion of various destructive and nondestructive methods for testing welded joints. (K9; 7-51, 1-52, 1-53, 17-54)

684-K. (Italian.) Importance and Limitations of Controlled Production in Resistance Spot Welding of Light Alloy for Aircraft. Domenico Raffone. Rivista Italiana della Saldatura, v. 13, Mar-Apr. 1961, p. 60-71.

Development of controlled procedures for resistance spot welding of structural aircraft elements in order to improve mechanical properties of welded metal. (K3n, T24a; EG-a39, 1-52)

685-K. (Italian.) Repair Welding of Iron Castings. Giacomo Storace. Fonderia, v. 10, June 1961, p. 247-249.

Techniques for welding castings when exact quality of the Fe is unknown. Use of an electric arc welding machine with Monel, Ni or austenitic 18 Cr-8 Ni electrodes. (K1, 18-72; Fe, 5)

686-K. Eutectic "Quench Weld" Arc Welding Process. Machinery (London), v. 99, July 12, 1961, p. 102.

Process for repairing or building up broken components or castings of cast iron and steel. The mating edges of the broken pieces are veed out. Transverse grooves are then formed and successive layers of weld metal applied. Each layer is quenched by a wet rag or by a blast of compressed air. (K1, 18-72; ST, CI, 5)

687-K. Die Castings Can Be Adhesive Bonded. Precision Metal Molding, v. 19, July 1961, p. 70-71.

Reduction of rejection rates and leak testing operations and elimination of field failures by bonding and sealing two mating Al die castings with die cut AF-6 adhesive film in the production of a pneumatically controlled manifold for a process controller. Properties of the adhesive film. (K12; Al, 5-61)

688-K. How Easily Can You Join Metals by Resistance Spotwelding? R. D. Enquist. Iron Age, v. 188, Aug. 10, 1961, p. 76-78.

Development of a formula for predicting weldability of ferrous metals, light metals, conductive and noble metals and refractory metals and their alloys from data on electrical resistivity, melting point and thermal conductivity. (K9s, K3n, P12n, P11h, P15g; Fe, EG-a39, EG-c, EG-d37)

689-K. Single Purpose Welder Does Seven Jobs. Steel, v. 149, Aug. 7, 1961, p. 81.

Welding of steel, brass, Be-Cu and Ag to produce electrical contacts using a magnetic force bench welder automated by handling, blanking and forming devices. (K-general, 1-52, 18-74; ST, Cu-n, Cu-b, Be, Ag, SGA-r)

690-K. Body Assembly Procedure on the Consul Classic 315. Sheet Metal Industries, v. 38, July 1961, p. 515-527, 540.

Sequence of operations, equipment and layout of main body assembly section at the Dagenham Works of the Ford Motor Co. Ltd. Multispot weld sequence and stations used for welding assemblies other than the fenders. (K-general, K3n, T21a)

691-K. Welding Torch Rides Piggyback. Folke Johanson. American Machinist/Metalworking Manufacturing, v. 105, Aug. 1961, p. 83-84.

Welding of 30 ft. long T-1 steel I-beams with an ML-3 semi-automatic Squirt welder mounted on a small carriage which rides on the parts to be welded. Pre and post weld operations. (K-general, 1-52, K9p, K9q; TS, 4-57)

692-K. (German-French.) Repair Welding of the Transmission Housing of a Rotary Snowplow. Schweisstechnik Soudure, v. 51, July 10, 1961, p. 256-257.

Tig repair welding operations on a cast housing including degreasing by heating up to 400° C., build-up welding of a broken piece, joint preparation by grinding, prevention of crack propagation by drilling, flame preheating and welding. After welding the housing is asbestos-protected against rapid cooling. (K1a, 18-72)

693-K. Aluminum Joining--Tabulation of Techniques. G. O. Hoglund and H. H. Caldwell. Electronics, v. 34, June 16, 1961, p. 76-79.

Summary of brazing, soldering and welding methods and techniques and the alloys to which each process is applicable. (K-general; Al-b)

694-K. Recommended Practice for Arc Welding Titanium Metals. Canadian Machinery and Metalworking, v. 12, June 1961, p. 153-154, 156, 158.

Tungsten or consumable metal inert gas arc welding of MST-40, MST-55 and MST-70 commercially pure Ti and MST-821, 5Al-2.5Sn and 6Al-4V Ti alloys to form fillet, square butt, single and double Vee and single and double U welds. Weld contamination and porosity are minimized by degreasing or mechanical cleaning of surfaces and edges to be joined. Inert gas shielding prevents weld embrittlement by H, N or O. (K1;Ti, 1-52)

695-K. Prototype Friction Welder Proves Process Feasible. Steel, v. 149, July 24, 1961, p. 102.

Tool joints are joined to 1 1/4 in. diameter tubing by friction welding under light pressure at high speeds. A prototype friction welder averages 20-27 welds per hr. (K6, 1-52, 3-67, 3-74; 4-60)

696-K. AC + Emissive Wire = Sound Welding. Steel, v. 149, July 24, 1961, p. 104-105.

Types E308, E308L and E321 stainless welding wires are welded using a-c.,a continuous electrode coated with Rb and Cs compounds and an argon gas shield. Tensile yield, elongation and impact stengths of E308L stainless are compared for a-c. and d-c. welding with an argon shield. (K1d, Q-general; SS, 4-61)

697-K. Multi-Spot Welders Simplify Fabrication. E. C. Hall. Metalworking Production, v. 105, Aug. 2, 1961, p. 57-60.

Techniques and equipment used to assemble washing machine components. Use of Zn-rich primer on mating faces to protect against corrosion. (K3n, 1-52, R10b, T10c)

698-K. (German.) Use of Modern Welding Techniques in Repair of Rail Vehicles. Otto Wolff. Deutsche Eisenbahntechnik, v. 9, June 1961, p. 288-294.

Applications and equipment for UP (under powder) welding, CO_2 inert gas deposit welding and arc welding of various steel and cast iron parts in repair welding of rail vehicles. (K1, 1-52, T23p, 18-72; ST, CI)

699-K. Thermatool High-Frequency Fin Welding. Machinery (London), v. 99, July 26, 1961, p. 188-189.

Zircalloy spiral and parallel fins ranging in thickness from 0.004-3/8 in. are welded at speeds up to 1000 ft. per min. to Zircalloy tubings by a high-frequency resistance process in which the current follows the low inductance path rather than the low resistance path resulting in localized heating of very high intensity. (K3; Zr-b, 4-60)

700-K. Induction Soldering and Brazing. Harold Ottobrini. American Jewelry Manufacturer, v. 6, June 1961, p. 12-13.

Joining by induction heating allows preplacement of parts in a nonconductive mold after applying soft solder, paste or shinstock. The assembly is automatically transported through the induction coil which heats the metal in the assembly. By regulating the field strength and conveyor speed, the output of the machine can be calculated. (K6n, K8, 18-74, T9s; Au, Ag)

701-K. Magnaflash Welding Electrical Contacts. Fansteel, v. 1, no. 2, 1961, p. 2-3.

A wide range of materials including Cu-W and Ag-W, Ag-Cd oxide combinations and ferrous alloys, can be joined by this process achieving bonds of 99-100% of the total weldable areas. Special atmospheres and fluxes are eliminated and ultrasonic inspection is reduced to a sampling basis. (K3r, 1-52, 17-57; Cu-b, Ag-b, Fe-b)

702-K. Some Aspects of Metals Joining for Electron Tube Applications. J. J. Vogi, W. A. Gibeaut, G. E. Faulkner and P. J. Rieppel. Paper from "Advances in Electron Tube Techniques". Fifth U. S. National Conference, Proceedings (Sept. 1960). Pergamon Press Inc., New York 22, 1961, p. 21-30.

Determination of weld characteristics by examination of as-welded cross-wires, weld cross sections and by strength tests. Evaluations are made for Ni to Ni, Mo to Mo and Mo to Ni welds, and for Hf and Cb alloys and various foil materials. 27 ref. (K9, K-general, T1; Ni-b, EG-d37, 4-56, 17-57)

703-K. Theory of Adherence in Ceramic-to-Metal Seals. S. S. Cole, Jr., and H. W. Larisch. Paper from "Advances in Electron Tube Techniques".

Fifth U. S. National Conference, Proceedings (Sept. 1960). Pergamon Press Inc., New York 22, 1961, p. 47-51.

Summary of compression and bond test data obtained on metallizing systems used in fabricating ceramic-to-metal seals by the refractory metal process. Comparison of the alumina reaction and glass migration theories of adherence. 16 ref. (K11b)

704-K. Vapor-Cooled Welder Increases Tube Production. Machinery, v. 67, Aug. 1961, p. 137.

A ribbon-wound core toroidal transformer and a two-section, low-impedance secondary are combined to form a rotary welder, cooled by a fluid dielectric and is sealed within the unit which is used to resistance weld tubing and pipe produced from cold rolled and aluminized steel for automotive tail pipe. (K3, 1-52, T21c; ST, 4-60, 8-62)

705-K. Vertical Electro-Slag Welding Machines. Engineer, v. 212, July 28, 1961, p. 164.

Description and operation of a welding machine for automatic vertical welding of seams in caisson section plates. The welding head assembly is mounted on a carriage which travels up a vertical column at a speed controlled by a differential thermocouple system in accordance with the rate of weld deposit. (K6, 1-52; ST, 4-53)

706-K. Welding Thin Stainless Steels. D. M. Potter. Welding and Metal Fabrication, v. 29, Aug. 1961, p. 314-323.

Layout, equipment and operation of a plant which produces components, tank linings and jet engine insulation blankets from stainless steel sheet. Dimpling, stretch forming, welding, electrolytic cleaning and testing procedures. (K-general, G3, G9 L13n, 1-52; SS, 4-53)

707-K. Projection Welding of Plugs and Bosses to Heavy Mild Steel Plates. C. Phillips. Welding and Metal Fabrication, v. 29, Aug. 1961, p. 324-332.

Testing of weld specimens for leaks, hardness and tensile failing load to determine optimum welding conditions and projection design and dimensions. (K3q, Q29, Q27; CN, 4-53, 7-51)

708-K. Body Production for the Consul Classic. Welding and Metal Fabrication, v. 29, Aug. 1961, p. 333-340.

Layout and operation of a welding line which incorporates automatic press welding machines and a number of spot welding stations for the production of car underbodies from mild steel sheet pressings. (K5, K3n, 1-52, T21a; CN)

709-K. Latest Design Trends in Tube Milling Welding. Machine Production, v. 20, Aug. 1961, p. 23-25.

Butt seam resistance welding of steel tubing and pipe by "Type-V" welder. Discussion of dielectrics and insulating materials. (K3p; St, 4-60)

710-K. How Do You Solve Your Welding Problems? Harry Thomasson. Canadian Metalworking, v. 24, Aug. 1961, p. 44-47.

Design stage of fabrication operations, welding processes, capacity of equipment and base material and its thickness are considered relative to welding problems and their prevention. Importance of residual stress factors and yield strength. (K9, 3-66)

711-K. H-F Induction Brazing and Soldering. Pt. 1. J. Libsch and P. Capolongo. Canadian Metalworking, v. 24, Aug. 1961, p. 49-51.

High-frequency fabrication of Al alloy, steel and brass forgings and stampings to increase service life and to maintain accuracy in alignment of joined components. Surface preparation, atmosphere control and alloy selection. (To be continued.) (K8k, K7e; Al-b, ST, Cu-n, 4-51, 4-59)

712-K. Pipewelding Machine May Save You Money. Canadian Metalworking, v. 24, Aug. 1961, p. 52-54.

Portable pipewelder is applied to butt welding of overland and shop fabrication piping in a variety of materials. Unit utilizes inert-gas metal-arc welding equipment and techniques. Economic considerations in welding of 6 in. diameter schedule 40 and 80 carbon steel pipe as compared to manual welding. (K1d, 1-52; CN, 4-60)

713-K. Fin Welding by High-Frequency Resistance. Light Metals, v. 24, Aug. 1961, p. 228.

Method for welding fine or other continuous projections, odd forms and shapes to tubing and flat sections at very high speeds. Application of the process to flat strips, structural shapes, two tubes of different diameter, lips or edges of drum heads, tapered tubes and perforated strip metal. (K3; 4-53, 4-57, 4-60)

714-K. Solid-Phase Bonding of Columbium. S. J. Paprocki, E. S. Hodge and P. J. Gripshover. Paper from "Columbium Metallurgy". v. 10. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1961, p. 13-30.

Components of Cb for bonding are enclosed in an evacuated envelope or welded to form a gastight assembly. The assembly is then subjected to an inert gas pressure and heated above the recrystallization temperature of Cb. The inert gas forces the components into the intimate contact necessary for diffusion to occur. Optimum bonding has been achieved at 1150° C. with 10,000 psi. of He gas for a time of 3 hr. (K5k, 2-61; Cb)

715-K. Aluminum Pipeline Automatically Welded. Canadian Welder, v. 52, Aug. 1961, p. 8.

Description and operation of an inert gas machine pipewelder which welds B51S-T4 Al oilfield pipeline sections with a wall thickness of 0.188 in. in the field at high speed. Up to 150 joints are welded in 9 hr. (K1d, 1-52, T26r; Al)

716-K. Welded Ore Bin. Canadian Welder, v. 52, Aug. 1961, p. 14-15.

An A-7 structural steel ore concentrate load-out bin is lined with abrasion resistant T-1 steel plates welded at 200-250° F. Capacity of the bin is 170,000 cu. ft. or 15,000 tons of ore concentrate. (K-general, W12c; TS, SGB-s)

717-K. Commercial Friction Welds Now a Reality. Canadian Welder, v. 52, Aug. 1961, p. 16.

Techniques and equipment for light pressure, high speed friction welding of male and female tool joints 1.75 in. in diameter to form 30 ft. tube lengths. Physical tests and microscopic examination. (K6, 1-52; 4-60)

718-K. (Pamphlet.) British Welding Research Assoc. 16th Annual Report, 1960-1961. 1961. 63 p. British Welding Research Assoc., 19 Fitzroy Square, London W. 1, England.

Survey of research in welding technology, brazing and fatique of weldments. Topics include welding properties of austenitic stainless steel, mild steel, low alloy steels, Al, Cu, Mg and Ti alloys; process involving bare wire CO_2 argon-CO_2 mixtures, gas-metal reactions, the welding ore and heat resisting materials; research on brittle fracture and manufacture of pressure vessels. (K-general, Q26s, T26q, 10-52, 10-54; ST, Al-b, Cu-b, Mg-b, Ti-b)

719-K. Glass-To-Metal Seals Take Hold. S. J. Koch. Iron Age, v. 188, Aug. 31, 1961, p. 88-89.

Mo wire is chromollized diffused with Cr bonding to glass in order to produce a good glass-to-metal seal in the manufacture of vacuum tubes. (K11a, L15, T1j, 17-57; Mo, Cr)

720-K. Broader Use of Aluminum in Air Conditioners Through Zinc-Soldering Production Technique. Industrial Heating, v. 28, Aug. 1961, p. 1480, 1486.

Automatic flame soldering technique for the joining of Al tube to finned Al coils for application in air conditioners. (K7, W10d, 1-52, 17-57; Al)

721-K. Alloying During Welding. George E. Linnert. Metals Engineering Quarterly, v. 1, Aug. 1961, p. 39-56.

Review of techniques which have proved practicable and dependable for welding processes such as manual shielded arc, submerged arc gas tungsten arc and gas-metal arc. Four forms of alloy additions are taken into account including filler wire, powdered metal, metal plating and gases for welding low-alloy, stainless and carbon steels. (K1d, K9n, 2-60; ST)

722-K. The Metallurgy of Weld Heat-Affected Zones in HY-80 High Strength Steel. G. N. Emmanual, D. E. Young and G. L. Spahr. Metals Engineering Quarterly, v. 1, Aug. 1961, p. 82-97.

Transformation characteristics of a commercial plate when austenitized at 2400° F.; hot ductility

tests; effect of base-plate chemistry; preheat temperatures; effects of hydrogen on weldability; influence of variations in chemical analyses on mechanical properties. (K9n, K9s; AY, SGB-a)

723-K. (French.) Comments on Tentative Specifications Relative to Arc Welding. A. Gaubert. Soudage et Techniques Connexes, v. 15, May-June 1961, p. 168-174.

Papers presented at the Society for Welding Engineers covering welding standards and specifications. Topics include dimensional characteristics of covered electrodes, tensile and notch impact tests on fusion weldments and specifications relative to covered electrodes for manual electric arc welding of unalloyed or low-alloy steels. (K1, K9, S22; ST)

724-K. (French.) Study of the Behavior of Brazing Filler Metals Using a Specimen With Variable GAP. B. Blanchet. Soudage et Techniques Connexes, v. 15, May-June 1961, p. 199-210.

Development of a testing method for determining wetting characteristics of brazing meterials of various compositions and resultant joints developed in the brazing of stainless steel. (K8, 1-54; SS, SGA-f, 17-57)

725-K. (French.) Technique for Spot Welding Low-Carbon Steel From 0.022 in. to 1/8 in. Soudage et Techniques Connexes, v. 15, May-June 1961, p. 211-218.

Recommended current, resistance, time, temperature and joint design parameters for producing sound welds in low-carbon steel. Influence of process variables on weld quality. (K3n, K9; CN-g)

726-K. (French.) Some Problems Concerning the Fusion Welding of Wrought Aluminum and Aluminum Alloys. H. Gerbeaux. Soudage et Techniques Connexes, v. 15, May-June 1961, p. 219-237.

Review of the production properties and use of Al and Al alloys with attention to weldability of Al-Mn alloys. Study of the oxy-acetylene and gas-shielded welding of Al and Al-Mg alloys with particular emphasis on prevention of swells, blowholes and crack phenomena. Data are given for radiographic inspection of welds and methods of chemical analysis, especially the determination of Mg. (K1, K2, K9; Al-b, 10-54)

727-K. (German.) Welding Under Inert Gas, Powder and Slag. W. Hummitz. Schweisstechnik, v. 15, Aug. 1961, p. 87-91.

Survey of manual and automatic welding methods such as short-arc welding, using CO_2 and Ar as inert gas; thermit powder welding and electroslag welding. Welding of steel sheet and parts (17 Mn 4 steel, grain refined steels containing 0.8-1.7% Mn, heat resistant steel with 1% Mn and 0.5% Mo). Review of welding mechanisms and process parameters. (K1d, K6, 17-57; SS, 10-54)

728-K. Metallurgical Problems Associated With the Construction of Gas-Cooled Reactor Pressure Vessels. W. C. Holliday and M. J. Noone. Paper from "Steel for Reactor Pressure Circuits". no. 69. Iron and Steel Institute, London SW 1, England, 1961, p. 207-239.

Reasons for selecting mild steel plates having a guaranteed minimum Charpy V-notch impact value of 35 ft. lb. at -10° C. Weld tests to qualify manual and submerged arc welding of thick plates. Results for submerged arc weld metal stress/rupture tests. (K9, K1e, Q6, T11, T26q; CN, 4-53, 17-57)

729-K. Fabrication of Reactor Vessel, Heat Exchangers and Circuitry for Dounreay Fast Reactor. P. K. Richards. Paper from "Steel for Reactor Pressure Circuits". no. 69. Iron and Steel Institute, London SW 1, England, 1961, p. 240-256.

It is possible to manipulate and weld vast amounts of stainless steel to the extra high standard required for nuclear plant and maintain this standard consistently throughout. Inspection methods are available or can be adapted to insure the desired standard is reached. (K-general, T11, T26q; SS, 17-57)

730-K. Shielding Gases--Their Function in the Welding Arc. Welding Engineer, v. 46, Aug. 1961, p. 35-38.

Methods of production and physical properties of Ar, He and CO_2. Effect of shielding gases on arc behavior and weld penetration. Shielding gas requirements for Mig and Tig arc welding of mild steel, low-alloy steel, stainless steel, Ni, Monel, Inconel, Al alloys, Mg, Ti, deoxidized Cu, aluminum bronze and silicon bronze.

(K1d, W29j, 17-57; ST, Ni-b, Al-b, Cu-b, Mg, Ti)

731-K. Will Mig and Tig Meet Your Needs? W. G. Schumacker. Welding Engineer, v. 46, Aug. 1961, p. 40-41.

Physics of welding and process parameters for inert gas shielded metal arc and tungsten arc welding of ferrous and nonferrous metals. Comparison of suitability for joining thin sheets and hard-to-weld metals such as Ti and Zr. (K1d)

732-K. Miles of CO_2-Shielded Welds Fabricate Railroad Hopper Cars. Welding Engineer, v. 46, Aug. 1961, p. 42-43.

Automatic and semi-automatic CO_2 shielded flux cored wire welding used for fabricating steel railroad cars at welding speeds as high as 50 in. per min. (K1d, T23p; ST, 17-57)

733-K. Revolving Tig Unit Cuts Costs but Maintains Quality. W. Twity and W. Purcell. Welding Engineer, v. 46, Aug. 1961, p. 44-45.

Automatic Tig welder with rotating head is used to weld Al tubing in all stages of assembly in the production of refrigerator evaporator compartments. (K1d, T10a; Al, 17-57)

734-K. Three Miles of Runway Girders Are Submerged-Arc Welded. Welding Engineer, v. 46, Aug. 1961, p. 56.

Runway girders, jack trusses and structural columns for a building housing a hot strip mill is fabricated by automatic submerged welding. (K1e; 4-57)

735-K. Designing a Weldable Alloy Using Metallurgical Parameters. W. N. Platte. Metal Progress, v. 80, Sept. 1961, p. 80-85.

The general aspects of developing alloys for weldability involve metallurgical and physical data. These parameters are applied to the design of weldable alloys. (K9s, P-general, Q-general, 2-60; Mo-b, 17-51)

736-K. The Evolution of Ductile High-Temperature Brazing Alloys. D. C. Herrschaft. Metal Progress, v. 80, Sept. 1961, p. 97-100.

Ag brazing alloys containing small amounts of Li, In and Pd are now being used to bond stainless steel honeycomb and alloys containing gold or palladium (or both) look promising for jet engine brazing applications. (K8, Q23p, 2-60, T24; SS, Ag-b, SGA-f, 17-57)

737-K. Brazing of Components for Small Gas Turbine Engines. M. J. Stern. Metal Progress, v. 80, Sept. 1961, p. 101-105.

Techniques and controls employed at Boeing in joining engine components made of Rene 41 and other high-temperature alloys. (K8, T24b; SGA-h, 17-57)

738-K. Calculating Cycles for Brazing. H. M. Lampert, Jr. Metal Progress, v. 80, Sept. 1961, p. 106-107.

When brazing stainless steels parts, it is necessary to know the time and temperatures at which they should be held during the cycle. Calculation of a time-temperature parameter. (K8, 2-61, 3-67; SS)

739-K. "Hot Box" Protects Parts During Welding. Metal Progress, v. 80, Sept. 1961. p. 112, 128.

Special equipment designed for Mig welding of H11 steel accommodates welding fixtures and weldments up to 30 ft. in length. Temperatures of 600° F. for welding and 1200° F. for stress relieving are controlled at 16 heat zones. A protective atmosphere flows into the chamber through a hollow drive shaft of the positioning motor. (K1d, J1a, J2k, 1-52; TS)

740-K. Split-Second Magnetic Force Welding Four Times Faster. Western Metalworking, v. 19, Aug. 1961, p. 27.

Welding process for joining clusters of Zr alloy clad Pu-Al alloy rods used in fuel elements, heat being generated by the electrical resistance of the metal. The welding current energizes an electromagnet which exerts pressure on a movable electrode and pushes the parts together. (K3, T11g; Al-b, Pu, 8-66)

741-K. 12 1/2-Ton Tooling Fixture Aids Saturn Welding. Western Metalworking, v. 19, Aug. 1961, p. 32.

An electronically controlled tooling fixture constructed from Al alloy is used for precision welding of Al alloy segments into 18 ft. diameter dome-shaped bulkheads of Saturn space vehicle. A

2 1/2 ton platform rotates from horizontal to vertical on two 18-ft. high end plates as it moves each segment joint past the welding torch. (K2, 1-52, T24e; Al-b, 17-57)

742-K. Double Driving Fasteners Assure Positive Seal. Western Metalworking, v. 19, Aug. 1961, p. 46, 48.

Process for joining structural members of fuel tanks using two-piece lockbolts consisting of an AISI 4037 alloy steel pin and a 2024-T4 Al alloy collar. When the pin is pulled through the hole, which is smaller in diameter than the pin, the hole is expanded slightly producing a metal-to-metal mechanical seal. (K13q, T7f; Al-b, AY, 17-57)

743-K. Electrode Coatings and Fluxes. W. W. Watson. New Zealand Engineering, v. 16, June 15, 1961, p. 217-220.

Flux coatings and the function of their individual consituents are discussed in terms of physical and chemical reactions and their effects on the metal. (K1a, K9n, W29h)

744-K. Impact Method Promises Light, Cheap Spotwelders. Steel, v. 149, Aug. 28, 1961, p. 75.

Production of mild steel welds with a 1200 lb. resistance in tension shear by using a resistance welding machine consisting of anvil, top electrode and a falling weight. Welds are made by applying power, striking the electrodes and allowing current to continue for a short time. (K3n, 1-52; CN)

745-K. Electron-Beam Welding. Aircraft Production, v. 23, Aug. 1961, p. 303-307.

Description, equipment and applications of process including typical setting for welding alloy steels, Cu, Ta, Be, Ti, Mo, Ni, Zr, Cd and Al alloy. (K6, 1-52, 17-57)

746-K. Designers Control Distortion by Welding Inside Out. Iron Age, v. 188, Sept. 7, 1961, p. 108-109.

Fabrication of 4130 steel shell motor case by short arc welding from within. Thermal expansion of the steel forces the joint tightly against an outer backup bar to control distortion. Rupture is from 1200-1500 psi. (K1, P11h, Q3m; AY, 9-74)

747-K. The Production of Hydraulic Pit-Props. S. C. Poulsen. Machinery (London), v. 99, Aug. 2, 1961, p. 245-249.

CO_2 shrouded arc welding of components using automatic 30-kVA machines. Welding and testing, cleaning and painting routines are outlined as part of final fabrication and assembly. (K1d, 1-52)

748-K. (Russian.) Friction Welding of Pins to a Plate. R. I. Zakson and V. D. Voznesenskii. Avtomaticheskaya Svarka, v. 14, June 1961, p. 58-62.

Mechanical and crystallographic properties of a friction welded joint. Effects of heat treatment. 6 ref. (K6, M26, Q-general, 2-64; 7-51)

749-K. (German-French.) Welding Tests on 13% Chromium Cast Steel. K. Gut and A. Werner. Schweisstechnik-Soudure, v. 51, June 1961, p. 203-211.

Heat treated square bars for water turbines are test welded at preheating temperature from 200-600° C. Investigation of microstructure, hardness, mechanical strength, notch impact strength as influenced by temperature and fatigue strength. (K9r, M-general, Q-general, 2-61)

750-K. Review of Recent Developments in Metals Joining. J. J. Vagi, W. J. Lepkowski, H. W. Mishler and H. E. Pattee. Defense Metals Information Center, Battelle Memorial Institute, DMIC Memo. 125, Sept. 1, 1961, 5 p.

Summary of reports for Apr. 30-July 20, 1961. Topics include the effects of welding on the metallurgical and mechanical properties of Cb alloys; plasma welding of refractory metals; explosive welding of 4340 steel, Ti-6Al-4V, Mo, Ti-13V-11Cr-3Al and of 310 stainless alloys; electroslag welding process and equipment; and development of ceramic adhesives for high-temperature applications. 8 ref. (K-general, 10-54; EG-d37, SGA-h)

751-K. Adhesives for Ordnance. Eileen R. Swick. Ordnance, v. 46, Sept-Oct. 1961, p. 295-298.

Evaluation of adhesive joining with epoxy based resins for use in ordnance field emergency repairs. The effects of curing conditions of fillers and flexibilizers in the adhesive and of temperature and weather conditions

on toughness, impact and heat resistance and shear strength of the bond are tested for steel to steel and Al to Al joints. Attention is given to corrosive effects of the adhesive on the metal. (K12, T2, 18-72; ST, Al, NM-d34, 17-57)

752-K. Volkswagen Depends on Automatic Resistance Welding. Welding Design & Fabrication, v. 34, Aug. 1961, p. 24-25, 58-59.

Techniques and equipment for automatic spot and seam welding and projection and flash welding. (K3, 1-52, T21)

753-K. Welded Design Makes Steel Yacht Safe for Sunday Sailors. Welding Design & Fabrication, v. 34, Aug. 1961 p. 26-27.

Welding, assembling and finishing operations in the construction of hot rolled steel yachts 28 and 32 ft. long. (K-general, L-general, T22; ST)

754-K. Automatic Welding Outdoors. Welding Design & Fabrication, v. 34, Aug. 1961, p. 28-29.

Assembly and CO_2 shielded and submerged arc welding of mild steel tanks 14 ft. in diameter and up to 240 ft. long. (K1d, K1e, T26q; CN)

755-K. Mig Braze Welding Saves Time and Money. Welding Design & Fabrication, v. 34, Aug. 1961, p. 57.

Mig braze welding with phosphor-bronze welding wire of actuating cylinders consisting of SAE 1020 steel cylinder tubes and ductile iron collars whose Ag-brazed joints had failed. (K1d, T21b; CN)

756-K. 7 Typical Joint Designs for Adhesive Bonding. Product Engineering (Design Digest Issue), v. 32, Sept. 4, 1961, p. 364-365.

Lap, angle, butt, stiffener, corner (sheet metal and rigid member) and cylindrical slip joint designs used to fasten structural members. (K12)

757-K. Inert-Gas-Shielded Arc Welding of Ferrous Metals. G. R. Rothschild and A. Lesnewich. Welding Research Council Bulletin, no. 70, July 1961, 21 p.

Review of Tig and Mig welding including physical characteristics of the processes, application to steel, comparison with other welding methods, properties of welded materials, design and operation of equipment and process variables. 18 ref. (K1d, 10-54; ST)

758-K. Heat Treating Teams With Brazing. John J. Lawless. American Machinist/Metalworking Manufacturing, v. 105, Aug. 21, 1961, p. 101-103.

Heating temperatures, furnace atmospheres, brazing alloy compositions and the cooling cycle are evaluated for combined furnace brazing and hardening of 17-7 PH, 440, 440 C, AM 350 and 355 stainless steels. T-T-T diagrams are constructed for austenite, ferrite and martensite transformations at 340-2050° F. (K8j, J2k, N8g, 2-61, 2-64; SS, SGA-f, 17-57)

759-K. How Electron Beam Welding Facilitates High Pressure Vessel Construction. Kenneth J. Miller. Modern Machine Shop, v. 34, Sept. 1961, p. 124-129.

Precision joining of hemispherical pressure-vessel halves made of exotic alloys including Ti, Ta, Cb, Mo, Udimet 500 and Rene 41. Applications of process in high precision milling and drilling. (K6, T26q, 1-52; Ti, Ta, Cb, Mo, Ni-b)

760-K. Submerged Arc Joins Aluminum. Iron Age, v. 188, Sept. 21, 1961, p. 104.

Filler wires in diameters up to 7/32 in. require heavy wire feeders and high-capacity power supplies to butt weld thick Al alloy plates. Submerged-arc equipment, suitably converted to use with Al, is also used for fillet welds. (K13, W29, 1-52; Al-b)

761-K. Brazing for High-Temperature Service. A. F. Haskins. Defense Metals Information Center, Battelle Memorial Institute, DMIC Memo. 48, Mar. 29, 1961, 12 p.

Summary of technical advances in brazing of filler metals with high-temperature, high-strength, corrosion-resistant alloys at temperatures in excess of 600° F. Filler metals analyzed include Ni and noble metal base alloys as well as filler additions of Li, Mn, Si, Cu, Co and Cr. 42 ref. (K8, 2-62, 10-54; SGA-g, SGA-h, SGB-a)

762-K. Percussive Welding Joins Fine Wire. W. A. Owczarski and A. J. Palmer. Metalworking Production, v. 105, Aug. 9, 1961, p. 57-59.

Welding of fine wires using a discharge from a capacitor bank at the moment when the two parts are brought together. Success of the process depends on close timing and control of positioning and clamping of parts to be welded. (K3a, 1-52; 4-61)

763-K. Welding Titanium. Tool and Manufacturing Engineer, v. 47, Sept. 1961, p. 115-116.

Precautions to take during welding to avoid embrittlement and contamination; advantages of sigma welding; data on joint design. (K1d; Ti)

764-K. Liquid Metal Fuel Reactor Experiment--Investigation of Beryllium Welding Techniques for Reactor Port Thimble Joints. P. C. Thys. Babcock & Wilcox. U. S. Office of Technical Services, BAW-1100, Apr. 1960, 23 p. $.75.

Be tubing is successfully joined using tungsten inert gas procedure in fabricating a thimble for insertion into the graphite core assembly of a liquid metal fuel reactor (LMFR). (K1d, T11; Be, 17-57)

765-K. Welded Butt Joints With Fine Wires. Lee Martz. Review of Scientific Instruments, v. 32, Aug. 1961, p. 990-991.

A method of fusing fine wires of dissimilar diameters and melting points by oxy-gas methods. Applications to wires of Cu, Ni, Cr, Pt, Au, Al, Co and their alloys. (K2m, 3-73; Cu-b, Cr-b, Ni-b, Pt-b, Au, Co-b, 4-61)

766-K. New Precision Orbital Welding Method. Metallurgia, v. 64, July 1961, p. 22.

Method effects a butt weld between a fully formed tube in a fixed position and an end fitting properly positioned. Degree of concentricity of weld crown and penetration bead is high. Description of equipment; applications in nuclear industry. (K-general, 1-52; 4-60)

767-K. (Czech.) Welding of Steels Containing 5% Chromium and Stabilized With Molybdenum or Tungsten. Vaclav Pilous. Zvaranie, v. 10, Jan. 1961, p. 5-9.

CSN 17102 and CSN 422900 steel are welded using cored and coated electrodes. Preheating from 200-400° C. and heat treating of weldments at 720° C. 14 ref. (K-general, K9p, K9q; AY, Cr, Mo, W)

768-K. (Czech.) Percussion Welding of Steel Tubing Used in Boilers. Jaroslav Vintr and Juraj Cervenka. Zvaranie, v. 10, Jan. 1961, p. 10-14.

Welding of tubing manufactured from steel containing 0.05-0.22% C, 0.25-0.65% Mn, 0-0.65% Cr and 0-1% Mn. Preparation of joints and percussion welding with simultaneous increase of the internal pressure by supplying compressed air to tube interior. (K3a, 3-74, K9p; ST, 4-60)

769-K. (Slovak.) Vacuum Brazing. Vladimir Horacek. Zvaranie, v. 10, Jan. 1961, p. 14-17.

Brazing of Cd, Zn, Mg, Pb, 18-8 stainless steel, Nimonic 90 or Ti in a vacuum furnace using solders containing Ag, Cu, Sn, Au, In, P, Mn, Ni, Fe, Pt or Mo. Wettability as a function of pressure. 8 ref. (K8, 1-73, 3-74; Cd, Zn, Mg, Pb, SS, Ti, Ni-b)

770-K. (Slovak.) Automatic Submerged Arc Welding of Austenitic Steels. Alfred Missikewitsch. Zvaranie, v. 10, Jan. 1961, p. 18-20.

Welding of 1Kh18N9T austenitic steels using fluxes of various compositions and carbon steel electrodes. Effects of flux composition and welding parameters on composition of weld metal, hot cracking, metal transport, tensile and bend properties and impact strength of weldments. 6 ref. (K1e, 18-74, Q-general; SS-e, 7-51, 9-71)

771-K. (Czech.) Cold Pressure Welding. Rudolf Krnak. Zvaranie, v. 10, Jan. 1961, p. 24-25.

Sheets or wires of various metals and alloys are welded in the cold state at pressures from 50-500 kg. per sq. mm. transmitted to the surfaces by special welding dies. Welding of spot, butt and overlap joints. (K-general, 1-67, 3-74; 4-53, 4-61)

772-K. Exothermic Brazing. Roger A. Long. Welding Journal, v. 40, Aug. 1961, p. 346s-350s.

Theory of exothermic reactions. Average ignition temperatures and approximate duration times of stoichiometric

mixtures. Effects of powder particle size and additions of inert materials on reaction duration. Utilization of the metallic products of the reactions as bonding adhesive and/or the heat from the reaction to braze stainless steel honeycomb panels. (K8; SS, 7-59)

773-K. Ultrasonic Welding of Heat-Resisting Metals. N. E. Weare and R. E. Monroe. Welding Journal, v. 40, Aug. 1961, p. 351s-358s.

Ultrasonic spot welding of various combinations of 316 stainless steel, Ti, Fe, Cb, Inconel and Mo-0.5% Ti alloy. Influence of clamping pressure, welding time and welding tip displacement on formation of welds and their room temperature properties. Metallurgical examination indicates that fatigue cracking occurs at the edge of the weld area. Only welds in Ti and between stainless steel, Fe and Cb had acceptable cross-tension strengths. 13 ref. (K6r, K9, Q7, Q27a; SS, Ti, Fe, Cb, Ni-b, Mo-b, SGA-h, 7-51)

774-K. Welding the Beta Titanium-Base Alloy Ti-13V-11Cr-3Al. H. D. Kessler. Welding Journal, v. 40, Aug. 1961, p. 359s-363s.

Tig welding of the alloy in annealed and aged conditions. Effects of various post-weld heat treatments, repair welding and cold working of welded area on tensile properties and notch sensitivity. (K1d, Q23s, Q27a, 2-64, 3-68; Ti-b, V, Cr, Al)

775-K. Effect of Welding Conditions on the Shrinkage Distortion in Welded Structures. Masaki Watanabe and Kunihiko Satoh. Welding Journal, v. 40, Aug. 1961, p. 377s-384s.

Shrinkage distortion is analyzed from the standpoint of welding heat and external restraint effects. Examples of applications of mathematical expressions for distortion in unrestrained and under external restraint conditions. 12 ref. (K9n; 7-51, 9-67, 9-74)

776-K. An Automatic Process for Welding Girth Joints in Steel Pipelines. J. W. Nelson, G. E. Faulkner, P. J. Rieppel and H. C. Cook. Welding Journal, v. 40, Aug. 1961, p. 813-820.

Automatic CO_2 shielded consumable electrode welding process is used in a fixed horizontal position in field pipe girth-welding. Weld geometry, welding conditions and weld quality. (K1d, 1-52, T26r)

777-K. Semi-Automatic Gas Tungsten-Arc Spot Welding of Stainless Steels and High Temperature Alloys. R. J. Campbell and D. R. Miller. Welding Journal, v. 40, Aug. 1961, p. 828-838.

Process for producing two-ply and multiple-thickness joints in 19-9DL and 316 stainless steels, Inconel, Inconel X, Hastelloy X and Rene 41 sheet. Equipment requirements and welding schedules. 4 ref. (K1d, K3n, 1-52; SS, Ni-b, SGA-h, 4-53)

778-K. Here's What Research at Orenda Revealed About Brazed Joints. Canadian Machinery and Metalworking, v. 72, Sept. 1961, p. 73-79.

Studies of alloys composed of Au (72-100%), Cr (7%), Ni (22-82.45%), Ag (35-92.8%), Cu (7-65%), Mn (5-70%), Pd (20%), Li (0.2%), Si (3.5-9%) and B (1.8-2.9%) for induction brazing of 410 stainless steel, Inconel and mild steel at 1750-2175° F. Alloy brazed joints are tested for shear and tensile strengths, corrosion resistance and stress rupture properties. (K8k, Q2, Q3q, Q27a, R11; ST, Ni-b)

779-K. Friction Welding Takes First Commercial Steps. Canadian Machinery and Metalworking, v. 72, Sept. 1961, p. 80.

Development of a welding technique in which the mechanical energy of two objects rotating in contact with each other is converted into thermal energy. Friction welding joins Cu to brass, brass to Al and Al to steel using light pressure and high speeds. (K6, Cu, Cu-n, Al; ST)

780-K. Stainless Steel Overlaying Using Inert Gas Metal Arc Process--Canadian Pioneer Research. E. G. Brown. Canadian Machinery and Metalworking, v. 72, Sept. 1961, p. 81-84.

Stainless steel wire is used to overlay mild steel A285 plates using standard Mig equipment. Effects of current and welding speed on dilution and penetration and the effect of dilution on hardness. 5 ref. (K1d, 1-52, 17-51; ST, SS)

781-K. Weld 9 3/8 In. Thick on Huge Suction Dredge Stands the Test of "World's Toughest Job". Canadian Machinery and Metalworking, v. 72, Sept. 1961, p. 86-87.

Cracks in solid medium carbon steel are examined by Magnaflux testing and are repaired by welding with low-hydrogen stick electrodes. A welding, peening and Magnaflux testing cycle is repeated to build up the sides of the cracks. (K2j, S13j, T4d; CN, 1-52, 9-72, 17-57)

782-K. Low-Temperature Silver-Brazed Joints Strong, Easily Made on Almost Any Joint. Dudley C. Lloyd. Canadian Machinery and Metalworking, v. 72, Sept. 1961, p. 88-89, 101.

Alloys varying in Ag content (15-50%) are used in torch and furnace brazing of Cu, brass, bronze, Ni, steel, stainless steel and Monel. Applications in plumbing, electronics and aircraft. (K8, 1-52, 1-67, 7-52, 17-57; Ag-b)

783-K. Welding Design, Procedure and Control in Relation to Canadian Standards. Ronald M. Gooderham. Canadian Machinery and Metalworking, v. 72, Sept. 1961, p. 90-95.

Canadian welding codes and processes. Requirements are given for backing bars, strength of weld, effective lengths, design stress requirement and rate of cooling. (K-general, 11-62)

784-K. Welding Secrets Uncovered by Mines Branch. W. P. Campbell. Canadian Machinery and Metalworking, v. 72, Sept. 1961, p. 98-99.

Welding research projects at Dept. of Mines and Technical Surveys, Ottawa, include induction welding and investigations of weldability of steel, uranium and tin-bronze castings. (K6n, K9s; ST, Sn, Cu-s, U)

785-K. Brazing Nickel and Its Alloys Need Proper Methods, Material. Canadian Machinery and Metalworking, v. 72, Sept. 1961, p. 116, 138.

Prebrazing procedures for Ni and Ni-base alloys include stress relief and mechanical or chemical cleaning. Choice of heating methods, fluxes and atmospheres for brazing with Ag-Cu-Zn-Cd alloys. (K8, J1a, L10, L12, 1-52; Ni)

786-K. Half an Acre of Jigs Yields Quality Welds. Canadian Machinery and Metalworking, v. 72, Sept. 1961, p. 130, 132.

Flash and arc welding of heavy equipment components using jigs to provide dimensional control. (K1, K3r, T3, T4, 1-52)

787-K. (French.) Friction Welding. Jan Mandaus and Josef Voboril. Mechanique Electricite, v. 45, Mar. 1961, p. 51-58.

Welding of high alloy, stainless, heat resistant, martensitic-ferritic, austenitic and structural steels, Cu, Al, brass, bronze and Ti. Heat produced as a function of contact pressure, time of operation, friction coefficient, thermal conductivity, rotation velocity and specific heat of the materials welded. (K6, 3-67; ST, Cu, Al, Cu-n, Cu-s, Ti)

788-K. Safeguarding Nichrome Brazing in Hydrogen. Lindsey Hoben. Metal Treating, v. 7, Aug-Sept. 1961, p. 19, 35.

A hydrogen atmosphere is used with brazing processes to prevent discoloration. A parallel two bank supply system incorporating a He purge facility eliminates explosive conditions. (K8, 1-52, 2-66; EG-n)

789-K. Jig Design for Precision Furnace Brazing. Alexander M. Hanfmann. Metalworking Production, v. 105, Aug. 30, 1961, p. 99-107.

Principles and processes for high volume assembly of uniform parts such as cooling coils and manifold joints, either with self-jigging parts or with brazing jigs. Consideration of design, assembly, inspection and maintenance for brazing jigs including tolerance and expansion factors. (K8j)

790-K. How to Calculate Welding Heat Processes. Harry Thomassen. Canadian Metalworking, v. 24, Sept. 1961, p. 40-41.

Analysis of phenomena associated with the flow of heat from the weld area to the adjacent metal. (K9)

791-K. H-F Induction Brazing and Soldering. J. Libsch and P. Capolongo. Canadian Metalworking, v. 24, Sept. 1961, p. 54-56.

Typical joint and coil designs; factors in the selection of generators and fixtures. (K7e, K8k, 1-52)

792-K. Dip Brazing Aluminum. George C. Sargeant. American Jewelry Manufacturer, v. 6, Aug. 1961, p. 24-25, 28.

Advantages of the process and brazability, melting range and suggested brazing temperatures of numerous Al alloys. Techniques for controlling process variables to assure strong, distortion free brazements. Brazing defects and causes. (K8n; Al-b, 7-52, 9)

793-K. New Seam Welder Increases Tube Mill Output. Metalworking Production, v. 105, Aug. 23, 1961, p. 43-44.

Use of V welding unit in the continuous electric resistance welding of pipe and tubes. The unit is based upon a vapor-cooled toroidal transformer which can be incorporated in tube mills. Production, capacity and costs. (K3p, T26p, 1-52)

794-K. Difficult Sealing Problem Solved With Electron Beam Welder. Wild Barfield Heat-Treatment Journal, v. 8, June 1961, p. 7-9.

Application of electron beam welding to high-precision pressure-sensing device of stainless steel and Inconel simplifies fabrication, assures vacuum tight sealing and prevents distortion and variations of joint quality. Electron beam welder is also used as a heat source for Ni, Nicrobraze and Cu brazing of stainless steel. (K6, K8, T24e, 1-52, 17-57; SS, Ni-b)

795-K. How to Design for Adhesive Bonding. R. F. Wegman, M. J. Bodnar and K. J. Taglier. Materials in Design Engineering, v. 54, Aug. 1961, p. 120-121.

Stress analysis and adhesive selection for bonding a cylindrical Al rod to a hollow steel tube. (K12, Q25; ST, 4-60, Al, 4-55, 7-58)

796-K. Vacuum Brazing of "Difficult" Alloys. P. Burtenshaw. Wild Barfield Heat-Treatment, Journal, v. 8, Mar. 1961, p. 4-6.

High temperature brazing of austenitic stainless steels and high performance Ni-Cr alloys in a vacuum brazing furnace prevents metallic oxide formation and impurity absorption. Brazing in a vacuum resistance furnace is compared with the use of chemical fluxes or of purified hydrogen. 7 ref. (K8m, 1-73; SS-e, Ni-b, Cr)

797-K. "Kid Glove" Welding of Zirconium. J. T. Maloney. American Machinist/Metalworking Manufacturing, v. 105, Sept. 4, 1961, p. 109.

Coolant tubes for a pressurized water test tube reactor are produced by arc welding of Zr tubing in a high purity argon atmosphere using Zircaloy-2 filler metal. Extreme cleanliness, controlled heat imput and purity of shielding gas are the critical factors. (K1d, 1-52, T11; Zr, 7-51)

798-K. Welding Titanium. Tool and Manufacturing Engineer, v. 47, Sept. 1961, p. 115-116.

Design data are given for T16 and sigma welding including weld type, thickness range, weld pass number, electrode and filler wire type and diameter and root opening and angle of bevel for joints. Survey of properties of Ti alloys affecting weldability. (K1d, K9s, 10-54; Ti-b)

799-K. Soviets Weld Steel to Aluminum. Iron Age, v. 188, Sept. 14, 1961, p. 181-183.

Tungsten arc process for welding galvanized steel and Al-Mg alloy plate, the arc vaporizing the Zn as the Al coats the hot steel, forming a layer of intermetallic compound at the line of contact. Data are given for mechanical properties of welds and for technological parameters of butt and fillet welding processes. (K1d, K9; Al-b, ST, 8-65)

800-K. Steelmaker Fabricates Vacuum Degassing Tanks. F. T. Tancula. Welding Engineer, v. 46, Sept. 1961, p. 39-41.

Submerged arc welding of mild steel. The top half of the degassing tank is lined with 10-gage stainless steel sheets to protect the carbon steel shell. (K1e; CN, SS)

801-K. Zinc Group Sponsors Tests to Set Spot Welding Standards for Galvanized Steel. Welding Engineer, v. 46, Sept. 1961, p. 42-44.

Cu-Zr electrode is used in test spot, butt and flash welds. Annealed in line and annealed out of line processes for production of Zn-coated steel sheet. Comparison of various weld testing methods. (K3, K9r; ST, Zn)

802-K. Which Water Cooling System Best Suits Your Particular Needs? R. A. Bernard. Welding Engineer, v. 46, Sept. 1961, p. 60, 62, 64, 66.

Cooling systems including use of city water, central cooling systems and self-contained water coolers considered with respect to suitability for plasma, induction, Tig, Mig, arc and resistance welding. (K-general, K9, 1-52)

803-K. Mig + 5086 Aluminum = Lightweight Boats. Welding Engineer, v. 46, Sept. 1961, p. 70.

5086-Al-alloy, 1/4, 3/16 + 1/8 in. thick plate, cut with carbide-tipped woodworking tools and Mig welded around steel jigs. (K1, G10h, T22g, 1-52; Al-b, 4-53)

804-K. (German.) Influence of Electrodes on Shrinkage of Welds. A. Matting and H. Wolf. Schweissen und Schneiden, v. 13, Aug. 1961, p. 315-319.

Electrical butt welding of 10 mm. thick St. 37 steel plates using electrodes of various diameter and coating thickness. Measurement of shrinkage of weld as influenced by electrode diameter and thickness of coating. (K1, K9r, 1-53, 3-73; ST, 7-51)

805-K. (German.) Autogenous Processing Techniques. H. v. Hofe and H. Killing. Schweissen und Schneiden, v. 13, Aug. 1961, p. 320-329.

Oxygen-acetylene techniques established by standard DIN 8522 include welding and soldering; flame cutting, planing and boring; autogenous stress free annealing; flame hardening, autogenous metal spraying flame descaling and polishing (of plastics). (K2, K3, G22, J2h, L10g, L23, 1-52, 11-62)

806-K. (German.) Examples for Random Sampling in the Field of Resistance Welding and Application of Mathematical Statistics. K. Haves. Schweissen und Schneiden, v. 13, Aug. 1961, p. 329-333.

Applications of statistical mathematics to random tests of resistance welded parts. Definitions of terms. (K3, K9, 1-54)

807-K. Big Electrode Promoted for Big Aluminum Plate. Steel, v. 149, Sept. 25, 1961, p. 156.

Welding Al plate more than 2 in. thick employing submerged arc equipment converted by replacement of flux and contact tube system. (K1e, 1-52, 3-73; Al, 4-53)

808-K. Malleable Iron Moves Up on Weldability Scale. Iron Age, v. 188, Sept. 28, 1961, p. 85-87.

Highly satisfactory results are obtained by using a method that avoids high heat concentration. Use of low hydrogen electrodes is the most successful in terms of performance plus economy. (K9s; CI-s)

809-K. (German-French.) Maximum Stresses in Welded Machine Parts. Richard Hanchen. Schweisstechnik Soudure, v. 51, Aug. 1961, p. 267-274.

Analysis of maximum stresses for continuously and discontinuously stressed welded machine parts as influenced by type of welding seam, with emphasis on butt welded seams and filled welds. 6 ref. (K9)

810-K. Welding in the Non-Ferrous Field. N. P. Inglis and E. A. Taylor. British Welding Journal, v. 8, Sept. 1961, p. 419-436.

Developments in the welding of non-ferrous metals including the state of welding design and construction and outline of welding processes. Welding properties, characteristics and applications of Cu, Al, Ni and their alloys and Ag, Ti and Zn. 12 ref. (K-general; Cu, Al, Ni, Ag, Ti, Zn, EG-a38)

811-K. Mechanical Properties and Metallurgical Features of Mild Steel Weld Metals. Pt. 1. H. F. Tremlett, R. G. Baker and J. M. Wheatley. British Welding Journal, v. 8, Sept. 1961, p. 437-447.

Investigation of factors governing strength of mild steel weld metal deposited by various processes and in particular the influence of grain size on yield stress and yield/ultimate ratio. Reasons for differences in strength of as-deposited and reheated weld metal are indicated. (K9, M27c, Q23b, 2-59; CN, 7-51, 17-57)

812-K. Metallographic Examination of Double-Run Specimens. Pt. 2. H. F. Tremlett and R. G. Baker. British Welding Journal, v. 8, Sept. 1961, p. 447-454.

Microstructure study of multirun weld metal deposits with reference to grain structure variations in the various

layers caused by subsequent run reheating and reheating at 950° C. Relationship of such variations to different welding processes. 6 ref. (K9, M27, 2-59; 7-51)

813-K. Automation in Production Welding. A. I. Akulov. NLL (National Lending Library for Science and Technology) Translations, Bulletin, v. 3, Aug. 1961, p. 676-687.

Summary of proceedings of an All-Union (USSR) conference on integrated mechanization and automation of production welding. Topics include gas arc, submerged arc and resistance welding, weld surface reinforcement and gas flame processing. (K-general, 1-52, 10-54, 18-74)

814-K. Selecting High Temperature Brazing Alloys. R. L. Peaslee. Machine Design, v. 33, Sept. 14, 1961, p. 160-163.

Composition, properties and applications for common Ni-base materials as a guide to selection. Filler metals are used for brazing parts for jet and rocket engines, nuclear reactor components, airframe structures and chemical and food-processing equipment. (K8, 17-57; Ni-b)

815-K. Vinyl-Metal Laminates--Strength, Texture, Warmth, Formability. Gerard H. Poll, Jr. Products Finishing, v. 25, Sept. 1961, p. 40-47.

Adhesive bonding techniques employed in the lamination of vinyl plastic to Al, steel and galvanized steel strip. Summary of cleaning, conversion coating, drying and rolling operations. Survey of applications and properties of coated sheets. (K11d; ST, Al)

816-K. Joining Molybdenum. F. G. Cox. Welding and Metal Fabrication, v. 29, Sept. 1961, p. 371-377.

Welding, brazing and mechanical joining of Mo sheet and rods. The testing of welds to determine the effects of the welding method, atmosphere and travel speed and of Mo purity, grain size and recrystallization temperature on weld strength, ductility and ductile-brittle transition temperature. Evaluation of shear strength and stress rupture curves of brazed joints. 13 ref. (K-general, K9r; Mo, 2-59, 3-69, 4-53, 4-55, 7-51)

817-K. (Slovak.) Weldability of Thin Steel Sheet. Michal Basista. Zvaranie, v. 10, Feb. 1961, p. 34-37.

Weldability ratings are determined from the appearance and shape of beads in butt welded samples. Comparison with results obtained in the Erichsen cupping test performed on welded and unwelded samples. (K9s, K9r; ST, 4-53)

818-K. (Slovak.) Quality Control of Resistance Welded Thin Sheets. Milan Lipa. Zvaranie, v. 10, Feb. 1961, p. 37-42.

Design of spot welded, seam welded and resistance welded steel samples for various static and dynamic tensile, shearing and peeling tests. Arrangement for ultrasonic testing. 6 ref. (K9s, K9r, K3, 1-54; ST, 4-53)

819-K. (Czeck.) Submerged Arc Welding of Aluminum. Jindrich Vana. Zvaranie, v. 10, Feb. 1961, p. 42-46.

Welding of 6-20 mm. thick Al plates using automatic equipment SUM 1000 and a 1.2-3.15 mm. electrode at current intensity of 180-470 amp., voltage of 27-28, welding speed of 13-27 m. per hr. and an electrode feed of 191-540 m. per hr. Data are given for macrostructure, microstructure, corrosion resistance in boiling 95% HNO_3, tensile and bend strengths of weldments. (K1e; Al, 4-53)

820-K. Shaped Pellets Aid Epoxy Bonding. Stephen J. Siner. American Machinist/Metalworking Manufacturing, v. 105, Sept. 18, 1961, p. 108-109.

Curing and use of shaped epoxy pellets to make a strong bond between dissimilar metals and to bond glass to metal. Applications and physical properties of the pellets. (K12, K11a, 1-52, 17-57; NM-d34)

821-K. Narrower, Deeper Electron Welds. American Machinist/ Metalworking Manufacturing, v. 105, Sept. 18, 1961, p. 111.

The use of the electron-beam gun in nuclear and missile applications to produce welds with high depth-to-width ratios at voltages of 30,000 v. or less. Depth-to-width ratio as a function of specific beam energy. (K6, 1-52)

822-K. New Inert Gas Barrier Aids Brazing--Of Stainless Honeycomb and of

Titanium Honeycomb. J. F. Cochran and D. R. Torgeson. American Machinist/ Metalworking Manufacturing, v. 105, Sept. 18, 1961, p. 122-125.

Prevention of contamination in brazing honeycomb panels by maintaining a pressure differential between the inside argon brazing atmosphere and an outside vacuum zone. Use of a special brazing alloy and insulation of the graphite block. (K8, 1-73, 2-66; SS, Ti, 7-59)

823-K. Evaluation of the Weldability of Low-Alloy High-Tensile Steels Made With Electrolytic Manganese. P. K. Chakravarty and S. Visvanathan. Indian Institute of Metals, Transactions, v. 14, Mar. 1961, p. 27-52.

Weldability ratings and weldment service performance. Data are obtained for steels containing 1.0-1.4% Mn, 0.1-0.15% Ti, 0.3-0.4% Cu and 0.002-0.004% B. Comparison with TISCOR, TISCROM and Fortiweld steels. 29 ref. (K9r, K9s, 2-60; AY, SGB-a)
